$$= -32 \text{ J/kg}$$ **Ans.**

INTRODUCTORY EXERCISE 13.4

1. The gravitational potential due to a mass distribution is $V = 3x^2y + y^3z$. Find the gravitational field.
2. Gravitational potential at $x = 2$ m is decreasing at a rate of 10 J/kg-m along the positive x-direction. It implies that the magnitude of gravitational field at $x = 2$ m is also 10 N/Kg. Is this statement true or false?
3. The gravitational potential in a region is given by, $V = 20(x + y)$ J/kg. Find the magnitude of the gravitational force on a particle of mass 0.5 kg placed at the origin.
4. The gravitational field in a region is given by $\mathbf{E} = (2\hat{i} + 3\hat{j})$ N/kg.

   Find the work done by the gravitational field when a particle of mass 1 kg is moved on the line $3y + 2x = 5$ from (1m, 1m) to (−2m, 3m).

13.7 Gravitational Potential Energy

The concept of potential energy has already been discussed in the chapter of work, energy and power. The word potential energy is defined only for a conservative force field. There we have discussed that the change in potential energy (dU) of a system corresponding to a conservative force is given by

$$dU = -\mathbf{F}\cdot d\mathbf{r} \quad \text{or} \quad \int_i^f dU = -\int_{\mathbf{r}_i}^{\mathbf{r}_f} \mathbf{F}\cdot d\mathbf{r} \quad \text{or} \quad U_f - U_i = -\int_{\mathbf{r}_i}^{\mathbf{r}_f} \mathbf{F}\cdot d\mathbf{r}$$

We generally choose the reference point at infinity and assume potential energy to be zero there, i.e. if we take $r_i = \infty$ (infinite) and $U_i = 0$, then we can write

$$\boxed{U = -\int_{\infty}^{\mathbf{r}} \mathbf{F}\cdot d\mathbf{r} = -W}$$

or potential energy of a body or system is negative of work done by the conservative forces in bringing it from infinity to the present position.

Gravitational Potential Energy of a two Particle System

Fig. 13.40

The gravitational potential energy of two particles of masses m_1 and m_2 separated by a distance r is given by,

$$\boxed{U = -\frac{Gm_1m_2}{r}}$$

This is actually the negative of work done in bringing those masses from infinity to a distance r by the gravitational forces between them.

Gravitational Potential Energy for a System of Particles

The gravitational potential energy for a system of particles (say m_1, m_2, m_3 and m_4) is given by

$$\boxed{U = -G\left[\frac{m_4m_3}{r_{43}} + \frac{m_4m_2}{r_{42}} + \frac{m_4m_1}{r_{41}} + \frac{m_3m_2}{r_{32}} + \frac{m_3m_1}{r_{31}} + \frac{m_2m_1}{r_{21}}\right]}$$

Thus, for a n particle system there are $\frac{n(n-1)}{2}$ pairs and the potential energy is calculated for each pair and added to get the total potential energy of the system.

Gravitational Potential Energy of a Body on Earth's Surface

The gravitational potential energy of mass m in the gravitational field of mass M at a distance r from it is,

$$U = -\frac{GMm}{r}$$

The earth behaves for all external points as if its mass M were concentrated at its centre. Therefore, a mass m near earth's surface may be considered at a distance R (the radius of earth) from M. Thus, the potential energy of the system will be

$$U = -\frac{GMm}{R}$$

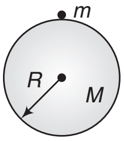

Fig. 13.41

Difference in Potential Energy (ΔU)

Let us find the difference in potential energy in two positions shown in figure. The potential energy when the mass is on the surface of earth (at B) is,

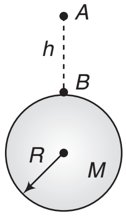

Fig. 13.42

$$U_B = -\frac{GMm}{R}$$

and potential energy when the mass m is at height h above the surface of earth (at A) is,

$$U_A = -\frac{GMm}{R+h} \qquad (U_A > U_B)$$

$$\therefore \qquad \Delta U = U_A - U_B$$

$$= -\frac{GMm}{R+h} - \left(-\frac{GMm}{R}\right)$$

$$= GMm\left(\frac{1}{R} - \frac{1}{R+h}\right)$$

$$= \frac{GMmh}{R(R+h)}$$

$$= \frac{GMmh}{R^2\left(1+\frac{h}{R}\right)} = \frac{mgh}{\left(1+\frac{h}{R}\right)} \qquad \left(\frac{GM}{R^2} = g\right)$$

$$\therefore \qquad \boxed{\Delta U = \frac{mgh}{1+\frac{h}{R}}}$$

For $$h << R, \quad \Delta U \approx mgh$$

Thus, mgh is the difference in potential energy (not the absolute potential energy), for $h << R$.

Extra Points to Remember

- **Maximum height attained by a particle**

  Suppose a particle of mass m is projected vertically upwards with a speed v and we want to find the maximum height h attained by the particle. Then we can use conservation of mechanical energy, i.e. Decrease in kinetic energy = increase in gravitational potential energy of particle.

  $$\therefore \qquad \frac{1}{2}mv^2 = \Delta U$$

  or $$\frac{1}{2}mv^2 = \frac{mgh}{1+\frac{h}{R}}$$

  Solving this, we get $$\boxed{h = \frac{v^2}{2g - \frac{v^2}{R}}}$$

  From this, we can see that $h \approx \frac{v^2}{2g}$ if v is small.

Example 13.18 *Three masses of 1 kg, 2 kg and 3 kg are placed at the vertices of an equilateral triangle of side 1 m. Find the gravitational potential energy of this system.*
Take $G = 6.67 \times 10^{-11}\ N\text{-}m^2/kg^2$

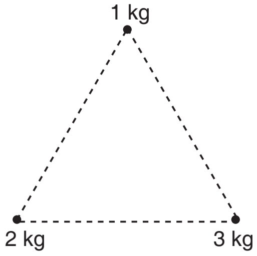

Fig. 13.43

Solution $U = -G\left(\frac{m_3 m_2}{r_{32}} + \frac{m_3 m_1}{r_{31}} + \frac{m_2 m_1}{r_{21}}\right)$

Here, $r_{32} = r_{31} = r_{21} = 1.0$ m, $m_1 = 1$ kg,

$m_2 = 2$ kg

and $m_3 = 3$ kg

Substituting the values, we get

$$U = -(6.67 \times 10^{-11})\left(\frac{3\times 2}{1} + \frac{3\times 1}{1} + \frac{2\times 1}{1}\right)$$

or $U = -7.337 \times 10^{-10}$ J **Ans.**

Example 13.19 *Eight particles of mass 'm' each are placed at the vertices of a cube of side 'a'. Find gravitational potential energy of this system.*

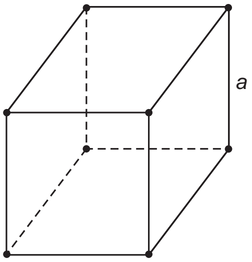

Fig. 13.44

Solution Total particles are $n = 8$

$\therefore$ Total number of pairs are $\frac{n(n-1)}{2}$ or 28.

In 12 pairs, distance between the particles is 'a'.

In 12 pairs, distance is $\sqrt{2}a$ and in remaining 4 pairs distance is $\sqrt{3}a$.

$$\therefore \quad U = 12\left(-\frac{Gmm}{a}\right) + 12\left(\frac{-Gmm}{\sqrt{2}a}\right) + 4\left(\frac{-Gmm}{\sqrt{3}a}\right)$$

$$= -\frac{Gm^2}{a}\left(12 + 6\sqrt{2} + \frac{4}{\sqrt{3}}\right)$$ **Ans.**

Example 13.20 *A particle of mass 'm' is raised from the surface of earth to a height h =2R. Find work done by some external agent in this process. Here, R is the radius of earth and g the acceleration due to gravity on earth's surface.*

Solution No information is given about the change in kinetic energy of the particle. So, assuming change in kinetic energy to be zero.

$$\text{Work done by external agent} = \text{change in potential energy}$$

$$= \Delta U = \frac{mgh}{1+\dfrac{h}{R}}$$

Substituting $h = 2R$, we get, $\quad$ Work done $= \frac{2}{3} mgR$ **Ans.**

Example 13.21 *A particle is projected from the surface of the earth with an initial speed of 4.0 km/s. Find the maximum height attained by the particle. Radius of earth = 6400 km and g = 9.8 m/s².*

Solution The maximum height attained by the particle is,

$$h = \frac{v^2}{2g - \dfrac{v^2}{R}}$$

Substituting the values, we have

$$h = \frac{(4.0 \times 10^3)^2}{2 \times 9.8 - \dfrac{(4.0 \times 10^3)^2}{6.4 \times 10^6}}$$

$$= 9.35 \times 10^5 \text{ m} \quad \text{or} \quad h \approx 935 \text{ km}$$ **Ans.**

INTRODUCTORY EXERCISE 13.5

1. Two particles of masses 20 kg and 10 kg are initially at a distance of 1.0 m. Find the speeds of the particles when the separation between them decreases to 0.5 m, if only gravitational forces are acting.
2. Four particles each of mass m are kept at the four vertices of a square of side 'a'. Find gravitational potential energy of this system.
3. A particle of mass 'm' is raised to a height $h = R$ from the surface of earth. Find increase in potential energy. R = radius of earth. g = acceleration due to gravity on the surface of earth.
4. Show that if a body be projected vertically upward from the surface of the earth so as to reach a height nR above the surface
   (i) the increase in its potential energy is $\left(\frac{n}{n+1}\right) mgR$,
   (ii) the velocity with which it must be projected is $\sqrt{\frac{2ngR}{n+1}}$, where R is the radius of the earth and m the mass of body.
5. A projectile is fired vertically from the earth's surface with an initial speed of 10 km/s. Neglecting air drag, how high above the surface of earth will it go?
6. A particle is fired vertically upwards from earth's surface and it goes upto a maximum height of 6400 km. Find the initial speed of the particle.

13.8 Binding Energy

Total mechanical energy (potential + kinetic) of a closed system is negative. The modulus of this total mechanical energy is known as the binding energy of the system. This is the energy due to which system is closed or different parts of the system are bound to each other.

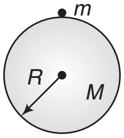

Fig. 13.45

Suppose the mass m is placed on the surface of earth. The radius of the earth is R and its mass is M. Then, the kinetic energy of the particle $K = 0$ and the potential energy is $U = -\frac{GMm}{R}$.

Therefore, the total mechanical energy is,

$$E = K + U = 0 - \frac{GMm}{R}$$

or
$$E = -\frac{GMm}{R}$$

$\therefore$
$$\text{Binding energy} = |E| = \frac{GMm}{R}$$

It is due to this energy, the particle is attached with the earth. If minimum this much energy is given to the particle in any form (normally kinetic) the particle no longer remains attached to the earth. It goes out of the gravitational field of earth.

Escape Velocity

As we discussed above, the binding energy of a particle on the surface of earth kept at rest is $\frac{GMm}{R}$. If this much energy in the form of kinetic energy is supplied to the particle, it leaves the gravitational field of the earth. So, if v_e is the escape velocity of the particle, then

$$\frac{1}{2} m v_e^2 = \frac{GMm}{R} \quad \text{or} \quad v_e = \sqrt{\frac{2GM}{R}}$$

or
$$\boxed{v_e = \sqrt{2gR}} \quad \text{as} \quad g = \frac{GM}{R^2}$$

Substituting the value of g (9.8 m/s^2) and R $(6.4 \times 10^6 \text{ m})$, we get

$$\boxed{v_e \approx 11.2 \text{ km/s}}$$

Thus, the minimum velocity needed to take a particle to infinity from the earth is called the escape velocity. On the surface of earth its value is 11.2 km/s.

Extra Points to Remember

- The value of escape velocity is 11.2 km/s from the surface of earth. From some height above the surface of earth this value will be less than 11.2 km/s.
- Escape velocity is independent of the direction in which it is projected. In the figure shown, body is given 11.2 km/s along three different paths. In each case, it will escape to infinity, but following different paths. For example, along path-1 it will follow a straight line.

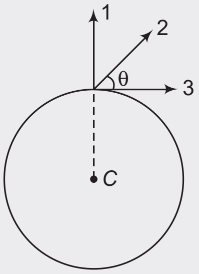

Fig. 13.46

- If velocity of a particle is v_e, then its total mechanical energy is zero. As the particle moves towards infinity its kinetic energy decreases and potential energy increases, but total mechanical energy remains constant. At any point

$$E = K + U = 0 \quad \Rightarrow \quad K = -U$$

  For example, if $K = 100\,\text{J}$ on the surface of earth then $U = -100\,\text{J}$. At some height suppose K becomes 60 J, then U will become $-60\,\text{J}$. At infinity $K = 0$. So U is also zero. Hence, speed at infinity will be zero.
- If velocity of the particle is less than v_e then total mechanical energy is negative and it does not escape to infinity.
- If velocity of the particle is more than v_e then total mechanical energy is positive. Even at infinity some kinetic energy and speed are left in the particle. Although its potential energy becomes zero.

Example 13.22 *Calculate the escape velocity from the surface of moon. The mass of the moon is* 7.4×10^{22} *kg and radius* $= 1.74 \times 10^6$ *m.*

Solution Escape velocity from the surface of moon is $v_e = \sqrt{\dfrac{2GM_m}{R_m}}$

Substituting the values, we have

$$v_e = \sqrt{\frac{2 \times 6.67 \times 10^{-11} \times 7.4 \times 10^{22}}{1.74 \times 10^6}}$$

$$= 2.4 \times 10^3 \text{ m/s} = 2.4 \text{ km/s}$$ **Ans.**

Example 13.23 *Kinetic energy of a particle on the surface is* E_0 *and potential energy is* $-\dfrac{E_0}{2}$.

(a) Will the particle escape to infinity ?

(b) At some height its kinetic energy becomes $0.6\,E_0$. *What is potential energy at this height ?*

(c) If the particle escapes to infinity, what is kinetic energy of the particle at infinity?

Solution (a) Total mechanical energy

$$E = K + U = E_0 - \frac{E_0}{2} = 0.5\,E_0$$

Since, E is positive, particle will escape to infinity.

(b) Potential energy $U = E - K = 0.5\,E_0 - 0.6\,E_0 = -0.1\,E_0$ **Ans.**

(c) At infinity, $U = 0$

$\therefore$ $$K = E = 0.5\,E_0$$ **Ans.**

INTRODUCTORY EXERCISE 13.6

1. What is the kinetic energy needed to project a body of mass m from the surface of the earth to infinity? Radius of earth is R and acceleration due to gravity on earth's surface is g.
2. Mass and radius of a planet are two times the values of earth. What is the value of escape velocity from the surface of this planet ?
3. Kinetic energy of a particle on the surface of earth is E_0 and the potential energy is $-2E_0$.
   (a) Will the particle escape to infinity ?
   (b) What is the value of potential energy where speed of the particle becomes zero ?

13.9 Motion of Satellites

Just as the planets revolve around the sun, in the same way few celestial bodies revolve around these planets. These bodies are called 'Satellites'. For example moon is a satellite of earth. Artificial satellites are launched from the earth. Such satellites are used for telecommunication, weather forecast and other applications. The path of these satellites are elliptical with the centre of earth at a focus. However the difference in major and minor axes is so small that they can be treated as nearly circular for not too sophisticated calculations. Let us derive certain characteristics of the motion of satellites by assuming the orbit to be perfectly circular.

Orbital Speed

The necessary centripetal force to the satellite is being provided by the gravitational force exerted by the earth on the satellite. Thus,

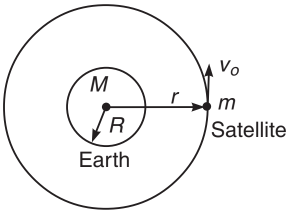

Fig. 13.47

$$\frac{mv_0^2}{r} = \frac{GMm}{r^2}$$

$$\therefore \quad \boxed{v_0 = \sqrt{\frac{GM}{r}}} \quad \text{or} \quad v_0 \propto \frac{1}{\sqrt{r}}$$

Hence, the orbital speed (v_o) of the satellite decreases as the orbital radius (r) of the satellite increases. Further, the orbital speed of a satellite close to the earth's surface ($r \approx R$) is,

$$\boxed{v_0 = \sqrt{\frac{GM}{R}} = \sqrt{gR} = \frac{v_e}{\sqrt{2}}}$$

Substituting $v_e = 11.2$ km/s $\Rightarrow$ $\boxed{v_0 = 7.9 \text{ km/s}}$

Period of Revolution

The period of revolution (T) is given by

$$T=\frac{2\pi r}{v_o} \quad \text{or} \quad T=\frac{2\pi r}{\sqrt{\dfrac{GM}{r}}}$$

or $$T=2\pi\sqrt{\frac{r^3}{GM}} \quad \text{or} \quad \boxed{T=2\pi\sqrt{\frac{r^3}{gR^2}}} \qquad (\text{as } GM=gR^2)$$

Energy of Satellite

The potential energy of the system is

$$\boxed{U=-\frac{GMm}{r}}$$

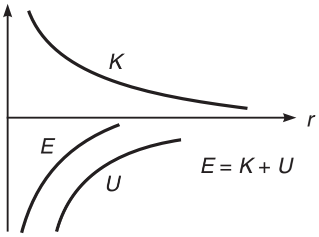

Fig. 13.48

The kinetic energy of the satellite is,

$$K=\frac{1}{2}mv_0^2=\frac{1}{2}m\left(\frac{GM}{r}\right)$$

or $$\boxed{K=\frac{1}{2}\frac{GMm}{r}}$$

The total energy is, $$E=K+U=-\frac{GMm}{2r}$$

or $$\boxed{E=-\frac{GMm}{2r}}$$

This energy is constant and negative, i.e. the system is closed. The farther the satellite from the earth the greater its total energy.

✓ Extra Points to Remember

- $T=2\pi\sqrt{\dfrac{r^3}{gR^2}} \Rightarrow T\propto r^{3/2}$ or $T^2\propto r^3$ (which is also the Kepler's third law)
- Time period of a satellite very close to earth's surface $(r\approx R)$ is,

  $$T=2\pi\sqrt{\frac{R}{g}}$$

  Substituting the values, we get $T\approx 84.6$ min
- Suppose the height of a satellite is such that the time period of the satellite is 24 h and it moves in the same sense as the earth. The satellite will always be overhead a particular place on the equator. As seen from the earth, this satellite will appear to be stationary. Such a satellite is called a geostationary satellite. Putting $T=24$ h in the expression of T, the radius of geostationary satellite comes out to be $r=4.2\times10^4$ km. The height above the surface of earth is about 36000 km.
- The plane of orbit of a satellite always passes through the centre of the earth as force is always towards centre of earth. In case of geostationary satellite it is an equatorial plane (passing through equator)

Example 13.24 *As orbital radius r of a satellite is increased, state which of the following quantities will increase and which will decrease ?*

(i) Orbital speed

(ii) Time period

(iii) Frequency

(iv) Angular speed

(v) Kinetic energy

(vi) Potential energy

(vii) Total mechanical energy

Solution (i) Orbital speed $v_o = \sqrt{\frac{GM}{r}}$ or $v_o \propto \frac{1}{\sqrt{r}}$.

Therefore, orbital speed will decrease.

(ii) $T = 2\pi\sqrt{\frac{r^3}{gR^2}}$ or $T \propto r^{3/2}$

Therefore, time period will increase.

(iii) Frequency, $f = \frac{1}{T}$

Time period is increasing. So, frequency will decrease.

(iv) Angular speed $\omega = \frac{2\pi}{T}$ or $\omega \propto \frac{1}{T}$

Time period is increasing. Hence, angular speed will decrease.

(v) Kinetic energy, $K = \frac{GMm}{2r}$ or $K \propto \frac{1}{r}$.

Therefore, kinetic energy will decrease.

(vi) Potential energy $U = -\frac{GMm}{r}$ or $U \propto -\frac{1}{r}$

Therefore, potential energy will increase.

(vii) Total mechanical energy, $E = -\frac{GMm}{2r}$ or $E \propto -\frac{1}{r}$

So, mechanical energy will also increase.

Example 13.25 *A geostationary satellite is orbiting the earth at a height of* 6R *above the surface of the earth where R is the radius of earth. The time period of another satellite at a distance of* 3.5 *R from the centre of the earth is .... hours.* **(JEE 1987)**

Solution $T \propto r^{\frac{3}{2}}$

$$\therefore \qquad \frac{T_2}{T_1} = \left(\frac{r_2}{r_1}\right)^{\frac{3}{2}} \quad \text{or} \quad T_2 = \left(\frac{r_2}{r_1}\right)^{\frac{3}{2}} T_1$$

$$T_2 = \left(\frac{3.5R}{7R}\right)^{\frac{3}{2}}(24)\,\text{h} = 8.48\,\text{h} \quad (T_1 = 24 \text{ h for geostationary satellite})$$

Example 13.26 *A spaceship is launched into a circular orbit close to the earth's surface. What additional velocity has now to be imparted to the spaceship in the orbit to overcome the gravitational pull. Radius of earth* $= 6400\ km$, $g = 9.8\ m/s^2$.

Solution The speed of the spaceship in a circular orbit close to the earth's surface is given by,

$$v_o = \sqrt{gR}$$

and escape velocity is given by, $v_e = \sqrt{2gR}$

∴ Additional velocity required to escape

$$v_e - v_o = \sqrt{2gR} - \sqrt{gR} = (\sqrt{2} - 1)\sqrt{gR}$$

Substituting the values of g and R, we get

$$v_e - v_o = 3.278 \times 10^3 \text{ m/s}$$ **Ans.**

Example 13.27 *What is the minimum energy required to launch a satellite of mass m from the surface of a planet of mass M and radius R in a circular orbit at an altitude of* $2R$? **(JEE 2013, Main)**

(a) $\dfrac{5GmM}{6R}$

(b) $\dfrac{2GmM}{3R}$

(c) $\dfrac{GmM}{2R}$

(d) $\dfrac{GmM}{3R}$

Solution E = Energy of satellite – energy of mass on the surface of planet

$$= -\frac{GMm}{2r} - \left(-\frac{GMm}{R}\right)$$

Here, $r = R + 2R = 3R$

Substituting the values in above equation we get, $E = \dfrac{5GMm}{6R}$

The correct answer is (a)

.Example 13.28 *An artificial satellite is moving in a circular orbit around the earth with a speed equal to half the magnitude of escape velocity from the earth.* **(1990, 8M)**

(a) Determine the height of the satellite above the earth's surface.

(b) If the satellite is stopped suddenly in its orbit and allowed to fall freely onto the earth, find the speed with which it hits the surface of the earth.

Solution (a) Orbital speed of a satellite at distance r from centre of earth,

$$v_0 = \sqrt{\frac{GM}{r}} = \sqrt{\frac{GM}{R+h}} \qquad \text{...(i)}$$

Given, $$v_0 = \frac{v_e}{2} = \frac{\sqrt{2GM/R}}{2} = \sqrt{\frac{GM}{2R}} \qquad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$h = R = 6400 \text{ km}$$

(b) Decrease in potential energy = increase in kinetic energy

or $$\frac{1}{2}mv^2 = \Delta U$$

$$\therefore \qquad v = \sqrt{\frac{2(\Delta U)}{m}} = \sqrt{\frac{2\left(\frac{mgh}{1 + h/R}\right)}{m}} = \sqrt{gR} \qquad (h = R)$$

$$= \sqrt{9.8 \times 6400 \times 10^3}$$

$$= 7919\,\text{m/s} = 7.9\,\text{km/s}$$ **Ans.**

INTRODUCTORY EXERCISE 13.7

1. Is it possible to have a geostationary satellite which always remains over New Delhi ?
2. Two satellites *A* and *B* revolve around a planet in two coplanar circular orbits in the same sense with radii 10^4 km and 2×10^4 km respectively. Time period of *A* is 28 hours. What is time period of another satellite?
3. Two satellites *A* and *B* of the same mass are orbiting the earth at altitudes *R* and 3*R* respectively, where *R* is the radius of the earth. Taking their orbits to be circular obtain the ratios of their kinetic and potential energies.
4. A satellite of mass 1000 kg is supposed to orbit the earth at a height of 2000 km above the earth's surface. Find (a) its speed in the orbit, (b) its kinetic energy, (c) the potential energy of the earth-satellite system and (d) its time period. Mass of the earth $= 6 \times 10^{24}$ kg.
5. A sky lab of mass 2×10^3 kg is first launched from the surface of earth in a circular orbit of radius 2*R* and then it is shifted from this circular orbit to another circular orbit of radius 3*R*. Calculate the energy required
   (a) to place the lab in the first orbit,
   (b) to shift the lab from first orbit to the second orbit. ($R = 6400$ km, $g = 10\,\text{m/s}^2$)

13.10 Kepler's Laws of Planetary Motion

Kepler discovered three empirical laws that accurately described the motion of the planets. The three laws may be stated as,

(i) Each planet moves in an elliptical orbit, with the sun at one focus of the ellipse. This law is also known as the **law of elliptical orbits** and obviously gives the shape of the orbits of the planets round the sun.

(ii) The radius vector, drawn from the sun to a planet, sweeps out equal areas in equal time, i.e. its areal velocity (or the area swept out by it per unit time) is constant. This is referred to as the **law of areas** and gives the relationship between the orbital speed of the planet and its distance from the sun.

(iii) The square of the planet's time period is proportional to the cube of the semi-major axis of its orbit. This is known as the **law of time period** and gives the relationship between the size of the orbit of a planet and its time of revolution.

Kepler did not know why the planets move in this way. Three generations later when Newton turned his attention to the motion of the planets, he discovered that each of Kepler's laws can be derived. They are consequences of Newton's law of motion and the law of gravitation.

Let us first consider the elliptical orbits described in Kepler's first law. Figure shows the geometry of the ellipse. The longest dimension is the major axis with half length *a.* This half length is called the semi-major axis.

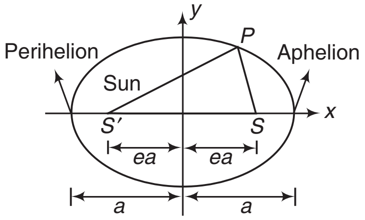

Fig. 13.49

$$SP + S'P = \text{constant}$$

Here, S and S' are the foci and P any point on the ellipse. The sun is at S and planet at P.

The distance of each focus from the centre of ellipse is *ea,* where *e* is the dimensionless number between 0 to 1 called the eccentricity. If $e = 0$, the ellipse is a circle. The actual orbits of the planets are nearly circular, their eccentricities range from 0.007 for Venus to 0.248 for Pluto. For earth $e = 0.017$. The point in the planet's orbit closest to the sun is the perihelion and the point most distant from the sun is aphelion.

Explanation of First Law

Newton was able to show that for a body acted on by an attractive force proportional to $\frac{1}{r^2}$, the only possible closed orbits are a circle or an ellipse. The open orbits must be parabolas or hyperbolas. He also showed that if total energy E is negative the orbit is an ellipse (or circle), if it is zero the orbit is a parabola and if E is positive the orbit is a hyperbola. Further, it was also shown that the orbits under the attractive force $F = \frac{K}{r^n}$, are stable for $n < 3$. Therefore, it follows that circular orbits will be stable for a force varying inversely as the distance or the square of the distance and will be unstable for the inverse cube (or a higher power) law.

Explanation of Second Law

$$PP' = v\,dt$$

$$P'M = (PP')\sin(180° - \theta) = PP'\sin\theta$$

$$= (v\sin\theta)\,dt$$

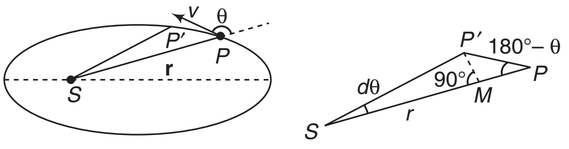

Fig. 13.50

Kepler's second law is shown in figure. In a small time interval dt, the line from the sun S to the planet P turns through an angle $d\theta$. The area swept out in this time interval is,

$$\begin{aligned} dA &= \text{area of triangle shown in figure} \\ &= \frac{1}{2}(\text{base})(\text{height}) \\ &= \frac{1}{2}(SP)(P'M) \\ &= \frac{1}{2}(r)\,(v\sin\theta)\,dt \end{aligned}$$

$$\therefore \qquad \text{Areal velocity } \frac{dA}{dt} = \frac{1}{2} rv\sin\theta \qquad \text{...(i)}$$

Now, $rv\sin\theta$ is the magnitude of the vector product $\mathbf{r}\times\mathbf{v}$ which in turn is $\frac{1}{m}$ times the angular momentum $\mathbf{L} = \mathbf{r}\times m\mathbf{v}$ of the planet with respect to the sun. So we have,

$$\frac{dA}{dt} = \frac{1}{2m}|\mathbf{r}\times m\mathbf{v}| = \frac{L}{2m} \qquad \text{...(ii)}$$

or

$$\boxed{\frac{dA}{dt} = \frac{L}{2m} = \text{constant}}$$

Thus, Kepler's second law, that areal velocity is constant, means that angular momentum is constant. It is easy to see why the angular momentum of the planet must be constant. According to Newton's law the rate of change of **L** equals the torque of the gravitational force **F** acting on the planet,

$$\frac{d\mathbf{L}}{dt} = \mathbf{r}\times\mathbf{F} = \tau$$

Here, **r** is the radius vector of planet from the centre of the sun and the force **F** is directed from the planet towards the centre of the sun. So, these vectors always lie along the same line and their vector product $\mathbf{r}\times\mathbf{F}$ is zero. Hence, $\frac{d\mathbf{L}}{dt} = 0$ or $\mathbf{L} = \text{constant}$. Thus, from Eq. (ii) we can see that $\frac{dA}{dt} = \text{constant}$ if $\mathbf{L} = \text{constant}$. **Thus, second law is actually the law of conservation of angular momentum.**

Explanation of Third Law

In Article 13.9 we have already derived Kepler's third law for the particular case of circular orbits ($T^2 \propto r^3$). Newton was able to show that the same relationship holds for an elliptical orbit, with the orbit radius r replaced by semimajor axis a. Thus,

$$\boxed{T = \frac{2\pi a^{3/2}}{\sqrt{GM_s}}} \qquad \text{(elliptical orbit)}$$

Here, M_s is the mass of the sun.

Extra Points to Remember

- Most of the problems of planetary motion are solved by two conservation laws:
  (i) conservation of angular momentum about centre of the sun and
  (ii) conservation of mechanical (potential + kinetic) energy

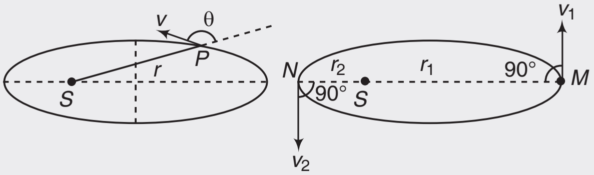

Fig. 13.51

Hence, the following two equations are used in most of the cases,

$$\boxed{\begin{aligned} mvr\sin\theta &= \text{constant} \qquad \ldots\text{(i)} \\ \frac{1}{2}mv^2 - \frac{GMm}{r} &= \text{constant} \qquad \ldots\text{(ii)} \end{aligned}}$$

At aphelion (or M) and perihelion (or N) positions $\theta = 90°$

Hence, Eq. (i) can be written as,

$$mvr\sin 90° = \text{constant}$$

or
$$mvr = \text{constant} \qquad \ldots\text{(iii)}$$

Further, since mass of the planet (m) also remains constant, Eq. (i) can also be written as

$$vr\sin\theta = \text{constant} \qquad \ldots\text{(iv)}$$

or
$$v_1r_1 = v_2r_2 \qquad (\theta = 90°)$$

$$r_1 > r_2$$

∴
$$v_1 < v_2$$

Example 13.29 *Name the physical quantities which remain constant in a planetary motion (in elliptical orbits).*

Solution Angular momentum about centre of sun and mechanical energy.

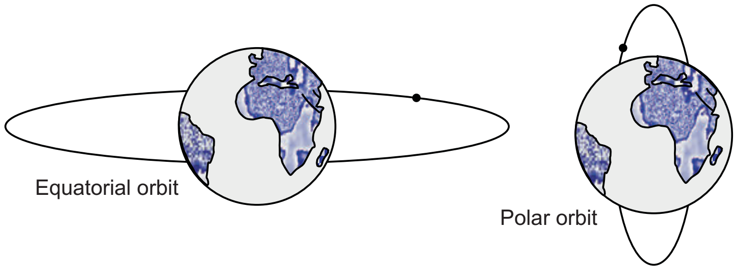
Example 13.30 *Consider a planet moving in an elliptical orbit round the sun. The work done on the planet by the gravitational force of the sun is zero in any small part of the orbit. Is this statement true or false ?*

Solution **False,** only at aphelion and perihelion positions **F** is perpendicular to $d\mathbf{S}$. So, at these two positions work done by gravitational force is zero. At other points angle between **F** and $d\mathbf{S}$ is not 90°. So, work done is not zero. But, being a conservative force work done in a closed path (or in one full rotation) is zero.

Final Touch Points

Polar and Geostationary Satellites

1. **Satellites in low polar orbit** pass over the poles. They orbit between 100 km and 200 km above the Earth's surface, taking around 90 minutes to make each orbit. The earth spins beneath the satellites as it moves, so the satellite can scan the whole surface of the earth. Low orbit polar satellites have uses such as



- Monitoring the weather.
- Observing the earth's surface.
- Military uses including spying.

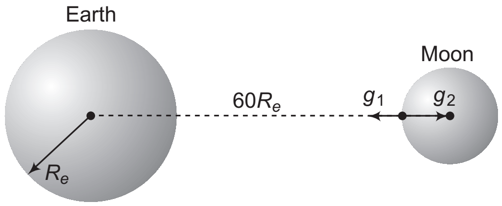
2. **Geostationary satellites** have a different trajectory to polar satellites. They are in orbit above the equator from west to east. The height of their orbit-36,000 km is just the right distance so that it takes them one day (24 hours) to make each orbit. This means that they stay in a fixed position over the earth's surface. A single geostationary satellite is on a line sight with about 40 percent of the earth's surface. Three such satellites, each separated by 120 degrees of longitude, can provide coverage of the entire planet. Geostationary satellites have uses such as:
   - communications- including satellites phones
   - global positioning or GPS.

   Geostationary satellites always appear in the same position when seen from the ground. This is why satellite television dishes can be bolted into one position and do not need to move.

3. Acceleration due to moon's gravity on moon's surface is $\frac{g_e}{6}$ because

$$\frac{M_m}{R_m^2} \approx \frac{1}{6}\frac{M_e}{R_e^2} \qquad \left(g = \frac{GM}{R^2}\right)$$

   While acceleration due to earth's gravity on moon's surface is approximately $\frac{g_e}{(60)^2}$ or $\frac{g_e}{3600}$. This is because distance of moon from the earth's centre is approximately equal to 60 times the radius of earth and $g \propto \frac{1}{r^2}$. In the shown figure



$$g_1 = \frac{g_e}{(60)^2} \quad \text{while} \quad g_2 = \frac{g_e}{6}$$

4. Total energy of a closed system is always negative. For example, energy of planet-sun, satellite-earth or electron-nucleus system is always negative.

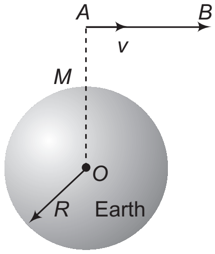
5. If the law of force obeys the inverse square law $\left(F \propto \frac{1}{r^2},\ F = \frac{-dU}{dr}\right)$

$$\boxed{K = \frac{|U|}{2} = |E|}$$

The same is true for electron-nucleus system because there also, the electrostatic force $F_e \propto \frac{1}{r^2}$.

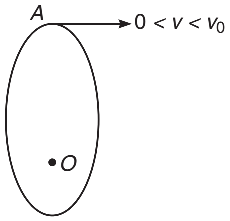
6. Trajectory of a body projected from point *A* in the direction *AB* with different initial velocities :

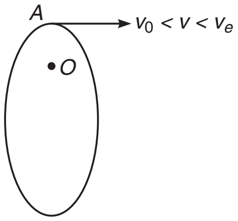
Let a body be projected from point *A* with velocity *v* in the direction *AB*. For different values of *v* the paths are different. Here, are the possible cases.



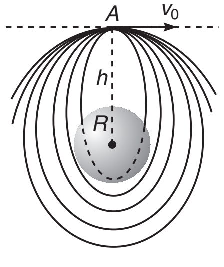
(i) If $v = 0$, path is a straight line from *A* to *M*.
(ii) If $0 < v < v_o$, path is an ellipse with centre *O* of the earth as a focus.
(iii) If $v = v_o$, path is a circle with *O* as the centre.
(iv) If $v_o < v < v_e$, path is again an ellipse with *O* as a focus.
(v) If $v = v_e$, body escapes from the gravitational pull of the earth and path is a parabola
(vi) If $v > v_e$, body again escapes but now the path is a hyperbola.

Here, v_o = orbital speed $\left(\sqrt{\frac{GM}{r}}\right)$ at *A* for a circular orbit and v_e = escape velocity from *A*.





Note 1. *From case (i) to (iv), total mechanical energy is negative. Hence, these are the closed orbits. For case (v), total energy is zero and for case (vi) total energy is positive. In these two cases orbits are open.*
2. *If v is not very large the elliptical orbit will intersect the earth and the body will fall back to earth.*



7. If $F \propto r^n$

then $T^2 \propto (r)^{1-n}$

and if $U \propto r^m$

then $T^2 \propto (r)^{2-m}$ (Applicable only for circular orbits)

8. $T = 2\pi\sqrt{\frac{R}{g}} \approx 84.6$ min comes in following four places in whole physics :

(i) If time period of rotation of earth becomes 84.6 min, effective value of g on equator becomes zero or we feel weightlessness on equator.

(ii) Time period of a satellite close to earth's surface is 84.6 min.

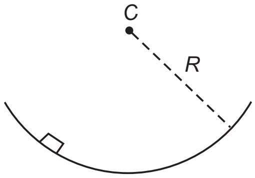
(iii) Time pendulum of a pendulum of infinite length is 84.6 min.

(iv) If a tunnel is dug along any chord of the earth and a particle is released from the surface of earth along this tunnel, then motion of this particle is simple harmonic and time period of this is also 84.6 min.

Note *(a) Points (iii) and (iv) come in the chapter of simple harmonic motion.*

(b) $T = 2\pi\sqrt{\frac{R}{g}}$ is also the time period of small oscillations of a block inside a smooth spherical bowl of radius R.

But this is not 84.6 min because here R is the radius of bowl not the radius of earth.



This expression can be compared with the time period of a pendulum $T = 2\pi\sqrt{\frac{l}{g}}$.

Solved Examples

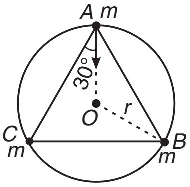
TYPED PROBLEMS

Type 1. *Two or more than two particles rotate in circular motion under their mutual gravitational attraction. We have to find speed of each particle.*

How to Solve?

Find net force on any one particle. It should come towards centre of the circle. This net force provides the necessary centripetal force.

Example 1 *Three particles each of mass m, are located at the vertices of an equilateral triangle of side a. At what speed must they move if they all revolve under the influence of their gravitational force of attraction in a circular orbit circumscribing the triangle while still preserving the equilateral triangle ?*



Solution $\mathbf{F}_A = \mathbf{F}_{AB} + \mathbf{F}_{AC}$

$$= 2\left[\frac{Gm^2}{a^2}\right]\cos 30° = \sqrt{3}\left[\frac{Gm^2}{a^2}\right]$$

$$r = \frac{a}{\sqrt{3}},$$

Now $$\frac{mv^2}{r} = F \quad \text{or} \quad \frac{\sqrt{3}mv^2}{a} = \frac{\sqrt{3}Gm^2}{a^2}$$

∴ $$v = \sqrt{\frac{Gm}{a}}$$ **Ans.**

Example 2 *In the above problem, find total mechanical energy of the system.*

Solution Total mechanical energy,

$$E = U + K$$

where, U = potential energy of 3 identical pairs of masses 'm' each at a distance 'a'

$$= -3\left[\frac{Gmm}{a}\right] = -\frac{3Gm^2}{a}$$

K = kinetic energy of three particles

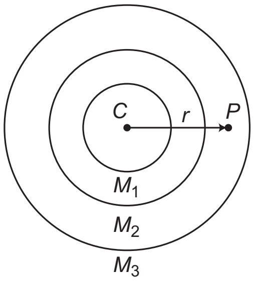
$$= 3\left[\frac{1}{2}mv^2\right] = \frac{3}{2}m\left(\sqrt{\frac{Gm}{a}}\right)^2 = \frac{3}{2}\frac{Gm^2}{a}$$

∴ $$E = U + K = -\frac{3Gm^2}{2a}$$ **Ans.**

Note *Total mechanical energy is negative, as the system is closed.*

Type 2. *Gravitational field and force on a mass due to spherical shells.*

Concept



According to Gauss theorem, net field strength at any point in the above situation is only due to the masses inside an imaginary spherical surface drawn at that point.

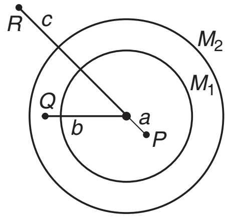
For example, field strength at P is

$$E_P = \frac{G(M_1 + M_2)}{r^2} \quad \text{(towards } C\text{)}$$

If a mass m is kept at P, then force on this mass is

$$F = mE_P = \frac{G(M_1 + M_2)m}{r^2} \quad \text{(towards } C\text{)}$$

Example 3 *Two concentric shells of masses M_1 and M_2 are concentric as shown. Calculate the gravitational force on m due to M_1 and M_2 at points P, Q and R.*



Solution At P, $F = 0$

At Q, $F = \dfrac{GM_1m}{b^2}$

At R, $F = \dfrac{G(M_1 + M_2)m}{c^2}$

Type 3. *To find variation of time period of a satellite in circular orbit with its orbital radius 'r' if gravitational potential energy between two point masses varies as $U \propto r^n$ with negative sign.*

How to Solve?

From the relation between conservative force F and its potential energy U,

$$F = -\frac{dU}{dr}$$

First find the variation of F with r. Then, this force provides the necessary centripetal force. So, find variation of v with r by putting,

$$F = \frac{mv^2}{r}$$

Now, finally time period is given by $T = \dfrac{2\pi r}{v}$. So, find variation of T with r.

Example 4 *Gravitational potential energy between two points masses is*

$$U = -\frac{K\, m_1 m_2}{r^n}$$

where, K is a positive constant. With what power of 'r' time period of a satellite of mass 'm' varies in circular orbit if mass of planet is M ?

Solution $U = -\frac{KMm}{r^n}$

$$F = -\frac{dU}{dr} = \frac{KMmn}{r^{n+1}} \quad \text{or} \quad F \propto r^{-(n+1)}$$

Now, this force provides the necessary centripetal force.

$$\therefore \qquad \frac{mv^2}{r} = \frac{KMm}{r^{n+1}} \quad \text{or} \quad v^2 \propto r^{-n}$$

$$\therefore \qquad v \propto r^{\frac{-n}{2}}$$

Time period is given by

$$T = \frac{2\pi r}{v} \quad \text{or} \quad T \propto \frac{r}{v}$$

$$\text{or} \qquad T \propto \frac{r}{r^{\frac{-n}{2}}} \Rightarrow \therefore \quad T \propto r^{1+\frac{n}{2}}$$

Note *Under normal conditions*

$$U = -\frac{GMm}{r}$$

So, if we compare with the given equation then, $n = 1$.

$$\text{Now,} \qquad T \propto r^{1+\frac{n}{2}} \quad \text{or} \quad T \propto r^{\frac{3}{2}} \qquad (\text{for } n = 1)$$

Example 5 *Imagine a light planet revolving around a very massive star in a circular orbit of radius R with a period of revolution T. If the gravitational force of attraction between the planet and the star is proportional to $R^{-5/2}$, then*

(a) T^2 is proportional to R^2

(b) T^2 is proportional to $R^{7/2}$

(c) T^2 is proportional to $R^{3/2}$

(d) T^2 is proportional to $R^{3.75}$

Solution $\frac{mv^2}{R} \propto R^{-5/2}$

$$\therefore \qquad v \propto R^{-3/4}$$

$$\text{Now,} \qquad T = \frac{2\pi R}{v} \quad \text{or} \quad T^2 \propto \left(\frac{R}{v}\right)^2$$

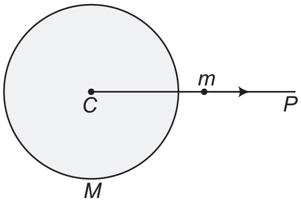
$$\text{or} \qquad T^2 \propto \left(\frac{R}{R^{-3/4}}\right)^2 \quad \text{or} \quad T^2 \propto R^{7/2}$$

$\therefore$ The correct answer is (b).

Type 4. *Based on conservation of mechanical energy.*

Concept

In the figure, $M >> m$, hence only the particle moves along the line CP. The spherical body remains at rest. The problem of any such type can be solved by energy conservation principle or



$$E_i = E_f$$

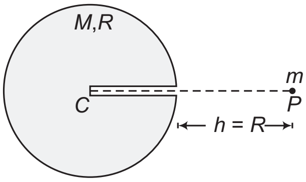
$$\Rightarrow \quad U_i + K_i = U_f + K_f$$

Here, $U = -\dfrac{GMm}{r}$ for external points

and $U = mV$ for internal points of sphere.

where, V is the gravitational potential due to M. In this type, we are using only one conservation law. Therefore, number of unknown should be only one.

Example 6 *There is a smooth tunnel upto centre C of a solid sphere of mass 'M' and radius R. A particle of mass $m\,(<< M)$ is released from point P along the line CP. Find velocity of 'm' while striking at C.*



Solution Using mechanical energy conservation equation.

$$E_C = E_P \quad \Rightarrow \quad K_C + U_C = K_P + U_P$$

$$\Rightarrow \quad \frac{1}{2}mv_C^2 + mV_C = 0 - \frac{GMm}{(R+R)} \qquad \ldots\text{(i)}$$

Here, V_C = potential at C due to mass $M = -\dfrac{3}{2}\dfrac{GM}{R}$

Substituting this value in Eq. (i) and then solving we get,

$$v_C = \sqrt{\frac{2GM}{R}} \qquad \textbf{Ans.}$$

Example 7 *A particle of mass 'm' is projected from the surface of earth with velocity $v = 2v_e$, where v_e is the value of escape velocity from the surface of earth. Find velocity of the particle on reaching to interstellar space (at infinity) in terms of v_e.*

Solution $v_e = \sqrt{\dfrac{2GM}{R}} \Rightarrow \dfrac{GM}{R} = \dfrac{v_e^2}{2}$ ...(i)

Using conservation of mechanical energy at the surface of earth and infinity.

We have,
$$K_f + U_f = K_i + U_i$$

$$\Rightarrow \qquad \frac{1}{2} m v_\infty^2 + 0 = \frac{1}{2} m \,(2v_e)^2 - \frac{GMm}{R} \qquad \text{...(ii)}$$

Substituting the value of $\dfrac{GM}{R} = \dfrac{v_e^2}{2}$

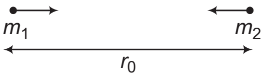
From Eq. (i) in Eq. (ii) we get, $v_\infty = \sqrt{3}\, v_e$

Alternate Method

On the surface of earth speed is two times the escape velocity. So, kinetic energy is four times. One kinetic energy is used in taking it to infinity. So, three kinetic energies are still left at infinity. In terms of speed it is $\sqrt{3} v_e$.

Type 5. *Based on conservation of mechanical energy and linear momentum.*

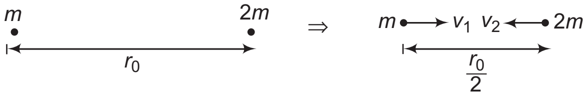
Concept



Two particles (or two spherical bodies) of masses m_1 and m_2 are free to move along the line joining them. This time their masses are comparable. Net force on the two particle system is zero.Therefore, linear momentum of the system may be conserved. Further, gravitational forces are conservative in nature.

Therefore, mechanical energy of the system is also conserved. Since, we are using two conservation laws, therefore number of unknowns are also two.

Example 8 *In the figure shown in the text, $m_1 = m$, $m_2 = 2m$ and initial distance between them is r_0. Find velocities of the masses when separation between them becomes $\dfrac{r_0}{2}$.*



Solution Let their velocities are v_1 and v_2. From conservation of linear momentum.

$$p_i = p_f$$

$$\therefore \qquad 0 = mv_1 - 2mv_2 \qquad \text{...(i)}$$

From conservation of mechanical energy,

$$E_i = E_f$$

$$\text{or} \qquad K_i + U_i = K_f + U_f$$

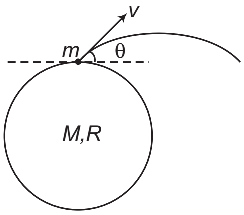
$$\text{or} \qquad 0 - \frac{G(m)\,(2m)}{r_0} = \frac{1}{2} m v_1^2 + \frac{1}{2} \times 2m \times v_2^2 - \frac{G(m)\,(2m)}{(r_2/2)} \qquad \text{...(ii)}$$

Solving Eqs. (i) and (ii), we get

$$v_1 = 2\sqrt{\frac{2Gm}{3r_0}}, \; v_2 = \sqrt{\frac{2Gm}{3r_0}} \qquad \textbf{Ans.}$$

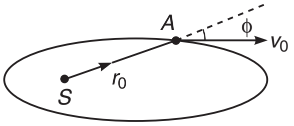
Type 6. *Based on conservation of angular momentum ($L = mvr \sin\theta$) and mechanical energy.*

Concept



In the figure shown, $M >> m$. Hence, the sphere of mass M is at rest and only the particle of mass 'm' will move. This particle is projected with velocity v at some angle θ from the surface as shown. Gravitational force on 'm' is always towards centre of 'M'. So, its torque about centre is always zero and angular momentum of particle about centre may be conserved. Further, the gravitational force, being a conservative force mechanical energy can also be conserved. We are applying two conservation laws, so number of unknown are also two.

Example 9 *Find the maximum and minimum distances of the planet A from the sun S, if at a certain moment of time it was at a distance r_0 and travelling with the velocity v_0, with the angle between the radius vector and velocity vector being equal to ϕ.*



Solution At minimum and maximum distances velocity vector (**v**) makes an angle of 90° with radius vector. Hence, from conservation of angular momentum,

$$mv_0r_0 \sin\phi = mrv \quad \text{...(i)}$$

Here, m is the mass of the planet.

From energy conservation law, it follows that

$$\frac{mv_0^2}{2} - \frac{GMm}{r_0} = \frac{mv^2}{2} - \frac{GMm}{r} \quad \text{...(ii)}$$

Here, M is the mass of the sun.

Solving Eqs. (i) and (ii) for r, we get two values of r, one is $r_{\max}$ and another is $r_{\min}$. So,

$$r_{\max} = \frac{r_0}{2-K}\left(1 + \sqrt{1 - K(2-K)\sin^2\phi}\right)$$

and

$$r_{\min} = \frac{r_0}{2-K}\left(1 - \sqrt{1 - K(2-K)\sin^2\phi}\right)$$

Here,

$$K = \frac{r_0^2 v_0^2}{GM}$$

Example 10 *A projectile of mass m is fired from the surface of the earth at an angle $\alpha = 60°$ from the vertical. The initial speed v_0 is equal to $\sqrt{\frac{GM_e}{R_e}}$. How high does the projectile rise ? Neglect air resistance and the earth's rotation.*

Solution Let v be the speed of the projectile at highest point and $r_{\max}$ its distance from the centre of the earth. Applying conservation of angular momentum and mechanical energy,

$$mv_0 \sin \alpha = mvr_{\max} \sin 90°$$

or
$$mv_0 \sin \alpha = mvr_{\max} \qquad \text{...(i)}$$

$$\frac{1}{2} mv_0^2 - \frac{GM_e m}{R_e} = \frac{1}{2} mv^2 - \frac{GM_e m}{r_{\max}} \qquad \text{...(ii)}$$

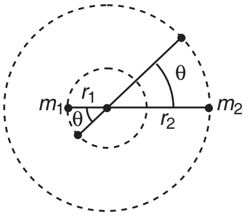
Solving these two equations with the given data we get,

$$r_{\max} = \frac{3R_e}{2}$$

or the maximum height
$$h_{\max} = r_{\max} - R_e = \frac{R_e}{2} \qquad \textbf{Ans.}$$

Type 7. *Based on double star system.*

Concept



In motion of a planet round the sun we have assumed the mass of the sun to be too large in comparison to the mass of the planet. Under such situation the sun remains stationary and the planet revolves round the sun. If however masses of sun and planet are comparable and motion of sun is also to be considered, then both of them revolve around their centre of mass with same angular velocity but different linear speeds in the circles of different radii. The centre of mass remains stationary. This system of two stars is called a double star system.

We use following equations under this condition.

$$m_1 r_1 = m_2 r_2 \qquad \text{...(i)}$$

$$m_1 r_1 \omega^2 = m_2 r_2 \omega^2 = \frac{G m_1 m_2}{(r_1 + r_2)^2} \qquad \text{...(ii)}$$

Solving these two equations, we can find that

$$\omega = \sqrt{\frac{GM}{r^3}} \quad \text{or} \quad T = \frac{2\pi r^{3/2}}{\sqrt{GM}}$$

Here,
$$M = m_1 + m_2 \quad \text{and} \quad r = r_1 + r_2$$

Further, angular momentum of the system about COM

$$L = (I_1 + I_2)\,\omega = \left(\frac{m_1 m_2}{m_1 + m_2}\right) r^2 \omega = \mu r^2 \omega$$

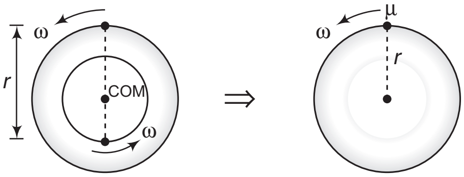
Kinetic energy of system, $K = \frac{1}{2}\left(\frac{m_1 m_2}{m_1 + m_2}\right) r^2 \omega^2 = \frac{1}{2} \mu r^2 \omega^2$

and moment of inertia of system,

$$I = \left(\frac{m_1 m_2}{m_1 + m_2}\right) r^2 = \mu r^2$$

Here,
$$\mu = \frac{m_1 m_2}{m_1 + m_2} = \text{reduced mass}$$

Thus, the two bodies can be replaced by a single body whose mass is equal to reduced mass. This single body revolve in a circular orbit whose radius is equal to the distance between two bodies and centripetal force of circular motion is equal to force of interaction between two bodies for actual separation.



Example 11 *A planet of mass m_1 revolves round the sun of mass m_2. The distance between the sun and the planet is r. Considering the motion of the sun find the total energy of the system assuming the orbits to be circular.*

Solution Both the planet and the sun revolve around their centre of mass with same angular velocity (say ω)

$$r = r_1 + r_2 \qquad \text{...(i)}$$

$$m_1 r_1 \omega^2 = m_2 r_2 \omega^2 = \frac{Gm_1 m_2}{r^2} \qquad \text{...(ii)}$$

Solving Eqs. (i) and (ii), we get

$$r_1 = r\left(\frac{m_2}{m_1 + m_2}\right)$$

$$r_2 = r\left(\frac{m_1}{m_1 + m_2}\right)$$

and
$$\omega^2 = \frac{G(m_1 + m_2)}{r^3}$$

Now, total energy of the system is

$$E = \text{PE} + \text{KE} \quad \text{or} \quad E = -\frac{Gm_1 m_2}{r} + \frac{1}{2} m_1 r_1^2 \omega^2 + \frac{1}{2} m_2 r_2^2 \omega^2$$

Substituting the values of r_1, r_2 and ω^2, we get

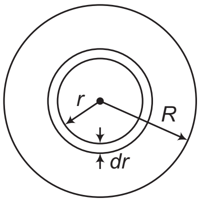
$$E = -\frac{Gm_1 m_2}{2r}$$

Ans.

Type 8. *To find gravitational field strength for spherical mass distribution when mass density is a function of r (not constant), where r is the distance from centre.*

Concept

Mass density of a solid sphere of radius R varies as $\rho = \rho_0 r^2$, where ρ_0 is a positive constant, we have to find variation of E with r.



According to Gauss theorem, the mass inside a spherical surface only contributes in the field strength on the surface of that sphere or at a distance 'r' from the centre

$$E = \frac{Gm_{\text{in}}}{r^2} \qquad \text{...(i)}$$

where, m_{in} is the mass inside that sphere. Here, m_{in} will be obtained by integration as the mass density is not constant.

Let us take a small element of thickness dr at distance 'r'. Volume of this element.

$$dV = (4\pi r^2)dr$$

Mass density at distance r is

$$\rho = \rho_0 r^2$$

Therefore, small mass of this element

$$dm = \rho\, dV$$

or
$$dm = (4\pi\rho_0 r^4)dr$$

$\therefore$
$$m_{\text{in}} = \int_0^r dm = \int_0^r (4\pi\rho_0 r^4)\, dr$$

or
$$m_{\text{in}} = \frac{4\pi\rho_0}{5} r^5 \qquad \text{...(ii)}$$

Substituting this value of m_{in} in Eq. (i) we can find E.

Example 12 *In the problem discussed in the text, find E-r expressions for inside and outside points.*

Solution **Inside points ($r \le R$)**

Directly substituting value of m_{in} from Eq. (ii) in Eq. (i) we have,

$$E = \frac{G}{r^2}\left[\frac{4\pi\rho_0 r^5}{5}\right]$$

or
$$E = \frac{4\pi G\rho_0 r^3}{5}$$

Outside points ($r \ge R$)

Mass is only upto $r = R$. So, substituting $r = R$ in Eq. (ii) we have,

$$m_{\text{in}} = \frac{4\pi\rho_0}{5} R^5$$

Now, substituting this value of m_{in} in Eq. (i), we have

$$E = \frac{G}{r^2}\left[\frac{4\pi\rho_0 R^5}{5}\right]$$

or
$$E = \frac{4\pi\, G\rho_0 R^5}{5r^2}$$

Note *Direction of* **E** *is always towards the centre of the sphere.*

Type 9. *To draw E - r and V - r graphs due to two points masses, along the line joining two masses.*

Concept

(i) Expressions of E and V due to a point mass are

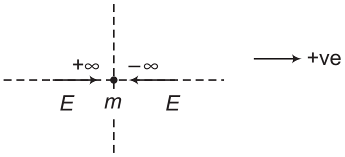
$$E = \frac{Gm}{r^2} \qquad \text{(towards the point mass)}$$

and
$$V = -\frac{Gm}{r}$$

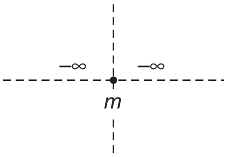
(ii) As $r \to \infty$, E and V both $\to 0$.

(iii) As $r \to 0$, $E \to \infty$ and $V \to -\infty$

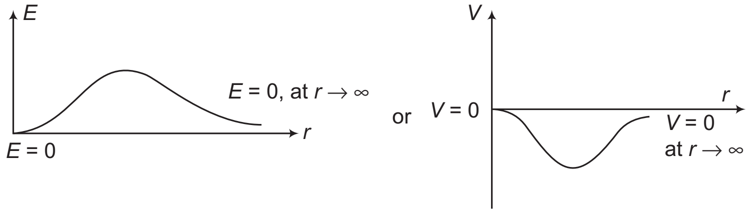
(iv) E is a vector quantity. On two sides of a point mass directions are different. So, on one side if value is $+\infty$ (just over the mass as $r \to 0$) and on its other side value will be $-\infty$.



(v) V is a scalar quantity. On both sides of the mass (as $r \to 0$) value will be $-\infty$.



(vi) Between two zero values, we will get one maximum (or minimum value)

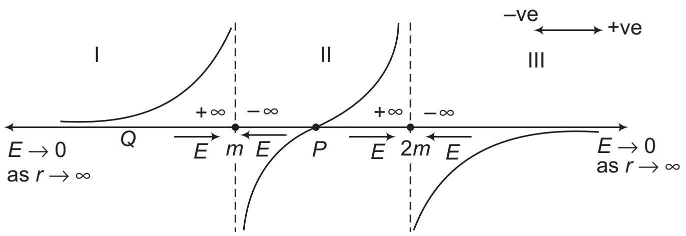


How to Solve?

Just write down the values at $r \to \infty$ and $r \to 0$, then draw the graph with the help of five points discussed above.

Example 13 Two points masses 'm' and $2m$ are kept at certain distance as shown in figure. Draw E - r and V - r graphs along the line joining them corresponding to given mass system.

Solution **E - r Graph**

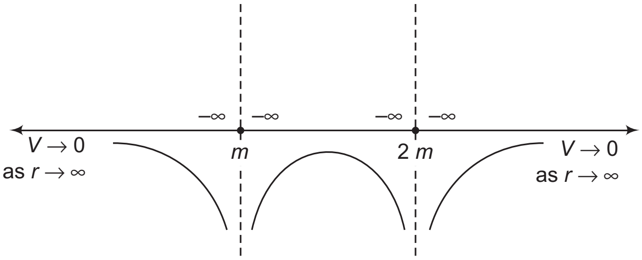


Region I Fields of m and $2m$ both are positive. Hence, net field at any point is also positive.

Region II Field at m is negative and field of $2m$ is positive. So, at some point P (nearer to m) two fields are equal and opposite and net field is zero.

Region III Fields of m and $2m$ both are negative. Hence, net field at any point is also negative.

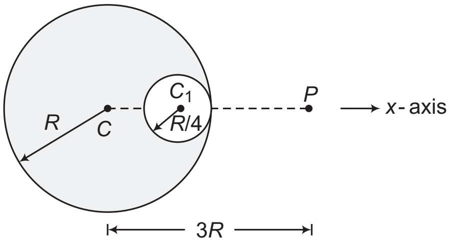
V-r Graph



Gravitational potential is always negative on both sides. So, net potential at any point is always negative. Between two masses potential varies between $-\infty$ and $-\infty$. So, graph is as shown in figure.

Type 10. *To find value of E or V at some point due to a solid sphere having some cavity in it.*

How to Solve?



Suppose a solid sphere of mass M and radius R has a cavity of radius $\frac{R}{4}$ as shown in figure and we wish to find net gravitational field and potential at point P. Then,

$$\mathbf{E}_T = \mathbf{E}_R + \mathbf{E}_C$$

$$\therefore \qquad \mathbf{E}_R = \mathbf{E}_T - \mathbf{E}_C \qquad \ldots\text{(i)}$$

Similarly,
$$V_R = V_T - V_C \qquad \ldots\text{(ii)}$$

Here, R stands for remaining mass, T for total mass and C for cavity.

Example 14 *In the problem discussed in the text, find the values of E and V at P due to the remaining mass.*

Solution Total mass is M of volume $\frac{4}{3}\pi R^3$. Therefore, mass of cavity of volume $\frac{4}{3}\pi\left(\frac{R}{4}\right)^3$ will be $\frac{M}{64}$.

Further,
$$C_1P = 2R + \frac{R}{4} = \frac{9R}{4}$$

Using Eq. (i),
$$\mathbf{E}_R = \frac{GM}{(3R)^2}(-\hat{\mathbf{i}}) - \frac{G\left(\frac{M}{64}\right)}{(9R/4)^2}(-\hat{\mathbf{i}})$$

Note *Field strength is always towards the centre.*

$$\therefore \qquad \mathbf{E}_R = \frac{35}{324}\frac{GM}{R^2}(-\hat{\mathbf{i}})$$ **Ans.**

$\therefore$ Field Strength is $\dfrac{35\,GM}{324\,R^2}$ towards C.

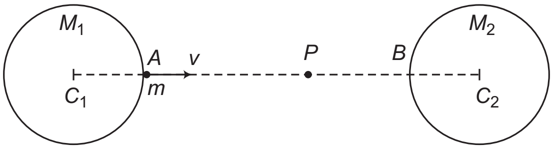
Using Eq. (ii), we have

$$V_R = -\frac{GM}{3R} - \left[\frac{-G\left(\frac{M}{64}\right)}{(9R/4)}\right]$$

$$= -\frac{47}{144}\frac{GM}{R}$$ **Ans.**

Type 11. *To find minimum velocity required to project one particle from the surface of one planet to other planet.*

Concept



Suppose the particle of mass 'm' is projected from the surface of planet of mass M_1 and we wish to project it upto the surface of other planet. In between the two planets, there is a point P, where net field strength is zero. Or, net force on 'm' is zero.

From C_1 to P field strength of M_1 is stronger and net force on 'm' is towards C_1. At point P field strengths of both M_1 and M_2 are equal and opposite. Between C_2 and P field strengths of M_2 is stronger and net force on 'm' is towards C_2.

So, we have to project the particle only upto P. After P, it automatically moves towards the surface of B by the attraction of M_2.

How to Solve?

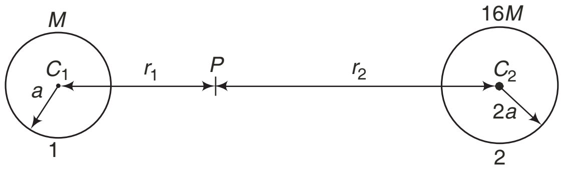
First find the point P, where net gravitational force on 'm' is zero. Then, apply energy conservation equation between A and P where,

v_A = minimum velocity required and v_P is tending to zero.

Note *By applying energy conservation principle we can also find velocity at B, on reaching to the surface of B.*

Example 15 *Distance between the centres of two stars is* $10a$. *The masses of these stars are* M *and* $16M$ *and their radii* a *and* $2a$ *respectively. A body of mass* m *is fired straight from the surface of the larger star towards the surface of the smaller star. What should be its minimum initial speed to reach the surface of the smaller star? Obtain the expression in terms of* G, M *and* a. **(JEE 1996)**

Solution Let there are two stars 1 and 2 as shown below.

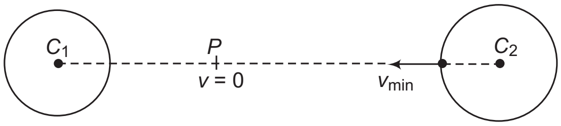


Let P is a point between C_1 and C_2, where gravitational field strength is zero or at P field strength due to star 1 is equal and opposite to the field strength due to star 2. Hence,

$$\frac{GM}{r_1^2} = \frac{G\,(16\,M)}{r_2^2} \quad \text{or} \quad \frac{r_2}{r_1} = 4 \quad \text{also} \quad r_1 + r_2 = 10\,a$$

$$\therefore \qquad r_2 = \left(\frac{4}{4+1}\right)(10\,a) = 8\,a \quad \text{and} \quad r_1 = 2a$$

Now, the body of mass m is projected from the surface of larger star towards the smaller one. Between C_2 and P it is attracted towards 2 and between C_1 and P it will be attracted towards 1. Therefore, the body should be projected to just cross point P because beyond that the particle is attracted towards the smaller star itself.



From conservation of mechanical energy $\frac{1}{2}mv^2_{\min}$

= Potential energy of the body at P – Potential energy at the surface of larger star.

$$\therefore \qquad \frac{1}{2}mv^2_{\min} = \left[-\frac{GMm}{r_1} - \frac{16\,GMm}{r_2}\right] - \left[-\frac{GMm}{10a - 2a} - \frac{16\,GMm}{2a}\right]$$

$$= \left[-\frac{GMm}{2a} - \frac{16\,GMm}{8a}\right] - \left[-\frac{GMm}{8a} - \frac{8\,GMm}{a}\right]$$

$$\text{or} \qquad \frac{1}{2}mv^2_{\min} = \left(\frac{45}{8}\right)\frac{GMm}{a} \Rightarrow \therefore\ v_{\min} = \frac{3\sqrt{5}}{2}\left(\sqrt{\frac{GM}{a}}\right)$$ **Ans.**

Type 12. *To find gravitational potential due to two or more than two spherical shells.*

Concept

At any point inside the shell (upto the surface).

$$V = -\frac{GM}{R} = \text{constant}$$

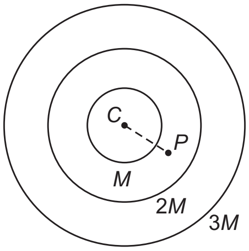
In the denominator, substitute R, radius of the shell.

At any point outside the shell,

$$V = -\frac{GM}{r} \quad \text{or} \quad V \propto -\frac{1}{r}$$

In the denominator, substitute r, actual distance of the point from the centre.

Example 16 *Three spherical shells of masses M, 2M and 3M have radii R, 3R and 4R as shown in figure. Find net potential at point P, where CP = 2R*



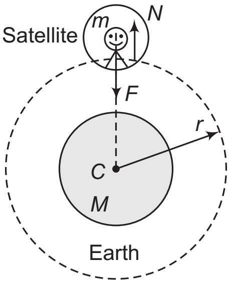
Solution Point P lies outside the innermost shell. So, in the denominator we will substitute actual distance of P from the centre or $r = CP = 2R$.

This point P lies inside the other two shells. So, we will substitute their radii, $3R$ and $4R$ in the denominator.

$$\therefore \qquad V_P = -\frac{GM}{2R} - \frac{G(2M)}{3R} - \frac{G(3M)}{4R} = -\frac{23\,GM}{12\,R} \qquad \textbf{Ans.}$$

Miscellaneous Examples

Example 17 *Explain the reason of weightlessness inside a satellite.*



Solution Feeling of weight is due to the normal reaction from the ground. Inside a satellite, this normal reaction becomes zero, which can be proved as given below.

Orbital speed is given by

$$v = \sqrt{\frac{GM}{r}} \qquad \text{...(i)}$$

Two forces are acting on the person.

(i) F = gravitational force from earth

or $$F = \frac{GMm}{r^2} \qquad \text{...(ii)}$$

(ii) N = normal reaction

Person is also revolving in circular motion with same speed v. So, it needs a centripetal force.

$$\therefore \qquad F - N = \frac{mv^2}{r} \quad \text{or} \quad N = F - \frac{mv^2}{r}$$

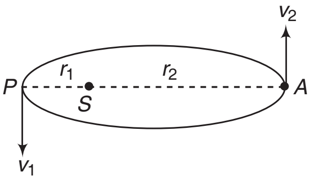
Substituting the values of F and v in Eqs. (i) and (ii) we have,

$$N = \frac{GMm}{r^2} - \frac{m}{r}\left(\sqrt{\frac{GM}{r}}\right)^2 = 0 \qquad \textbf{Hence Proved.}$$

Note *Moon is also an earth's satellite but there we don't feel weightlessness because mass of moon is large and we feel weight due to the gravitational force due to the moon (which is not insignificant like other satellite as its mass is less in comparison to the moon).*

Example 18 *Find the speeds of a planet of mass m in its perihelion and aphelion positions. The semimajor axis of its orbit is a, eccentricity is e and the mass of the sun is M. Also find the total energy of the planet in terms of the given parameters.*

Solution Let v_1 and v_2 be the speeds of the planet at perihelion and aphelion positions.



$$r_1 = a(1-e)$$

and $$r_2 = a(1+e) \qquad \text{...(i)}$$

Applying conservation of angular momentum of the planet at P (perihelion) and A (aphelion)

$$mv_1 r_1 \sin 90° = mv_2 r_2 \sin 90°$$

or $$v_1 r_1 = v_2 r_2 \qquad \text{...(ii)}$$

Applying conservation of mechanical energy in these two positions, we have

$$\frac{1}{2}mv_1^2 - \frac{GMm}{r_1} = \frac{1}{2}mv_2^2 - \frac{GMm}{r_2} \qquad \text{...(iii)}$$

Solving Eqs. (i), (ii) and (iii), we get

$$v_1 = \sqrt{\frac{GM}{a}\left(\frac{1+e}{1-e}\right)} \quad \text{and} \quad v_2 = \sqrt{\frac{GM}{a}\left(\frac{1-e}{1+e}\right)}$$

Further, total energy of the planet

$$E = \frac{1}{2}mv_1^2 - \frac{GMm}{r_1} = \frac{1}{2}m\left[\frac{GM}{a}\left(\frac{1+e}{1-e}\right)\right] - \frac{GMm}{a(1-e)}$$

$$= \frac{GMm}{a(1-e)}\left[\left(\frac{1+e}{2}\right) - 1\right]$$

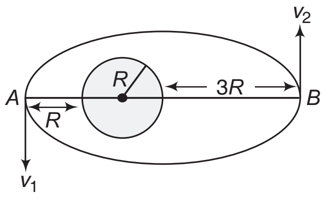
$$= \frac{GMm}{a(1-e)}\left(\frac{e-1}{2}\right) \quad \text{or} \quad E = -\frac{GMm}{2a}$$ **Ans.**

Example 19 *The minimum and maximum distances of a satellite from the centre of the earth are 2R and 4R respectively, where R is the radius of earth and M is the mass of the earth. Find*

(a) its minimum and maximum speeds,

(b) radius of curvature at the point of minimum distance.

Solution (a) Applying conservation of angular momentum



$$mv_1(2R) = mv_2(4R)$$

$$v_1 = 2v_2 \qquad \text{... (i)}$$

From conservation of energy

$$\frac{1}{2}mv_1^2 - \frac{GMm}{2R} = \frac{1}{2}mv_2^2 - \frac{GMm}{4R} \qquad \text{... (ii)}$$

Solving Eqs. (i) and (ii), we get

$$v_2 = \sqrt{\frac{GM}{6R}}, \quad v_1 = \sqrt{\frac{2GM}{3R}}$$

(b) If r is the radius of curvature at point A

$$\frac{mv_1^2}{r} = \frac{GMm}{(2R)^2}$$

$$r = \frac{4v_1^2R^2}{GM} = \frac{8R}{3} \qquad \text{(putting value of } v_1\text{)}$$

Example 20 *A planet of mass m revolves in elliptical orbit around the sun of mass M so that its maximum and minimum distances from the sun are equal to r_a and r_p respectively. Find the angular momentum of this planet relative to the sun.*

Solution Using conservation of angular momentum

$$mv_pr_p = mv_ar_a$$

As velocities are perpendicular to the radius vectors at apogee and perigee.

$$\Rightarrow \qquad v_pr_p = v_ar_a$$

Using conservation of energy,

$$-\frac{GMm}{r_p} + \frac{1}{2}mv_p^2 = \frac{-GMm}{r_a} + \frac{1}{2}mv_a^2$$

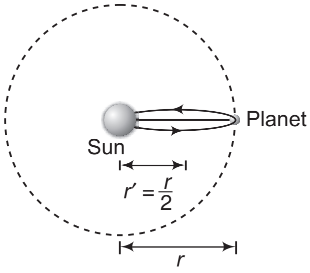
By solving, the above equations,

$$v_p = \sqrt{\frac{2GMr_a}{r_p(r_p + r_a)}}$$

$$L = mv_pr_p = m\sqrt{\frac{2GMr_pr_a}{(r_p + r_a)}}$$

Example 21 *If a planet was suddenly stopped in its orbit supposed to be circular, show that it would fall onto the sun in a time $\frac{\sqrt{2}}{8}$ times the period of the planet's revolution.*

Solution Consider an imaginary planet moving along a strongly extended flat ellipse, the extreme points of which are located on the planet's orbit and at the centre of the sun. The semi-major axis of the orbit of such a planet would apparently be half the semi-major axis of the planet's orbit. So, the time period of the imaginary planet T' according to Kepler's law will be given by



$$\left(\frac{T'}{T}\right) = \left(\frac{r'}{r}\right)^{\frac{3}{2}}$$

or

$$T' = T\left(\frac{1}{2}\right)^{\frac{3}{2}} \qquad \left(\text{as} \quad r' = \frac{r}{2}\right)$$

∴ Time taken by the planet to fall onto the sun is

$$t = \frac{T'}{2} = \frac{T}{2}\left(\frac{1}{2}\right)^{\frac{3}{2}} \Rightarrow t = \frac{\sqrt{2}}{8}\,T$$

Example 22 *A satellite is revolving round the earth in a circular orbit of radius r and velocity* v_0. *A particle is projected from the satellite in forward direction with relative velocity* $v = (\sqrt{5/4} - 1)\, v_0$. *Calculate its minimum and maximum distances from earth's centre during subsequent motion of the particle.*

Solution $v_o = \sqrt{\frac{GM}{r}}$ = orbital speed of satellite ...(i)

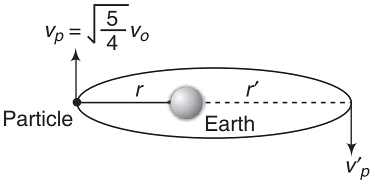
where, M = mass of earth.

Absolute velocity of particle would be

$$v_p = v + v_0 = \sqrt{\frac{5}{4}}\, v_0 = \sqrt{1.25}\, v_0 \qquad \text{...(ii)}$$

Since, v_p lies between orbital velocity and escape velocity, path of the particle would be an ellipse with r being the minimum distance.

Let r' be the maximum distance and v_p' its velocity at that moment.



Then, from conservation of angular momentum and conservation of mechanical energy, we get

$$m v_p r = m v_p' r' \qquad \text{...(iii)}$$

and

$$\frac{1}{2} m v_p^2 - \frac{GMm}{r} = \frac{1}{2} m v_p'^2 - \frac{GMm}{r'} \qquad \text{...(iv)}$$

Solving the above Eqs. (i), (ii), (iii) and (iv), we get

$$r' = \frac{5r}{3} \quad \text{and} \quad r$$

Hence, the maximum and minimum distances are $\frac{5r}{3}$ and r respectively.

Example 23 *An earth satellite is revolving in a circular orbit of radius a with velocity* v_o. *A gun is in the satellite and is aimed directly towards the earth. A bullet is fired from the gun with muzzle velocity* $\frac{v_0}{2}$. *Neglecting resistance offered by cosmic dust and recoil of gun, calculate maximum and minimum distance of bullet from the centre of earth during its subsequent motion.*

Solution Orbital speed of satellite is

$$v_o = \sqrt{\frac{GM}{a}} \qquad \text{...(i)}$$

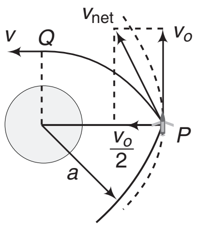
From conservation of angular momentum at P and Q, we have

$$m a v_o = m v r$$

or

$$v = \frac{a v_o}{r} \qquad \text{...(ii)}$$

From conservation of mechanical energy at P and Q, we have



$$\frac{1}{2}m\left(v_o^2+\frac{v_o^2}{4}\right)-\frac{GMm}{a}=\frac{1}{2}mv^2-\frac{GMm}{r}$$

or $$\frac{5}{8}v_o^2-\frac{GM}{a}=\frac{v^2}{2}-\frac{GM}{r}$$

Substituting values of v and v_o from Eqs. (i) and (ii), we get

$$\frac{5}{8}\frac{GM}{a}-\frac{GM}{a}=\frac{a^2}{r^2}\cdot\left(\frac{GM}{2a}\right)-\frac{GM}{r}$$

or $$-\frac{3}{8a}=\frac{a}{2r^2}-\frac{1}{r}$$

or $$-3r^2=4a^2-8ar$$

or $$3r^2-8ar+4a^2=0$$

or $$r=\frac{8a\pm\sqrt{64a^2-48a^2}}{6}$$

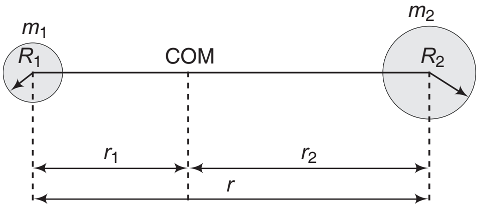
or $$r=\frac{8a\pm 4a}{6}$$

or $$r=2a \text{ and } \frac{2a}{3}$$

Hence, the maximum and minimum distances are $2a$ and $\frac{2a}{3}$ respectively.

Example 24 *Binary stars of comparable masses m_1 and m_2 rotate under the influence of each other's gravity with a time period T. If they are stopped suddenly in their motions, find their relative velocity when they collide with each other. The radii of the stars are R_1 and R_2 respectively. G is the universal constant of gravitation.*

Solution Both the stars rotate about their centre of mass (COM).



For the position of COM, $$\frac{r_1}{m_2}=\frac{r_2}{m_1}=\frac{r_1+r_2}{m_1+m_2}=\frac{r}{m_1+m_2} \qquad (r=r_1+r_2)$$

Also, $$m_1 r_1 \omega^2 = \frac{Gm_1 m_2}{r^2}$$

or $$\omega^2 = \frac{Gm_2}{r_1 r^2} \qquad \left(\omega = \frac{2\pi}{T}\right)$$

But, $$r_1 = \frac{m_2 r}{m_1 + m_2}$$

∴ $$\omega^2 = \frac{G(m_1 + m_2)}{r^3}$$

or $$r = \left\{\frac{G(m_1 + m_2)}{\omega^2}\right\}^{1/3} \qquad \text{...(i)}$$

Applying conservation of mechanical energy, we have

$$-\frac{Gm_1 m_2}{r} = -\frac{Gm_1 m_2}{(R_1 + R_2)} + \frac{1}{2}\mu v_r^2 \qquad \text{...(ii)}$$

Here, $$\mu = \text{reduced mass}$$
$$= \frac{m_1 m_2}{m_1 + m_2}$$

and v_r = relative velocity between the two stars.

From Eq. (ii), we find that

$$v_r^2 = \frac{2Gm_1 m_2}{\mu}\left(\frac{1}{R_1 + R_2} - \frac{1}{r}\right)$$
$$= \frac{2Gm_1 m_2}{\dfrac{m_1 m_2}{m_1 + m_2}}\left(\frac{1}{R_1 + R_2} - \frac{1}{r}\right)$$
$$= 2G(m_1 + m_2)\left(\frac{1}{R_1 + R_2} - \frac{1}{r}\right)$$

Substituting the value of r from Eq. (i), we get

$$v_r = \sqrt{2G(m_1 + m_2)\left[\frac{1}{R_1 + R_2} - \left\{\frac{4\pi^2}{G(m_1 + m_2)T^2}\right\}^{1/3}\right]}$$

Exercises

LEVEL 1

Assertion and Reason

Directions : *Choose the correct option.*

(*a*) *If both **Assertion** and **Reason** are true and the **Reason** is correct explanation of the **Assertion.***

(*b*) *If both **Assertion** and **Reason** are true but **Reason** is not the correct explanation of **Assertion.***

(*c*) *If **Assertion** is true, but the **Reason** is false.*

(*d*) *If **Assertion** is false but the **Reason** is true.*

1. **Assertion :** When two masses come closer, their gravitational potential energy decreases.

   Reason : Two masses attract each other.

2. **Assertion :** In moving from centre of a solid sphere to its surface, gravitational potential increases.

   Reason : Gravitational field strength increases.

3. **Assertion :** There are two identical spherical bodies fixed in two positions as shown. While moving from A to B gravitational potential first increases then decreases.

   Reason : At centre point of A and B field strength will be zero.

4. **Assertion :** If we plot potential *versus* x-coordinate graph along the x-axis, then field strength is zero where slope of V-x graph is zero.

   Reason : If potential is function of x-only then

$$E = -\frac{dV}{dx}$$

5. **Assertion :** A particle is projected upwards with speed v and it goes to a height h. If we double the speed then it will move to height $4h$.

   Reason : In case of earth, acceleration due to gravity g varies as

$$g \propto \frac{1}{r^2} \qquad \text{(for } r \geq R\text{)}$$

6. **Assertion :** In planetary motion angular momentum of planet about centre of sun remains constant. But linear momentum of system does not remain constant.

   Reason : Net torque on planet about any point is zero.

7. **Assertion :** Plane of space satellite is always equatorial plane.

   Reason : On the equator value of g is minimum.

8. **Assertion :** On satellites we feel weightlessness. Moon is also a satellite of earth. But we do not feel weightlessness on moon.

   Reason : Mass of moon is considerable.

9. **Assertion :** Plane of geostationary satellites always passes through equator.

   Reason : Geostationary satellites always lies above Moscow.

10. **Assertion :** It we double the circular radius of a satellite, then its potential energy, kinetic energy and total mechanical energy will become half.

    Reason : Orbital speed of a satellite.

    $$v \propto \frac{1}{\sqrt{r}}$$

    where, r is its radius of orbit.

11. **Assertion :** If the radius of earth is decreased keeping its mass constant, effective value of g may increase or decrease at pole.

    Reason : Value of g on the surface of earth is given by $g = \frac{GM}{R^2}$.

Objective Questions

Single Correct Option

1. A satellite orbiting close to the surface of earth does not fall down because the gravitational pull of earth
   (a) is balanced by the gravitational pull of moon
   (b) is balanced by the gravitational pull of sun
   (c) provides the necessary acceleration for its motion along the circular path
   (d) makes it weightless

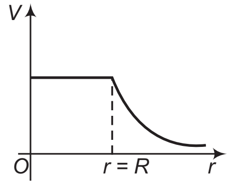
2. For the planet-sun system identify the correct statement.
   (a) the angular momentum of the planet is conserved about any point
   (b) the total energy of the system is conserved
   (c) the momentum of the planet is conserved
   (d) All of the above

3. If the earth stops rotating about its axis, then the magnitude of gravity
   (a) increases everywhere on the surface of earth
   (b) will increase only at the poles
   (c) will not change at the poles
   (d) All of the above

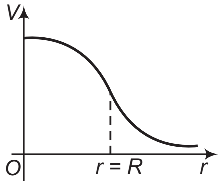
4. For a body to escape from earth, angle from horizontal at which it should be fired is
   (a) 45°
   (b) 0°
   (c) 90°
   (d) any angle

5. The correct variation of gravitational potential V with radius r measured from the centre of earth of radius R is given by

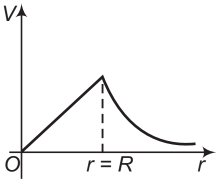
(a)



(b)



(c)



(d) None of these

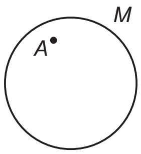
6. The Gauss' theorem for gravitational field may be written as

(a) $\oint \mathbf{g} \cdot d\mathbf{S} = \frac{m}{G}$ (b) $-\oint \mathbf{g} \cdot d\mathbf{S} = 4\pi mG$ (c) $\oint \mathbf{g} \cdot d\mathbf{S} = \frac{m}{4\pi G}$ (d) $-\oint \mathbf{g} \cdot d\mathbf{S} = \frac{m}{G}$

7. In the earth-moon system, if T_1 and T_2 are period of revolution of earth and moon respectively about the centre of mass of the system then

(a) $T_1 > T_2$ (b) $T_1 = T_2$ (c) $T_1 < T_2$ (d) Insufficient data

8. The figure shows a spherical shell of mass M. The point A is not at the centre but away from the centre of the shell. If a particle of mass m is placed at A, then

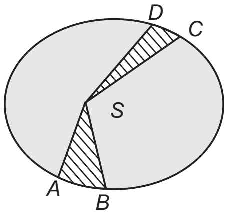


(a) it remains at rest
(b) it experiences a net force towards the centre
(c) it experiences a net force away from the centre
(d) None of the above

9. If the distance between the earth and the sun were reduced to half its present value, then the number of days in one year would have been

(a) 65 (b) 129
(c) 183 (d) 730

10. The figure represents an elliptical orbit of a planet around sun. The planet takes time T_1 to travel from A to B and it takes time T_2 to travel from C to D. If the area CSD is double that of area ASB, then



(a) $T_1 = T_2$
(b) $T_1 = 2T_2$
(c) $T_1 = 0.5T_2$
(d) Data insufficient

11. At what depth from the surface of earth the time period of a simple pendulum is 0.5% more than that on the surface of the Earth? (Radius of earth is 6400 km)

(a) 32 km (b) 64 km (c) 96 km (d) 128 km

12. If M is the mass of the earth and R its radius, the ratio of the gravitational acceleration and the gravitational constant is

(a) $\frac{R^2}{M}$ (b) $\frac{M}{R^2}$ (c) MR^2 (d) $\frac{M}{R}$

13. The height above the surface of earth at which the gravitational field intensity is reduced to 1% of its value on the surface of earth is

(a) $100R_e$ (b) $10R_e$ (c) $99R_e$ (d) $9R_e$

14. For a satellite orbiting close to the surface of earth the period of revolution is 84 min. The time period of another satellite orbiting at a height three times the radius of earth from its surface will be

(a) $(84)\,2\sqrt{2}$ min (b) 8 (84) min

(c) $(84)\,3\sqrt{3}$ min (d) 3 (84) min

15. The angular speed of rotation of earth about its axis at which the weight of man standing on the equator becomes half of his weight at the poles is given by

(a) 0.034 rad s^{-1} (b) 8.75×10^{-4} rad s^{-1}

(c) 1.23×10^{-2} rad s^{-1} (d) 7.65×10^{-7} rad s^{-1}

16. The height from the surface of earth at which the gravitational potential energy of a ball of mass m is half of that at the centre of earth is (where R is the radius of earth)

(a) $\frac{R}{4}$ (b) $\frac{R}{3}$ (c) $\frac{3R}{4}$ (d) $\frac{4R}{3}$

17. A body of mass m is lifted up from the surface of earth to a height three times the radius of the earth R. The change in potential energy of the body is

(a) $3mgR$ (b) $\frac{5}{4}mgR$

(c) $\frac{3}{4}mgR$ (d) $2mgR$

18. A satellite is revolving around earth in its equatorial plane with a period T. If the radius of earth suddenly shrinks to half without change in the mass. Then, the new period of revolution will be

(a) $8T$ (b) $2\sqrt{2}\,T$

(c) $2T$ (d) T

19. A planet has twice the density of earth but the acceleration due to gravity on its surface is exactly the same as that on the surface of earth. Its radius in terms of earth's radius R will be

(a) $R/4$ (b) $R/2$

(c) $R/3$ (d) $R/8$

20. The speed of earth's rotation about its axis is ω. Its speed is increased to x times to make the effective acceleration due to gravity equal to zero at the equator, then x is around ($g = 10$ ms^{-2}; $R = 6400$ km)

(a) 1 (b) 8.5

(c) 17 (d) 34

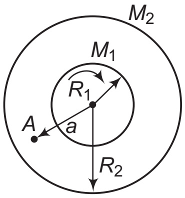
21. A satellite is seen every 6 h over the equator. It is known that it rotates opposite to that of earth's direction. Then, the angular velocity (in radian per hour) of satellite about the centre of earth will be

(a) $\frac{\pi}{2}$ (b) $\frac{\pi}{3}$ (c) $\frac{\pi}{4}$ (d) $\frac{\pi}{8}$

22. For a planet revolving around sun, if a and b are the respective semi-major and semi-minor axes, then the square of its time period is proportional to

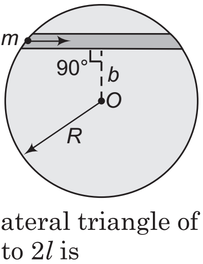
(a) $\left(\frac{a+b}{2}\right)^3$ (b) $\left(\frac{a-b}{2}\right)^3$

(c) b^3 (d) a^3



23. The figure represents two concentric shells of radii R_1 and R_2 and masses M_1 and M_2 respectively. The gravitational field intensity at the point A at distance a ($R_1 < a < R_2$) is

(a) $\dfrac{G(M_1+M_2)}{a^2}$
(b) $\dfrac{GM_1}{a^2}+\dfrac{GM_2}{R_2^2}$
(c) $\dfrac{GM_1}{a^2}$
(d) zero



24. A straight tunnel is dug into the earth as shown in figure at a distance b from its centre. A ball of mass m is dropped from one of its ends. The time it takes to reach the other end is approximately

(a) 42 min
(b) 84 min
(c) $84\left(\dfrac{b}{R}\right)$ min
(d) $42\left(\dfrac{b}{R}\right)$ min

25. Three identical particles each of mass M are placed at the corners of an equilateral triangle of side l. The work done by external force to increase the side of triangle from l to $2l$ is

(a) $-\dfrac{3}{2}\dfrac{GM^2}{l}$
(b) $\dfrac{-3GM^2}{l}$
(c) $\dfrac{3}{2}\dfrac{GM^2}{l}$
(d) $\dfrac{3GM^2}{l}$

26. A particle is thrown vertically upwards from the surface of earth and it reaches to a maximum height equal to the radius of earth. The ratio of the velocity of projection to the escape velocity on the surface of earth is

(a) $\dfrac{1}{\sqrt{2}}$
(b) $\dfrac{1}{2}$
(c) $\dfrac{1}{4}$
(d) $\dfrac{1}{2\sqrt{2}}$

27. The gravitational potential energy of a body at a distance r from the centre of earth is U. Its weight at a distance $2r$ from the centre of earth is

(a) $\dfrac{U}{r}$
(b) $\dfrac{U}{2r}$
(c) $\dfrac{U}{4r}$
(d) $\dfrac{U}{\sqrt{2}r}$

Subjective Questions

1. A particle of mass 1 kg is kept on the surface of a uniform sphere of mass 20 kg and radius 1.0 m. Find the work to be done against the gravitational force between them to take the particle away from the sphere.

2. What is the fractional decrease in the value of free-fall acceleration g for a particle when it is lifted from the surface to an elevation h? ($h << R$)

3. Two masses m_1 and m_2 at an infinite distance from each other are initially at rest, start interacting gravitationally. Find their velocity of approach when they are at a distance r apart.

4. If a satellite is revolving close to a planet of density ρ with period T, show that the quantity ρT^2 is a universal constant.

5. A satellite is revolving around a planet in a circular orbit. What will happen, if its speed is increased from v_0 to

(a) $\sqrt{1.5}\,v_0$
(b) $2v_0$

6. If the radius of the earth contracts to half of its present value without change in its mass, what will be the new duration of the day?

7. Two concentric spherical shells have masses m_1, m_2 and radii $R_1, R_2 (R_1 < R_2)$. Calculate the force exerted by this system on a particle of mass m, if it is placed at a distance $\frac{(R_1 + R_2)}{2}$ from the centre.

8. Find the force of attraction on a particle of mass m placed at the centre of a semicircular wire of length L and mass M.

9. A rocket is accelerated to speed $v = 2\sqrt{gR}$ near the earth's surface (R = radius of earth). Show that very far from earth its speed will be $v = \sqrt{2gR}$.

10. Two spheres one of mass M has radius R. Another sphere has mass $4M$ and radius $2R$. The centre to centre distance between them is $12R$. Find the distance from the centre of smaller sphere where

(a) net gravitational field is zero,

(b) net gravitational potential is half the potential on the surface of larger sphere.

11. A uniform solid sphere of mass M and radius a is surrounded symmetrically by a uniform thin spherical shell of equal mass and radius $2a$. Find the gravitational field at a distance (a) $\frac{3}{2}a$ from the centre, (b) $\frac{5}{2}a$ from the centre.

12. The density inside a solid sphere of radius a is given by $\rho = \rho_0 a/r$, where ρ_0 is the density at the surface and r denotes the distance from the centre. Find the gravitational field due to this sphere at a distance $2a$ from its centre.

13. Two neutron stars are separated by a distance of 10^{10} m. They each have a mass of 10^{30} kg and a radius of 10^5 m. They are initially at rest with respect to each other.

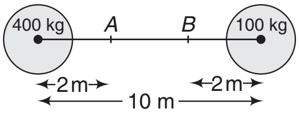
As measured from the rest frame, how fast are they moving when

(a) their separation has decreased to one-half its initial value,

(b) they are about to collide.

14. A mass m is taken to a height R from the surface of the earth and then is given a vertical velocity v. Find the minimum value of v, so that mass never returns to the surface of the earth. (Radius of earth is R and mass of the earth M).

15. In the figure masses 400 kg and 100 kg are fixed.



(a) How much work must be done to move a 1 kg mass from point A to point B ?

(b) What is the minimum kinetic energy with which the 1 kg mass must be projected from A to the right to reach the point B ?

16. Two identical stars of mass M orbit around their centre of mass. Each orbit is circular and has radius R, so that the two stars are always on opposite sides of the circle.

(a) Find the gravitational force of one star on the other.

(b) Find the orbital speed of each star and the period of the orbit.

(c) What minimum energy would be required to separate the two stars to infinity ?

17. Consider two satellites A and B of equal mass, moving in the same circular orbit of radius r around the earth but in the opposite sense and therefore a collision occurs.

(a) Find the total mechanical energy $E_A + E_B$ of the two satellite-plus-earth system before collision.

(b) If the collision is completely inelastic, find the total mechanical energy immediately after collision. Describe the subsequent motion of the combined satellite.

18. In a certain binary star system, each star has the same mass as our sun. They revolve about their centre of mass. The distance between them is the same as the distance between earth and the sun. What is their period of revolution in years ?

19. (a) Does it take more energy to get a satellite upto 1500 km above earth than to put it in circular orbit once it is there.

(b) What about 3185 km?

(c) What about 4500 km? (Take $R_e = 6370$ km)

LEVEL 2

Objective Questions

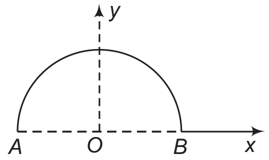
Single Correct Option

1. An artificial satellite of mass m is moving in a circular orbit at a height equal to the radius R of the earth. Suddenly due to internal explosion the satellite breaks into two parts of equal pieces. One part of the satellite stops just after the explosion. The increase in the mechanical energy of the system due to explosion will be
(Given, acceleration due to gravity on the surface of earth is g)

(a) mgR (b) $\frac{mgR}{2}$

(c) $\frac{mgR}{4}$ (d) $\frac{3mgR}{4}$

2. Gravitational field at the centre of a semicircle formed by a thin wire AB of mass M and length l is



(a) $\frac{GM}{l^2}$ along x-axis (b) $\frac{GM}{\pi l^2}$ along y-axis

(c) $\frac{2\pi GM}{l^2}$ along x-axis (d) $\frac{2\pi GM}{l^2}$ along y-axis

3. Four particles, each of mass M, move along a circle of radius R under the action of their mutual gravitational attraction. The speed of each particle is

(a) $\frac{GM}{R}$ (b) $\sqrt{2\sqrt{2}\frac{GM}{R}}$

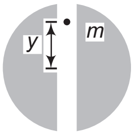
(c) $\sqrt{\frac{GM}{R}(2\sqrt{2}+1)}$ (d) $\sqrt{\frac{GM}{R}\frac{2\sqrt{2}+1}{4}}$

4. A projectile is fired from the surface of earth of radius R with a velocity kv_e (where v_e is the escape velocity from surface of earth and $k < 1$). Neglecting air resistance, the maximum height of rise from the centre of earth is

(a) $\dfrac{R}{k^2 - 1}$ (b) k^2R

(c) $\dfrac{R}{1 - k^2}$ (d) kR

5. Suppose a vertical tunnel is dug along the diameter of earth, which is assumed to be a sphere of uniform mass density ρ. If a body of mass m is thrown in this tunnel, its acceleration at a distance y from the centre is given by



(a) $\dfrac{4\pi}{3} G\rho y m$ (b) $\dfrac{3}{4}\pi\rho y$

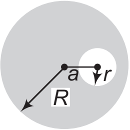
(c) $\dfrac{4}{3}\pi\rho y$ (d) $\dfrac{4}{3}\pi G\rho y$

6. A train of mass m moves with a velocity v on the equator from east to west. If ω is the angular speed of earth about its axis and R is the radius of the earth then the normal reaction acting on the train is

(a) $mg\left[1 - \dfrac{(\omega R - 2v)\,\omega}{g} - \dfrac{v^2}{Rg}\right]$ (b) $mg\left[1 - 2\dfrac{(\omega R - v)\,\omega}{g} - \dfrac{v^2}{Rg}\right]$

(c) $mg\left[1 - \dfrac{(\omega R + 2v)\,\omega}{g} - \dfrac{v^2}{Rg}\right]$ (d) $mg\left[1 - 2\dfrac{(\omega R - v)\,\omega}{g} - \dfrac{v^2}{Rg}\right]$

7. The figure represents a solid uniform sphere of mass M and radius R. A spherical cavity of radius r is at a distance a from the centre of the sphere. The gravitational field inside the cavity is



(a) non-uniform (b) towards the centre of the cavity

(c) directly proportional to a (d) All of these

8. If v_e is the escape velocity for earth when a projectile is fired from the surface of earth. Then, the escape velocity if the same projectile is fired from its centre is

(a) $\sqrt{\dfrac{3}{2}}\,v_e$ (b) $\dfrac{3}{2}\,v_e$

(c) $\sqrt{\dfrac{2}{3}}\,v_e$ (d) $\dfrac{2}{3}\,v_e$

9. If the gravitational field intensity at a point is given by $g = \dfrac{GM}{r^{2.5}}$. Then, the potential at a distance r is

(a) $\dfrac{-2GM}{3r^{1.5}}$ (b) $\dfrac{-GM}{r^{2.5}}$

(c) $\dfrac{2GM}{3r^{1.5}}$ (d) $\dfrac{GM}{r^{3.5}}$

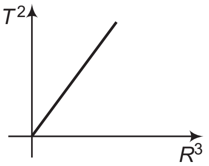
10. Three identical particles each of mass M move along a common circular path of radius R under the mutual interaction of each other. The velocity of each particle is

(a) $\sqrt{\dfrac{GM}{R}\sqrt{\dfrac{2}{3}}}$ (b) $\sqrt{\dfrac{GM}{\sqrt{3}R}}$

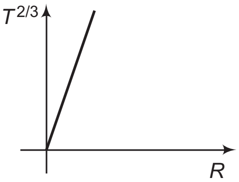
(c) $\sqrt{\dfrac{GM}{3R}}$ (d) $\sqrt{\dfrac{2}{3}\dfrac{GM}{R}}$

11. If T be the period of revolution of a planet revolving around sun in an orbit of mean radius R, then identify the **incorrect** graph.

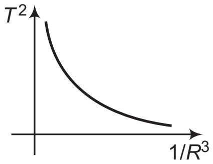
(a)



(b)



(c)

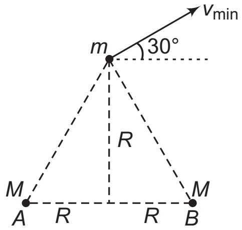


(d) None of these

12. A person brings a mass of 1 kg from infinity to a point A. Initially, the mass was at rest but it moves at a speed of 3 m/s as it reaches A. The work done by the person on the mass is – 5.5 J. The gravitational potential at A is

(a) – 1 J/kg (b) – 4.5 J/kg (c) – 5.5 J/kg (d) – 10 J/kg

13. With what minimum speed should m be projected from point C in presence of two fixed masses M each at A and B as shown in the figure such that mass m should escape the gravitational attraction of A and B?



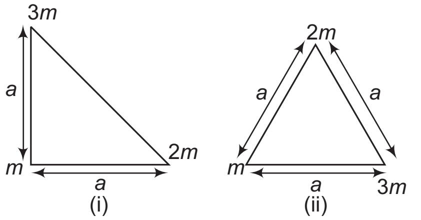
(a) $\sqrt{\frac{2GM}{R}}$

(b) $\sqrt{\frac{2\sqrt{2}GM}{R}}$

(c) $2\sqrt{\frac{GM}{R}}$

(d) $2\sqrt{2}\sqrt{\frac{GM}{R}}$

14. Consider two configurations of a system of three particles of masses m, $2m$ and $3m$. The work done by gravity in changing the configuration of the system from figure (i) to figure (ii) is



(i) (ii)

(a) zero (b) $\frac{6\,Gm^2}{a}\left\{1+\frac{1}{\sqrt{2}}\right\}$ (c) $\frac{6\,Gm^2}{a}\left\{1-\frac{1}{\sqrt{2}}\right\}$ (d) $\frac{6\,Gm^2}{a}\left\{2-\frac{1}{\sqrt{2}}\right\}$

15. A tunnel is dug along the diameter of the earth. There is a particle of mass m at the centre of the tunnel. Find the minimum velocity given to the particle so that is just reaches to the surface of the earth.(R = radius of earth)

(a) $\sqrt{\frac{GM}{R}}$

(b) $\sqrt{\frac{GM}{2R}}$

(c) $\sqrt{\frac{2GM}{R}}$

(d) it will reach with the help of negligible velocity

16. A body is projected horizontally from the surface of the Earth (radius = R) with a velocity equal to n times the escape velocity. Neglect rotational effects of the earth. The maximum height attained by the body from the earth's surface is $R/2$. Then, n must be

(a) $\sqrt{0.6}$ (b) $(\sqrt{3})/2$ (c) $\sqrt{0.4}$ (d) 1/2

17. A tunnel is dug in the earth across one of its diameter. Two masses m and $2m$ are dropped from the two ends of the tunnel. The masses collide and stick each other. They perform SHM, the amplitude of which is (R = radius of earth)

(a) R (b) $R/2$ (c) $R/3$ (d) $2R/3$

18. There are two planets. The ratio of radius of the two planets is k but ratio of acceleration due to gravity of both planets is g. What will be the ratio of their escape velocity?

(a) $(kg)^{1/2}$ (b) $(kg)^{-1/2}$ (c) $(kg)^2$ (d) $(kg)^{-2}$

19. A body of mass 2 kg is moving under the influence of a central force whose potential energy is given by $U = 2r^3$ J. If the body is moving in a circular orbit of 5 m, its energy will be

(a) 625 J (b) 250 J (c) 500 J (d) 125 J

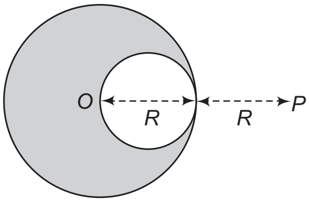
20. A research satellite of mass 200 kg circles the earth in an orbit of average radius $3R/2$, where R is the radius of the earth. Assuming the gravitational pull on the mass of 1 kg on the earth's surface to be 10 N, the pull on the satellite will be

(a) 1212 N (b) 889 N (c) 1280 N (d) 960 N

21. A satellite of mass m revolves around the earth of radius R at a height x from its surface. If g is the acceleration due to gravity on the surface of the earth, the orbital speed of the satellite is

(a) $\sqrt{gx}$ (b) $\sqrt{\dfrac{gR}{R-x}}$ (c) $\sqrt{\dfrac{gR^2}{R-x}}$ (d) $\sqrt{\dfrac{gR^2}{R+x}}$

22. A solid sphere of uniform density and radius R applies a gravitational force of attraction equal to F_1 on a particle placed at P, distance $2R$ from the centre O of the sphere. A spherical cavity of radius $R/2$ is now made in the sphere as shown in figure. The sphere with cavity now applies a gravitational force F_2 on same particle placed at P. The ratio F_2/F_1 will be



(a) 1/2 (b) 7/9
(c) 3 (d) 7

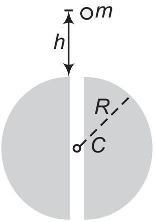
More than One Correct Options

1. Three planets of same density have radii R_1, R_2 and R_3 such that $R_1 = 2R_2 = 3R_3$. The gravitational field at their respective surfaces are g_1, g_2 and g_3 and escape velocities from their surfaces are v_1, v_2 and v_3, then

(a) $g_1/g_2 = 2$ (b) $g_1/g_3 = 3$
(c) $v_1/v_2 = 1/4$ (d) $v_1/v_3 = 3$

2. For a geostationary satellite orbiting around the earth identify the necessary condition.

(a) it must lie in the equatorial plane of earth
(b) its height from the surface of earth must be 36000 km
(c) it period of revolution must be $2\pi\sqrt{\dfrac{R}{g}}$, where R is the radius of earth
(d) its period of revolution must be 24 hrs



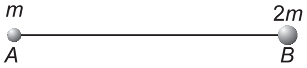
3. A ball of mass m is dropped from a height h equal to the radius of the earth above the tunnel dug through the earth as shown in the figure. Choose the correct options. (Mass of earth = M)

(a) Particle will oscillate through the earth to a height h on both sides

(b) Particle will execute simple harmonic motion

(c) Motion of the particle is periodic

(d) Particle passes the centre of earth with a speed $v = \sqrt{\frac{2GM}{R}}$



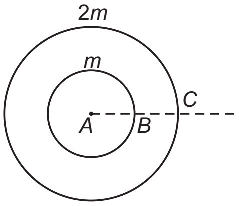
4. Two point masses m and $2m$ are kept at points A and B as shown. E represents magnitude of gravitational field strength and V the gravitational potential. As we move from A to B

(a) E will first decrease then increases

(b) E will first increase then decrease

(c) V will first decrease then increase

(d) V will first increase then decrease



5. Two spherical shells have masses m and $2m$ as shown. Choose the correct options.

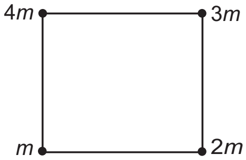
(a) Between A and B gravitational field strength is zero

(b) Between A and B gravitational potential is constant

(c) There will be two points one lying between B and C and other lying between C and infinity where gravitational field strength are same

(d) There will be a point between B and C where gravitational potential will be zero

6. Four point masses are placed at four corners of a square as shown. When positions of m and $2m$ are interchanged



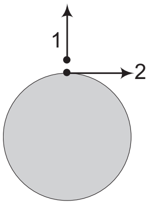
(a) gravitational field strength at centre will increase

(b) gravitational field strength at centre will decrease

(c) gravitational potential at centre will remain unchanged

(d) gravitational potential at centre will decrease

7. Two identical particles 1 and 2 are projected from surface of earth with same velocities in the directions shown in figure.



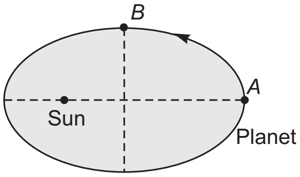
(a) Both the particles will stop momentarily (before striking with ground) at different times

(b) Particle-2 will rise upto lesser height compared to particle-2

(c) Minimum speed of particle-2 is more than that of particle-1

(d) Particle-1 will strike the ground earlier

8. A planet is moving round the sun in an elliptical orbit as shown. As the planet moves from A to B



(a) its kinetic energy will decrease
(b) its potential energy will remain unchanged
(c) its angular momentum about centre of sun will remain unchanged
(d) its speed is minimum at A

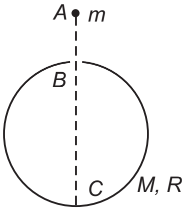
9. A satellite of mass m is just placed over the surface of earth. In this position mechanical energy of satellite is E_1. Now it starts orbiting round the earth in a circular path at height h = radius of earth. In this position, kinetic energy, potential energy and total mechanical energy of satellite are K_2, U_2 and E_2 respectively. Then

(a) $U_2 = \frac{E_1}{2}$ (b) $E_2 = \frac{E_1}{4}$ (c) $K_2 = -E_2$ (d) $K_2 = -\frac{U_2}{2}$

10. A satellite is revolving round the earth in circular orbit
(a) if mass of earth is made four times, keeping other factors constant, orbital speed of satellite will become two times
(b) corresponding to change in part (a), times period of satellite will remain half
(c) when value of G is made two times orbital speed increases and time period decreases
(d) G has no effect on orbital speed and time period

Match the Columns

1. There is a small hole in a spherical shell of mass M and radius R. A particle of mass m is dropped from point A as shown. Match the two columns for the situation shown in figure.



Column I	Column II
(a) Potential energy from A to B	(p) Continuously increases
(b) Potential energy from B to C	(q) Continuously decreases
(c) Speed of particle from B to C	(r) First increases then remains constant
(d) Acceleration of particle from A to C	(s) None of these

2. Five point masses m each are placed at five corners of a regular pentagon. Distance of any corner from centre is r. Match the following two columns.

Column I	Column II
(a) Gravitational field strength at centre	(p) Gm/r^2
(b) Gravitational potential at centre	(q) $4Gm/r$
(c) When one mass is removed gravitational field strength at centre	(r) zero
(d) When one mass is removed gravitational potential at centre	(s) None of these

3. | Potential | on the surface of a solid sphere is x and radius is y. Match the following two columns.

Column I	Column II
(a) Field strength at distance $2y$ from centre	(p) $\frac{x}{2y}$
(b) | Potential | at distance $\frac{y}{2}$ from centre	(q) $\frac{x}{2}$
(c) Field strength at distance $y/2$ from centre	(r) $\frac{x}{4y}$
(d) | Potential | at distance $2y$ from centre	(s) None

4. Match the following two columns.

Column I	Column II
(a) Work done is raising a mass m to a height $h = R$	(p) $\frac{1}{4} mgR$
(b) Kinetic energy of a satellite of mass m at height $h = R$	(q) mgR
(c) Difference in energies of two satellites each of mass m but one at height $h_1 = R$ and another of height $h_2 = 2R$	(r) $\frac{1}{2} mgR$
(d) Kinetic energy required to raise a particle of mass m to a height $h = R$ if projected vertically from surface of earth.	(s) None

5. Match the following two columns.

Column I	Column II
(a) Gravitational field strength is maximum at	(p) $r = 0$
(b) Gravitational field strength is zero at	(q) $r = R$
(c) Gravitational potential is minimum at	(r) $r = \frac{R}{\sqrt{2}}$
(d) Gravitational potential is zero at	(s) None of these

Here, r is distance from centre of a solid sphere or distance from centre of a ring along its axis.

Subjective Questions

1. Three particles of mass m each are placed at the three corners of an equilateral triangle of side a. Find the work which should be done on this system to increase the side of the triangle to $2a$.

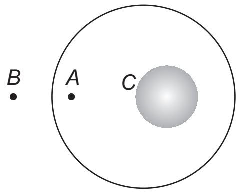
2. A man can jump vertically to a height of 1.5 m on the earth. Calculate the radius of a planet of the same mean density as that of the earth from whose gravitational field he could escape by jumping. Radius of earth is 6.41×10^6 m.

3. An artificial satellite is moving in a circular orbit around the earth with a speed equal to half the magnitude of escape velocity from the surface of earth. (Radius of earth = 6400 km)

(a) Determine the height of the satellite above the earth's surface.

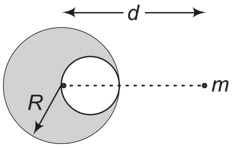
(b) If the satellite is stopped suddenly in its orbit and allowed to fall freely on the earth, find the speed with which it hits the surface of earth.

4. A uniform metal sphere of radius R and mass m is surrounded by a thin uniform spherical shell of same mass and radius $4R$. The centre of the shell C falls on the surface of the inner sphere. Find the gravitational fields at points A and B.

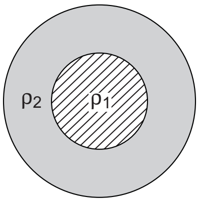


$AC = 3R, \quad BC = 5R$

5. Figure shows a spherical cavity inside a lead sphere. The surface of the cavity passes through the centre of the sphere and touches the right side of the sphere. The mass of the sphere before hollowing was M. With what gravitational force does the hollowed out lead sphere attract a particle of mass m that lies at a distance d from the centre of the lead sphere on the straight line connecting the centres of the spheres and of the cavity.



6. The density of the core of a planet is ρ_1 and that of the outer shell is ρ_2, the radii of the core and that of the planet are R and $2R$ respectively. The acceleration due to gravity at the surface of the planet is same as at a depth R. Find the ratio of $\frac{\rho_1}{\rho_2}$.



7. If a satellite is revolving around a planet of mass M in an elliptical orbit of semi-major axis a. Show that the orbital speed of the satellite when it is at a distance r from the focus will be given by

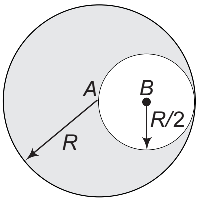
$$v^2 = GM\left[\frac{2}{r} - \frac{1}{a}\right]$$

8. A uniform ring of mass m and radius a is placed directly above a uniform sphere of mass M and of equal radius. The centre of the ring is at a distance $\sqrt{3}a$ from the centre of the sphere. Find the gravitational force exerted by the sphere on the ring.

9. Distance between the centres of two stars is $10a$. The masses of these stars are M and $16M$ and their radii a and $2a$ respectively. A body of mass m is fired straight from the surface of the larger star towards the smaller star. What should be its minimum initial speed to reach the surface of the smaller star? Obtain the expression in terms of G, M and a.

10. A smooth tunnel is dug along the radius of earth that ends at centre. A ball is released from the surface of earth along tunnel. Coefficient of restitution for collision between soil at centre and ball is 0.5. Calculate the distance travelled by ball just before second collision at centre. Given mass of the earth is M and radius of the earth is R.

11. Inside a fixed sphere of radius R and uniform density ρ, there is spherical cavity of radius $\frac{R}{2}$ such that surface of the cavity passes through the centre of the sphere as shown in figure. A particle of mass m_0 is released from rest at centre B of the cavity. Calculate velocity with which particle strikes the centre A of the sphere. Neglect earth's gravity. Initially sphere and particle are at rest.

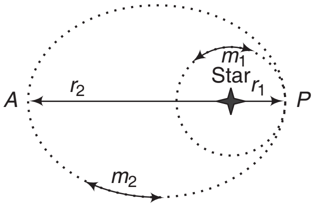


12. A ring of radius $R = 4$ m is made of a highly dense material. Mass of the ring is $m_1 = 5.4 \times 10^9$ kg distributed uniformly over its circumference. A highly dense particle of mass $m_2 = 6 \times 10^8$ kg is placed on the axis of the ring at a distance $x_0 = 3$ m from the centre. Neglecting all other forces, except mutual gravitational interaction of the two. Calculate

(i) displacement of the ring when particle is at the centre of ring, and

(ii) speed of the particle at that instant.

13. Two planets of equal mass orbit a much more massive star (figure). Planet m_1 moves in a circular orbit of radius 1×10^8 km with period 2 yr. Planet m_2 moves in an elliptical orbit with closest distance $r_1 = 1 \times 10^8$ km and farthest distance $r_2 = 1.8 \times 10^8$ km, as shown.



(a) Using the fact that the mean radius of an elliptical orbit is the length of the semi-major axis, find the period of m_2's orbit.

(b) Which planet has the greater speed at point P ? Which has the greater total energy ?

(c) Compare the speed of planet m_2 at P with that at A.

14. In a double star, two stars one of mass m_1 and another of mass m_2, with a separation d, rotate about their common centre of mass. Find

(a) an expression for their time period of revolution.

(b) the ratio of their kinetic energies.

(c) the ratio of their angular momenta about the centre of mass.

(d) the total angular momentum of the system.

(e) the kinetic energy of the system.

Simple Harmonic Motion

Chapter Contents

14.1 Introduction
14.2 Displacement Equation of SHM
14.3 Time Equation of SHM
14.4 Relation between SHM and Uniform Circular Motion
14.5 Methods of Finding Time Period of a SHM
14.6 Vector Method of Combining Two or More SHM

14.1 Introduction

Following are given some general points regarding motion, periodic motion and simple harmonic motion (SHM):

1. In general, motion of a body (or its path) depends on two factors:
   (i) the nature of force (or acceleration) of the body and
   (ii) its velocity

   For example

   A constant force or constant acceleration always gives a straight line or parabolic path. If initial velocity is zero or parallel (or antiparallel) to constant acceleration then path is straight line. In all other cases, path is a parabola. For small height, acceleration due to gravity $(\mathbf{a}=\mathbf{g})$ is constant. So, path is either straight line or parabola.

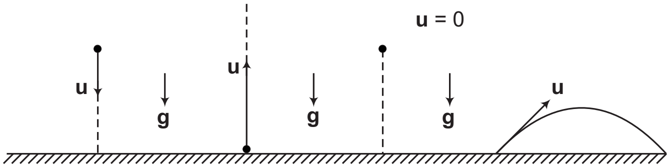

Fig. 14.1

   If force of constant magnitude is acting on a particle and its direction is always perpendicular to velocity, then path is circular motion in which speed is constant. This is also called uniform circular motion.

$$|\mathbf{F}_1|=|\mathbf{F}_2|=|\mathbf{F}_3|=|\mathbf{F}_4|=\frac{mv^2}{R}=\text{centripetal force}$$

$$|\mathbf{v}_1|=|\mathbf{v}_2|=|\mathbf{v}_3|=|\mathbf{v}_4|=v=\text{speed of the particle.}$$

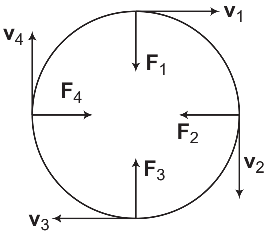

Fig. 14.2

   Now let us consider a particle free to move along x-axis, which is being acted upon by a force given by,

$$F=-kx^n$$

   Here, k is a positive constant.

   Now, following cases are possible depending on the value of n :
   (i) If n is an even integer (0, 2, 4, … etc), force is always along negative x-axis. If the particle is released from any position on the x-axis (except at $x=0$) a force in negative direction of x-axis acts on it and it moves rectilinearly along negative x-axis.
   (ii) If n is an odd integer (1, 3, 5, … etc), force is along negative x-axis for $x>0$, along positive x-axis for $x<0$ and zero for $x=0$. Thus, the particle will oscillate about stable equilibrium position (also called the mean position), $x=0$. The force in this case is called the restoring force. Of these, if $n=1$, i.e. $F=-kx$ the motion is said to be SHM.
2. In every oscillatory motion, there is one mean position (or stable equilibrium position) and two extreme positions.
3. Distance between mean position and the extreme position is called amplitude of oscillation A.

4. Oscillations does not start by itself. Normally the body has to be displaced from the mean position. In this displacement $F=-kx$ type force opposes the motion. So, work has to be done against this force which remains stored in the system in the form of mechanical energy. In the absence of any dissipative forces (like friction or viscous force) this mechanical energy remains constant. While moving from extreme positions to mean position potential energy decreases and kinetic energy increases but total mechanical energy remains constant. Similarly, in moving from mean position to extreme positions potential energy increases and kinetic energy decreases.
5. The more the initial displacement from the mean position, more is the amplitude, more is the initial work done and more is the mechanical energy given for oscillations.
6. Like any other motion, SHM is also a motion. So, basic characteristics of any motion (like $\mathbf{v}=\frac{d\mathbf{s}}{dt}$, $\mathbf{a}=\frac{d\mathbf{v}}{dt}$ etc.) can also be applied to SHM.
7. In most of the motions, displacement of the particle is measured from the starting point ($t=0$). But in SHM displacement is normally measured from the mean position and it is denoted by x (or y).
8. **At mean position**, $x=0$, $F=0$, $a=0$

   $v=$ maximum, kinetic energy $=$ maximum and potential energy is minimum (not necessarily zero)

   At extreme positions, $x=\pm A$, $F=$ maximum, $a=$ maximum, kinetic energy $=0$ and potential energy $=$ maximum.
9. SHM is called simple harmonic motion because its mathematics is simple. Mathematics of periodic motion of higher powers ($n=3, 5, 7$ etc in $F=-kx^n$) is slightly complex. This is the reason, we study only simple harmonic oscillatory motion at this stage.
10. In SHM, we shall discuss $x, A, v, a, F, K, U, E, T, f$ and ω. Here,

    $x=$ displacement from the mean position
    $A=$ amplitude of oscillations
    $v=$ velocity (or speed)
    $a=$ acceleration
    $F=$ force
    $K=$ kinetic energy
    $U=$ potential energy
    $E=$ total mechanical energy
    $T=$ time period of oscillations
    $f=$ frequency of oscillations and
    $\omega=$ angular frequency of oscillations.
11. SHM may be linear or angular. For example, motion of a pendulum for small amplitudes is angular SHM and motion of spring block system is linear SHM.
12. Like any other motion, equations of SHM can be written in terms of its displacement ($v^2=u^2+2as$) or time ($v=u+at$). The only difference is, in most of the equations of SHM 'x' is measured from the mean position.

14.2 Displacement Equations of SHM

In most of the equations of SHM displacement will be represented by x, where $x =$ displacement from the mean position.

Force Equation As we have discussed earlier also,

$$\boxed{F = -Kx}$$

is the force required for a particle to execute SHM. This type of force is obtained when a block is attached with a spring. Therefore, motion of block with a spring is always SHM.

Following are given some important points in this equation :

(i) x varies between $+A$ and $-A$

(ii) F - x graph is a straight line passing through $x = 0$ or the mean position (not necessarily the origin)

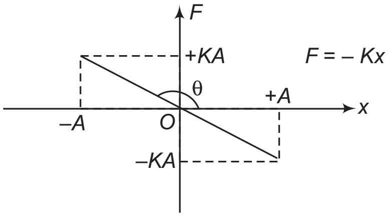

Fig. 14.3

At $x = \pm A$, $F = \mp KA$

(iii) $F = 0$ at $x = 0$ or at the mean position

(iv) $|F|_{\max} = KA$ at $x = \pm A$ or at the extreme positions.

(v) $F \propto -x$

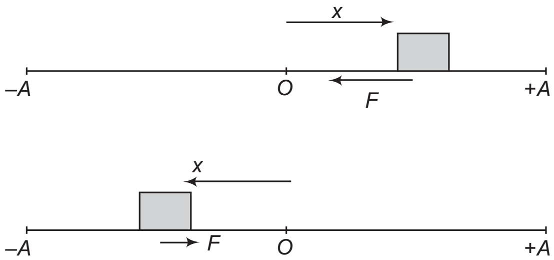

Fig. 14.4

Here, negative sign implies that direction of F and x are always opposite or direction of force is always towards the mean position. Hence, it is always restoring in nature.

Further, magnitude of force is proportional to magnitude of x. It means magnitude of force varies linearly with magnitude of x. If magnitude of x is doubled then magnitude of force will also become two times.

(vi) $\tan\theta =$ slope of F - x graph $= -K$

Acceleration Equation

$$\boxed{a=\frac{F}{m}=-\frac{K}{m}x=-\omega^2 x}$$

Here, $$\boxed{\omega^2=\frac{K}{m} \text{ or } \omega=\sqrt{\frac{K}{m}}}$$

Following are given some important points in above two equations:

(i) $\omega=\sqrt{\frac{K}{m}}$ is called angular frequency of SHM. Later we will see that most of the equations of SHM can be derived from uniform circular motion. Angular frequency of SHM is similar to angular speed ω of uniform circular motion. At both places we can find time period T and frequency f from ω.

$$\omega=\sqrt{\frac{K}{m}}=\frac{2\pi}{T}$$

$$\therefore \qquad \boxed{T=2\pi\sqrt{\frac{m}{K}}} \qquad \text{(in SHM)}$$

(ii) a - x graph is a straight line passing through $x=0$ or the mean position.

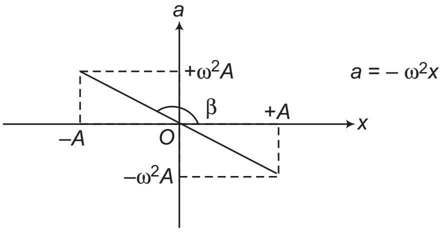

Fig. 14.5

$$\tan\beta=\text{Slope}=-\omega^2 \quad \Rightarrow \quad \text{At } x=\pm A,\ a=\mp\omega^2 A$$

(iii) $a=0$ at $x=0$, or at the mean position.

(iv) $|a|_{\max}=\omega^2 A$ at $x=\pm A$ or at extreme positions.

(v) $a \propto -x$

So, direction of 'a' is always opposite to the direction of x

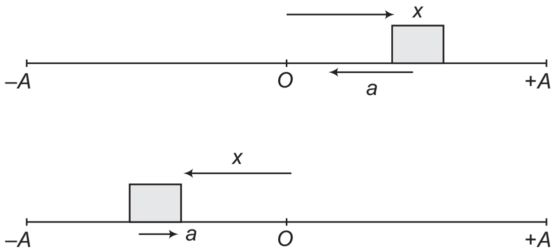

Fig. 14.6

or acceleration is always towards the mean position. Further, magnitude of 'a' is directly proportional to (linear variation) magnitude of 'x'.

Velocity Equation v - x graph in SHM is given by

$$\boxed{v=\pm\omega\sqrt{A^2-x^2}}$$

Note *We will derive this v-x equation in example* 14.7.

Following are given some important points in this equation:

(i) The given equation can be written as

$$\frac{v^2}{\omega^2}+\frac{x^2}{(1)^2}=A^2$$

Therefore, v - x graph is an ellipse as shown below.

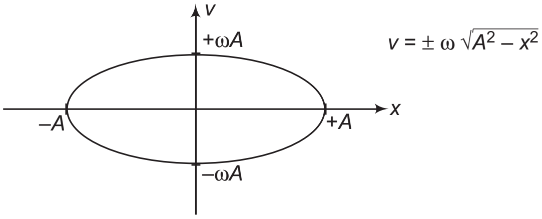

Fig. 14.7

(ii) $v=0$ at $x=\pm A$ or at extreme positions.

(iii) $v=\pm\omega A$ or $|v|_{\max}=\omega A$ at $x=0$, or at the mean position.

(iv) For upper half of the ellipse velocity is positive (when the body is moving from $-A$ to $+A$). For lower half of the ellipse velocity is negative (when the body is moving from $+A$ to $-A$).

(v) At mean position (or $x=0$), velocity is $+\omega A$ when the body is moving towards $+A$ and velocity is $-\omega A$ when the body is moving towards $-A$.

Energy Equations

Total Mechanical Energy

As we have discussed earlier also, at mean position potential energy is minimum (say U_0). This minimum potential energy U_0 may be zero, positive or negative. If not given in the question then we will take is zero. Now, suppose W is the work done in displacing the body from $x=0$ to $x=A$. Then, total mechanical energy is now $E=W+U_0$. Let us start with an example of spring-block system kept at height h, so that the block has already a potential energy, $U_0=mgh$ at mean position or natural length of spring where $F=0$.

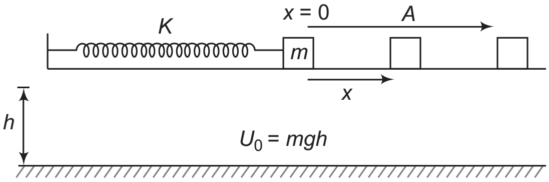

Fig. 14.8

Now, the block is displaced upto $x=A$. Work done (by external agent) in this displacement (against the spring force $-kx$) is $W=\frac{1}{2}KA^2$.

∴ Total mechanical energy $E = U_0 + W$

or $$\boxed{E = U_0 + \frac{1}{2}KA^2 = U_0 + \frac{1}{2}m\omega^2 A^2} \qquad \left(\text{as } \omega^2 = \frac{K}{m} \text{ or } K = m\omega^2\right)$$

Note *(i) In the above discussion, U_0 is positive as the spring block system is kept at some height. This value will be zero if the system is kept on ground. In some cases, it may be negative also.*

(ii) In the absence of any dissipative forces, this total mechanical energy remains constant at every point between +A and –A.

At extreme positions, kinetic energy is zero. So, total mechanical energy is in the form of potential energy.

$$E = U = U_0 + \frac{1}{2}KA^2$$

or $$U_0 + \frac{1}{2}m\omega^2 A^2$$

At mean position, potential energy is minimum or U_0 and the kinetic energy is $\frac{1}{2}KA^2$ or $\frac{1}{2}m\omega^2 A^2$.

Thus, U_0 is present at every point. This is initial work done $W\left(= \frac{1}{2}KA^2 \text{ or } \frac{1}{2}m\omega^2 A^2\right)$

which changes between potential and kinetic energies. This is also called energy of oscillation. At mean position, it completely converts into kinetic energy and at extreme positions it converts into potential energy.

Potential Energy From Fig. 14.8, we can see that, at a general displacement x (from the mean position) the potential energy is

$$U = U_0 + \text{Spring potential energy} \quad \text{or} \quad \boxed{U = U_0 + \frac{1}{2}Kx^2 = U_0 + \frac{1}{2}m\omega^2 x^2}$$

Kinetic Energy Here, let us call it T as we are using K for spring constant of spring.

At a general displacement x,

$$T = E - U$$

$$= \left(U_0 + \frac{1}{2}KA^2\right) - \left(U_0 + \frac{1}{2}Kx^2\right)$$

∴ $$T = \frac{1}{2}K(A^2 - x^2) = \frac{1}{2}m\omega^2 (A^2 - x^2)$$

Note *At some places kinetic energy may be represented by K and force constant by k.*

Alternate Method

$$T = \frac{1}{2}mv^2 = \frac{1}{2}m[\pm \omega\sqrt{A^2 - x^2}]$$

$$= \frac{1}{2}m\omega^2 (A^2 - x^2)$$

Graphs The three equations of total mechanical energy, potential energy and kinetic energy are

$$E = U_0 + \frac{1}{2} K A^2 = U_0 + \frac{1}{2} m\omega^2 A^2$$

$$U = U_0 + \frac{1}{2} K x^2 = U_0 + \frac{1}{2} m\omega^2 x^2$$

$$T = \frac{1}{2} K (A^2 - x^2) = \frac{1}{2} m\omega^2 (A^2 - x^2)$$

E is a constant function. U - x and T - x graphs are parabolas as shown in the Fig.14.9.

At mean position ($x = 0$)

$$E = U_0 + \frac{1}{2} KA^2$$

$$U = U_0 = \text{minimum value and}$$

$$T = \frac{1}{2} KA^2 = \text{maximum value.}$$

At extreme positions ($x = \pm A$)

$$E = U_0 + \frac{1}{2} KA^2$$

$$U = U_0 + \frac{1}{2} KA^2 = \text{maximum value}$$

and $T = 0$

The three graphs are as shown in figure.

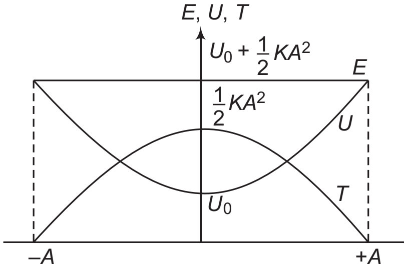

Fig. 14.9

Example 14.1 *Describe the motion of a particle acted upon by a force*

(i) $F = -2(x - 2)^3$

(ii) $F = -2(x - 2)^2$

(iii) $F = -2(x - 2)$

Solution (i) $F = -2(x - 2)^3$

$$F = 0 \quad \text{at} \quad x = 2$$

Force is along negative x-direction for $x > 2$ and it is along positive x-direction for $x < 2$. Thus, the motion of the particle is oscillatory (but not simple harmonic) about $x = 2$.

(ii) $F = 0$ for $x = 2$, but force is always along negative x-direction for any value of x except at $x = 2$. Thus, the motion of the particle is rectilinear along negative x-direction provided it is not kept at rest at $x = 2$.

(iii) Let, us take $x - 2 = X$, then the given force can be written as,

$$F = -2X$$

This is the equation of SHM. Hence, the particle oscillates simple harmonically about $X = 0$ or $x = 2$.

Example 14.2 *Maximum acceleration of a particle in SHM is 16 cm/s^2 and maximum velocity is 8 cm/s. Find time period and amplitude of oscillations.*

Solution

$$a_{\max} = \omega^2 A = 16\,\text{cm/s} \qquad \ldots\text{(i)}$$

$$u_{\max} = \omega A = 8\,\text{cm/s} \qquad \ldots\text{(ii)}$$

Solving Eqs. (i) and (ii), we get

$$A = 4\,\text{cm} \qquad \textbf{Ans.}$$

and

$$\omega = 2\,\text{rad/s}$$

Now,

$$T = \frac{2\pi}{\omega} = \frac{2\pi}{2} = (\pi)\,\text{s}$$

or

$$T \approx 3.14\,\text{s} \qquad \textbf{Ans.}$$

Example 14.3 *F - x equation of a body in SHM is*

$$F + 4x = 0$$

Here, F is in newton and x in metre. Mass of the body is 1 kg. Find time period of oscillations.

Solution The given equation can be written as

$$F = -4x$$

Comparing this equation with the standard equation of SHM or

$$F = -Kx$$

we get

$$K = 4\,\text{N/m}$$

Now,

$$T = 2\pi\sqrt{\frac{m}{K}}$$

$$= 2\pi\sqrt{\frac{1}{4}} = (\pi)\text{s} \qquad \textbf{Ans.}$$

Example 14.4 *A linear harmonic oscillator has a total mechanical energy of* 200 *J. Potential energy of it at mean position is* 50 *J. Find*

(i) the maximum kinetic energy,
(ii) the minimum potential energy,
(iii) the potential energy at extreme positions.

Solution At mean position, potential energy is minimum and kinetic energy is maximum. Hence,

$$U_{\min} = 50\,\text{J} \qquad \text{(at mean position)}$$

and

$$K_{\max} = E - U_{\min} = 200 - 50$$

$$= 150\,\text{J} \qquad \text{(at mean position)}$$

At extreme positions kinetic energy is zero and potential energy is maximum

∴

$$U_{\max} = E$$

$$= 200\,\text{J} \qquad \text{(at extreme position)}$$

Example 14.5 *A particle executes SHM.*

(a) What fraction of total energy is kinetic and what fraction is potential when displacement is one half of the amplitude?

(b) At what value of displacement are the kinetic and potential energies equal?

Solution Here, let us take minimum potential energy at mean position

$$U_0 = 0$$

We know that $E_{\text{total}} = \frac{1}{2} m\omega^2 A^2$

$$\text{KE} = \frac{1}{2} m\omega^2 (A^2 - x^2) \quad \text{and} \quad U = \frac{1}{2} m\omega^2 x^2$$

(a) When $x = \frac{A}{2}$

$$\text{KE} = \frac{1}{2} m\omega^2 \left(\frac{3A^2}{4}\right)$$

$\Rightarrow$ $\frac{\text{KE}}{E_{\text{total}}} = \frac{3}{4}$ **Ans.**

At $x = \frac{A}{2}$, $U = \frac{1}{2} m\omega^2 \left(\frac{A^2}{4}\right)$

$\Rightarrow$ $\frac{\text{PE}}{E_{\text{total}}} = \frac{1}{4}$ **Ans.**

(b) Since, $K = U$

$$\frac{1}{2} m\omega^2 (A^2 - x^2) = \frac{1}{2} m\omega^2 x^2$$

or $2x^2 = A^2$ or $x = \frac{A}{\sqrt{2}} = 0.707A$ **Ans.**

Example 14.6 *The potential energy of a particle oscillating along x-axis is given as*

$$U = 20 + (x - 2)^2$$

Here, U is in joules and x in metres. Total mechanical energy of the particle is 36 J.

(a) State whether the motion of the particle is simple harmonic or not.

(b) Find the mean position.

(c) Find the maximum kinetic energy of the particle.

Solution (a) $F = -\frac{dU}{dx} = -2(x - 2)$

By assuming $x - 2 = X$, we have $F = -2X$

Since, $F \propto -X$

The motion of the particle is simple harmonic.

(b) The mean position of the particle is $X = 0$ or $x - 2 = 0$, which gives $x = 2$ m.

(c) Maximum kinetic energy of the particle is,

$$K_{\max} = E - U_{\min} = 36 - 20 = 16 \text{ J}$$

Note *$U_{\min}$ is 20 J at mean position or at $x = 2$ m.*

INTRODUCTORY EXERCISE 14.1

1. a - x equation of a particle in SHM is $a + 4x = 0$

   Here, a is in cm/s^2 and x in cm. Find time period in seconds.

2. At $x = \frac{A}{4}$, what fraction of the mechanical energy is potential? What fraction is kinetic? Assume potential energy to be zero at mean position.

3. A cart of mass 2.00 kg is attached to the end of a horizontal spring with force constant $k = 150$ N/m. The cart is displaced 15.0 cm from its equilibrium position and released. What are (a) the amplitude (b) the period (c) the frequency (d) the mechanical energy (e) the maximum velocity of the cart? Neglect friction.

4. A 0.5 kg body performs simple harmonic motion with a frequency of 2 Hz and an amplitude of 8 mm. Find the maximum velocity of the body, its maximum acceleration and the maximum restoring force to which the body is subjected.

5. Can we use the equation $v = u + at$ in SHM or not ?

14.3 Time Equations of SHM

In one dimensional motion, if acceleration as a function of time is given, then by integrating a - t equation we can make v - t equation. By further integrating v - t equation we can make s - t or x - t equation.

Meaning of General Solution

In one dimensional motion, if $a =$ constant then general solution of v - t equation is (which can be obtained by integrating a - t equation)

$$v = u + at$$

In this equation, u and a are constants but v and t are variables. In different problems, values of these constants u and a are different but basic nature of all v - t equations are same. Here, the basic nature is linear equation in v and t or straight line graph between v and t.

Standard Differential Equation of SHM

In article 14.2, we have seen that a - x equation of SHM is

$$a = -\omega^2 x$$

This equation can also be written as

$$\boxed{\frac{d^2x}{dt^2} = -\omega^2 x} \qquad \ldots\text{(i)}$$

This is standard second order differential equation of SHM. Solving this differential equation we can find x - t equation. But normally we do not solve a differential equation in physics at this stage. So, we can directly write general solution of Eq. (i). The general solution of Eq. (i) is

$$x = A\sin(\omega t \pm \phi) \quad \text{or} \quad x = A\cos(\omega t \pm \phi)$$

In these equations x and t are variables. But A, ω and ϕ are constants. In different problems, values of these constants are different but basic nature of all equations will be same. Here, the basic nature is sinusoidal (sine or cosine) x - t equation and x - t graph.

By differentiating x - t equation we can also make other equations. For example, if

$$x = A\sin(\omega t \pm \phi)$$

Then
$$v = \frac{dx}{dt} = \omega A\cos(\omega t \pm \phi)$$

and,
$$a = \frac{dv}{dt} = -\omega^2 A\sin(\omega t \pm \phi) = -\omega^2 x \qquad [\text{as } A\sin(\omega t \pm \phi) = x]$$

Time Period (T) and Frequency (f)

In the above equations, time period of oscillations is

$$T = \frac{2\pi}{\omega}$$

and frequency of oscillation is

$$f = \frac{1}{T} = \frac{\omega}{2\pi}$$

Phase Angle at Time t

In any trigonometric function its angle is very important. The value of function varies with this angle. For example, suppose we have a trigonometric function.

$$y = \sin\theta \text{ then, } y = 0 \text{ for } \theta = 0°, \; y = \frac{1}{2} \text{ for } \theta = 30°$$

So, value of y depends on the angle θ. This angle is called the phase angle. In x - t, v - t and a - t equations of SHM we have seen above that the phase angle is same, $(\omega t \pm \phi)$. This may be called the phase angle of x - t, v - t and a - t equations at time t. With the help of this angle values of x, v and a can be obtained at any time t. Here, x varies between $+A$ and $-A$, v varies between $+\omega A$ and $-\omega A$ and a varies between $+\omega^2 A$ and $-\omega^2 A$. If $(\omega t \pm \phi)$ is 30° at some instant, then according to above equations values of x, v and a are $+\frac{A}{2}$, $+\frac{\sqrt{3}\,\omega A}{2}$ and $-\frac{\omega^2 A}{2}$.

This condition is shown in following figure:

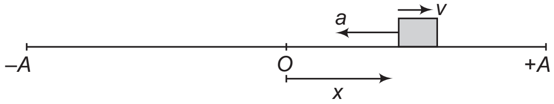

Fig. 14.10

$$x = +\frac{A}{2}, \; v = \frac{+\sqrt{3}\,\omega A}{2} \text{ and } a = \frac{-\omega^2 A}{2}$$

Initial Phase Angle

In the phase angle $\omega t \pm \phi$ if we substitute $t = 0$, then the angle is $\pm\phi$. This is called initial phase angle. With the help of initial phase angle we can determine initial values of x, v and a.

Dependence of Initial Phase Angle

Initial phase angle depends on following three factors :

(i) Whether we write sine equation or cosine equation.

(ii) Initial value of x (at $t = 0$)

(iii) Initial direction of velocity.

For example, in first figure the body starts

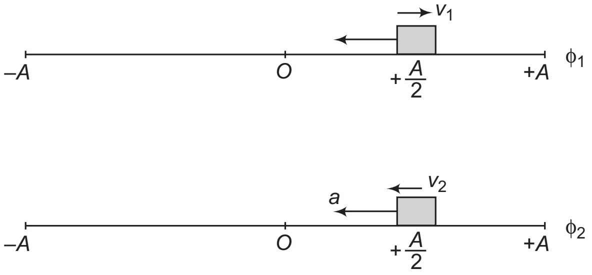

Fig. 14.11

($t = 0$, $u \neq 0$) from $x = +\frac{A}{2}$ with velocity $v_1 = \frac{\sqrt{3}\,\omega A}{2}$ and the initial phase angle is suppose ϕ_1 (corresponding to sine equation)

In second figure, body starts from the same point $x = +\frac{A}{2}$ but direction of velocity is opposite or $v_2 = -\frac{\sqrt{3}\,\omega A}{2}$ and the initial phase angle is suppose ϕ_2 (corresponding to sine equation). Then

$$\phi_1 \neq \phi_2$$

Similarly, if we wish to write cosine equations and their initial phase angles are suppose ϕ_1' and ϕ_2', then $\phi_1 \neq \phi_1'$ and $\phi_2 \neq \phi_2'$

Four Frequently used x - t Equations

Between $+A$ and $-A$ there may be infinite number of points from where the body may start its journey ($t = 0$ but u is zero only if, it starts from $+A$ or $-A$).

Further at every point (except at $+A$ and $-A$) two directions (positive x or negative x) of initial velocity can exist. So, infinite number of initial phase angles are possible or infinite number of x - t equations can be written. But following four initial conditions ($t = 0$) and corresponding four x - t equations are frequently used.

Table 14.1

Initial Conditions at $t=0$	x - t equation	x - t graph
	$x = A\sin\omega t$		$x = -A\sin\omega t$		$x = A\cos\omega t$		$x = -A\cos\omega t$	
Six Time Equations of SHM and their Graphs

Six time equations in SHM are x - t, v - t, a - t, E - t, U - t and T - t ($T =$ kinetic energy). If one equation is given other five equations can be made. Let us start with x - t equation :

$$\boxed{x = A\sin\omega t} \qquad \ldots\text{(i)}$$

According to this equation the body starts from mean positive, moving towards positive x-direction with initial velocity, $u = +\omega A$.

Now,
$$v = \frac{dx}{dt} = \frac{d}{dt}(A\sin\omega t) = \omega A\cos\omega t$$

or
$$\boxed{v = \omega A\cos\omega t} \qquad \ldots\text{(ii)}$$

$$a = \frac{dv}{dt} = \frac{d}{dt}(\omega A\cos\omega t) = -\omega^2 A\sin\omega t$$

or
$$\boxed{a = -\omega^2 A\sin\omega t} \qquad \ldots\text{(iii)}$$

$$\boxed{E = U_0 + \frac{1}{2}KA^2 = U_0 + \frac{1}{2}m\omega^2 A^2} \qquad \ldots\text{(iv)}$$

$$U = U_0 + \frac{1}{2}Kx^2 = U_0 + \frac{1}{2}KA^2 \sin^2 \omega t$$

$$= U_0 + \frac{1}{2}m\omega^2 A^2 \sin^2 \omega t$$

or $$\boxed{U = U_0 + \frac{1}{2}KA^2 \sin^2 \omega t = U_0 + \frac{1}{2}m\omega^2 A^2 \sin^2 \omega t} \quad \ldots\text{(v)}$$

$$T = \frac{1}{2}mv^2 = \frac{1}{2}m(\omega A \cos \omega t)^2$$

$$= \frac{1}{2}m\omega^2 A^2 \cos^2 \omega t = \frac{1}{2}KA^2 \cos^2 \omega t$$

or $$\boxed{T \text{ or KE} = \frac{1}{2}KA^2 \cos^2 \omega t = \frac{1}{2}m\omega^2 A^2 \cos^2 \omega t} \quad \ldots\text{(vi)}$$

From the above six equations, we can draw following conclusions :

(i) $x - t$, $v - t$ and $a - t$ are sine or cosine functions of same ω. So, x, v and a oscillate sinusoidally with same time period $T = \frac{2\pi}{\omega}$.

(ii) U - t and T - t are $\sin^2$ and $\cos^2$ functions of time. But oscillation frequency of $\sin^2$ or $\cos^2$ functions is double of the oscillation frequency of sine and cosine functions. So, U and T oscillate with double the frequency of oscillations of x, v and a.

Minimum value of U is U_0 and maximum value of U is $U_0 + \frac{1}{2}KA^2$ or $U_0 + \frac{1}{2}m\omega^2 A^2$. Therefore, U oscillates between U_0 and $U_0 + \frac{1}{2}KA^2$. Similarly, minimum value of T is zero and the maximum value is $\frac{1}{2}KA^2$ or $\frac{1}{2}m\omega^2 A^2$.

Hence, T oscillates between 0 and $\frac{1}{2}KA^2$.

(iii) E does not oscillate because it is constant.

(iv) At $t = 0$

$x = 0$ (starts from mean position)
$v = \omega A$ (maximum velocity)
$a = 0$
$E = U_0 + \frac{1}{2}KA^2$
$U = U_0$ (minimum value)

and T or KE $= \frac{1}{2}KA^2$

or $\frac{1}{2}m\omega^2 A^2$ (maximum value)

(v) Average value of $\cos^2$ function in one time period is $\frac{1}{2}$. Therefore, from Eq. (vi) we can see that maximum value of kinetic energy is $\frac{1}{2}KA^2$ or $\frac{1}{2}m\omega^2\ A^2$. But average value of kinetic energy in one time period is $\frac{1}{4}KA^2$ or $\frac{1}{4}m\omega^2 A^2$.

(vi) The six graphs are as shown below.

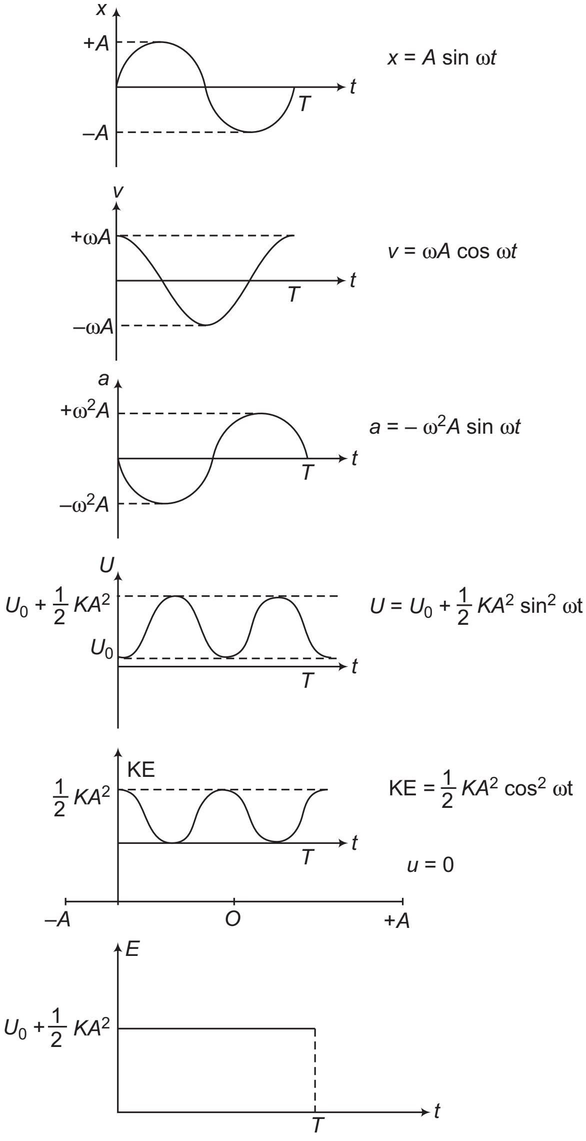

Fig. 14.12

In the first five graphs we can see that in time $T(=2\pi/\omega)$: x, v and a oscillate once but U and KE oscillate twice.

Note *(i) If the first equation, $x = A\sin\omega t$ is changed then other five equations (and their graphs also) will change. But the basic nature will remain same. Here the basic nature is that x, v and a oscillate sinusoidally with same time period and frequency. E does not oscillate. U and KE oscillate with double frequency.*

(ii) Phase difference between x - t and v - t equations or between v - t and a - t equations is $\frac{\pi}{2}$ or 90°. Phase difference between x - t and a - t equations is π or 180°.

List of Formulae of Articles 14.2 and 14.3 (with $U_0 = 0$)

Table 14.2

S.No.	Name of the equation	Expression of the equation	Remarks
1.	Displacement-time	$x = A\cos(\omega t + \phi)$	x varies between $+A$ and $-A$
2.	Velocity - time $\left(v = \frac{dx}{dt}\right)$	$v = -A\omega\sin(\omega t + \phi)$	v varies between $+A\omega$ and $-A\omega$
3.	Acceleration - time $\left(a = \frac{dv}{dt}\right)$	$a = -A\omega^2\cos(\omega t + \phi)$	a varies between $+A\omega^2$ and $-A\omega^2$
4.	Kinetic energy - time $\left(\text{KE} = \frac{1}{2}mv^2\right)$	$\text{KE} = \frac{1}{2}mA^2\omega^2\sin^2(\omega t + \phi)$	KE varies between 0 and $\frac{1}{2}mA^2\omega^2$
5.	Potential energy - time $\left(U = \frac{1}{2}m\omega^2x^2\right)$	$\text{KE} = \frac{1}{2}m\omega^2A^2\cos^2(\omega t + \phi)$	U varies between $\frac{1}{2}mA^2\omega^2$ and 0
6.	Total energy - time ($E = \text{KE} + U$)	$E = \frac{1}{2}m\omega^2A^2$	E is constant
7.	Velocity - displacement	$v = \pm\omega\sqrt{A^2 - x^2}$	$v = 0$ at $x = \pm A$ and at $x = 0$ $v = \pm A\omega$
8.	Acceleration - displacement	$a = -\omega^2x$	$a = 0$ at $x = 0$ $a = \pm\omega^2A$ at $x = \mp A$
9.	Kinetic energy - displacement	$\text{KE} = \frac{1}{2}m\omega^2(A^2 - x^2)$	$\text{KE} = 0$ at $x = \pm A$, $\text{KE} = \frac{1}{2}m\omega^2A^2$ at $x = 0$
10.	Potential energy - displacement	$U = \frac{1}{2}m\omega^2x^2$	$U = 0$ at $x = 0$, $U = \frac{1}{2}m\omega^2A^2$ at $x = \pm A$
11.	Total energy - displacement	$E = \frac{1}{2}m\omega^2A^2$	E is constant

Example 14.7 *From the time equations of SHM, prove the relation,*

$$v \pm \omega\sqrt{A^2 - x^2}$$

Solution Let, $x = A\sin\omega t$

Then,
$$\sin\omega t = \frac{x}{A}$$

Now,
$$v = \frac{dx}{dt} = \omega A\cos\omega t$$
$$= \omega A\sqrt{1 - \sin^2\omega t}$$

$$= \omega A\sqrt{1-\left(\frac{x}{A}\right)^2}$$

∴ $$v = \omega A\sqrt{\frac{A^2 - x^2}{A^2}}$$

or $$v = \pm\omega\sqrt{A^2 - x^2}$$ **Hence Proved.**

Example 14.8 *If a SHM is represented by the equation* $x = 10 \sin\left(\pi t + \frac{\pi}{6}\right)$ *in SI units, then determine its amplitude, time period and maximum velocity* $v_{\max}$?

Solution Comparing the above equation with

$$x = A \sin(\omega t + \phi), \text{ we get}$$

$$A = 10 \text{ m}$$ **Ans.**

$$\omega = (\pi)\frac{\text{rad}}{\text{s}} \quad \text{and} \quad \phi = \frac{\pi}{6}$$

∵ $$T = \frac{2\pi}{\omega} \quad \Rightarrow \quad T = 2 \text{s}$$ **Ans.**

$$v_{\max} = \omega A = (10\pi) \text{ m/s}$$ **Ans.**

Example 14.9 *A particle executes SHM with a time period of* 4 *s. Find the time taken by the particle to go directly from its mean position to half of its amplitude.*

Solution If the particle starts from the mean position in positive direction, then:

$$x = A \sin(\omega t)$$

or $$\frac{A}{2} = A \sin(\omega t)$$

or $$\frac{1}{2} = \sin(\omega t)$$

$$\omega t = \sin^{-1}\left(\frac{1}{2}\right) = \frac{\pi}{6}$$

$$t = \frac{\pi}{6\omega} = \frac{\pi T}{6(2\pi)}$$

as $$\omega = \frac{2\pi}{T}$$

⇒ $$t = \frac{T}{12} = \frac{4}{12} = \frac{1}{3} \text{s}$$ **Ans.**

Example 14.10 *A particle executes simple harmonic motion about the point $x = 0$. At time $t = 0$, it has displacement $x = 2$ cm and zero velocity. If the frequency of motion is $0.25\ \text{s}^{-1}$, find (a) the period, (b) angular frequency, (c) the amplitude, (d) maximum speed, (e) the displacement from the mean position at $t = 3$ s and (f) the velocity at $t = 3$ s.*

Solution (a) Period $T = \dfrac{1}{f}$

$$= \frac{1}{0.25\ \text{s}^{-1}} = 4\ \text{s}$$ **Ans.**

(b) Angular frequency $\omega = \dfrac{2\pi}{T}$

$$= \frac{2\pi}{4} = \frac{\pi}{2}\ \text{rad/s}$$

$$= 1.57\ \text{rad/s}$$ **Ans.**

(c) Amplitude is the maximum displacement from mean position. Hence, $A = 2 - 0 = 2$ cm.

(d) Maximum speed $v_{\max} = A\,\omega$

$$= 2 \cdot \frac{\pi}{2} = \pi\ \text{cm/s}$$

$$= 3.14\ \text{cm/s}$$ **Ans.**

(e) At $t = 0$, particle starts from extreme position.

$\therefore$ $$x = A\cos\omega t$$

$$= 2\cos\left(\frac{\pi}{2}t\right)$$

At $$t = 3\ \text{sec}$$

$$x = 0$$ **Ans.**

(f) Velocity at $x = 0$, is $v_{\max}$ i.e. 3.14 cm/s. **Ans.**

Example 14.11 *Find the period of the function,*

$$y = \sin\omega t + \sin 2\omega t + \sin 3\omega t$$

Solution The given function can be written as,

$$y = y_1 + y_2 + y_3$$

Here, $$y_1 = \sin\omega t,\ T_1 = \frac{2\pi}{\omega}$$

$$y_2 = \sin 2\omega t,\ T_2 = \frac{2\pi}{2\omega} = \frac{\pi}{\omega}$$

and $$y_3 = \sin 3\omega t,\ T_3 = \frac{2\pi}{3\omega}$$

$\therefore$ $$T_1 = 2T_2 \quad \text{and} \quad T_1 = 3T_3$$

So, the time period of the given function is T_1 or $\frac{2\pi}{\omega}$. **Ans.**

Because in time $T = \frac{2\pi}{\omega}$, first function completes one oscillation, the second function two oscillations and the third three.

INTRODUCTORY EXERCISE 14.2

1. A 2.0 kg particle undergoes SHM according to $x = 1.5 \sin\left(\frac{\pi t}{4} + \frac{\pi}{6}\right)$ (in SI units)
   (a) What is the total mechanical energy of the particle?
   (b) What is the shortest time required for the particle to move from $x = 0.5$ m to $x = -0.75$ m?
2. Given that the equation of motion of a mass is $x = 0.20 \sin(3.0t)$ m. Find the velocity and acceleration of the mass when the object is 5 cm from its equilibrium position. Repeat for $x = 0$.
3. A particle executes simple harmonic motion of amplitude A along the x-axis. At $t = 0$, the position of the particle is $x = \frac{A}{2}$ and it moves along the positive x-direction. Find the phase constant δ, if the equation is written as $x = A \sin(\omega t + \delta)$.
4. An object of mass 0.8 kg is attached to one end of a spring and the system is set into simple harmonic motion. The displacement x of the object as a function of time is shown in the figure. With the aid of the data, determine
   (a) the amplitude A of the motion,
   (b) the angular frequency ω,
   (c) the spring constant K,
   (d) the speed of the object at $t = 1.0$ s and
   (e) the magnitude of the object's acceleration at $t = 1.0$ s.

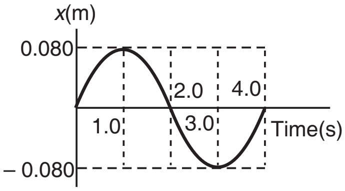

Fig. 14.13

5. The equation of motion of a particle started at $t = 0$ is given by $x = 5 \sin\left(20t + \frac{\pi}{3}\right)$, where x is in cm and t in sec. When does the particle (a) first come to rest, (b) first have zero acceleration, (c) first have maximum speed.
6. Describe the motion corresponding to x - t equation, $x = 10 - 4 \cos \omega t$.

14.4 Relation between Simple Harmonic Motion and Uniform Circular Motion

Consider a particle Q, moving on a circle of radius A with constant angular velocity ω. The projection of Q on a diameter BC is P. It is clear from the figure that as Q moves around the circle the projection P oscillates between B and C. The angle that the radius OQ makes with the x-axis is, $\theta = \omega t + \phi$. Here, ϕ is the angle made by the radius OQ with the x-axis at time $t = 0$. Further,

$$OP = OQ \cos\theta$$

or

$$x = A \cos(\omega t + \phi)$$

This is standard $x-t$ equation of SHM. Hence, P executes SHM. That is

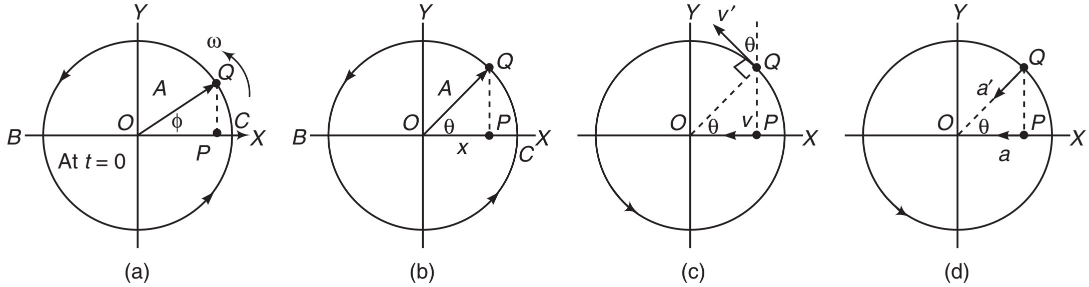

Fig. 14.14 Relation between SHM and uniform circular motion. (b) Position, (c) velocity and (d) acceleration

When a particle moves with uniform circular motion, its projection on a diameter moves with SHM.

The velocity of Q is perpendicular to OQ and has a magnitude of velocity $v'=\omega A$. The component of v' along the x-axis is,

$$v=-v'\sin\theta \quad \text{or} \quad v=-\omega A\sin(\omega t+\phi)$$

which is also the velocity of P. The acceleration of Q is centripetal and has a magnitude, $a'=\omega^2 A$.

The component of a' along the x-axis is

$$a=-a'\cos\theta \quad \text{or} \quad a=-\omega^2 A\cos(\omega t+\phi)$$

Which again coincides with the acceleration of P.

Note *v = velocity of SHM of particle P* $=\frac{dx}{dt}=\frac{d}{dt}[A\cos(\omega t+\phi)]=-\omega A\sin(\omega t+\phi)$

a = acceleration of SHM of particle $=\frac{dv}{dt}=-\omega^2 A\cos(\omega t+\phi)$

14.5 Methods of Finding Time Period of a Simple Harmonic Motion

If F-x or a-x equations are known then we can easily find the time period of SHM. For example, F-x equation is of type $F=-Kx$

and time period in this case is $T=2\pi\sqrt{\frac{m}{K}}$

Similarly, a-x equation is of type

$$a=-\omega^2 x$$

$$\therefore \quad \omega=\sqrt{\left|\frac{a}{x}\right|}=\frac{2\pi}{T}$$

$$\text{or} \quad T=2\pi\sqrt{\left|\frac{x}{a}\right|}=2\pi\sqrt{\left|\frac{\text{displacement}}{\text{acceleration}}\right|}$$

In angular SHM, we will be required $\tau-\theta$ or $\alpha-\theta$ equations.

Now, there are following two methods of finding F-x and a-x equations (or $\tau-\theta$ and $\alpha-\theta$ equations).

Restoring Force or Torque Method

The following steps are usually followed in this method:

Step 1 Find the stable equilibrium position which usually is also known as the mean position. Net force or torque on the particle in this position is zero. Potential energy is minimum.

Step 2 Displace the body from its mean position by a small displacement x (in case of a linear SHM) or θ (in case of an angular SHM).

Step 3 Find net force or torque in this displaced position.

Step 4 Show that this force or torque has a tendency to bring the body back to its mean position and magnitude of force or torque is proportional to displacement, i.e.

$$F \propto -x \quad \text{or} \quad F = -Kx \qquad \ldots\text{(i)}$$

or

$$\tau \propto -\theta \quad \text{or} \quad \tau = -K\theta \qquad \ldots\text{(ii)}$$

This force or torque is also known as restoring force or restoring torque.

Step 5 Find linear acceleration by dividing Eq. (i) by mass m or angular acceleration by dividing Eq. (ii) by moment of inertia I. Hence,

$$a = -\frac{K}{m}.x = -\omega^2 x \quad \text{or} \quad \alpha = -\frac{K}{I}\theta = -\omega^2\theta$$

Step 6 Finally,

$$\omega = \sqrt{\left|\frac{a}{x}\right|} \quad \text{or} \quad \sqrt{\left|\frac{\alpha}{\theta}\right|}$$

or

$$\frac{2\pi}{T} = \sqrt{\left|\frac{a}{x}\right|} \quad \text{or} \quad \sqrt{\left|\frac{\alpha}{\theta}\right|}$$

$\therefore$

$$T = 2\pi\sqrt{\left|\frac{x}{a}\right|} \quad \text{or} \quad 2\pi\sqrt{\left|\frac{\theta}{\alpha}\right|}$$

Energy Method

Repeat steps-1 and step-2 as in method-1. Find the total mechanical energy (E) in the displaced position. Since, mechanical energy in SHM remains constant.

$$\frac{dE}{dt} = 0$$

By differentiating the energy equation with respect to time and substituting $\frac{dx}{dt} = v$, $\frac{d\theta}{dt} = \omega$, $\frac{dv}{dt} = a$, and $\frac{d\omega}{dt} = \alpha$ we come to step-5 or we directly get $F - x$ and $a - x$ equations (or $\tau - \theta$ or $x - \theta$ equation). The remaining procedure is same.

Note *(i) E usually consists of following terms :*

(a) Gravitational PE (b) Elastic PE (c) Electrostatic PE

(d) Rotational KE and (e) Translational KE

(ii) For gravitational PE, choose the reference point ($h = 0$) at mean position.

Now, let us take few examples of finding time period (T) of certain simple harmonic motions.

The Simple Pendulum

An example of SHM is the motion of a pendulum. A simple pendulum is defined as a particle of mass m suspended from a point O by a string of length l and of negligible mass.

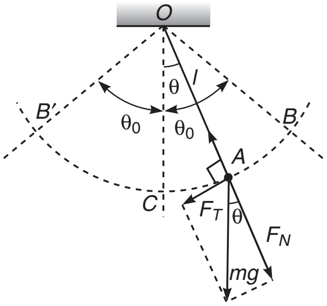

Fig. 14.15

When the particle is pulled aside to position B, so that the string makes an angle θ_0 with the vertical OC and then released, the pendulum will oscillate between B and the symmetric position B'. The oscillatory motion is due to the tangential component F_T of the weight mg of the particle. This force F_T is maximum at B and B' and zero at C. Thus, we can write,

$$F_T = -mg \sin\theta$$

Here, minus sign appears because it is opposite to the displacement.

$$x = CA$$

$$\therefore \quad ma_T = -mg\sin\theta \qquad \ldots\text{(i)}$$

Here, $$a_T = l\alpha \qquad \left(\text{where, } \alpha = \frac{d^2\theta}{dt^2}\right)$$

and $$\sin\theta \approx \theta \qquad \text{for small oscillations}$$

$$\therefore \quad ml\alpha = -mg\theta$$

Since, α is proportional to $-\theta$. Hence, motion is simple harmonic.

or $$\alpha = -\left(\frac{g}{l}\right)\theta \quad \text{or} \quad \left|\frac{\theta}{\alpha}\right| = \frac{l}{g}$$

$$\therefore \quad T = 2\pi\sqrt{\left|\frac{\theta}{\alpha}\right|} \quad \text{or} \quad \boxed{T = 2\pi\sqrt{\frac{l}{g}}}$$

Note *that the period is independent of the mass of the pendulum.*

Energy Method

Let us derive the same expression by energy method. Suppose ω be the angular velocity of particle at angular displacement θ about point O. Then, total mechanical energy of particle in position A is,

$$E = \frac{1}{2}I\omega^2 + mg(h_A - h_C)$$

or $$E = \frac{1}{2}(ml^2)\,\omega^2 + mgl(1-\cos\theta)$$

E is constant, therefore, $\frac{dE}{dt} = 0$ or $0 = ml^2\omega\left(\frac{d\omega}{dt}\right) + mgl\sin\theta\left(\frac{d\theta}{dt}\right)$

Putting $\frac{d\theta}{dt} = \omega$, $\frac{d\omega}{dt} = \alpha$ and $\sin\theta \approx \theta$, we get the same expression

$$\alpha = -\left(\frac{g}{l}\right)\theta$$

$$\therefore \qquad T = 2\pi\sqrt{\left|\frac{\theta}{\alpha}\right|} \quad \text{or} \quad \boxed{T = 2\pi\sqrt{\frac{l}{g}}}$$

Spring-block System

Suppose a mass m is attached to the free end of a massless spring of spring constant k, with its other end fixed to a rigid support.

If the mass be displaced through a distance x, as shown, a linear restoring force,

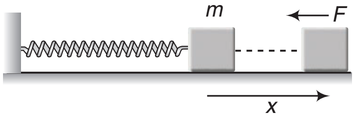

Fig. 14.16

$$F = -kx \qquad \text{...(i)}$$

starts acting on the mass, tending to bring it back into its original position. The negative sign simply indicates that it is directed oppositely to the displacement of the mass.

Eq. (i) can be written as,

$$ma = -kx \qquad \text{...(ii)}$$

$$\text{or} \qquad \left|\frac{x}{a}\right| = \frac{m}{k}$$

$$\therefore \qquad T = 2\pi\sqrt{\left|\frac{x}{a}\right|} \quad \text{or} \quad T = 2\pi\sqrt{\frac{m}{k}}$$

Energy Method

The time period of the spring-block system can also be obtained by the energy method. Let v be the speed of the mass in displaced position. Then total mechanical energy of the spring-block system is.

$$E = \text{kinetic energy of the block + elastic potential energy}$$

$$\text{or} \qquad E = \frac{1}{2}mv^2 + \frac{1}{2}kx^2$$

Since, E is constant

$$\frac{dE}{dt} = 0 \quad \text{or} \quad 0 = mv\left(\frac{dv}{dt}\right) + kx\left(\frac{dx}{dt}\right)$$

Substituting, $\frac{dx}{dt} = v$ and $\frac{dv}{dt} = a$

We have,

$$ma = -kx$$

$$\therefore \qquad T = 2\pi\sqrt{\left|\frac{x}{a}\right|} = 2\pi\sqrt{\frac{m}{k}}$$

Example 14.12 *F-x equation of a body of mass 2 kg in SHM is*

$$F + 8x = 0$$

Here, F is in newton and x in metre. Find time period of oscillations.

Solution The given equation can be written as, $F = -8x$

Comparing with the standard equation of SHM, $F = -Kx$ we have,

$$K = 8\,\text{N/m}$$

$$\therefore \qquad T = 2\pi\sqrt{\frac{m}{K}}$$

$$= 2\pi\sqrt{\frac{2}{8}}$$

$$= (\pi)\,\text{s} = 3.14\,\text{s} \qquad \textbf{Ans.}$$

Example 14.13 *Acceleration of a particle in SHM at displacement $x = 10$ cm (from the mean position is $a = -2.5$ cm/s^2). Find time period of oscillations.*

Solution Time period is given by

$$T = 2\pi\sqrt{\left|\frac{x}{a}\right|}$$

Substituting the values we have,

$$T = 2\pi\sqrt{\frac{10}{2.5}} = (4\pi)\,\text{s} \qquad \textbf{Ans.}$$

Example 14.14 *Find time period of a vertical spring-block system by both methods.*

Solution **Force Method**

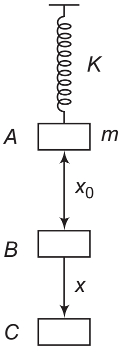

Fig. 14.17

Position *A* In this position, spring is in its natural length. But net force on block is not zero. Its *mg* is downwards.

Position B This is equilibrium position. Net force on block is zero. Spring force kx_0 in upward direction is equal to mg force in downward direction.

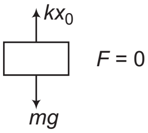

Fig. 14.18

Position C This is displaced position.

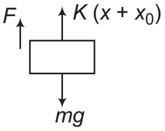

Fig. 14.19

Net restoring force is upward direction or towards the mean position is

$$F = -[k(x + x_0) - mg] = -kx \quad (\text{as } kx_0 = mg)$$

Since, $F = -kx$

$$T = 2\pi\sqrt{\frac{m}{k}}$$

Energy Method Taking $h = 0$, at the mean position B, total mechanical energy in displaced position C is

$$E = \frac{1}{2}mv^2 + \frac{1}{2}k(x + x_0)^2 - mg\,x$$

As $E = \text{constant}$ $\frac{dE}{dt} = 0$

or $$\frac{1}{2}m(2v)\frac{dv}{dt} + \frac{1}{2}k[2(x + x_0)]\frac{dx}{dt} - mg\frac{dx}{dt} = 0$$

Substituting, $\frac{dx}{dt} = v$, $\frac{dv}{dt} = a$, $kx_0 = mg$ and $ma = F$, the above equation also converts into,

$$F = -kx$$

$\therefore$ $$T = 2\pi\sqrt{\frac{m}{k}}$$

Example 14.15 *A block with a mass of 3.00 kg is suspended from an ideal spring having negligible mass and stretches the spring by 0.2 m.*

(a) What is the force constant of the spring?

(b) What is the period of oscillation of the block if it is pulled down and released?

Solution (a) In equilibrium,

$$kl = mg \qquad (l = \text{extension in spring})$$

$\therefore$ $$k = \frac{mg}{l} \qquad \ldots\text{(i)}$$

Substituting the proper values, we have

$$k = \frac{(3.00)(9.8)}{0.2}$$

$$= 147 \text{ N/m}$$ **Ans.**

(b) From Eq. (i) $$\frac{m}{k} = \frac{l}{g}$$

$\therefore$ $$T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{l}{g}}$$

$$= 2\pi\sqrt{\frac{0.2}{9.8}} = 0.897\,\text{s}$$ **Ans.**

INTRODUCTORY EXERCISE 14.3

1. a - x equation of a body in SHM is $a + 16\,x = 0$. Here, x is in cm and a in cm/s^2. Find time period of oscillations.
2. A mass M, attached to a spring, oscillates with a period of 2 s. If the mass is increased by 4 kg, the time period increases by one second. Assuming that Hooke's law is obeyed, find the initial mass M.
3. Three masses of 500 g, 300 g and 100 g are suspended at the end of a spring as shown and are in equilibrium. When the 500 g mass is removed suddenly, the system oscillates with a period of 2 s. When the 300 g mass is also removed, it will oscillate with period T. Find the value of T.

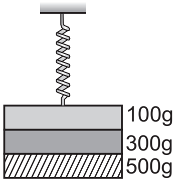

Fig. 14.20

4. A particle executes simple harmonic motion. Its instantaneous acceleration is given by $a = -px$, where p is a positive constant and x is the displacement from the mean position. Find angular frequency of oscillations.
5. A mass M is suspended from a spring of negligible mass. The spring is pulled a little then released, so that the mass executes simple harmonic motion of time period T. If the mass is increased by m, the time period becomes $\frac{5T}{3}$. Find the ratio of m/M.
6. The length of a simple pendulum is decreased by 21%. Find the percentage change in its time period.
7. A particle executes SHM on a straight line path. The amplitude of oscillation is 2 cm. When the displacement of the particle from the mean position is 1 cm, the numerical value of magnitude of acceleration is equal to the numerical value of magnitude of velocity. Find the frequency of SHM (in Hz).

14.6 Vector Method of Combining Two or More Simple Harmonic Motions

A simple harmonic motion is produced when a force (called restoring force) proportional to the displacement acts on a particle. If a particle is acted upon by two such forces the resultant motion of the particle is a combination of two simple harmonic motions. Suppose the two individual motions are represented by,

$$x_1 = A_1 \sin \omega t$$

and $$x_2 = A_2 \sin (\omega t + \phi)$$

Both the simple harmonic motions have same angular frequency ω.

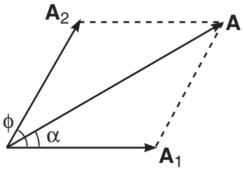

Fig. 14.21

The resultant displacement of the particle is given by,

$$\begin{aligned} x &= x_1 + x_2 \\ &= A_1 \sin \omega t + A_2 \sin (\omega t + \phi) \\ &= A \sin (\omega t + \alpha) \end{aligned}$$

Here, $$A = \sqrt{A_1^2 + A_2^2 + 2A_1 A_2 \cos \phi}$$

and $$\tan \alpha = \frac{A_2 \sin \phi}{A_1 + A_2 \cos \phi}$$

Thus, we can see that this is similar to the vector addition. The same method of vector addition can be applied to the combination of more than two simple harmonic motions.

Example 14.16 *Find the displacement equation of the simple harmonic motion obtained by combining the motions.*

$$x_1 = 2 \sin \omega t, \quad x_2 = 4 \sin \left(\omega t + \frac{\pi}{6}\right) \quad \textit{and} \quad x_3 = 6 \sin \left(\omega t + \frac{\pi}{3}\right)$$

Solution The resultant equation is,

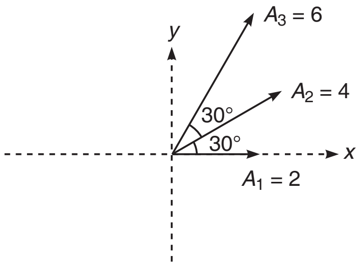

Fig. 11.22

$$x = A \sin(\omega t + \phi)$$

$$\Sigma A_x = 2 + 4\cos 30° + 6\cos 60° = 8.46$$

and $$\Sigma A_y = 4\sin 30° + 6\cos 30° = 7.2$$

$\therefore$ $$A = \sqrt{(\Sigma A_x)^2 + (\Sigma A_y)^2}$$

$$= \sqrt{(8.46)^2 + (7.2)^2}$$

$$= 11.25$$

and $$\tan\phi = \frac{\Sigma A_y}{\Sigma A_x}$$

$$= \frac{7.2}{8.46} = 0.85$$

or $$\phi = \tan^{-1}(0.85)$$

$$= 40.4°$$

Thus, the displacement equation of the combined motion is,

$$x = 11.25 \sin(\omega t + \phi)$$

where, $$\phi = 40.4°$$ **Ans.**

INTRODUCTORY EXERCISE 14.4

1. A particle is subjected to two simple harmonic motions of the same frequency and direction. The amplitude of the first motion is 4.0 cm and that of the second is 3.0 cm. Find the resultant amplitude if the phase difference between the two motions is
   (a) 0° (b) 60° (c) 90° (d) 180°
2. A particle is subjected to two simple harmonic motions.
   $$x_1 = 4.0 \sin(100\pi t) \quad \text{and} \quad x_2 = 3.0 \sin\left(100\pi t + \frac{\pi}{3}\right)$$
   Find
   (a) the displacement at $t = 0$
   (b) the maximum speed of the particle and
   (c) the maximum acceleration of the particle.
3. Three simple harmonic motions of equal amplitudes A and equal time periods in the same direction combine. The phase of the second motion is 60° ahead of the first and the phase of the third motion is 60° ahead of the second. Find the amplitude of the resultant motion.
4. A particle is subjected to two simple harmonic motions in the same direction having equal amplitudes and equal frequency. If the resultant amplitude is equal to the amplitude of the individual motions. Find the phase difference between the individual motions.

Final Touch Points

1. Simple Pendulum

(i) Time period $T = 2\pi\sqrt{\frac{l}{g}}$ is applicable only for small oscillations.

(ii) If the time period of a simple pendulum is 2 s, it is called **seconds pendulum.** Length of this pendulum is 1 m.

(iii) If length of the pendulum is large, g no longer remains vertical but will be directed towards the centre of the earth and expression for time period is given by,

$$T = 2\pi\sqrt{\frac{1}{g\left(\frac{1}{l}+\frac{1}{R}\right)}}$$

Here, R is the radius of earth. From this expression we can see that,

(a) if $l \ll R$, $\frac{1}{l} >> \frac{1}{R}$ and $T = 2\pi\sqrt{\frac{l}{g}}$

(b) as $l \to \infty, \frac{1}{l} \to 0$ and $T = 2\pi\sqrt{\frac{R}{g}}$ and substituting the value of R and g, we get $T = 84.6$ min.

(iv) Time period of a simple pendulum depends on acceleration due to gravity 'g' $\left(\text{as } T \propto \frac{1}{\sqrt{g}}\right)$ so take $|\mathbf{g}_{\text{eff}}|$ in $T = 2\pi\sqrt{\frac{l}{g}}$. Following two cases are possible :

(a) If a simple pendulum is in a carriage which is accelerating with acceleration **a**, then

$$\mathbf{g}_{\text{eff}} = \mathbf{g} - \mathbf{a}$$

e.g. if the acceleration **a** is upwards, then

$$|\mathbf{g}_{\text{eff}}| = g + a \quad \text{and} \quad T = 2\pi\sqrt{\frac{l}{g+a}}$$

If the acceleration **a** is downwards, then (with $g > a$)

$$|\mathbf{g}_{\text{eff}}| = g - a \quad \text{and} \quad T = 2\pi\sqrt{\frac{l}{g-a}}$$

If the acceleration **a** is in horizontal direction, then

$$|\mathbf{g}_{\text{eff}}| = \sqrt{a^2 + g^2}$$

In a freely falling lift $g_{\text{eff}} = 0$ and $T = \infty$ i.e. the pendulum will not oscillate.

(b) If in addition to gravity one additional force **F**, (e.g. electrostatic force $\mathbf{F}_e$) is also acting on the bob, then in that case,

$$\mathbf{g}_{\text{eff}} = \mathbf{g} + \frac{\mathbf{F}}{m}$$

Here, m is the mass of the bob.

(v) Due to change in temperature, length of pendulum and so the time period will change. If $\Delta\theta$ is the increase in temperature then,

$$l' = l(1 + \alpha\Delta\theta) \quad \text{or} \quad \frac{l'}{l} = 1 + \alpha\Delta\theta$$

$$\therefore \qquad \frac{T'}{T} = \sqrt{\frac{l'}{l}} = (1 + \alpha\Delta\theta)^{1/2} \approx \left(1 + \frac{1}{2}\alpha\Delta\theta\right)$$

∴ $$\frac{T'}{T} - 1 \approx \frac{1}{2}\alpha\Delta\theta$$

or $$\frac{T' - T}{T} = \frac{1}{2}\alpha\Delta\theta$$

or $$\Delta T = \frac{1}{2}T\alpha\Delta\theta$$

Note *In case of a pendulum clock, time is lost if T increases and gained if T decreases. Time lost or gained in time t is given by,*

$$\Delta t = \frac{\Delta T}{T'} . t$$

e.g. if $T = 2$ s, $T' = 3$ s, then $\Delta T = 1$ s

∴ *Time lost by the clock in 1 h.*

$$\Delta t = \frac{1}{3} \times 3600 = 1200 \text{ s}$$

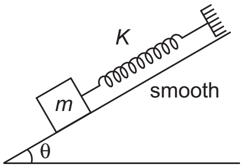
(vi) Above the surface of earth, blow the surface of earth, in moving from pole to equator and on moon value of g decreases, therefore time period of pendulum will increase.

2. Spring-block System

(i)

(a)

(b)



(c)

In all three figures shown above, restoring force in displaced position is $F = -kx$. Therefore, time period is,

$$T = 2\pi\sqrt{\frac{m}{K}}$$

The only difference is, their mean positions are different. In the first figure, mean position is at the natural length of spring. In the second figure, mean position is obtained after an extension of $x_0 = \frac{mg}{K}$ (as $kx_0 = mg$) and in the third figure after an extension of $x_0 = \frac{mg\sin\theta}{K}$.

(ii) In case of a vertical spring-block system, time period can also be written as,

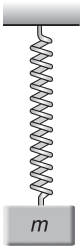
$$\boxed{T = 2\pi\sqrt{\frac{l}{g}}}$$

Here, l = extension in the spring when the mass m is suspended from the spring. This can be seen as under :

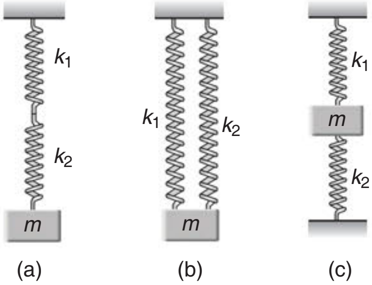
$$kl = mg \qquad \text{(in equilibrium position)}$$

∴ $$\frac{m}{k} = \frac{l}{g}$$

or $$T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{l}{g}}$$



(iii) **Equivalent force constant (k)** If a spring block system is constructed by using two springs and a mass, the following three situations are possible:



Refer Fig. (a)

In this case,

$$\frac{1}{k}=\frac{1}{k_1}+\frac{1}{k_2}$$

or $$k=\frac{k_1k_2}{k_1+k_2}$$

∴ $$T=2\pi\sqrt{\frac{m}{k}}=2\pi\sqrt{\frac{m(k_1+k_2)}{k_1k_2}}$$

Fig. (b) and (c)

In both the cases,

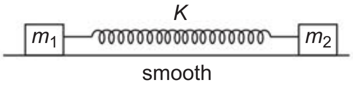
$$k=k_1+k_2$$

or $$T=2\pi\sqrt{\frac{m}{k}}=2\pi\sqrt{\frac{m}{k_1+k_2}}$$

(iv) If spring has a mass m_s and a mass m is suspended from it, then time period is given by,

$$T=2\pi\sqrt{\frac{m+\frac{m_s}{3}}{k}}$$

(v) If the spring connected with two masses m_1 and m_2 is compressed or elongated by x_0 and then left for oscillations then both blocks execute SHM with same time period (and therefore same frequency) but different amplitudes.



This time period is

$$T=2\pi\sqrt{\frac{\mu}{K}}$$

Here, μ is called their reduced mass given by

$$\frac{1}{\mu}=\frac{1}{m_1}+\frac{1}{m_2}\text{ or }\mu=\frac{m_1m_2}{m_1+m_2}$$

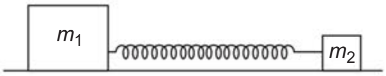
Their amplitudes of oscillations are in inverse ratio of their masses or

$$A\propto\frac{1}{m}\quad\Rightarrow\quad\frac{A_1}{A_2}=\frac{m_2}{m_1}$$

⇒ $$A_1=\left(\frac{m_2}{m_1+m_2}\right)x_0\quad\text{and}\quad A_2=\left(\frac{m_1}{m_1+m_2}\right)x_0$$

Note *If $m_1>>m_2$, then $\frac{1}{m_1}<<\frac{1}{m_2}$*

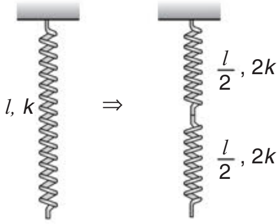
∴ $$\frac{1}{\mu}\approx\frac{1}{m_2}\quad\text{or}\quad\mu\approx m_2\quad\text{and}\quad T=2\pi\sqrt{\frac{m_2}{K}}$$



So, in this case we can understand that m_1 is almost stationary. Only m_2 will oscillate.

(vi) The force constant (k) of a spring is inversely proportional to the length of the spring. i.e.

$$k \propto \frac{1}{\text{length of spring}}$$

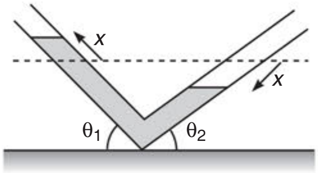


This can be visualized as:

A spring of length l and spring constant k can be supposed to be made up by two springs in series, of length $\frac{l}{2}$ and force constant $2k$. In series,

$$k_{\text{eff}} = \frac{k_1 k_2}{k_1 + k_2} = \frac{(2k)(2k)}{2k + 2k} = k$$

3. Oscillations of a fluid column



Initially the level of liquid in both the columns is same. The area of cross-section of the tube is uniform. If the liquid is depressed by x in one limb, it will rise by x along the length of the tube is the other limb. Here, the restoring force is provided by the hydrostatic pressure difference.

$$\therefore \qquad F = -(\Delta P)A = -(h_1 + h_2)\rho g A$$

$$= -\rho g A(\sin\theta_1 + \sin\theta_2)\,x$$

Let, m be the mass of the liquid in the tube. Then,

$$ma = -\rho g A(\sin\theta_1 + \sin\theta_2)\,x$$

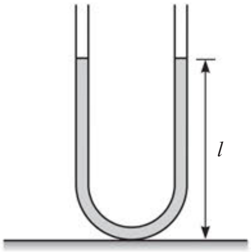
Since, F or a is proportional to $-x$, the motion of the liquid column is simple harmonic in nature, time period of which is given by,

$$T = 2\pi\sqrt{\left|\frac{x}{a}\right|}$$

or

$$\boxed{T = 2\pi\sqrt{\frac{m}{\rho g A(\sin\theta_1 + \sin\theta_2)}}}$$

Note *For a U-tube, if the liquid is filled to a height* l, $\theta_1 = 90° = \theta_2$ *and* $m = 2(lA\rho)$



So, $$T = 2\pi\sqrt{\frac{l}{g}}$$

Thus, we see that the expression $T = 2\pi\sqrt{\frac{l}{g}}$ *comes in picture at three places.*

(i) Time period of a simple pendulum for small oscillations.
(ii) Time period of a spring-block system in vertical position.
(iii) Time period of a liquid column in a U-tube filled to a height l.

But l has different meanings at different places.

4. Lissajous figures Suppose two forces act on a particle, the first alone would produce a simple harmonic motion in x-direction given by,

$$x = a\sin\omega t$$

and the second would produce a simple harmonic motion in y-direction given by,

$$y = b\sin(\omega t + \phi)$$

The amplitudes a and b may be different and their phases differ by ϕ. The frequencies of the two simple harmonic motions are assumed to be equal. The resultant motion of the particle is a combination of the two simple harmonic motions.

Depending on the value of ϕ and relation between a and b, the particle follows different paths. These different paths are called Lissajous figures. Given below are few special cases :

***Case* 1 (When $\phi = 0°$)** When the phase difference between two simple harmonic motions is 0°, i.e.

$$x = a \sin \omega t \quad \Rightarrow \quad \sin \omega t = \frac{x}{a} \qquad \text{...(i)}$$

$$y = b \sin \omega t \quad \Rightarrow \quad \sin \omega t = \frac{y}{b} \qquad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{x}{a} = \frac{y}{b} \quad \text{or} \quad y = \left(\frac{b}{a}\right) x$$

which is equation of a straight line with slope $\frac{b}{a}\cdot$ Thus, the path of the particle is a straight line. As a special case $y = x$ if $a = b$ or slope is 1.

***Case* 2 $\left(\text{when } \phi = \frac{\pi}{2}\right)$** When the phase difference is $\frac{\pi}{2}$ i.e.

$$x = a \sin \omega t \quad \Rightarrow \quad \sin \omega t = \frac{x}{a} \qquad \text{...(iii)}$$

$$y = b \sin \left(\omega t + \frac{\pi}{2}\right) = b \cos \omega t$$

$$\Rightarrow \qquad \cos \omega t = \frac{y}{b} \qquad \text{...(iv)}$$

Squaring and adding, Eqs. (iii) and (iv), we get

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

which is an **ellipse.** Again as a special case, the above equation reduces to,

$$\frac{x^2}{a^2} + \frac{y^2}{a^2} = 1$$

$$\text{or} \qquad x^2 + y^2 = a^2 \qquad (\text{for } a = b)$$

This is an equation of a **circle.**

5. Free and damped oscillations

We know that in reality, a spring won't oscillate forever with constant amplitude. These constant amplitude oscillations (which will really occur in vacuum) are called **"free oscillations"**. Frictional forces will diminish the amplitude of oscillation until eventually the system comes to rest.

We will now add frictional forces to the mass and spring. Imagine that the mass was put in a viscous liquid. To incorporate friction, we can just say that there is a frictional force that's proportional to the velocity of the mass. This is a pretty good approximation for a body moving at a low velocity in air, or in a liquid. So we say the frictional force $f_r = -bv$. The constant b depends on the kind of liquid and the shape of the mass. The negative sign, just says that the force is in the opposite direction to the body's motion. Let's add this frictional force in to the equation $F_{\text{net}} = ma$

$$-kx - bv = ma \qquad \text{...(i)}$$

In terms of derivatives,

$$m \frac{d^2x}{dt^2} + b \frac{dx}{dt} + kx = 0 \qquad \text{...(ii)}$$

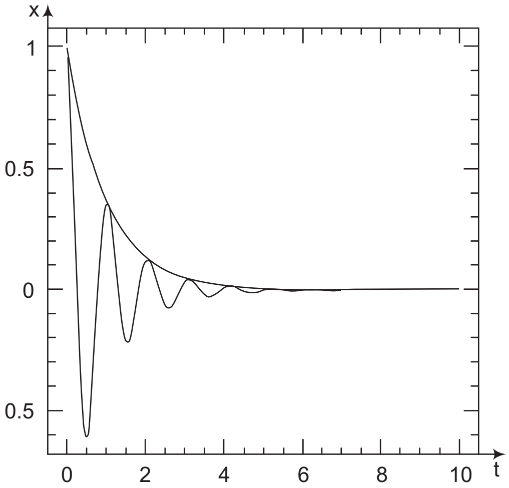
This is a differential equation. In the solution of this type of differential equation instead of the amplitude being constant, it is decaying with time.

$$\boxed{A(t) = A_0 e^{-\alpha t}}$$

Here, α is a positive constant.

So, $\boxed{x(t) = A(t)\cos(\omega t + \delta) = A_0 e^{-\alpha t}\cos(\omega t + \delta)}$

Here's a plot of an example of such a function.



These types of oscillations which eventually come to end are called **"damped oscillations".** There are further three types of damped oscillations, namely

(i) Under damped
(ii) Critically damped and
(iii) Over damped oscillations

But their detailed discussion is out of our syllabus at this stage.

Natural Frequency (or Characteristic Frequency)

That is the frequency at which a system would oscillate by itself if displaced. The natural frequency of a spring-mass system is $f_0 = \dfrac{1}{2\pi}\sqrt{\dfrac{k}{m}}$, where k is the spring constant and m is the mass of the object attached to the spring.

Forced Oscillations

A periodic force at a given frequency (called driving frequency f_d) is applied to an oscillating system of natural frequency f_0. At the beginning (transient stage), there is a mixture of two kinds of oscillations, one has the frequency f_0 and the other has f_d. The former will gradually die out because of the damping effect. Eventually (at the steady state) the system settles down with oscillation at the frequency of the driving force (f_d).

Resonance

When the driving frequency is at the same frequency as the natural frequency of the oscillator, the amplitude of oscillation is at its greatest. When this happens the energy of the oscillator becomes a maximum. This is called a condition of resonance.

Resonance and its Consequences

The fact that there is an amplitude peak at driving frequencies close to the natural frequency of the system is called **resonance.** Physics is full of examples of resonance ; building up the oscillations of a child on a swing by pushing with a frequency equal to the swing's natural frequency is one. Inexpensive loudspeakers often have an unwanted boom or buzz when a musical note happens to coincide with the resonant frequency of the speaker cone. Resonance also occurs in electric circuits ; a tuned circuit in a radio or television receiver responds strongly to waves having frequencies near its resonant frequency, and this fact is used to select a particular station and reject the others.

Resonance in mechanical systems can be destructive. A company of soldiers once destroyed a bridge by marching across it in step ; the frequency of their steps was close to the natural vibration frequency of the bridge and the resulting oscillation had large enough amplitude to tear the bridge apart. Ever since, marching soldiers have been ordered to break step before crossing a bridge.

Nearly everyone has seen the film of the collapse of the Tacoma Narrows suspension bridge in 1940.

Solved Examples

TYPED PROBLEMS

Type 1. *According to given x - t equation we have to find initial conditions (at $t = 0$).*

Concept

The method discussed here is a general method which can be applied for any type of motion.

How to Solve?

Differentiate the given x - t equation and find v - t equation. Now, put $t = 0$ in both x - t and v - t equations.

Example 1 *x - t equation of a particle executing SHM is*

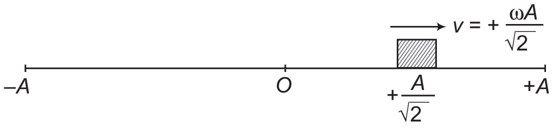
$$x = A\cos(\omega t - 45°)$$

Find the point from where particle starts its journey and the direction of its initial velocity.

Solution Given,
$$x = A\cos(\omega t - 45°) \qquad \text{...(i)}$$
$$v = \frac{dx}{dt} = -\omega A\sin(\omega t - 45°) \qquad \text{...(ii)}$$

Putting $t = 0$ in both equations we have,

$$x = +\frac{A}{\sqrt{2}} \quad \text{and} \quad v = +\frac{\omega A}{\sqrt{2}}$$



At $t = 0$

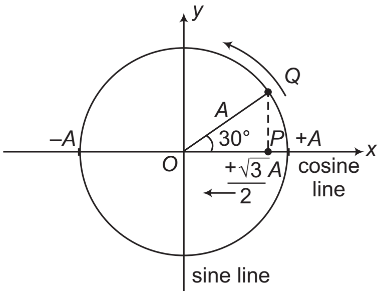
So, the particle starts from $x = +\frac{A}{\sqrt{2}}$ with velocity in positive direction.

Note *By further differentiating v - t equation, we can make a - t equation and by putting $t = 0$, we can also find initial value of acceleration.*

Type 2. *First Use of reference circle (to make x - t equation corresponding to given initial conditions).*

How to Solve?

For the given SHM particle P on the diameter we have to find its circular motion particle Q on the circle according to given initial conditions. The following points will help you in finding the particle Q.



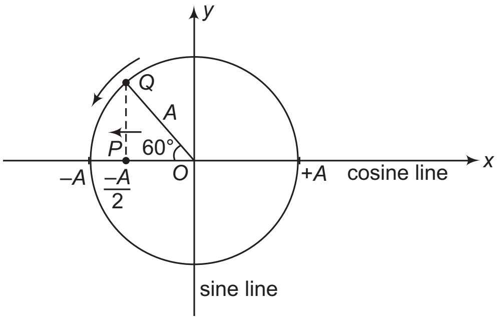
- Particle Q can rotate, either clockwise or anticlockwise. But in all problems, we will take it anticlockwise.
- We can draw the perpendicular on any diameter but in all problems we will draw the perpendicular lying along x-axis.
- If initial velocity of SHM particle P is negative then Q lies in upper half of the reference circle. Because, when Q moves in upper half of the circle (anticlockwise) P moves from $+A$ to $-A$ along negative x-direction. Similarly, if P has an initial velocity in positive direction then Q is in lower half of the circle.
- If initial value of x is positive then Q lies to the right of O (between 0 and $+A$) and if x is negative, then Q lies to the left of O (between 0 and $-A$).
- If initial value of x is suppose $+\frac{\sqrt{3}}{2}A$ and velocity is negative then circular particle Q is in the position as shown in figure.

  This particle is 120° ahead (in anticlockwise direction) or 240° behind (in clockwise direction) from sine line or it is 30° ahead or 330° behind the cosine line. Hence, the x-t equation corresponding to given initial conditions may be

$$\begin{aligned} x &= A\sin(\omega t + 120°) \\ &= A\sin(\omega t - 240°) \\ &= A\cos(\omega t + 30°) \\ &= A\cos(\omega t - 330°) \end{aligned}$$

Example 2 *A particle in SHM starts its journey (at $t=0$) from $x=-\frac{A}{2}$ in negative direction. Write x-t equation corresponding to given conditions. Angular frequency of oscillations is ω.*

Solution For the given initial conditions, particle Q on reference circle is as shown in figure. This is 210° ahead or 150° behind the sine line or 120° ahead or 240° behind the cosine line. Therefore, the x-t equation can be written as



$$x = A\sin(\omega t + 210°) = A\sin(\omega t - 150°) = A\cos(\omega t + 120°) = A\cos(\omega t - 240°)$$

Type 3. *Second use of reference circle (to find the shortest time in moving the particle from one point to another point between $+A$ and $-A$).*

Concept

Linear speed of particle in SHM is not constant (more near mean positive and less near mean extreme positions)

So, we cannot apply

$$\text{time} = \frac{\text{distance}}{\text{speed}}$$

but the angular speed of its corresponding particle on reference circle is constant.

Therefore, $$t = \frac{\theta}{\omega} \quad (\theta \text{ in radian})$$

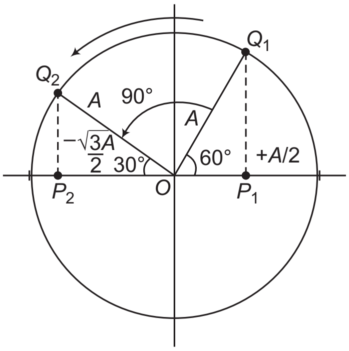
can be applied for that particle. The following table will help you in solving such problems.

Angle rotated in radian	Angle rotated in degrees	Time taken
2π	360°	T
π	180°	$T/2$
$\pi/3$	120°	$T/3$
$\pi/2$	90°	$T/4$
$\pi/4$	45°	$T/8$
$\pi/6$	30°	$T/12$

Example 3 *In terms of time period of oscillations T, find the shortest time in moving a particle from* $+\frac{A}{2}$ *to* $-\frac{\sqrt{3}}{2}$.

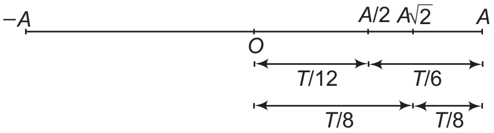
Solution As shown in figure, as the SHM particle P moves from P_1 to P_2, its corresponding particle Q on reference circle rotates from Q_1 to Q_2 an angle of 90°. From the above table, we can see that, in rotating an angle of 90° the time taken is $\frac{T}{4}$.

$$t = \frac{T}{4}$$ **Ans.**



Note *Some, standard results which are frequently asked are given in following table:*

From	To	Time taken
O	$A/2$	$T/12$
$A/2$	A	$T/6$
O	$A/\sqrt{2}$	$T/8$
$A/\sqrt{2}$	A	$T/8$

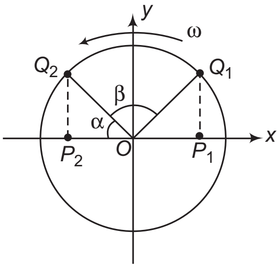


Near the mean position, speed of particle is more. Therefore, it covers first half of the distance (from 0 to $A/2$) in a shorter time compared to the second half (from $A/2$ to A).

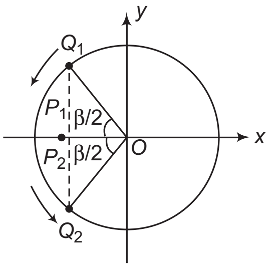
Type 4. *Third Use of reference circle (finding time of collision of two particles executing SHM along same straight line with same ω and A but different initial conditions).*

How to Solve?

Corresponding to initial conditions of SHM particles P_1 and P_2, first find their particles Q_1 and Q_2 on the reference circle.



Now, we can see that the particles Q_1 and Q_2 will never collide as they are rotating in the same direction (anticlockwise) with same ω and T. But the perpendiculars from Q_1 and Q_2 on our diameter along x-axis will collide when this diameter becomes the bisector line of the constant angle β (between OQ_1 and OQ_2) as shown below.



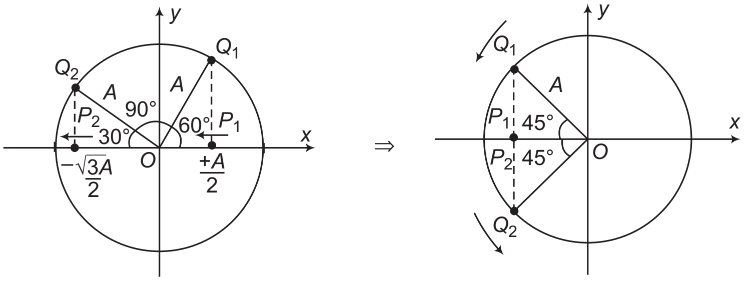
Now, either of the two particles has rotated an angle.

$$\theta = \alpha + (\beta/2)$$

∴ Time taken is
$$t = \frac{\theta}{\omega}$$

Example 4 *Two SHM particles* P_1 *and* P_2 *start from* $+\frac{A}{2}$ *and* $-\frac{\sqrt{3}A}{2}$, *both in negative directions. Find the time (in terms of T) when they collide. Both particles have same* ω, *A and T and they execute SHM along the same line.*

Solution



In the first figure, we have shown two particles Q_1 and Q_2 corresponding to given initial conditions of P_1 and P_2. In the second figure, we have shown the moment when the SHM particles are colliding at $x = -A\cos 45° = -\frac{A}{\sqrt{2}}$.

We can see that either of the particles Q_1 and Q_2 has rotated an angle $\theta = 75°$ or $\frac{5\pi}{12}$. So, the time taken is

$$t = \frac{\theta}{\omega} = \frac{(5\pi/12)}{(2\pi/T)} = \left(\frac{5}{24}\right)T$$

Note *In the above problem, the constant angle between* OQ_1 *and* OQ_2 *is 90°. So, the constant phase difference between two SHM particles corresponding to given initial conditions is also 90°.*

Type 5. *Spring Block Systems.*

Concept

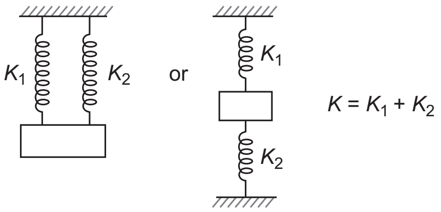
There are a lot of problems based on spring-block system. The main concepts are:

(i) $T = 2\pi\sqrt{\frac{m}{K}}$ and $\omega = \frac{2\pi}{T} = \sqrt{\frac{K}{m}}$

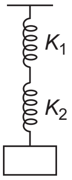
(ii) Force constant of spring,

$$K \propto \frac{1}{\text{Length of spring}}$$

(iii)



(iv)



$$\frac{1}{K} = \frac{1}{K_1} + \frac{1}{K_2}$$

$$\text{or } K = \frac{K_1 K_2}{K_1 + K_2}$$

Let us take some examples based on the above concepts.

Example 5 *A mass is suspended separately by two springs and the time periods in the two cases are T_1 and T_2. Now the same mass is connected in parallel $(K = K_1 + K_2)$ with the springs and the time is suppose T_P. Similarly time period in series is T_S, then find the relation between T_1, T_2 and T_P in the first case and T_1, T_2 and T_S in the second case.*

Solution $T = 2\pi\sqrt{\frac{m}{K}}$

$\therefore$ $$T = \frac{\alpha}{\sqrt{K}} \qquad \text{(where, } 2\pi\sqrt{m} = \alpha = \text{constant)}$$

$\Rightarrow$ $$K = \frac{\alpha^2}{T^2} \qquad \text{...(i)}$$

or $$\frac{1}{K} = \frac{T^2}{\alpha^2} \qquad \text{...(ii)}$$

First case In parallel,

$$K = K_1 + K_2$$

Using Eq. (i), $$\frac{\alpha^2}{T_P^2} = \frac{\alpha^2}{T_1^2} + \frac{\alpha^2}{T^2}$$

$\therefore$ $$T_P^{-2} = T_1^{-2} + T_2^{-2}$$ **Ans.**

This is the desired relation.

Second case In series, $$\frac{1}{K} = \frac{1}{K_1} + \frac{1}{K_2}$$

Now, using Eq. (ii) we have, $$\frac{T_s^2}{\alpha^2} = \frac{T_1^2}{\alpha^2} + \frac{T_2^2}{\alpha^2}$$

$\therefore$ $$T_s^2 = T_1^2 + T_2^2$$ **Ans.**

This is the desired relation in this case.

Example 6 *Time period of a block with a spring is T_0. Now, the spring is cut in two parts in the ratio 2 : 3. Now find the time period of same block with the smaller part of the spring.*

Solution $T = 2\pi\sqrt{\frac{m}{K}}$ $\Rightarrow$ $$T \propto \frac{1}{\sqrt{K}}$$

But $$K \propto \frac{1}{l} \qquad (l = \text{length of spring})$$

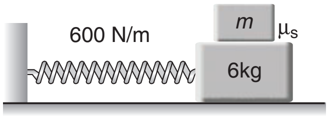
$\therefore$ $$T \propto \sqrt{l} \qquad \text{...(i)}$$

Now, suppose total length of the spring is $5l$ and it is cut in two parts of lengths $2l$ and $3l$. Eq. (i) can be written as

$$\frac{T_{2l}}{T_{5l}}=\sqrt{\frac{2l}{5l}}=\sqrt{\frac{2}{5}}$$

$\therefore$
$$T_{2l}=\left(\sqrt{\frac{2}{5}}\right)T_{5l}=\left(\sqrt{\frac{2}{5}}\right)T_0$$ **Ans.**

Example 7 *With the assumption of no slipping, determine the mass m of the block which must be placed on the top of a 6 kg cart in order that the system period is 0.75 s. What is the minimum coefficient of static friction* μ_s *for which the block will not slip relative to the cart if the cart is displaced 50 mm from the equilibrium position and released? Take* $(g=9.8\ m/s^2)$.



Solution (a)
$$T=2\pi\sqrt{\frac{m+6}{600}} \qquad \left(T=2\pi\sqrt{\frac{m}{K}}\right)$$

or
$$0.75=2\pi\sqrt{\frac{m+6}{600}}$$

$\therefore$
$$m=\frac{(0.75)^2\times 600}{(2\pi)^2}-6$$
$$=2.55\text{ kg}$$ **Ans.**

(b) Maximum acceleration of SHM is,

$$a_{\max}=\omega^2 A \qquad (A=\text{amplitude})$$

i.e. maximum force on mass *'m'* is $m\omega^2A$ which is being provided by the force of friction between the mass and the cart. Therefore,

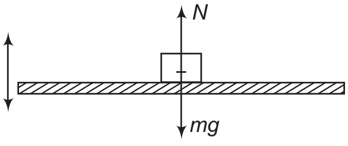
$$\mu_s mg\geq m\omega^2A \quad \text{or} \quad \mu_s\geq\frac{\omega^2A}{g}$$

or
$$\mu_s\geq\left(\frac{2\pi}{T}\right)^2\cdot\frac{A}{g} \quad \text{or} \quad \mu_s\geq\left(\frac{2\pi}{0.75}\right)^2\left(\frac{0.05}{9.8}\right) \qquad (A=50\text{ mm})$$

or
$$\mu_s\geq 0.358$$

Thus, the minimum value of μ_s should be 0.358. **Ans.**

Example 8 *A block is kept over a horizontal platform, executing vertical SHM of angular frequency* ω. *Find maximum amplitude of oscillations, so that the block does not leave contact with the platform.*



Solution At mean position, acceleration, $a = 0$

$$\Rightarrow \qquad N = mg \qquad (N = \text{normal reaction})$$

Below the mean position, acceleration is upwards (towards the mean position)

$$\therefore \qquad N - mg = ma \quad \text{or} \quad N = m(g + a)$$

Above the mean position, acceleration is downwards (towards the mean position)

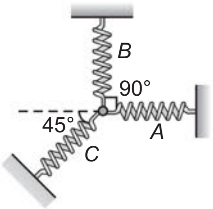
$$\therefore \qquad mg - N = ma \quad \text{or} \quad N = m\,(g - a)$$

In this case, N decreases as 'a' increases. At the extreme position acceleration is maximum $(=\omega^2 A)$, so N is minimum. When the block leaves contact with the plank N becomes zero.

$$\therefore \qquad 0 = m(g - \omega^2 A) \quad \text{or} \quad A = \frac{g}{\omega^2}$$

Therefore, the maximum value of amplitude A for not leaving the contact is $\frac{g}{\omega^2}$.

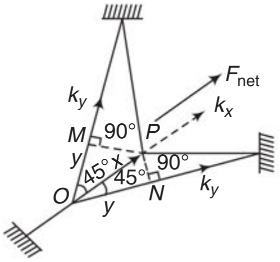
Example 9 *A particle of mass m is attached with three springs A, B and C of equal force constants k as shown in figure. The particle is pushed slightly against the spring C and released. Find the time period of oscillation.*



Solution $OP = x$

$$\angle POM = \angle PON \approx 45°$$

$$y = x \cos 45° = \frac{x}{\sqrt{2}}$$



Net restoring force,

$$F_{\text{net}} = -\,[kx + 2ky \cos 45°\,]$$

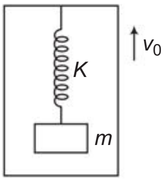
$$= -\,(2k)\,x \qquad \left(\text{as } y = \frac{x}{\sqrt{2}}\right)$$

$$\therefore \qquad k_e = 2\,k$$

Now,

$$T = 2\pi\sqrt{\frac{m}{k_e}} = 2\pi\sqrt{\frac{m}{2k}}$$

Example 10 *A spring block system is kept inside a lift moving with a constant velocity v_0 as shown in figure. Block is in equilibrium and at rest with respect to lift. The lift is suddenly stopped at time $t = 0$. Taking upward direction as the positive direction, write x-t equation of the block.*



Solution Lift is suddenly stopped but block will not stop instantly. It will have same velocity v_0 at $t = 0$. But this is the velocity at its mean position (as it was at rest w.r.t lift). So, this is also its maximum velocity of SHM.

$$\therefore \qquad v_0 = v_{\max} = \omega A \;\Rightarrow\; A = \frac{v_0}{\omega} \qquad \left(\text{where, } \omega = \sqrt{\frac{K}{m}}\right)$$

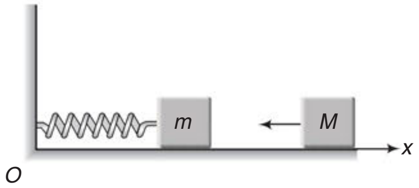
Now, at $t = 0$, block is at mean position and has a velocity v_0 in upward or positive direction. Therefore, the x-t equation is

$$x = A \sin \omega t \qquad \textbf{Ans.}$$

where,

$$A = \frac{v_0}{\omega} \text{ and } \omega = \sqrt{\frac{K}{m}}$$

Example 11 *One end of an ideal spring is fixed to a wall at origin O and axis of spring is parallel to x-axis. A block of mass* $m = 1$ *kg is attached to free end of the spring and it is performing SHM. Equation of position of the block in co-ordinate system shown in figure is* $x = 10 + 3\sin(10t)$. *Here, t is in second and x in cm. Another block of mass* $M = 3$ *kg, moving towards the origin with velocity 30 cm/s collides with the block performing SHM at* $t = 0$ *and gets stuck to it. Calculate*



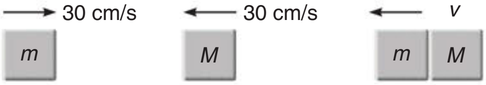
(a) new amplitude of oscillations,

(b) new equation for position of the combined body,

(c) loss of energy during collision. Neglect friction.

Solution (a) Initially, $\omega^2 = \frac{k}{m}$

$$\therefore \qquad k = m\omega^2 = (1)\,(10)^2 = 100 \text{ N/m}$$



At $t = 0$, block of mass m is at mean position ($x = 10$ cm) and moving towards positive x-direction with velocity $A\omega$ or 30 cm/s.

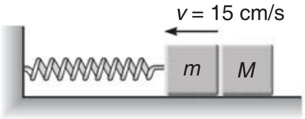
From conservation of linear momentum,

$$(M + m)v = M(30) - m(30)$$

Substituting the values, we have

$v =$ velocity of combined mass just after collision = 15 cm/s or 0.15 m/s

From conservation of mechanical energy,



$$\frac{1}{2}(M + m)v^2 = \frac{1}{2}k(A')^2$$

Here, A' = new amplitude of oscillation of combined mass

$$\therefore \qquad A' = \left(\sqrt{\frac{M + m}{k}}\right)v = \left(\frac{4}{100}\right)^{1/2}(0.15) = 0.03 \text{ m}$$

or $\qquad A' = 3$ cm **Ans.**

(b) New angular frequency $\omega' = \sqrt{\frac{k}{M + m}} = \sqrt{\frac{100}{4}} = 5$ rad/s

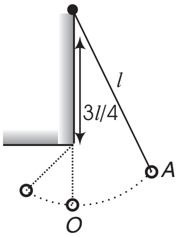
$$\therefore \qquad x' = 10 - 3\sin 5t$$ **Ans.**

(c) Loss of mechanical energy $E_f - E_i$

$$= \frac{1}{2}(1)(0.3)^2 + \frac{1}{2}(3)(0.3)^2 - \frac{1}{2}(4)(0.15)^2$$

$$= 0.135 \text{ J}$$ **Ans.**

Type 6. *Time period of a periodic motion which is not completely simple harmonic.*

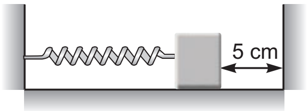


Example 12 *A pendulum has a period T for small oscillations. An obstacle is placed directly beneath the pivot, so that only the lowest one-quarter of the string can follow the pendulum bob when it swings to the left of its resting position. The pendulum is released from rest at a certain point. How long will it take to return to that point again ? In answering this question, you may assume that the angle between the moving string and the vertical stays small throughout the motion.*

Solution Half the oscillation is completed with length l and rest half with length $\frac{l}{4}$.

$$T = \frac{T_1}{2} + \frac{T_2}{2} = \frac{1}{2}\left[2\pi\sqrt{\frac{l}{g}} + 2\pi\sqrt{\frac{\frac{l}{4}}{g}}\right]$$

$$= \frac{3}{4}\left[2\pi\sqrt{\frac{l}{g}}\right] = \frac{3}{4}T, \text{ where } T = 2\pi\sqrt{\frac{l}{g}} \qquad \textbf{Ans.}$$



Example 13 *A block of mass 100 g attached to a spring of stiffness 100 N/m is lying on a frictionless floor as shown. The block is moved to compress the spring by 10 cm and released. If the collision with the wall is elastic then find the time period of oscillations.*

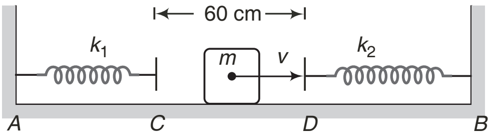
Solution The given distance on RHS 5 cm is $\frac{A}{2}$ and from 0 to $\frac{A}{2}$ time taken is $\frac{T}{12}$.

$$T = t_{\text{LHS}} + t_{\text{RHS}} = \frac{T}{2} + 2\left(\frac{T}{12}\right)$$

$$= \frac{2}{3}T = \frac{2}{3}(2\pi)\sqrt{\frac{m}{k}}$$

$$= \frac{4\pi}{3}\sqrt{\frac{0.1}{100}} = 0.133 \text{ s} \qquad \textbf{Ans.}$$

Example 14 *Two light springs of force constants k_1 and k_2 and a block of mass m are in one line AB on a smooth horizontal table such that one end of each spring is fixed on rigid supports and the other end is free as shown in the figure. The distance CD between the free ends of the spring is 60 cm. If the block moves along AB with a velocity 120 cm/s in between the springs, calculate the period of oscillation of the block. (Take $k_1 = 1.8$ N/m, $k_2 = 3.2$ N/m, $m = 200$ g)* **(JEE 1985)**



Solution Between C and D block will move with constant speed of 120 cm/s. Therefore, period of oscillation will be (starting from C).

$$T = t_{CD} + \frac{T_2}{2} + t_{DC} + \frac{T_1}{2}$$

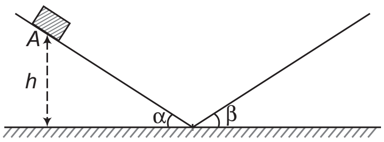
Here, $$T_1 = 2\pi\sqrt{\frac{m}{k_1}} \text{ and } T_2 = 2\pi\sqrt{\frac{m}{k_2}}$$

and $$t_{CD} = t_{DC} = \frac{60}{120} = 0.5 \text{ s}$$

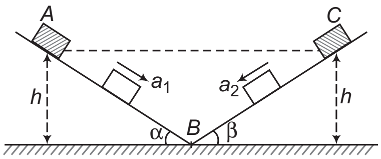
$\therefore$ $$T = 0.5 + \frac{2\pi}{2}\sqrt{\frac{0.2}{3.2}} + 0.5 + \frac{2\pi}{2}\sqrt{\frac{0.2}{1.8}}$$

$$T = 2.82 \text{ s}$$ **Ans.**

Example 15 *A block is released from point A as shown in figure. All surfaces are smooth and there is no loss of mechanical energy anywhere. Find the time period of oscillations of block.*



Solution As there is no loss of mechanical energy, the block rises upto the same height 'h' on other side also.



$$AB = \frac{h}{\sin\alpha}, \; BC = \frac{h}{\sin\beta}$$

$$a_1 = g\sin\alpha, \; a_2 = g\sin\beta$$

$$u_A = u_C = 0$$

Using $$t = \sqrt{\frac{2s}{a}}$$ (with $u = 0$)

$\therefore$ Time period of oscillations,

$$T = 2t_{AB} + 2t_{CB} = 2(t_{AB} + t_{CB})$$

$$= 2\left[\sqrt{\frac{2 \times \frac{h}{\sin\alpha}}{g\sin\alpha}} + \sqrt{\frac{2 \times \frac{h}{\sin\beta}}{g\sin\beta}}\right]$$

$$= 2\sqrt{\frac{2h}{g}}\,[\text{cosec}\,\alpha + \text{cosec}\,\beta]$$ **Ans.**

Type 7. *When point of suspension of the pendulum has an acceleration* **a**.

Concept

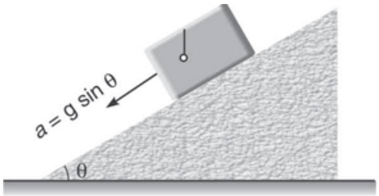
As we have discussed in the theory, time period in this case is

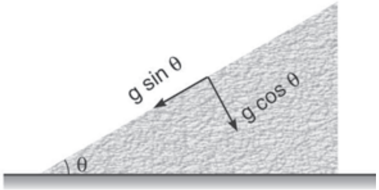
$$T = 2\pi\sqrt{\frac{l}{g_e}}$$

where, $$\mathbf{g}_e = \mathbf{g} - \mathbf{a} \text{ or } \mathbf{g} + (-\mathbf{a}) \text{ and } g_e = |\mathbf{g}_e|$$

Example 16 *A simple pendulum of length l is suspended from the ceiling of a cart which is sliding without friction on an inclined plane of inclination θ. What will be the time period of the pendulum?*

Solution Here, point of suspension has an acceleration. $a = g \sin\theta$ (down the plane). Further, $\mathbf{g}$ can be resolved into two components $g\sin\theta$ (along the plane) and $g\cos\theta$ (perpendicular to plane).





$$\therefore \qquad \mathbf{g}_{\text{eff}} = \mathbf{g} - \mathbf{a} = \mathbf{g} + (-\mathbf{a})$$

Resultant of $\mathbf{g}$ and $-\mathbf{a}$ will be $g\cos\theta$.

$$\therefore \qquad g_{\text{eff}} = g\cos\theta \qquad \text{(perpendicular to plane)}$$

$$\therefore \qquad T = 2\pi\sqrt{\frac{l}{|\mathbf{g}_{\text{eff}}|}} = 2\pi\sqrt{\frac{l}{g\cos\theta}} \qquad \textbf{Ans.}$$

Note *If* $\theta = 0°$, $T = 2\pi\sqrt{\frac{l}{g}}$ *which is quiet obvious.*

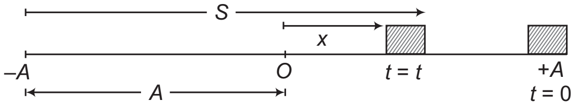
Type 8. *When displacement is not measured from the mean position.*

Concept

In most of the x-t equations of SHM, x is measured from the mean position. In this type of problems, we have to write S-t equation. But S here is not measured from the mean position. The method can be best explained by the following example:

Example 17 *A block in SHM starts from $+A$ position. Write S-t equation of the block, if S is measured from $-A$.*

Solution



When the block starts from $+A$ and x at any time 't' is measured from the mean position, then

$$x = A\cos\omega t$$

In the figure, we can see that

$$S = A + x \quad \text{or} \quad S = A + A\cos\omega t \quad \text{or} \quad S = A(1+\cos\omega t) \qquad \textbf{Ans.}$$

Check From the equation we can see that,

$$S = 2A \text{ at } t = 0$$

$$S = A \text{ at } t = \frac{T}{4} \text{ and } \omega = \frac{2\pi}{T} \Rightarrow \omega t = \frac{\pi}{2}$$

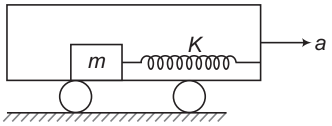
$$S = 0 \text{ at } T = \frac{T}{2} \text{ and } \omega = \frac{2\pi}{T} \Rightarrow \omega t = \pi$$

Type 9. *Based on the concept of pseudo force.*

Concept

If a block is observed from an accelerating or non-inertial frame of reference, a pseudo force ($= -m\mathbf{a}$) has to be applied on the block. Here, 'm' is the mass of the block and $\mathbf{a}$ the acceleration of frame of reference.

Example 18 *A spring block system is kept inside the smooth surface of a trolley as shown in figure.*



At $t = 0$, trolley is given an acceleration 'a' in the direction shown in figure.

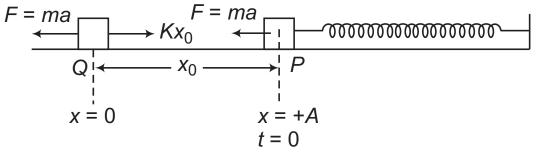
Write S - t equation of the block

(a) with respect to trolley.

(b) with respect to ground.

Note *S has to be measured from the starting point (at $t = 0$) not from the mean position of SHM with respect to trolley.*

Solution (a) Trolley is an accelerating or non-inertial frame. So, a pseudo force $F = ma$ has to be applied on the block towards left.



Here, P or natural length of the spring is not the mean position (of SHM of the block with respect to trolley).

Let mean position (where $\mathbf{F}_{\text{net}} = 0$) is obtained after an extension of x_0. Then

$$ma = kx_0 \Rightarrow x_0 = \frac{ma}{k}$$

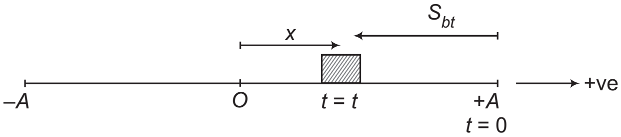
This x_0 is also the amplitude of SHM of block with respect to trolley.

$\therefore$ $$A = x_0 = \frac{ma}{k}$$

Further, at $t = 0$, block is at $x = +A$.

Therefore, x - t equation of block is, $\quad x = A\cos\omega t \quad$ (where, $\omega = \sqrt{\frac{k}{m}}$)

But in this equation x is measured from the mean position and we have to measure S from the starting point ($= +A$)



From the figure we can see that,

S_{bt} = displacement of block with respect to trolley.

$$= -(A - x)$$

$$= -(A - A\cos\omega t)$$

$$S_{bt} = (A\cos\omega t - A)$$ **Ans.**

(b) Displacement of trolley at time 't' is

$$S_t = \frac{1}{2}at^2$$

Now $$S_{bt} = S_b - S_t$$

∴ $$S_b = S_{bt} + S_t$$

or S_b = displacement of block with respect to ground.

or $$S_b = (A\cos\omega t - A) + \frac{1}{2}at^2$$ **Ans.**

Type 10. *Distance travelled in a given time interval.*

Concept

Linear speed of particle in SHM is not constant. Therefore, we cannot apply,

distance = speed × time

How to Solve?

From the given x-t equation, find the starting point, amplitude and time period of oscillations.

Example 19 *x-t equation of a particle in SHM is*

$$x = (4\,cm)\cos\left(\frac{\pi}{2}t\right)$$

Here, t is in seconds. Find the distance travelled by the particle in first three seconds.

Solution $A = 4$ cm

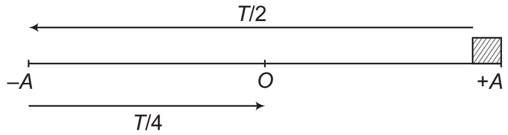
$$\omega = \left(\frac{\pi}{2}\right)\text{rad/s}$$

∴ $$T = \frac{2\pi}{T} = 4\,\text{sec}$$

The given equation is $x = A\cos\omega t$.

Therefore, the particle starts from $x = +A$.

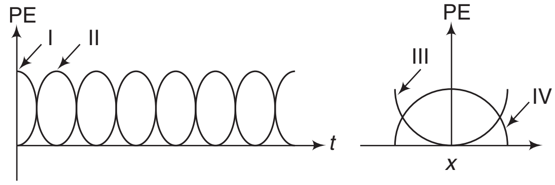
The given time $t = 3$ sec is $\frac{3T}{4}$. So, the particle moves from $+A$ to $-A$ and then from $-A$ to O.



So, distance travelled in the given time interval is $3A$ or 12 cm. **Ans.**

Type 11. *Graph Based problems.*

Example 20 *For a particle executing SHM, the displacement x is given by $x = A\cos\omega t$. Identify the graph which represents the variation of potential energy (PE) as a function of time t and displacement x.* **(JEE 2003)**

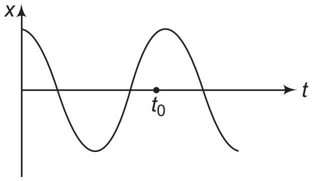


(a) I, III *(b)* II, IV *(c)* II, III *(d)* I, IV

Solution Potential energy is minimum (in this case zero) at mean position ($x = 0$) and maximum at extreme positions ($x = + A$).

At time $t = 0$, $x = A$. Hence, PE should be maximum. Therefore, graph I is correct. Further in graph III, PE is minimum at $x = 0$. Hence, this is also correct.

Example 21 *x - t graph of a particle in SHM is*



At time $t = t_0$, what are the signs of v and a of the particle?

Solution $v = \frac{dx}{dt}$ = slope of x - t graph.

At time $t = t_0$, slope is positive. So, velocity is positive.

$$a \propto -x$$

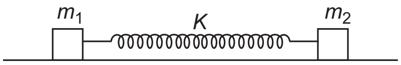
At time $t = t_0$, x is positive. Hence, acceleration is negative because 'a' and 'x' are always of opposite signs.

Note *At time t_0, velocity is positive and acceleration is negative. So, speed of the particle at this instant is decreasing or the particle is moving towards the extreme position.*

Type 12. *Based on two body oscillator system.*

Concept

As discussed in the theory, if the spring is compressed or elongated by x_0 and released then both blocks execute SHM with same time period T (and ω also) but different amplitudes in the inverse ratio of their masses.



$$T = 2\pi\sqrt{\frac{\mu}{k}}$$

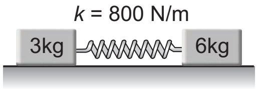
Here, $\mu = \text{reduced mass} = \dfrac{m_1 m_2}{m_1 + m_2}$

$$A \propto \frac{1}{m} \quad \text{or} \quad \frac{A_1}{A_2} = \frac{m_2}{m_1}$$

$\therefore$ $A_1 = \left(\dfrac{m_2}{m_1 + m_2}\right) x_0$

and $A_2 = \left(\dfrac{m_1}{m_1 + m_2}\right) x_0$

Example 22 *The system shown in the figure can move on a smooth surface. They are initially compressed by 6 cm and then released, then choose the correct options.*



(a) *The system performs, SHM with time period* $\dfrac{\pi}{10}$ *s*

(b) *The block of mass 3 kg perform SHM with amplitude 4 cm*

(c) *The block of mass 6 kg will have maximum momentum of 2.40 kg-m/s*

(d) *The time periods of two blocks are in the ratio of* $1:\sqrt{2}$

Solution μ = Reduced mass

$$= \frac{m_1\, m_2}{m_1 + m_2} = 2 \text{ kg}$$

$$T = 2\pi\sqrt{\frac{\mu}{k}}$$

$$= 2\pi\sqrt{\frac{2}{800}} = \frac{\pi}{10} \text{ s} = T_3 = T_6$$

$$A \propto \frac{1}{m}$$

$\therefore$ $\dfrac{A_3}{A_6} = \dfrac{6}{3} = \dfrac{2}{1}$

$\therefore$ $A_3 = 4 \text{ cm} \quad \text{and} \quad A_6 = 2 \text{ cm}$

$$(P_6)_{\max} = m_6\, (v_6)_{\max}$$

$$= m_6\, (\omega A_6)$$

$$= (6)\left(\frac{2\pi}{\pi/10}\right)(2 \times 10^{-2})$$

$$= 2.4 \text{ kg-m/s}$$

$\therefore$The correct options are (a, b, c)

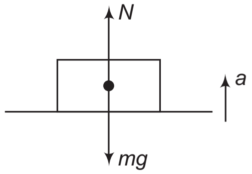
Type 13. *Change in variable force method for finding time period of SHM.*

Concept

(i) Two types of forces may act on a body: constant and variable.

Weight of a body (for small heights) and the upthrust force on a solid when it is completely immersed in a liquid are constant forces.

Spring force, upthrust force when the body is partially immersed in a liquid, tension and normal reaction are variable forces. Tension and normal reaction seem to be constant forces but actually they are variable forces.



In the figure shown,

$N = mg$ if $a = 0$

$N = m(g + a)$ if a is upwards and

$N = m(g - a)$ if a is downwards.

So, normal reaction N is not a constant force.

(ii) In equilibrium, summation of all constant and variable forces is zero.

(iii) When displaced from the mean position, constant forces do not contribute in the net restoring force (therefore in time period). They can only change the mean position.

So, just forget the constant forces. Only change in variable force becomes the net restoring force.

$$\therefore \qquad F_{\text{net}} = -|\Delta \mathbf{F}| = \text{net restoring force.}$$

where, $\mathbf{F}$ is the variable force.

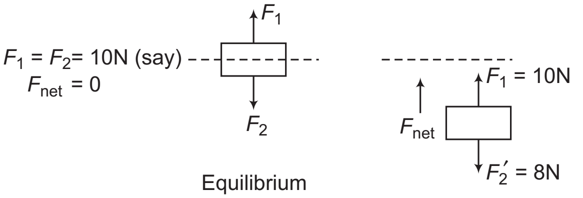
(iv) If two or more than two variable forces are acting on a body and both either increase or decrease (when displaced from the mean position), then

$$\mathbf{F}_{\text{net}} = -[|\Delta \mathbf{F}_1| + |\Delta \mathbf{F}_2|]$$

If one variable force increases and the other decreases then,

$$\mathbf{F}_{\text{net}} = -[|\Delta \mathbf{F}_1| \sim |\Delta \mathbf{F}_2|]$$

Let us understand this concept with an example.



Equilibrium position

Displaced position

In the above figures, F_1 is a constant force and F_2 is a variable force. In equilibrium,

$$F_1 = F_2 = 10\,\text{N (say)}$$

or

$$F_{\text{net}} = 0$$

When displaced from the mean position, F_1 being a constant force remains 10 N.

But, suppose F_2 becomes $F_2' = 8\,\text{N}$.

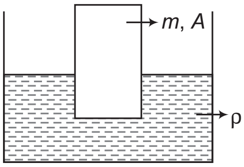
Then, net force is $2\,\text{N} (= F_1 - F_2')$ in upward direction or towards the mean position. We can see that this net force is also equal to change (here decrease) in variable force F_2.

How to Solve?

- Consider a mean or equilibrium position of the body.
- Displace the body from the mean position and find the change(s) in variable force(s) and calculate the net restoring force by the method discussed above. This net restoring force should be of type

$$F = -kx \Rightarrow \text{Now, } T = 2\pi\sqrt{\frac{m}{k}}$$

Example 23 *A plank of mass 'm' and area of cross-section A is floating in a non-viscous liquid of density ρ. When displaced slightly from the mean position, it starts oscillating. Prove that oscillations are simple harmonic and find its time period.*



Solution Two forces are acting on the plank: weight and upthrust. Weight is a constant force. So, forget it. Upthrust (if partially immersed) is a variable force. When displaced downwards by a distance x, then

$$\begin{aligned}\text{Net restoring force } F_{\text{net}} &= -\,[\text{change or increase in variable force upthrust}]\\ &= -\,[(\text{extra immersed volume})(\text{density of liquid})(g)]\\ &= -\,[(Ax)(\rho)(g)]\end{aligned}$$

This force is of type $F = -kx$.

So, motion is simple harmonic, where $k = \rho Ag$

$$\therefore \qquad T = 2\pi\sqrt{\frac{m}{k}} \quad \text{or} \quad T = 2\pi\sqrt{\frac{m}{\rho Ag}} \qquad \textbf{Ans.}$$

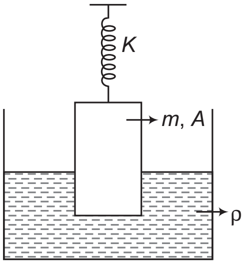
Note (i) *Upthrust force is given by*

$$F = (\text{immersed volume of solid})\,(\text{density of liquid})\,(g)$$
$$= V_i \rho g \Rightarrow \therefore \quad \Delta F = (\Delta V_i)\rho g \qquad [\text{as } \rho \text{ and } g \text{ are constant}]$$

(ii) *In the above problem, upthrust is just like a spring force of force constant:*

$$k = \rho Ag$$

Example 24 *A plank of mass 'm' and area of cross-section A is floating as shown in figure. When slightly displaced from mean position, plank starts oscillations. Find time period of these oscillations.*



Solution Three forces are acting on the plank :

(i) weight (ii) spring force

(iii) upthrust

Weight is a constant force. So, it will not contribute in the time period. Spring force and upthrust are variable forces. When displaced downwards from the mean position, both forces increase.

So, their force constants are additive

$$\therefore \qquad k_e = k + \rho A g$$

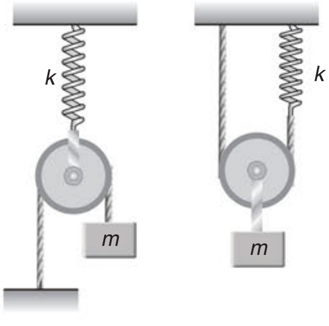
$$\therefore \qquad T = 2\pi\sqrt{\frac{m}{k_e}}$$

$$= 2\pi\sqrt{\frac{m}{k+\rho A g}} \qquad \textbf{Ans.}$$

Note *If the plank oscillates with fully immersed position, then upthrust also becomes a constant force. So, the only varibale force remains kx. Therefore,*

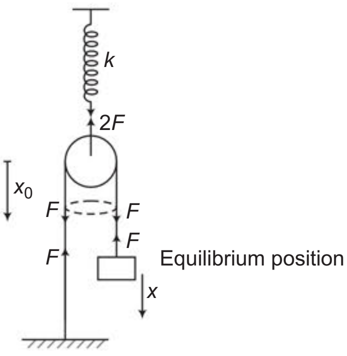
$$T = 2\pi\sqrt{\frac{m}{k}}$$

Example 25 *Figure shows a system consisting of a massless pulley, a spring of force constant k and a block of mass m. If the block is slightly displaced vertically down from its equilibrium position and released, find the period of its vertical oscillation in cases (a) and (b).*



(a) (b)

Solution (a)



Two forces are acting on the block :

(i) weight

(ii) tension

Weight is a constant force which does not contribute in time period. Tension is a variable force. Let tension increases by F when displaced from the equilibrium position by x. This increase in tension is the change in variable force. So, this is also the net restoring force. The distribution of this increase in tension F is as shown in figure.

Spring gets an extra stretching force $2F$. Let x_0 is the extra extension in the spring by this extra force $2F$. Then,

$$2F = kx_0$$

or
$$x_0 = \frac{2F}{k} \qquad \ldots\text{(i)}$$

Now, we can see that by this extra extension of spring, pulley will also come down by the same distance x_0 and

$$x = 2x_0 = 2\left(\frac{2F}{k}\right)$$

$\Rightarrow$
$$F = \frac{k}{4}x$$

But F is also the net restoring force on block. So, we can write

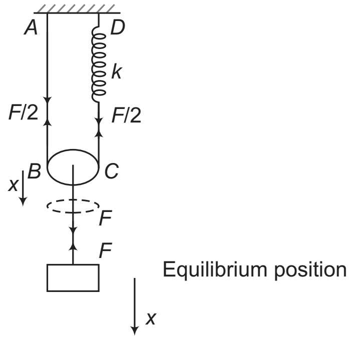
$$F = -\left(\frac{k}{4}\right)x$$

$\therefore$
$$T = 2\pi\sqrt{\frac{m}{k/4}} \qquad (\text{as } k_e = k/4)$$

$$= 2\pi\sqrt{\frac{4m}{k}}$$

Ans.

(b) Using the same concepts as discussed above,



$$\frac{F}{2} = kx_0$$

or
$$x_0 = \frac{F}{2k}$$

But this time,

x_0 = extra extension on spring.

= extra increase in length $ABCD$

= $2x$

or
$$\frac{F}{2k} = 2x$$

or
$$F = 4kx$$

Due to the restoring nature of F we can write,

$$F = -(4k)x$$

$\therefore$
$$T = 2\pi\sqrt{\frac{m}{4k}} \qquad (\text{as } k_e = 4k)$$

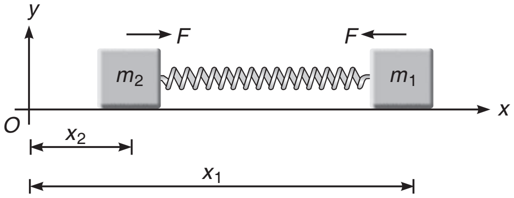
Miscellaneous Examples

Example 29 *For a two body oscillator system, prove the relation,*

$$T = 2\pi\sqrt{\frac{\mu}{k}}$$

where, $\mu = \frac{m_1 m_2}{m_1 + m_2}$ *= reduced mass*

Solution A system of two bodies connected by a spring so that both are free to oscillate simple harmonically along the length of the spring constitutes a two body harmonic oscillator.



Suppose, two masses m_1 and m_2 are connected by a horizontal massless spring of force constant k, so as to be free to oscillate along the length of the spring on a frictionless horizontal surface.

Let l_0 be the natural length of the spring and let x_1 and x_2 be the coordinates of the two masses at any instant of time. Then,

Extension of the spring $$x = (x_1 - x_2) - l_0 \quad \text{...(i)}$$

For $x > 0$, the spring force $F = kx$ acts on the two masses in the directions shown in above figure.

Thus, we can write

$$m_1 \frac{d^2x_1}{dt^2} = -kx \quad \text{...(ii)}$$

$$m_2 \frac{d^2x_2}{dt^2} = kx \quad \text{...(iii)}$$

Multiplying Eq. (ii) by m_2 and Eq. (iii) by m_1 and subtracting the latter from the former, we have

$$m_1m_2 \frac{d^2x_1}{dt^2} - m_1m_2 \frac{d^2x_2}{dt^2} = -(m_2 + m_1)\,kx$$

or $$m_1m_2 \frac{d^2(x_1 - x_2)}{dt^2} = -kx\,(m_1 + m_2)$$

or $$\left(\frac{m_1m_2}{m_1 + m_2}\right) \frac{d^2}{dt^2}(x_1 - x_2) = -kx \quad \text{...(iv)}$$

Differentiating Eq. (i), twice with respect to time, we have

$$\frac{d^2x}{dt^2} = \frac{d^2}{dt^2}(x_1 - x_2)$$

Also, $$\frac{m_1 m_2}{m_1 + m_2} = \mu = \text{ reduced mass of the two blocks}$$

Substituting these values in Eq. (iv), we have

$$\mu \frac{d^2x}{dt^2} = -kx$$

or $$\mu a_r = -kx \qquad \left(\text{Here, } a_r = \frac{d^2x}{dt^2} = \frac{d^2x_1}{dt^2} - \frac{d^2x_2}{dt^2} = \text{Relative acceleration}\right)$$

This, is the standard differential equation of SHM. Time period of which is

$$T = 2\pi\sqrt{\left|\frac{x}{a_r}\right|} \quad \text{or} \quad T = 2\pi\sqrt{\frac{\mu}{k}}$$

Example 30 *Two particles move parallel to x-axis about the origin with the same amplitude and frequency. At a certain instant they are found at distance* $\frac{A}{3}$ *from the origin on opposite sides but their velocities are found to be in the same direction. What is the phase difference between the two ?*

Solution Let equations of two SHM be

$$x_1 = A \sin \omega t \qquad \dots \text{(i)}$$

$$x_2 = A \sin (\omega t + \phi) \qquad \dots \text{(ii)}$$

Give that $$\frac{A}{3} = A \sin \omega t$$

and $$-\frac{A}{3} = A \sin (\omega t + \phi)$$

Which gives $$\sin \omega t = \frac{1}{3} \qquad \dots \text{(iii)}$$

$$\sin (\omega t + \phi) = -\frac{1}{3} \qquad \dots \text{(iv)}$$

From Eq. (iv),

$$\sin \omega t \cos \phi + \cos \omega t \sin \phi = -\frac{1}{3}$$

$\Rightarrow$ $$\frac{1}{3}\cos \phi + \sqrt{1 - \frac{1}{9}} \sin \phi = -\frac{1}{3}$$

Solving this equation, we get

or $$\cos \phi = -1, \frac{7}{9}$$

$\Rightarrow$ $$\phi = \pi \quad \text{or} \quad \cos^{-1}\left(\frac{7}{9}\right)$$

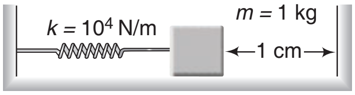
Differentiating Eqs. (i) and (ii), we obtain

$$v_1 = A\omega \cos \omega t \quad \text{and} \quad v_2 = A\omega \cos (\omega t + \phi)$$

If we put $\phi = \pi$, we find v_1 and v_2 are of opposite signs. Hence, $\phi = \pi$ is not acceptable.

$\therefore$ $$\phi = \cos^{-1}\left(\frac{7}{9}\right)$$ **Ans.**

Example 31 *For the arrangement shown in figure, the spring is initially compressed by* 3 *cm. When the spring is released the block collides with the wall and rebounds to compress the spring again.*



(a) *If the coefficient of restitution is* $\frac{1}{\sqrt{2}}$, *find the maximum compression in the spring after collision.*

(b) *If the time starts at the instant when spring is released, find the minimum time after which the block becomes stationary.*

Solution (a) Velocity of the block just before collision,

$$\frac{1}{2}mv_0^2 + \frac{1}{2}kx^2 = \frac{1}{2}kx_0^2$$

or
$$v_0 = \sqrt{\frac{k}{m}(x_0^2 - x^2)}$$

Here, $x_0 = 0.03$ m, $x = 0.01$ m, $k = 10^4$ N/m, $m = 1$ kg

$\therefore$
$$v_0 = 2\sqrt{2} \text{ m/s}$$

After collision,
$$v = ev_0 = \frac{1}{\sqrt{2}} 2\sqrt{2} = 2 \text{ m/s}$$

Maximum compression in the spring is

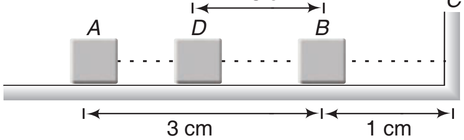
$$\frac{1}{2}kx_m^2 = \frac{1}{2}kx^2 + \frac{1}{2}mv^2$$

or
$$x_m = \sqrt{x^2 + \frac{m}{k}v^2}$$

$$= \sqrt{(0.01)^2 + \frac{(1)(2)^2}{10^4}} \text{ m} = 2.23 \text{ cm}$$ **Ans.**

(b) In the case of spring-mass system, since the time period is independent of the amplitude of oscillation.

$$\text{Time} = t_{AB} + t_{BC} + t_{CB} + t_{BD}$$
$$= \frac{T_0}{4} + \left(\frac{T_0}{2\pi}\right)\sin^{-1}\left(\frac{1}{3}\right) + \left(\frac{T_0}{2\pi}\right)\sin^{-1}\left(\frac{1}{2.23}\right) + \frac{T_0}{4}$$

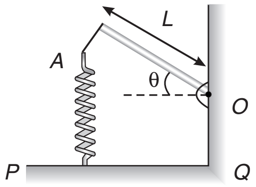


Here,
$$T_0 = 2\pi\sqrt{\frac{m}{k}}$$

Substituting the values, we get

$$\text{Total time} = \sqrt{\frac{m}{k}}\left[\pi + \sin^{-1}\left(\frac{1}{3}\right) + \sin^{-1}\left(\frac{1}{2.23}\right)\right]$$ **Ans.**

Example 32 *A long uniform rod of length L and mass M is free to rotate in a horizontal plane about a vertical axis through its one end ‘O’. A spring of force constant k is connected between one end of the rod and PQ. When the rod is in equilibrium it is parallel to PQ.*



(a) *What is the period of small oscillation that result when the rod is rotated slightly and released?*

(b) *What will be the maximum speed of the displaced end of the rod, if the amplitude of motion is θ_0?*

Solution (a) Restoring torque about ‘O’ due to elastic force of the spring

$$\tau = -FL = -kyL \qquad (F = ky)$$

$$\tau = -kL^2\theta \qquad (\text{as } y = L\theta)$$

$$\tau = I\alpha = \frac{1}{3}ML^2\frac{d^2\theta}{dt^2}$$

$$\frac{1}{3}ML^2\frac{d^2\theta}{dt^2} = -kL^2\theta$$

$$\frac{d^2\theta}{dt^2} = -\frac{3k}{M}\theta$$

$$\omega = \sqrt{\frac{3k}{M}}$$

$$\Rightarrow \qquad T = 2\pi\sqrt{\frac{M}{3k}}$$ **Ans.**

(b) In angular SHM, maximum angular velocity

$$\left(\frac{d\theta}{dt}\right)_{\max} = \theta_0\,\omega = \theta_0\sqrt{\frac{3k}{M}}$$

$$v = r\left(\frac{d\theta}{dt}\right)$$

So ,

$$v_{\max} = L\left(\frac{d\theta}{dt}\right)_{\max} = L\theta_0\sqrt{\frac{3k}{M}}$$ **Ans.**

Example 33 *A block with a mass of 2 kg hangs without vibrating at the end of a spring of spring constant 500 N/m, which is attached to the ceiling of an elevator. The elevator is moving upwards with an acceleration $\frac{g}{3}$. At time $t = 0$, the acceleration suddenly ceases.*

(a) *What is the angular frequency of oscillation of the block after the acceleration ceases?*

(b) *By what amount is the spring stretched during the time when the elevator is accelerating?*

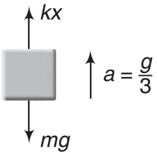
(c) *What is the amplitude of oscillation and initial phase angle observed by a rider in the elevator in the equation, $x = A\sin(\omega t + \phi)$? Take the upward direction to be positive. Take $g = 10.0\ m/s^2$.*

Solution (a) Angular frequency

$$\omega = \sqrt{\frac{k}{m}} \quad \text{or} \quad \omega = \sqrt{\frac{500}{2}}$$

or $$\omega = 15.81 \text{ rad/s}$$ **Ans.**

(b) Equation of motion of the block (while elevator is accelerating) is,



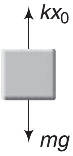
$$kx - mg = ma = m\frac{g}{3}$$

$\therefore$ $$x = \frac{4mg}{3k}$$

$$= \frac{(4)(2)(10)}{(3)(500)} = 0.053 \text{ m}$$

or $$x = 5.3 \text{ cm}$$ **Ans.**

(c) (i) In equilibrium when the elevator has zero acceleration, the equation of motion is,



$$kx_0 = mg$$

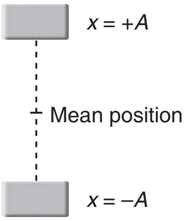
or $$x_0 = \frac{mg}{k} = \frac{(2)(10)}{500}$$

$$= 0.04 \text{ m} = 4 \text{ cm}$$

$\therefore$ Amplitude $$A = x - x_0 = 5.3 - 4.0$$

$$= 1.3 \text{ cm}$$ **Ans.**

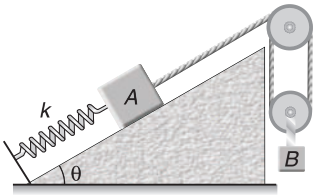
(ii) At time $t = 0$, block is at $x = -A$. Therefore, substituting $x = -A$ and $t = 0$ in equation,



$$x = A \sin(\omega t + \phi)$$

We get initial phase $$\phi = \frac{3\pi}{2}$$ **Ans.**

Example 34 *Calculate the angular frequency of the system shown in figure. Friction is absent everywhere and the threads, spring and pulleys are massless. Given that* $m_A = m_B = m$.



Solution Let x_0 be the extension in the spring in equilibrium. Then, equilibrium of A and B give,

$$T = kx_0 + mg\sin\theta \qquad \text{...(i)}$$

and
$$2T = mg \qquad \text{...(ii)}$$

Here, T is the tension in the string. Now, suppose A is further displaced by a distance x from its mean position and v be its speed at this moment. Then, B lowers by $\frac{x}{2}$ and speed of B at this instant will be $\frac{v}{2}$. Total energy of the system in this position will be,

$$E = \frac{1}{2}k(x + x_0)^2 + \frac{1}{2}m_A v^2 + \frac{1}{2}m_B\left(\frac{v}{2}\right)^2 + m_A g h_A - m_B g\, h_B$$

or
$$E = \frac{1}{2}k(x + x_0)^2 + \frac{1}{2}mv^2 + \frac{1}{8}mv^2 + mgx\sin\theta - mg\frac{x}{2}$$

or
$$E = \frac{1}{2}k(x + x_0)^2 + \frac{5}{8}mv^2 + mgx\sin\theta - mg\frac{x}{2}$$

Since, E is constant,
$$\frac{dE}{dt} = 0$$

or
$$0 = k(x + x_0)\frac{dx}{dt} + \frac{5}{4}mv\left(\frac{dv}{dt}\right) + mg(\sin\theta)\left(\frac{dx}{dt}\right) - \frac{mg}{2}\left(\frac{dx}{dt}\right)$$

Substituting,
$$\frac{dx}{dt} = v \Rightarrow \frac{dv}{dt} = a$$

and
$$kx_0 + mg\sin\theta = \frac{mg}{2} \qquad \text{[From Eqs. (i) and (ii)]}$$

We get,
$$\frac{5}{4}m\,a = -kx$$

Since,
$$a \propto -x$$

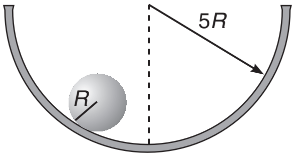
Motion is simple harmonic, time period of which is,

$$T = 2\pi\sqrt{\left|\frac{x}{a}\right|}$$

$$= 2\pi\sqrt{\frac{5m}{4k}}$$

∴
$$\omega = \frac{2\pi}{T} = \sqrt{\frac{4k}{5m}} \qquad \textbf{Ans.}$$

Example 35 *A solid sphere (radius = R) rolls without slipping in a cylindrical through (radius = 5R). Find the time period of small oscillations.*



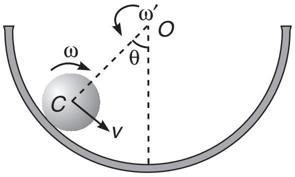
Solution For pure rolling to take place,

$$v = R\omega$$

ω' = angular velocity of COM of sphere C about O

$$= \frac{v}{4R} = \frac{R\omega}{4R} = \frac{\omega}{4}$$

$$\therefore \quad \frac{d\omega'}{dt} = \frac{1}{4}\frac{d\omega}{dt}$$



or $$\alpha' = \frac{\alpha}{4}$$

$$\alpha = \frac{a}{R} \text{ for pure rolling}$$

where, $$a = \frac{g\sin\theta}{1 + \frac{I}{mR^2}}$$

$$= \frac{5g\sin\theta}{7}$$

as, $$I = \frac{2}{5}mR^2$$

$$\therefore \quad \alpha' = \frac{5g\sin\theta}{28R}$$

For small θ, $\sin\theta \approx \theta$, being restoring in nature,

$$\alpha' = -\frac{5g}{28R}\theta$$

$$\therefore \quad T = 2\pi\sqrt{\left|\frac{\theta}{\alpha'}\right|}$$

$$= 2\pi\sqrt{\frac{28R}{5g}}$$ **Ans.**

Example 36 *Consider the earth as a uniform sphere of mass M and radius R. Imagine a straight smooth tunnel made through the earth which connects any two points on its surface. Show that the motion of a particle of mass m along this tunnel under the action of gravitation would be simple harmonic. Hence, determine the time that a particle would take to go from one end to the other through the tunnel.*

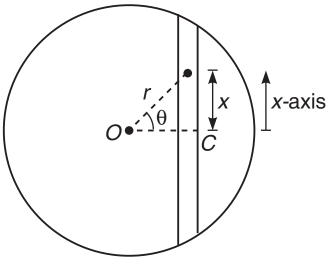
Solution Suppose at some instant, the particle is at radial distance r from centre of earth O. Since, the particle is constrained to move along the tunnel, we define its position as distance x from C. Hence, equation of motion of the particle is,

$$ma_x = F_x$$

The gravitational force on mass m at distance r is,

$$F = \frac{GMmr}{R^3} \qquad \text{(towards } O\text{)}$$

Therefore,



$$\begin{aligned} F_x &= -F \sin\theta \\ &= -\frac{GMmr}{R^3}\left(\frac{x}{r}\right) \\ &= -\frac{GMm}{R^3}\cdot x \end{aligned}$$

Since, $F_x \propto -x$, motion is simple harmonic in nature. Further,

$$ma_x = -\frac{GMm}{R^3}\cdot x$$

or

$$a_x = -\frac{GM}{R^3}\cdot x$$

∴ Time period of oscillation is,

$$\begin{aligned} T &= 2\pi\sqrt{\left|\frac{x}{a_x}\right|} \\ &= 2\pi\sqrt{\frac{R^3}{GM}} \end{aligned}$$

The time taken by particle to go from one end to the other is $\frac{T}{2}$.

∴

$$\begin{aligned} t &= \frac{T}{2} \\ &= \pi\sqrt{\frac{R^3}{GM}} \end{aligned}$$

Ans.

Exercises

LEVEL 1

Assertion and Reason

Directions : *Choose the correct option.*

(*a*) *If both **Assertion** and **Reason** are true and the **Reason** is correct explanation of the **Assertion.***

(*b*) *If both **Assertion** and **Reason** are true but **Reason** is not the correct explanation of **Assertion.***

(*c*) *If **Assertion** is true, but the **Reason** is false.*

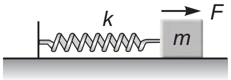
(*d*) *If **Assertion** is false but the **Reason** is true.*

1. Assertion : In $x = A\cos\omega t$, x is the displacement measured from extreme position.
Reason : In the above equation $x = A$ at time $t = 0$.

2. Assertion : A particle is under SHM along the x-axis. Its mean position is $x = 2$, amplitude is $A = 2$ and angular frequency ω. At $t = 0$, particle is at origin, then x-co-ordinate *versus* time equation of the particle will be $x = -2\cos\omega t + 2$.

Reason : At $t = 0$, particle is at rest.

3. Assertion : A spring block system is kept over a smooth surface as shown in figure. If a constant horizontal force F is applied on the block it will start oscillating simple harmonically.



Reason : Time period of oscillation is less than $2\pi\sqrt{\dfrac{m}{k}}$.

4. Assertion : Time taken by a particle in SHM to move from $x = A$ to $x = \dfrac{\sqrt{3}A}{2}$ is same as the time taken by the particle to move from $x = \dfrac{\sqrt{3}A}{2}$ to $x = \dfrac{A}{2}$.

Reason : Corresponding angles rotated in the reference circle are same in the given time intervals.

5. Assertion : Path of a particle in SHM is always a straight line.

Reason : All straight line motions are not simple harmonic.

6. Assertion : In spring block system if length of spring and mass of block both are halved, then angular frequency of oscillations will remain unchanged.

Reason : Angular frequency is given by $\omega = \sqrt{\dfrac{k}{m}}$

7. Assertion : All small oscillations are simple harmonic in nature.

Reason : Oscillations of spring block system are always simple harmonic whether amplitude is small or large.

8. Assertion : In $x = A\cos\omega t$, the dot product of acceleration and velocity is positive for time interval $0 < t < \frac{\pi}{2\omega}$.

Reason : Angle between them is 0°.

9. Assertion : For a given simple harmonic motion displacement (from the mean position) and acceleration have a constant ratio.

Reason : $T = 2\pi\sqrt{\left|\frac{\text{displacement}}{\text{acceleration}}\right|}$

10. Assertion : We can call circular motion also as simple harmonic motion.

Reason : Angular velocity in uniform circular motion and angular frequency in simple harmonic motion have the same meanings.

Objective Questions

Single Correct Option

1. A simple harmonic oscillation has an amplitude A and time period T. The time required to travel from $x = A$ to $x = \frac{A}{2}$ is

(a) $\frac{T}{6}$ (b) $\frac{T}{4}$ (c) $\frac{T}{3}$ (d) $\frac{T}{12}$

2. The potential energy of a particle executing SHM varies sinusoidally with frequency f. The frequency of oscillation of the particle will be

(a) $\frac{f}{2}$ (b) $\frac{f}{\sqrt{2}}$ (c) f (d) $2f$

3. For a particle undergoing simple harmonic motion, the velocity is plotted against displacement. The curve will be

(a) a straight line (b) a parabola

(c) a circle (d) an ellipse

4. A simple pendulum is made of bob which is a hollow sphere full of sand suspended by means of a wire. If all the sand is drained out, the period of the pendulum will

(a) increase (b) decrease

(c) remain same (d) become erratic

5. Two simple harmonic motions are given by $y_1 = a\sin\left[\left(\frac{\pi}{2}\right)t + \phi\right]$ and $y_2 = b\sin\left[\left(\frac{2\pi}{3}\right)t + \phi\right]$. The phase difference between these after 1 s is

(a) zero (b) $\pi/2$

(c) $\pi/4$ (d) $\pi/6$

6. A particle starts performing simple harmonic motion. Its amplitude is A. At one time its speed is half that of the maximum speed. At this moment the displacement is

(a) $\frac{\sqrt{2}A}{3}$ (b) $\frac{\sqrt{3}A}{2}$

(c) $\frac{2A}{\sqrt{3}}$ (d) $\frac{3A}{\sqrt{2}}$

7. Which of the following is not simple harmonic function?

(a) $y = a \sin 2\omega t + b \cos^2 \omega t$
(b) $y = a \sin \omega t + b \cos 2\omega t$
(c) $y = 1 - 2 \sin^2 \omega t$
(d) $y = (\sqrt{a^2 + b^2}) \sin \omega t \cos \omega t$

8. The displacement of a particle varies according to the relation $y = 4(\cos \pi t + \sin \pi t)$. The amplitude of the particle is

(a) 8 units
(b) 2 units
(c) 4 units
(d) $4\sqrt{2}$ units

9. Two pendulums X and Y of time periods 4 s and 4.2 s are made to vibrate simultaneously. They are initially in same phase. After how many vibrations of X, they will be in the same phase again?

(a) 30
(b) 25
(c) 21
(d) 26

10. A mass M is suspended from a massless spring. An additional mass m stretches the spring further by a distance x. The combined mass will oscillate with a period

(a) $2\pi \sqrt{\left\{\frac{(M + m)\,x}{mg}\right\}}$
(b) $2\pi \sqrt{\left\{\frac{mg}{(M + m)\,x}\right\}}$
(c) $2\pi \sqrt{\left\{\frac{(M + m)}{mgx}\right\}}$
(d) $\frac{\pi}{2} \sqrt{\left\{\frac{mg}{(M + m)\,x}\right\}}$

11. Two bodies P and Q of equal masses are suspended from two separate massless springs of force constants k_1 and k_2 respectively. If the two bodies oscillate vertically such that their maximum velocities are equal. The ratio of the amplitude of P to that of Q is

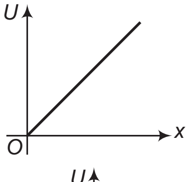
(a) $\sqrt{\frac{k_1}{k_2}}$
(b) $\frac{k_1}{k_2}$
(c) $\sqrt{\frac{k_2}{k_1}}$
(d) $\frac{k_2}{k_1}$

12. A disc of radius R is pivoted at its rim. The period for small oscillations about an axis perpendicular to the plane of disc is

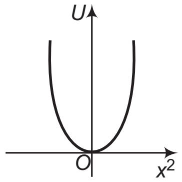
(a) $2\pi\sqrt{\frac{R}{g}}$
(b) $2\pi\sqrt{\frac{2R}{g}}$
(c) $2\pi\sqrt{\frac{2R}{3g}}$
(d) $2\pi\sqrt{\frac{3R}{2g}}$

13. Identify the correct variation of potential energy U as a function of displacement x from mean position (or x^2) of a harmonic oscillator (U at mean position = 0)

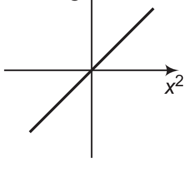
(a)



(b)



(c)



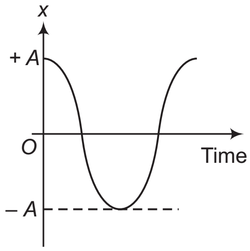
(d) None of these

14. If the length of a simple pendulum is equal to the radius of the earth, its time period will be

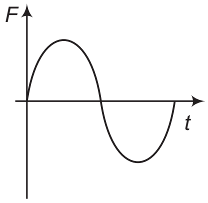
(a) $2\pi\sqrt{R/g}$ (b) $2\pi\sqrt{R/2g}$

(c) $2\pi\sqrt{2R/g}$ (d) infinite

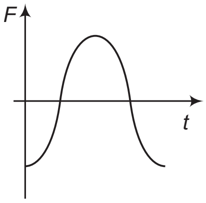
15. The displacement-time (x-t) graph of a particle executing simple harmonic motion is shown in figure. The correct variation of net force F acting on the particle as a function of time is



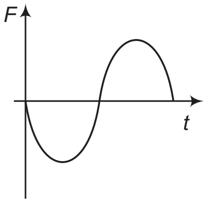
(a)



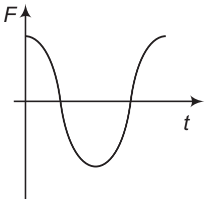
(b)



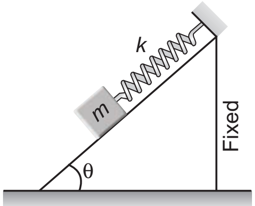
(c)



(d)



16. In the figure shown the time period and the amplitude respectively, when m is left from rest when spring is relaxed are (the inclined plane is smooth)



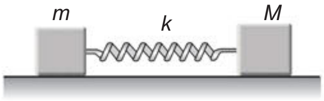
(a) $2\pi\sqrt{\frac{m}{k}}, \frac{mg\sin\theta}{k}$ (b) $2\pi\sqrt{\frac{m\sin\theta}{k}}, \frac{2\,mg\sin\theta}{k}$

(c) $2\pi\sqrt{\frac{m}{k}}, \frac{mg\cos\theta}{k}$ (d) None of these

17. The equation of motion of a particle of mass 1 g is $\frac{d^2x}{dt^2} + \pi^2 x = 0$, where x is displacement (in m) from mean position. The frequency of oscillation is (in Hz)

(a) 1/2 (b) 2 (c) $5\sqrt{10}$ (d) $1/5\sqrt{10}$

18. The spring as shown in figure is kept in a stretched position with extension x when the system is released. Assuming the horizontal surface to be frictionless, the frequency of oscillation is



(a) $\frac{1}{2\pi}\sqrt{\left[\frac{k(M+m)}{Mm}\right]}$ (b) $\frac{1}{2\pi}\sqrt{\left[\frac{mM}{k(M+m)}\right]}$

(c) $\frac{1}{2\pi}\sqrt{\left[\frac{kM}{m+M}\right]}$ (d) $\frac{1}{2\pi}\sqrt{\left[\frac{km}{M+m}\right]}$

19. The mass and diameter of a planet are twice those of earth. What will be the period of oscillation of a pendulum on this planet. It is a second's pendulum on earth?

(a) $\sqrt{2}$ s (b) $2\sqrt{2}$ s (c) $\frac{1}{\sqrt{2}}$ s (d) $\frac{1}{2\sqrt{2}}$ s

20. The resultant amplitude due to superposition of three simple harmonic motions $x_1 = 3\sin\omega t$, $x_2 = 5\sin(\omega t + 37°)$ and $x_3 = -15\cos\omega t$ is

(a) 18 (b) 10 (c) 12 (d) None of these

21. Two SHMs $s_1 = a\sin\omega t$ and $s_2 = b\sin\omega t$ are superimposed on a particle. The s_1 and s_2 are along the directions which makes 37° to each other

(a) the particle will perform SHM
(b) the path of particle is straight line
(c) Both (a) and (b) are correct
(d) Both (a) and (b) are wrong

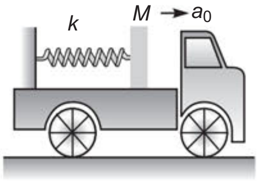
22. The amplitude of a particle executing SHM about O is 10 cm. Then

(a) when the KE is 0.64 times of its maximum KE, its displacement is 6 cm from O
(b) its speed is half the maximum speed when its displacement is half the maximum displacement
(c) Both (a) and (b) are correct
(d) Both (a) and (b) are wrong

23. A particle is attached to a vertical spring and is pulled down a distance 4 cm below its equilibrium and is released from rest. The initial upward acceleration is 0.5 ms^{-2}. The angular frequency of oscillation is

(a) 3.53 rad/s (b) 0.28 rad/s
(c) 1.25 rad/s (d) 0.08 rad/s

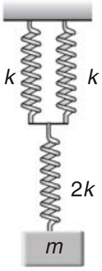
24. A block of mass 1 kg is kept on smooth floor of a truck. One end of a spring of force constant 100 N/m is attached to the block and other end is attached to the body of truck as shown in the figure. At $t = 0$, truck begins to move with constant acceleration 2 m/s^2. The amplitude of oscillation of block relative to the floor of truck is



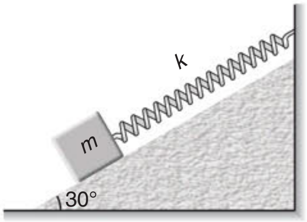
(a) 0.06 m (b) 0.02 m (c) 0.04 m (d) 0.03 m

Subjective Questions

1. Find the period of oscillation of the system shown in figure.



2. A block of mass 0.2 kg is attached to a massless spring of force constant 80 N/m as shown in figure. Find the period of oscillation. Take $g = 10$ m/s^2. Neglect friction.

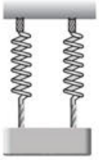


3. A body of weight 27 N hangs on a long spring of such stiffness that an extra force of 9 N stretches the spring by 0.05 m. If the body is pulled downward and released, what is the period ?

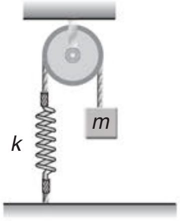
4. A clock with an iron pendulum keeps correct time at 20°C. How much time will it lose or gain in a day if the temperature changes to 40°C. Thermal coefficient of linear expansion $\alpha = 0.000012$ per°C.

5. A 50 g mass hangs at the end of a massless spring. When 20 g more are added to the end of the spring, it stretches 7.0 cm more. (a) Find the spring constant. (b) If the 20 g are now removed, what will be the period of the motion ?

6. An object suspended from a spring exhibits oscillations of period T. Now, the spring is cut in half and the two halves are used to support the same object, as shown in figure. Show that the new period of oscillation is $T/2$.



7. The string, the spring and the pulley shown in figure are light. Find the time period of the mass m.



8. A simple pendulum with a solid metal bob has a period T. What will be the period of the same pendulum if it is made to oscillate in a non-viscous liquid of density one-tenth of the metal of the bob?

9. A particle moves under the force $F(x) = (x^2 - 6x)$ N, where x is in metres. For small displacements from the origin what is the force constant in the simple harmonic motion approximation?

10. The initial position and velocity of a body moving in SHM with period $T = 0.25$ s are $x = 5.0$ cm and $v = 218$ cm/s. What are the amplitude and phase constant of the motion?

11. A point particle of mass 0.1 kg is executing SHM of amplitude 0.1 m. When the particle passes through the mean position, its kinetic energy is 8×10^{-3} J. Write down the equation of motion of this particle when the initial phase of oscillation is 45°.

12. Potential energy of a particle in SHM along x-axis is given by

$$U = 10 + (x - 2)^2$$

Here, U is in joule and x in metre. Total mechanical energy of the particle is 26 J. Mass of the particle is 2 kg. Find

(a) angular frequency of SHM,

(b) potential energy and kinetic energy at mean position and extreme position,

(c) amplitude of oscillation,

(d) x-coordinates between which particle oscillates.

13. A simple pendulum is taken at a place where its separation from the earth's surface is equal to the radius of the earth. Calculate the time period of small oscillations if the length of the string is 1.0 m. Take $g = \pi^2$ m/s^2 at the surface of the earth.

14. A solid cylinder of mass $M = 10$ kg and cross-sectional area $A = 20$ cm^2 is suspended by a spring of force constant $k = 100$ N/m and hangs partially immersed in water. Calculate the period of small oscillations of the cylinder.

15. A simple pendulum of length l and mass m is suspended in a car that is moving with constant speed v around a circle of radius r. Find the period of oscillation and equilibrium position of the pendulum.

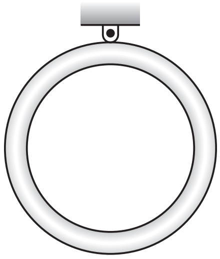
16. A body of mass 0.10 kg is attached to a vertical massless spring with force constant 4.0×10^3 N/m. The body is displaced 10.0 cm from its equilibrium position and released. How much time elapses as the body moves from a point 8.0 cm on one side of the equilibrium position to a point 6.0 cm on the same side of the equilibrium position?

17. A body of mass 200 g is in equilibrium at $x = 0$ under the influence of a force $F(x) = (-100x + 10x^2)$ N.

(a) If the body is displaced a small distance from equilibrium, what is the period of its oscillations?

(b) If the amplitude is 4.0 cm, by how much do we error in assuming that $F(x) = -kx$ at the end points of the motion.

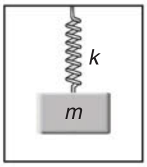
18. A ring of radius r is suspended from a point on its circumference. Determine its angular frequency of small oscillations.



19. A spring mass system is hanging from the ceiling of an elevator in equilibrium. The elevator suddenly starts accelerating upwards with acceleration a. Find

(a) the frequency and

(b) the amplitude of the resulting SHM.



20. A body makes angular simple harmonic motion of amplitude $\pi / 10$ rad and time period 0.05 s. If the body is at a displacement $\theta = \pi / 10$ rad at $t = 0$, write the equation giving angular displacement as a function of time.

21. A particle executes simple harmonic motion of period 16 s. Two seconds later after it passes through the centre of oscillation its velocity is found to be 2 m/s. Find the amplitude.

22. A simple pendulum consists of a small sphere of mass m suspended by a thread of length l. The sphere carries a positive charge q. The pendulum is placed in a uniform electric field of strength E directed vertically upwards. With what period will pendulum oscillate if the electrostatic force acting on the sphere is less than the gravitational force?

Hint: Electrostatic force is given by $\mathbf{F} = q\mathbf{E}$

23. Find the period of oscillation of a pendulum of length l if its point of suspension is

(a) moving vertically up with acceleration a.

(b) moving vertically down with acceleration a ($< g$).

(c) falling freely under gravity

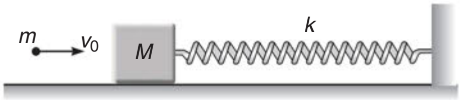
(d) moving horizontally with acceleration a.

24. A block with mass M attached to a horizontal spring with force constant k is moving with simple harmonic motion having amplitude A_1. At the instant when the block passes through its equilibrium position a lump of putty with mass m is dropped vertically on the block from a very small height and sticks to it.

(a) Find the new amplitude and period.

(b) Repeat part (a) for the case in which the putty is dropped on the block when it is at one end of its path.

25. A bullet of mass m strikes a block of mass M. The bullet remains embedded in the block. Find the amplitude of the resulting SHM.



26. An annular ring of internal and outer radii r and R respectively oscillates in a vertical plane about a horizontal axis perpendicular to its plane and passing through a point on its outer edge. Calculate its time period and show that the length of an equivalent simple pendulum is $\frac{3R}{2}$ as $r \to 0$ and $2R$ as $r \to R$.

27. A body of mass 200 g oscillates about a horizontal axis at a distance of 20 cm from its centre of gravity. If the length of the equivalent simple pendulum is 35 cm, find its moment of inertia about the point of suspension.

28. Show that the period of oscillation of simple pendulum at depth h below earth's surface is inversely proportional to $\sqrt{R - h}$, where R is the radius of earth. Find out the time period of a second pendulum at a depth $R/2$ from the earth's surface ?

29. The period of a particle in SHM is 8 s. At $t = 0$ it is in its equilibrium position.

(a) Compare the distance travelled in the first 4 s and the second 4 s.

(b) Compare the distance travelled in the first 2 s and the second 2 s.

30. (a) The motion of the particle in simple harmonic motion is given by $x = a \sin \omega t$. If its speed is u, when the displacement is x_1 and speed is v, when the displacement is x_2, show that the amplitude of the motion is

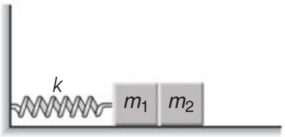
$$A = \left[\frac{v^2 x_1^2 - u^2 x_2^2}{v^2 - u^2}\right]^{1/2}$$

(b) A particle is moving with simple harmonic motion in a straight line. When the distance of the particle from the equilibrium position has the values x_1 and x_2, the corresponding values of velocity are u_1 and u_2, show that the period is

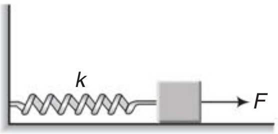
$$T = 2\pi \left[\frac{x_2^2 - x_1^2}{u_1^2 - u_2^2}\right]^{1/2}$$

31. Show that the combined spring energy and gravitational energy for a mass m hanging from a light spring of force constant k can be expressed as $U_0 + \frac{1}{2} ky^2$, where y is the distance above or below the equilibrium position and U_0 is constant.

32. The masses in figure slide on a frictionless table. m_1 but not m_2, is fastened to the spring. If now m_1 and m_2 are pushed to the left, so that the spring is compressed a distance d, what will be the amplitude of the oscillation of m_1 after the spring system is released ?



33. The spring shown in figure is unstretched when a man starts pulling on the cord. The mass of the block is M. If the man exerts a constant force F, find

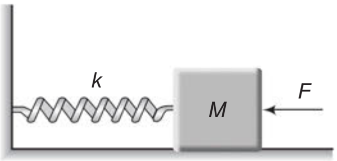


(a) the amplitude and the time period of the motion of the block,

(b) the energy stored in the spring when the block passes through the equilibrium position and

(c) the kinetic energy of the block at this position.

34. In figure, $k = 100$ N/m, $M = 1$ kg and $F = 10$ N.



(a) Find the compression of the spring in the equilibrium position.

(b) A sharp blow by some external agent imparts a speed of 2 m/s to the block towards left. Find the sum of the potential energy of the spring and the kinetic energy of the block at this instant.

(c) Find the time period of the resulting simple harmonic motion.

(d) Find the amplitude.

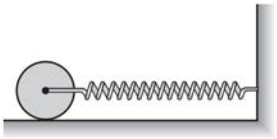
(e) Write the potential energy of the spring when the block is at the left extreme.

(f) Write the potential energy of the spring when the block is at the right extreme.

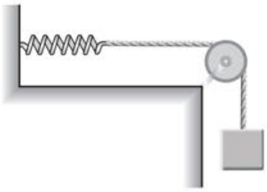
The answers of (b), (e) and (f) are different. Explain why this does not violate the principle of conservation of energy?

35. Pendulum A is a physical pendulum made from a thin, rigid and uniform rod whose length is d. One end of this rod is attached to the ceiling by a frictionless hinge, so that the rod is free to swing back and forth. Pendulum B is a simple pendulum whose length is also d. Obtain the ratio $\frac{T_A}{T_B}$ of their periods for small angle oscillations.

36. A solid cylinder of mass m is attached to a horizontal spring with force constant k. The cylinder can roll without slipping along the horizontal plane. (See the accompanying figure.) Show that the centre of mass of the cylinder executes simple harmonic motion with a period $T = 2\pi\sqrt{\frac{3m}{2k}}$, if displaced from mean position.



37. A cord is attached between a 0.50 kg block and a spring with force constant $k = 20$ N/m. The other end of the spring is attached to the wall and the cord is placed over a pulley ($I = 0.60\,MR^2$) of mass 5.0 kg and radius 0.50 m. (See the accompanying figure). Assuming no slipping occurs, what is the frequency of the oscillations when the body is set into motion?



38. Two linear SHM of equal amplitudes A and frequencies ω and 2ω are impressed on a particle along x and y-axes respectively. If the initial phase difference between them is $\pi/2$. Find the resultant path followed by the particle.

39. A particle is subjected to two simple harmonic motions given by

$$x_1 = 2.0\sin(100\,\pi t) \quad \text{and} \quad x_2 = 2.0\sin(120\,\pi\, t + \pi/3)$$

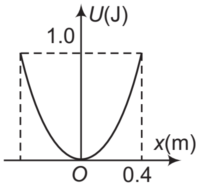
where, x is in cm and t in second. Find the displacement of the particle at

(a) $t = 0.0125$, (b) $t = 0.025$.

LEVEL 2

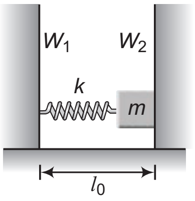
Objective Questions

Single Correct Option



1. A particle of mass 2 kg moves in simple harmonic motion and its potential energy U varies with position x as shown. The period of oscillation of the particle is

(a) $\frac{2\pi}{5}$ s
(b) $\frac{2\sqrt{2}\pi}{5}$ s
(c) $\frac{\sqrt{2}\pi}{5}$ s
(d) $\frac{4\pi}{5}$ s



2. In the figure shown, a spring mass system is placed on a horizontal smooth surface in between two vertical rigid walls W_1 and W_2. One end of spring is fixed with wall W_1 and other end is attached with mass m which is free to move. Initially, spring is tension free and having natural length l_0. Mass m is compressed through a distance a and released. Taking the collision between wall W_2 and mass m as elastic and K as spring constant, the average force exerted by mass m on wall W_2 in one oscillation of block is

(a) $\frac{2aK}{\pi}$
(b) $\frac{2ma}{\pi}$
(c) $\frac{aK}{\pi}$
(d) $\frac{2aK}{m}$

3. Two simple harmonic motions are represented by the following equations $y_1 = 40 \sin \omega t$ and $y_2 = 10 (\sin \omega t + c \cos \omega t)$. If their displacement amplitudes are equal, then the value of c (in appropriate units) is

(a) $\sqrt{13}$
(b) $\sqrt{15}$
(c) $\sqrt{17}$
(d) 4

4. A particle executes simple harmonic motion with frequency 2.5 Hz and amplitude 2 m. The speed of the particle 0.3 s after crossing, the equilibrium position is

(a) zero
(b) 2π m/s
(c) 4π m/s
(d) π m/s

5. A particle oscillates simple harmonically with a period of 16 s. Two second after crossing the equilibrium position its velocity becomes 1 m/s. The amplitude is

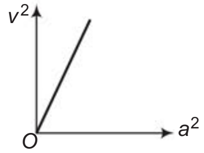
(a) $\frac{\pi}{4}$ m
(b) $\frac{8\sqrt{2}}{\pi}$ m
(c) $\frac{8}{\pi}$ m
(d) $\frac{4\sqrt{2}}{\pi}$ m

6. A seconds pendulum is suspended from the ceiling of a trolley moving horizontally with an acceleration of 4 m/s^2. Its period of oscillation is

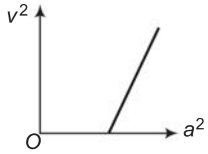
(a) 1.90 s
(b) 1.70 s
(c) 2.30 s
(d) 1.40 s

7. A particle is performing a linear simple harmonic motion. If the instantaneous acceleration and velocity of the particle are a and v respectively, identify the graph which correctly represents the relation between a and v.

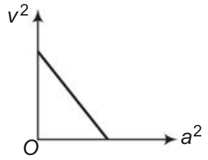
(a)



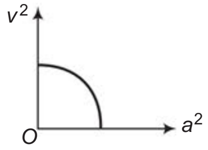
(b)



(c)



(d)



8. In a vertical U-tube a column of mercury oscillates simple harmonically. If the tube contains 1 kg of mercury and 1 cm of mercury column weighs 20 g, then the period of oscillation is

(a) 1 s
(b) 2 s
(c) $\sqrt{2}$ s
(d) Insufficient data

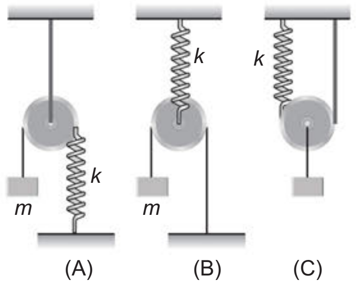
9. A solid cube of side a and density ρ_0 floats on the surface of a liquid of density ρ. If the cube is slightly pushed downward, then it oscillates simple harmonically with a period of

(a) $2\pi\sqrt{\frac{\rho_0}{\rho}\frac{a}{g}}$
(b) $2\pi\sqrt{\frac{\rho}{\rho_0}\frac{a}{g}}$
(c) $2\pi\sqrt{\frac{a}{\left(1-\frac{\rho}{\rho_0}\right)g}}$
(d) $2\pi\sqrt{\frac{a}{\left(1+\frac{\rho}{\rho_0}\right)g}}$

10. A uniform stick of length l is mounted so as to rotate about a horizontal axis perpendicular to the stick and at a distance d from the centre of mass. The time period of small oscillations has a minimum value when d/l is

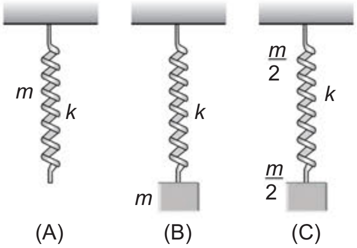
(a) $\frac{1}{\sqrt{2}}$
(b) $\frac{1}{\sqrt{12}}$
(c) $\frac{1}{\sqrt{3}}$
(d) $\frac{1}{\sqrt{6}}$

11. Three arrangements of spring-mass system are shown in figures (A), (B) and (C). If T_1, T_2 and T_3 represent the respective periods of oscillation, then correct relation is



(a) $T_1 > T_2 > T_3$
(b) $T_3 > T_2 > T_1$
(c) $T_2 > T_1 > T_3$
(d) $T_2 > T_3 > T_1$

12. Three arrangements are shown in figure.



(a) A spring of mass m and stiffness k

(b) A block of mass m attached to massless spring of stiffness k

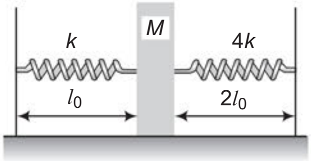
(c) A block of mass $\frac{m}{2}$ attached to a spring of mass $\frac{m}{2}$ and stiffness k

If T_1, T_2 and T_3 represent the period of oscillation in the three cases respectively, then identify the correct relation.

(a) $T_1 < T_2 < T_3$ (b) $T_1 < T_3 < T_2$

(c) $T_1 > T_3 > T_2$ (d) $T_3 < T_1 < T_2$

13. A block of mass M is kept on a smooth surface and touches the two springs as shown in the figure but not attached to the springs. Initially springs are in their natural length. Now, the block is shifted $(l_0/2)$ from the given position in such a way that it compresses a spring and released. The time-period of oscillation of mass will be



(a) $\frac{\pi}{2}\sqrt{\frac{M}{k}}$ (b) $2\pi\sqrt{\frac{M}{5k}}$

(c) $\frac{3\pi}{2}\sqrt{\frac{M}{k}}$ (d) $\pi\sqrt{\frac{M}{2k}}$

14. A particle moving on x-axis has potential energy $U = 2 - 20x + 5x^2$ joule along x-axis. The particle is released at $x = -3$. The maximum value of x will be (x is in metre)

(a) 5 m (b) 3 m

(c) 7 m (d) 8 m

15. A block of mass m, when attached to a uniform ideal spring with force constant k and free length L executes SHM. The spring is then cut in two pieces, one with free length $n\,L$ and other with free length $(1 - n)\,L$. The block is also divided in the same fraction. The smaller part of the block attached to longer part of the spring executes SHM with frequency f_1. The bigger part of the block attached to smaller part of the spring executes SHM with frequency f_2. The ratio f_1/f_2 is

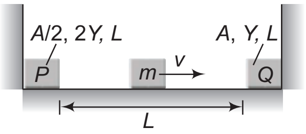
(a) 1 (b) $\frac{n}{1-n}$

(c) $\frac{1+n}{n}$ (d) $\frac{n}{1+n}$

16. A body performs simple harmonic oscillations along the straight line $ABCDE$ with C as the midpoint of AE. Its kinetic energies at B and D are each one fourth of its maximum value. If $AE = 2R$, the distance between B and D is

(a) $\frac{\sqrt{3}}{2}R$ (b) $\frac{R}{\sqrt{2}}$ (c) $\sqrt{3}\,R$ (d) $\sqrt{2}R$

17. In the given figure, two elastic rods P and Q are rigidly joined to end supports. A small mass m is moving with velocity v between the rods. All collisions are assumed to be elastic and the surface is given to be smooth. The time period of small mass m will be (A = area of cross section, Y = Young's modulus, L = length of each rod)



(a) $\frac{2L}{v} + 2\pi\sqrt{\frac{mL}{AY}}$ (b) $\frac{2L}{v} + 2\pi\sqrt{\frac{2mL}{AY}}$

(c) $\frac{2L}{v} + \pi\sqrt{\frac{mL}{AY}}$ (d) $\frac{2L}{v}$

18. A particle executes SHM of period 1.2 s and amplitude 8 cm. Find the time it takes to travel 3 cm from the positive extremity of its oscillation. [$\cos^{-1}(5/8) = 0.9$ rad]

(a) 0.28 s (b) 0.32 s (c) 0.17 s (d) 0.42 s

19. A wire frame in the shape of an equilateral triangle is hinged at one vertex so that it can swing freely in a vertical plane, with the plane of the triangle always remaining vertical. The side of the frame is $1/\sqrt{3}$ m. The time period in seconds of small oscillations of the frame will be ($g = 10\ \text{m/s}^2$)

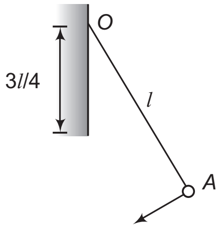
(a) $\pi/\sqrt{2}$ (b) $\pi/\sqrt{3}$

(c) $\pi/\sqrt{6}$ (d) $\pi/\sqrt{5}$

20. A particle moves along the x-axis according to $x = A\,[1 + \sin\omega t]$. What distance does is travel in time interval from $t = 0$ to $t = 2.5\pi/\omega$?

(a) $4\,A$ (b) $6\,A$ (c) $5\,A$ (d) $3\,A$

21. A small bob attached to a light inextensible thread of length l has a periodic time T when allowed to vibrate as a simple pendulum. The thread is now suspended from a fixed end O of a vertical rigid rod of length $3l/4$. If now the pendulum performs periodic oscillations in this arrangement, the periodic time will be

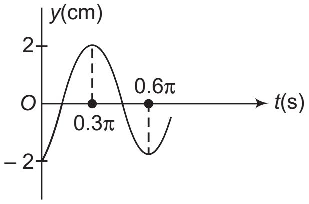


(a) $3T/4$ (b) $4T/5$ (c) $2T/3$ (d) $5T/6$

22. A stone is swinging in a horizontal circle of diameter 0.8 m at 30 rev/min. A distant light causes a shadow of the stone on a nearly wall. The amplitude and period of the SHM for the shadow of the stone are

(a) 0.4 m, 4s
(b) 0.2 m, 2s
(c) 0.4 m, 2s
(d) 0.8 m, 2s

23. Part of SHM is graphed in the figure. Here, y is displacement from mean position. The correct equation describing the SHM is



(a) $y = 4\cos(0.6\,t)$
(b) $y = 2\sin\left(\frac{10}{3}t - \frac{\pi}{2}\right)$
(c) $y = 2\sin\left(\frac{\pi}{2} - \frac{10}{3}t\right)$
(d) $y = 2\cos\left(0.6\,t + \frac{\pi}{2}\right)$

24. A particle performs SHM with a period T and amplitude a. The mean velocity of particle over the time interval during which it travels a distance $a/2$ from the extreme position is

(a) $6\,a/T$
(b) $2\,a/T$
(c) $3\,a/T$
(d) $a/2T$

25. A man of mass 60 kg is standing on a platform executing SHM in the vertical plane. The displacement from the mean position varies as $y = 0.5\sin(2\pi ft)$. The value of f, for which the man will feel weightlessness at the highest point, is (y in metre)

(a) $g/4\pi$
(b) $4\pi g$
(c) $\frac{\sqrt{2g}}{2\pi}$
(d) $2\pi\sqrt{2g}$

26. A particle performs SHM on a straight line with time period T and amplitude A. The average speed of the particle between two successive instants, when potential energy and kinetic energy become same is

(a) $\frac{A}{T}$
(b) $\frac{4\sqrt{2}A}{T}$
(c) $\frac{2A}{T}$
(d) $\frac{2\sqrt{2}A}{T}$

27. The time taken by a particle performing SHM to pass from point A to B where its velocities are same is 2 s. After another 2 s it returns to B. The ratio of distance OB to its amplitude (where O is the mean position) is

(a) $1:\sqrt{2}$
(b) $(\sqrt{2}-1):1$
(c) $1:2$
(d) $1:2\sqrt{2}$

28. A particle is executing SHM according to the equation $x = A\cos\omega t$. Average speed of the particle during the interval $0 \le t \le \frac{\pi}{6\omega}$ is

(a) $\frac{\sqrt{3}A\omega}{2}$
(b) $\frac{\sqrt{3}A\omega}{4}$
(c) $\frac{3\,A\omega}{\pi}$
(d) $\frac{3\,A\omega}{\pi}(2-\sqrt{3})$

More than One Correct Options

1. A simple pendulum with a bob of mass m is suspended from the roof of a car moving with horizontal acceleration a

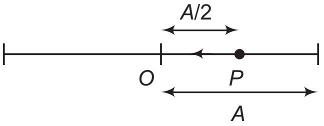
(a) The string makes an angle of $\tan^{-1}(a/g)$ with the vertical

(b) The string makes an angle of $\sin^{-1}\left(\frac{a}{g}\right)$ with the vertical

(c) The tension in the string is $m\sqrt{a^2+g^2}$

(d) The tension in the string is $m\sqrt{g^2-a^2}$

2. A particle starts from a point P at a distance of $A/2$ from the mean position O and travels towards left as shown in the figure. If the time period of SHM, executed about O is T and amplitude A then the equation of the motion of particle is



(a) $x = A\sin\left(\frac{2\pi}{T}t+\frac{\pi}{6}\right)$

(b) $x = A\sin\left(\frac{2\pi}{T}t+\frac{5\pi}{6}\right)$

(c) $x = A\cos\left(\frac{2\pi}{T}t+\frac{\pi}{6}\right)$

(d) $x = A\cos\left(\frac{2\pi}{T}t+\frac{\pi}{3}\right)$

3. A spring has natural length 40 cm and spring constant 500 N/m. A block of mass 1 kg is attached at one end of the spring and other end of the spring is attached to a ceiling. The block is released from the position, where the spring has length 45 cm

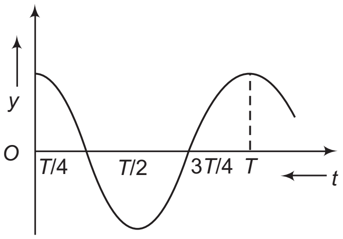
(a) the block will perform SHM of amplitude 5 cm

(b) the block will have maximum velocity $30\sqrt{5}$ cm/s

(c) the block will have maximum acceleration 15 m/s^2

(d) the minimum elastic potential energy of the spring will be zero

4. The displacement-time graph of a particle executing SHM is shown in figure. Which of the following statements is/are true?



(a) The velocity is maximum at $t = T/2$

(b) The acceleration is maximum at $t = T$

(c) The force is zero at $t = 3T/4$

(d) The kinetic energy equals the total oscillation energy at $t = T/2$

5. For a particle executing SHM, x = displacement from mean position, v = velocity and a = acceleration at any instant, then

(a) v-x graph is a circle

(b) v-x graph is an ellipse

(c) a-x graph is a straight line

(d) a-x graph is a circle

6. The acceleration of a particle is $a = -100x + 50$. It is released from $x = 2$. Here, a and x are in SI units

(a) the particle will perform SHM of amplitude 2 m
(b) the particle will perform SHM of amplitude 1.5 m
(c) the particle will perform SHM of time period 0.63 s
(d) the particle will have a maximum velocity of 15 m/s

7. Two particles are performing SHM in same phase. It means that

(a) the two particles must have same distance from the mean position simultaneously
(b) two particles may have same distance from the mean position simultaneously
(c) the two particles must have maximum speed simultaneously
(d) the two particles may have maximum speed simultaneously

8. A particle moves along y-axis according to the equation

y (in cm) $= 3\sin 100\pi t + 8\sin^2 50\pi t - 6$

(a) the particle performs SHM
(b) the amplitude of the particle's oscillation is 5 cm
(c) the mean position of the particle is at $y = -2$ cm
(d) the particle does not perform SHM

Comprehension Based Questions

Passage (Q Nos. 1 to 2)

A 2 kg block hangs without vibrating at the bottom end of a spring with a force constant of 400 N/m. The top end of the spring is attached to the ceiling of an elevator car. The car is rising with an upward acceleration of 5 m/s^2 when the acceleration suddenly ceases at time $t = 0$ and the car moves upward with constant speed ($g = 10\ m/s^2$)

1. What is the angular frequency of oscillation of the block after the acceleration ceases?

(a) $10\sqrt{2}$ rad/s
(b) 20 rad/s
(c) $20\sqrt{2}$ rad/s
(d) 32 rad/s

2. The amplitude of the oscillation is

(a) 7.5 cm
(b) 5 cm
(c) 2.5 cm
(d) 1 cm

Match the Columns

1. For the x-t equation of a particle in SHM along x-axis, match the following two columns.

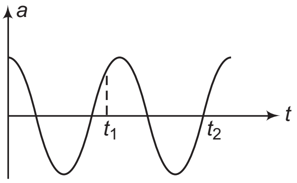
$$x = 2 + 2\cos \omega t$$

Column I	Column II
(a) Mean position	(p) $x = 0$
(b) Extreme position	(q) $x = 2$
(c) Maximum potential energy at	(r) $x = 4$
(d) Zero potential energy at	(s) Can't tell

2. Potential energy of a particle at mean position is 4 J and at extreme position is 20 J. Given that amplitude of oscillation is A. Match the following two columns.

Column I	Column II
(a) Potential energy at $x = \frac{A}{2}$	(p) 18 J
(b) Kinetic energy at $x = \frac{A}{4}$	(q) 16 J
(c) Kinetic energy at $x = 0$	(r) 8 J
(d) Kinetic energy at $x = \frac{A}{2}$	(s) None

3. Acceleration-time graph of a particle in SHM is as shown in figure. Match the following two columns.



Column I	Column II
(a) Displacement of particle at t_1	(p) zero
(b) Displacement of particle at t_2	(q) positive
(c) Velocity of particle at t_1	(r) negative
(d) Velocity of particle at t_2	(s) maximum

4. Mass of a particle is 2 kg. Its displacement-time equation in SHM is

$$x = 2 \sin (4\pi t) \qquad \text{(SI Units)}$$

Match the following two columns for 1 second time interval.

Column I	Column II
(a) Speed becomes 30 m/s	(p) two times
(b) Velocity becomes + 10 m/s	(q) four times
(c) Kinetic energy becomes 400 J	(r) one time
(d) Acceleration becomes– 100 m/s^2	(s) None

5. x-t equation of a particle in SHM is, $x = 4 + 6 \sin \pi t$. Match the following tables corresponding to time taken in moving from

Column I	Column II
(a) $x = 10$ m to $x = 4$ m	(p) $\frac{1}{3}$ second
(b) $x = 10$ m to $x = 7$ m	(q) $\frac{1}{2}$ second
(c) $x = 7$ m to $x = 1$ m	(r) 1 second
(d) $x = 10$ m to $x = -2$ m	(s) None

Subjective Questions

1. A 1 kg block is executing simple harmonic motion of amplitude 0.1 m on a smooth horizontal surface under the restoring force of a spring of spring constant 100 N/m. A block of mass 3 kg is gently placed on it at the instant it passes through the mean position. Assuming that the two blocks move together. Find the frequency and the amplitude of the motion.

2. Two particles are in SHM along same line. Time period of each is T and amplitude is A. After how much time will they collide if at time $t = 0$. (a) first particle is at $x_1 = +\frac{A}{2}$ and moving towards positive x-axis and second particle is at $x_2 = -\frac{A}{\sqrt{2}}$ and moving towards negative x-axis, (b) rest information are same as mentioned in part (a) except that particle first is also moving towards negative x-axis.

3. A particle that hangs from a spring oscillates with an angular frequency of 2 rad/s. The spring particle system is suspended from the ceiling of an elevator car and hangs motionless (relative to the elevator car) as the car descends at a constant speed of 1.5 m/s. The car then stops suddenly. (a) With what amplitude does the particle oscillate ? (b) What is the equation of motion for the particle ? (Choose upward as the positive direction)

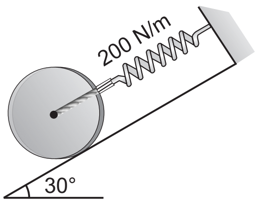
4. A 2 kg mass is attached to a spring of force constant 600 N/m and rests on a smooth horizontal surface. A second mass of 1 kg slides along the surface toward the first at 6 m/s.
   (a) Find the amplitude of oscillation if the masses make a perfectly inelastic collision and remain together on the spring. What is the period of oscillation ?
   (b) Find the amplitude and period of oscillation if the collision is perfectly elastic.
   (c) For each case, write down the position x as a function of time t for the mass attached to the spring, assuming that the collision occurs at time $t = 0$. What is the impulse given to the 2 kg mass in each case?

5. A block of mass 4 kg hangs from a spring of force constant $k = 400$ N/m. The block is pulled down 15 cm below equilibrium and released. How long does it take the block to go from 12 cm below equilibrium (on the way up) to 9 cm above equilibrium?

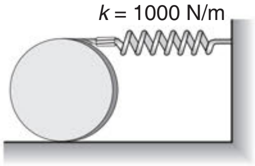
6. A plank with a body of mass m placed on it starts moving straight up according to the law $y = a(1 - \cos \omega t)$, where y is the displacement from the initial position, $\omega = 11$ rad/s. Find
   (a) The time dependence of the force that the body exerts on the plank.
   (b) The minimum amplitude of oscillation of the plank at which the body starts falling behind the plank.

7. A particle of mass m free to move in the x-y plane is subjected to a force whose components are $F_x = -kx$ and $F_y = -ky$, where k is a constant. The particle is released when $t = 0$ at the point (2, 3). Prove that the subsequent motion is simple harmonic along the straight line $2y - 3x = 0$.

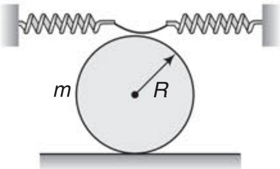
8. Determine the natural frequency of vibration of the 100 N disk. Assume the disk does not slip on the inclined surface.



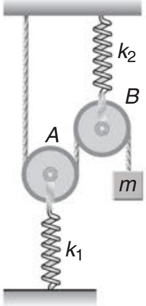
9. The disk has a weight of 100 N and rolls without slipping on the horizontal surface as it oscillates about its equilibrium position. If the disk is displaced, by rolling it counterclockwise 0.4 rad, determine the equation which describes its oscillatory motion when it is released.



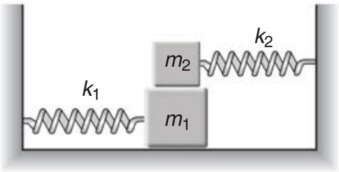
10. A solid uniform cylinder of mass m performs small oscillations due to the action of two springs of stiffness k each (figure). Find the period of these oscillations in the absence of sliding.



11. A block of mass m is attached to one end of a light inextensible string passing over a smooth light pulley B and under another smooth light pulley A as shown in the figure. The other end of the string is fixed to a ceiling. A and B are held by springs of spring constants k_1 and k_2. Find angular frequency of small oscillations of the system.

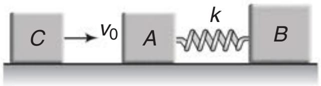


12. In the shown arrangement, both the springs are in their natural lengths. The coefficient of friction between m_2 and m_1 is μ. There is no friction between m_1 and the surface. If the blocks are displaced slightly, they together perform simple harmonic motion. Obtain



(a) Frequency of such oscillations.
(b) The condition if the frictional force on block m_2 is to act in the direction of its displacement from mean position.
(c) If the condition obtained in (b) is met, what can be maximum amplitude of their oscillations?

13. Two blocks A and B of masses $m_1 = 3$ kg and $m_2 = 6$ kg respectively are connected with each other by a spring of force constant $k = 200$ N/m as shown in figure. Blocks are pulled away from each other by $x_0 = 3$ cm and then released. When spring is in its natural length and blocks are moving towards each other, another block C of mass $m = 3$ kg moving with velocity $v_0 = 0.4$ m/s (towards right) collides with A and gets stuck to it. Neglecting friction, calculate



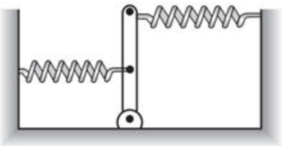
(a) velocities v_1 and v_2 of the blocks A and B respectively just before collision and their angular frequency.

(b) velocity of centre of mass of the system, after collision,

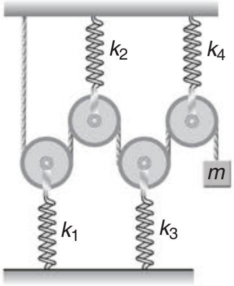
(c) amplitude of oscillations of combined body,

(d) loss of energy during collision.

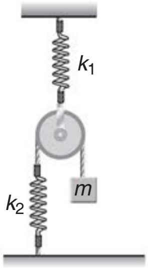
14. A rod of length l and mass m, pivoted at one end, is held by a spring at its mid-point and a spring at far end. The springs have spring constant k. Find the frequency of small oscillations about the equilibrium position.



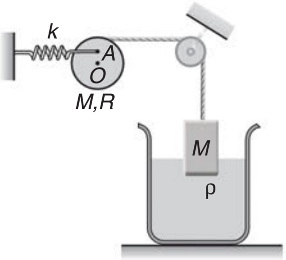
15. In the arrangement shown in figure, pulleys are light and springs are ideal. k_1, k_2, k_3 and k_4 are force constants of the springs. Calculate period of small vertical oscillations of block of mass m.



16. A light pulley is suspended at the lower end of a spring of constant k_1, as shown in figure. An inextensible string passes over the pulley. At one end of string a mass m is suspended, the other end of the string is attached to another spring of constant k_2. The other ends of both the springs are attached to rigid supports, as shown. Neglecting masses of springs and any friction, find the time period of small oscillations of mass m about equilibrium position.

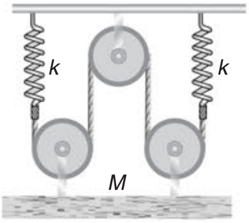


17. Figure shows a solid uniform cylinder of radius R and mass M, which is free to rotate about a fixed horizontal axis O and passes through centre of the cylinder. One end of an ideal spring of force constant k is fixed and the other end is hinged to the cylinder at A. Distance OA is equal to $\frac{R}{2}$. An inextensible thread is wrapped round the cylinder and passes over a smooth, small pulley. A block of equal mass M and having cross sectional area A is suspended from free end of the thread. The block is partially immersed in a non-viscous liquid of density ρ.



If in equilibrium, spring is horizontal and line OA is vertical, calculate frequency of small oscillations of the system.

18. Find the natural frequency of the system shown in figure. The pulleys are smooth and massless.



Answers

Introductory Exercise 14.1

1. π **2.** $\frac{1}{16}, \frac{15}{16}$ **3.** (a) 15.0 cm (b) 0.726 s (c) 1.38 Hz (d) 1.69 J (e) 1.30 m/s

15.4 Hooke’s Law and Modulus of Elasticity
15.5 The Stress-Strain Curve
15.6 Potential Energy Stored in a Stretched Wire
15.7 Thermal Stresses of Strain

15.1 Introduction

The properties of material under the action of external deforming forces are very essential, for an engineer, to enable him, in designing him all types of structures and machines.

Whenever a load is attached to a thin hanging wire it elongates and the load moves downwards (sometimes through a negligible distance). The amount by which the wire elongates depends upon the amount of load and the nature of wire material. Cohesive force, between the molecules of the hanging wire offer resistance against the deformation, and the force of resistance increases with the deformation. The process of deformation stops when the force of resistance is equal to the external force (i.e. the load attached). Sometimes the force of resistance offered by the molecules is less than the external force. In such a case, the deformation continues until the wire breaks.

Thus, we may conclude that if some external deforming force is applied to a body it has two effects on it, namely :

(i) deformation of the body,

(ii) internal resistance (restoring) forces are developed.

15.2 Elasticity

As we have already discussed that whenever a single force (or a system of forces) acts on a body it undergoes some deformation and the molecules offer some resistance to the deformation. When the external force is removed, the force of resistance also vanishes and the body returns back to its original shape. But it is only possible if the deformation is within a certain limit. Such a limit is called elastic limit. This property of materials of returning back to their original position is called the elasticity.

A body is said to be perfectly elastic if it returns back completely to its original shape and size after removing the external force. If a body remains in the deformed state and does not even partially regain its original shape after the removal of the deforming forces, it is called a perfectly inelastic or plastic body. Quite often, when the external forces are removed, the body partially regains the original shape. Such bodies are partially elastic. If the force acting on the body is increased and the deformation exceeds the elastic limit, the body loses to some extent, its property of elasticity. In this case, the body will not return to its original shape and size even after removal of the external force. Some deformation is left permanently.

15.3 Stress and Strain

Stress

When an external force is applied to a body then at each cross-section of the body an internal restoring force is developed which tends to restore the body to its original state. The internal restoring force per unit area of cross-section of the deformed body is called stress. It is usually denoted by σ (sigma).

Thus,
$$\boxed{\text{Stress } (\sigma) = \frac{\text{Restoring force}}{\text{Area}}}$$

Note *In equilibrium, when further deformation stops, the restoring force is equal to the external force (or the suspended load from a hanging wire). Therefore, the stress is also sometime called the external deforming force per unit area.*

Strain

When the size or shape of a body is changed under an external force, the body is said to be strained. The change occurred in the unit size of the body is called strain. Usually, it is denoted by ε. Thus,

$$\boxed{\varepsilon = \frac{\Delta x}{x}}$$

Here, Δx is the change (may be in length, volume etc.) and x the original value of the quantity in which change has occurred. For example, when the length of a suspended wire increases under an applied load, the value of strain is,

$$\boxed{\varepsilon = \frac{\Delta l}{l}}$$

15.4 Hooke's Law and the Modulus of Elasticity

According to Hooke's law,

"For small deformation, the stress in a body is proportional to the corresponding strain." i.e.

$$\text{stress} \propto \text{strain} \quad \text{or} \quad \boxed{\text{stress} = (E)\,(\text{strain})}$$

Here, $E = \frac{\text{stress}}{\text{strain}}$ is a constant called the modulus of elasticity. Now, depending upon the nature of deforming force applied on the body, stress, strain and hence modulus of elasticity are classified in following three types:

Young's Modulus of Elasticity (Y)

When a wire is acted upon by two equal and opposite forces in the direction of its length, the length of the body is changed. The change in length per unit length $\left(\frac{\Delta l}{l}\right)$ is called the **longitudinal strain** and the restoring force (which is equal to the applied force in equilibrium) per unit area of cross section of the wire is called the **longitudinal stress**.

For small change in the length of the wire, the ratio of the longitudinal stress to the corresponding strain is called the Young's modulus of elasticity (Y) of the wire. Thus,

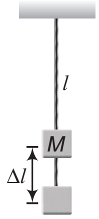

Fig. 15.1

$$Y = \frac{F/A}{\Delta l/l} \quad \text{or} \quad \boxed{Y = \frac{Fl}{A\Delta l}}$$

Let there be a wire of length l and radius r. Its one end is clamped to a rigid support and a mass M is attached at the other end. Then,

$$F = Mg \quad \text{and} \quad A = \pi r^2$$

Substituting in above equation, we have

$$\boxed{Y = \frac{Mgl}{(\pi r^2)\Delta l}}$$

Bulk Modulus of Elasticity *(B)*

When a uniform pressure (normal force) is applied all over the surface of a body, the volume of the body changes. The change in volume per unit volume of the body is called the '**volume strain**' and the normal force acting per unit area of the surface (pressure) is called the normal stress or **volume stress**. For small strains, the ratio of the volume stress to the volume strain is called the 'bulk modulus' of the material of the body. It is denoted by *B*. Then,

$$\boxed{B = \frac{-p}{\Delta V/V} \quad \text{or} \quad \frac{-\Delta p}{(\Delta V/V)}}$$

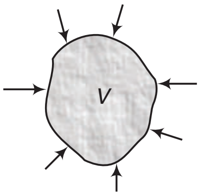

Fig. 15.2

Here, negative sign implies that, when the pressure increases volume decreases and *vice-versa*.

Compressibility

The reciprocal of the bulk modulus of the material of a body is called the 'compressibility' of that material. Thus,

$$\boxed{\text{Compressibility} = \frac{1}{B}}$$

Modulus of Rigidity (η)

When a body is acted upon by an external force tangential to a surface of the body, the opposite surface being kept fixed, it suffers a change in shape, its volume remaining unchanged. Then, the body is said to be sheared.

The ratio of the displacement of a layer in the direction of the tangential force and the distance of the layer from the fixed surface is called the **shearing strain** and the tangential force acting per unit area of the surface is called the "**shearing stress**".

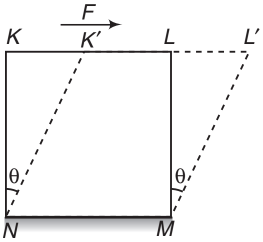

Fig. 15.3

For small strain the ratio of the shearing stress to the shearing strain is called the "modulus of rigidity" of the material of the body. It is denoted by η.

Thus, $$\eta = \frac{F/A}{KK'/KN}$$

Here, $$\frac{KK'}{KN} = \tan\theta \approx \theta$$

∴ $$\eta = \frac{F/A}{\theta} \quad \text{or} \quad \boxed{\eta = \frac{F}{A\theta}}$$

Extra Points to Remember

- If a spring is stretched or compressed by an amount Δl, the restoring force produced in it is,

$$F_s = k\,\Delta l \qquad \text{...(i)}$$

Here, k = force constant of spring

Similarly, if a wire is stretched by an amount Δl, the restoring force produced in it is,

$$\boxed{F = \left(\frac{YA}{l}\right)\Delta l} \qquad \text{...(ii)}$$

as, $Y = \dfrac{F/A}{\Delta l/l}$

Comparing Eqs. (i) and (ii), we can see that force constant of a wire is,

$$k = \frac{YA}{l} \qquad \text{...(iii)}$$

i.e. a wire is just like a spring of force constant $\dfrac{YA}{l}$. So, all formulae which we use in case of a spring can be applied to a wire also.

From Eq. (iii), we may also conclude that force constant of a spring is inversely proportional to the length of the spring l or

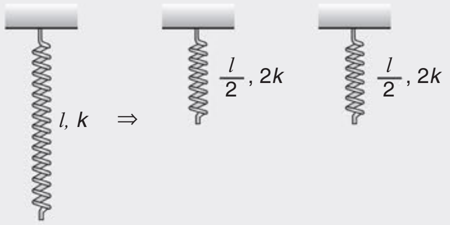

Fig. 15.4

$$\boxed{k \propto \frac{1}{l}}$$

i.e. if a spring is cut into two equal pieces its force constant is doubled.

Example 15.1 *Determine the elongation of the steel bar* $1\,m$ *long and* $1.5\ cm^2$ *cross-sectional area when subjected to a pull of* $1.5 \times 10^4\ N$.
(Take $Y = 2.0 \times 10^{11}\ N/m^2$*)*

Solution $Y = \dfrac{F/A}{\Delta l/l}$

$$\therefore \qquad \Delta l = \frac{Fl}{AY}$$

Substituting the values,

$$\Delta l = \frac{(1.5 \times 10^4)(1.0)}{(1.5 \times 10^{-4})(2.0 \times 10^{11})}$$

$$= 0.5 \times 10^{-3}\ \text{m}$$

or $\qquad \Delta l = 0.5\ \text{mm}$ **Ans.**

Example 15.2 *The bulk modulus of water is* $2.3 \times 10^9\ N/m^2$.

(a) Find its compressibility in the units atm^{-1}.

(b) How much pressure in atmospheres is needed to compress a sample of water by 0.1% ?

Solution Here, $B = 2.3 \times 10^9\ \text{N/m}^2$

$$= \frac{2.3 \times 10^9}{1.01 \times 10^5}$$

$$= 2.27 \times 10^4\ \text{atm}$$

(a) Compressibility $= \frac{1}{B} = \frac{1}{2.27 \times 10^4} = 4.4 \times 10^{-5}\ \text{atm}^{-1}$ **Ans.**

(b) Here, $\frac{\Delta V}{V} = -\,0.1\% = -\,0.001$

Required increase in pressure,

$$\Delta p = B \times \left(-\frac{\Delta V}{V}\right)$$

$$= 2.27 \times 10^4 \times 0.001$$

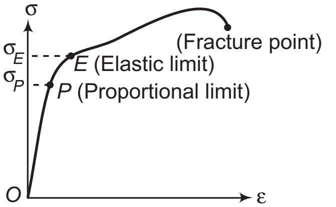
$$= 22.7\ \text{atm}$$ **Ans.**

INTRODUCTORY EXERCISE 15.1

1. Two wires *A* and *B* of same dimensions are stretched by same amount of force. Young's modulus of *A* is twice that of *B*. Which wire will get more elongation?
2. A rod 100 cm long and of 2 cm × 2 cm cross-section is subjected to a pull of 1000 kg force. If the modulus of elasticity of the material is $2.0 \times 10^6\ \text{kg/cm}^2$, determine the elongation of the rod.
3. A cast iron column has internal diameter of 200 mm. What should be the minimum external diameter so that it may carry a load of 1.6 MN without the stress exceeding $90\ \text{N/mm}^2$?
4. Find the dimensions of stress, strain and modulus of elasticity.

15.5 The Stress-Strain Curve

A plot of longitudinal stress (either tensile or compressive) *versus* longitudingal strain for a typical solid is shown in figure. The strain is directly proportional to the applied stress for values of stress upto σ_P. In this linear region, the material returns to its original size when the stress is removed. Point *P* is known as the proportional limit of the solid. For stresses between σ_P and σ_E, where point *E* is called the elastic limit, the material also returns to its original size.



The stress-strain curve for a typical solid

Fig. 15.5

However, notice that stress and strain are not proportional in this region. For deformations beyond the elastic limit, the material does not return to its original size when the stress is removed, it is permanently distorted. Finally, further stretching beyond the elastic limit leads to the eventual fracture of the solid. The proportionality constant for linear region or the slope of stress-strain curve in this curve is called the Young's modulus of elasticity *Y*.

15.6 Potential Energy Stored in a Stretched Wire

When a wire is stretched, work is done against the inter atomic forces. This work is stored in the wire in the form of elastic potential energy. Suppose on applying a force F on a wire of length l, the increase in length is Δl. The area of cross-section of the wire is A. The potential energy stored in the wire should be,

$$\boxed{U = \frac{1}{2} k (\Delta l)^2}$$

Here, $$k = \frac{YA}{l}$$

∴ $$U = \frac{1}{2} \frac{YA}{l} (\Delta l)^2$$

Elastic potential energy per unit volume of the wire (also called energy density) is,

$$u = \frac{U}{\text{volume}} \quad \text{or} \quad u = \frac{\frac{1}{2}\frac{YA}{l}(\Delta l)^2}{Al}$$

or $$u = \frac{1}{2}\left(\frac{\Delta l}{l}\right)\left(Y \cdot \frac{\Delta l}{l}\right) \quad \text{or} \quad u = \frac{1}{2}(\text{strain})\,(Y \times \text{strain})$$

or $$\boxed{u = \frac{1}{2}(\text{strain}) \times (\text{stress})}$$

15.7 Thermal Stresses or Strains

Whenever there is some increase or decrease in the temperature of the body, it causes the body to expand or contract. If the body is allowed to expand or contract freely, with the rise or fall of the temperature, no stresses are induced in the body. But if the deformation of the body is prevented, some stresses are induced in the body. Such stresses are called thermal stresses or temperature stresses. The corresponding strains are called thermal strains or temperature strains.

Consider a rod AB fixed at two supports as shown in figure.

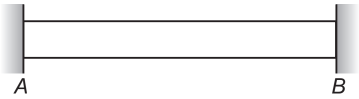


Fig. 15.6

Let l = length of rod

A = area of cross-section of the rod

Y = Young's modulus of elasticity of the rod

and α = thermal coefficient of linear expansion of the rod

Let the temperature of the rod is increased by an amount t. The length of the rod would had increased by an amount Δl, if it were not fixed at two supports. Here

$$\Delta l = l \alpha t$$

But the rod is fixed at the supports. Hence a compressive strain will be produced in the rod. Because at the increased temperature, the natural length of the rod is $l + \Delta l$, while being fixed at two supports its actual length is l. Hence, thermal strain

$$\varepsilon = \frac{\Delta l}{l + \Delta l} \approx \frac{\Delta l}{l} = \frac{l \alpha t}{l} = \alpha t$$

or $$\boxed{\varepsilon = \alpha t}$$

Therefore, thermal stress $$\sigma = Y\varepsilon \qquad \text{(stress} = Y \times \text{strain)}$$

or $$\boxed{\sigma = Y\alpha t}$$

or force on the supports,

$$\boxed{F = \sigma A = YA\alpha t}$$

This force F is in the direction shown below.

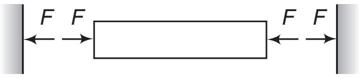

Fig. 15.7

Example 15.3 *A steel wire* 4.0 *m in length is stretched through* 2.0 *mm. The cross-sectional area of the wire is* 2.0 mm^2. *If Young's modulus of steel is* 2.0×10^{11} N/m^2. *Find*

(a) the energy density of wire,

(b) the elastic potential energy stored in the wire.

Solution Here, $l = 4.0$ m, $\Delta l = 2 \times 10^{-3}$ m, $A = 2.0 \times 10^{-6}$ m^2, $Y = 2.0 \times 10^{11}$ N/m^2

(a) The energy density of stretched wire

$$U = \frac{1}{2} \times \text{stress} \times \text{strain}$$

$$= \frac{1}{2} \times Y \times (\text{strain})^2$$

$$= \frac{1}{2} \times 2.0 \times 10^{11} \times \left(\frac{(2 \times 10^{-3})}{4}\right)^2$$

$$= 0.25 \times 10^5 = 2.5 \times 10^4 \text{ J/m}^3$$ **Ans.**

(b) Elastic potential energy = energy density × volume

$$= 2.5 \times 10^4 \times (2.0 \times 10^{-6}) \times 4.0 \text{ J}$$

$$= 20 \times 10^{-2} = 0.20 \text{ J}$$ **Ans.**

Example 15.4 *A rubber cord has a cross-sectional area* 1 mm^2 *and total unstretched length* 10.0 *cm. It is stretched to* 12.0 *cm and then released to project a missile of mass* 5.0 *g. Taking Young's modulus Y for rubber as* 5.0×10^8 N/m^2. *Calculate the velocity of projection.*

Solution Equivalent force constant of rubber cord

$$k = \frac{YA}{l} = \frac{(5.0 \times 10^8)(1.0 \times 10^{-6})}{(0.1)} = 5.0 \times 10^3 \text{ N/m}$$

Now, from conservation of mechanical energy,

elastic potential energy of cord = kinetic energy of missile

$$\therefore \qquad \frac{1}{2} k (\Delta l)^2 = \frac{1}{2} mv^2 \quad \Rightarrow \quad \therefore \quad v = \left(\sqrt{\frac{k}{m}}\right) \Delta l$$

$$= \left(\sqrt{\frac{5.0 \times 10^3}{5.0 \times 10^{-3}}}\right)(12.0 - 10.0) \times 10^{-2} = 20 \text{ m/s}$$

Ans.

Note *Following assumptions have been made in this problem :*

(*i*) *k has been assumed constant, even though it depends on the length* (*l*).

(*ii*) *The whole of the elastic potential energy is converting into kinetic energy of missile.*

INTRODUCTORY EXERCISE 15.2

1. Find the dimensions of energy density.
2. (a) A wire 4 m long and 0.3 mm in diameter is stretched by a force of 100 N. If extension in the wire is 0.3 mm, calculate the potential energy stored in the wire.

   (b) Find the work done in stretching a wire of cross-section 1 mm^2 and length 2 m through 0.1 mm. Young's modulus for the material of wire is 2.0×10^{11} N/m^2.

Extra Points to Remember

- Modulus of elasticity E (whether, it is Y, B or η) is given by

$$E = \frac{\text{stress}}{\text{strain}}$$

Following conclusions can be made from the above expression :

(i) $E \propto$ stress (for same strain), i.e. if we want the equal amount of strain in two different materials, the one which needs more stress is having more E.

(ii) $E \propto \frac{1}{\text{strain}}$ (for same stress), i.e. if the same amount of stress is applied on two different materials, the one having the less strain is having more E. Rather we can say that the material which offers more resistance to the external forces is having greater value of E. So, we can see that modulus of elasticity of steel is more than that of rubber or

$$\boxed{E_{\text{steel}} > E_{\text{rubber}}}$$

(iii) E = stress for unit strain $\left(\frac{\Delta x}{x} = 1 \text{ or } \Delta x = x\right)$, i.e. suppose the length of a wire is 2 m, then the Young's modulus of elasticity (Y) is the stress applied on the wire to stretch the wire by the same length of 2 m.

- The material which has smaller value of Y is more ductile, i.e. it offers less resistance in framing it into a wire. Similarly, the material having the smaller value of B is more malleable. Thus, for making wire we will more concentrate on Y.

- A solid will have all the three modulii of elasticity Y, B and η. But in case of a liquid or a gas only B can be defined, as a liquid or a gas cannot be framed into a wire or no shear force can be applied on them.
- For a liquid or a gas,

$$\boxed{B = \left(\frac{-dp}{dV/V}\right) \quad \text{or} \quad \left(-\frac{\Delta p}{\Delta V/V}\right)}$$

So, instead of p we are more interested in change in pressure dp or Δp.

- In case of a gas, bulk modulus is process dependent and is given by,

$$\boxed{B = xp}$$

in the process pV^x = constant

For example, for $x = 1$, or pV = constant (isothermal process), $B = p$.

i.e., isothermal bulk modulus of a gas (denoted by B_T) is equal to the pressure of the gas at that instant of time or

$$\boxed{B_T = p}$$

Similarly, for $x = \gamma = \dfrac{C_p}{C_V}$ or pV^γ = constant (adiabatic process), $B = \gamma p$.

i.e., adiabatic bulk modulus of a gas (denoted by B_s) is equal to γ times the pressure of the gas at that instant of time or $B_s = \gamma p$

In general for a gas, $B \propto p$ in all processes.

Physically this can be explained as under:

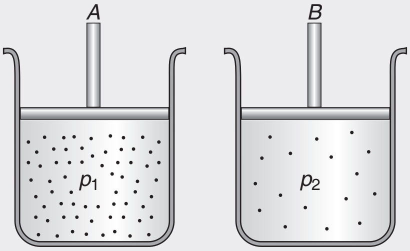

Fig. 15.8

Suppose we have two containers A and B. Some gas is filled in both the containers. But the pressure in A is more than the pressure in B, i.e. $p_1 > p_2$

So, bulk modulus of A should be more than the bulk modulus of B, or $B_1 > B_2$

and this is quiet obvious, because it is more difficult to compress the gas in chamber A, i.e. it provides more resistance to the external forces. And as we have discussed earlier also, the modulus of elasticity is more for a material which offers more resistance to external forces.

- When a pressure is applied on a substance, its density is changed. The change in density can be calculated as under :

$$\rho = \frac{\text{mass}}{\text{volume}} \qquad (\rho = \text{density})$$

or

$$\rho \propto \frac{1}{V} \qquad (\text{mass} = \text{constant})$$

$$\frac{\rho'}{\rho} = \frac{V}{V'} = \frac{V}{V + dV}$$

or

$$\rho' = \rho\left(\frac{V}{V + dV}\right)$$

$$= \rho\left(\frac{V}{V-(dp/B)V}\right) \qquad \left(\text{as } B = -\frac{dp}{dV/V}\right)$$

$$\rho' = \frac{\rho}{1-\frac{dp}{B}}$$

From this expression, we can see that ρ′ increases as pressure is increased (*dp* is positive) and *vice-versa*.

We can also write the above equation as

$$\rho' = \rho\left(1-\frac{dp}{B}\right)^{-1}$$

or $$\rho' \approx \rho\left(1+\frac{dp}{B}\right) \qquad (\text{if } dp << B)$$

or $$\rho'-\rho = \Delta\rho = \rho\frac{(dp)}{B}$$

∴ $$\Delta\rho = \rho\left(\frac{\Delta p}{B}\right)$$

- In the figure shown

Work done by gravity is

$$W = (Mg)\Delta l \qquad \ldots\text{(i)}$$

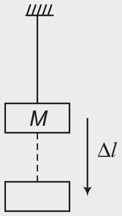

Fig. 15.9

But potential energy stored in the stretched wire is

$$U = \left(\frac{\text{energy}}{\text{volume}} \text{ or energy density}\right)(\text{volume})$$

$$= \left[\frac{1}{2}(\text{stress}) \times (\text{strain})\right][\text{volume}]$$

$$= \frac{1}{2}\left(\frac{Mg}{A}\right)\left(\frac{\Delta l}{l}\right)(Al)$$

or $$U = \frac{1}{2}(Mg)(\Delta l) \qquad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we can see that half of the work done by gravity is stored as potential energy in stretched wire and rest half (or 50%) is dissipated in the form of heat, sound etc. during stretching.

Solved Examples

TYPED PROBLEMS

Type 1. *Based on change in length of a wire.*

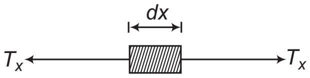
Concept

We have discussed in article 15.4 that change in length is given by $\Delta l = \dfrac{Fl}{AY}$

Here, F is the internal restoring force in the wire. So, this is also the tension in the wire. Therefore, we can also write the above equation as

$$\Delta l = \frac{Tl}{AY}$$

Now, the concept is, if tension is uniform then this equation can be applied directly to find the change in length. If tension is non-uniform then we will find change in length by integration.



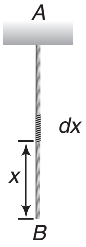
In that case, $$\Delta l = \int dl = \int \frac{T_x \cdot dx}{AY}$$

Here, T_x is the tension at some intermediate point x and

$dl = \dfrac{T_x\,dx}{AY}$ is the change in length in a small element dx, due to the tension T_x at this point.

Note *To find T_x at some intermediate point (if it is non-uniform) students can refer the chapter 'Laws of motion'.*

Example 1 *A bar of mass m and length l is hanging from point A as shown in figure. Find the increase in its length due to its own weight. The Young's modulus of elasticity of the wire is Y and area of cross-section of the wire is A.*



Solution Consider a small section dx of the bar at a distance x from B.

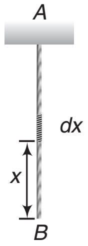
Tension in the bar at this point is $T_x = W_x = \left(\dfrac{mg}{l}\right) x$

Elongation in section dx will be $dl = \dfrac{T_x dx}{AY} = \left(\dfrac{mg}{lAY}\right) x\,dx$

Total elongation in the bar can be obtained by integrating this expression from $x = 0$ to $x = l$.

$\therefore$ $$\Delta l = \int_{x=0}^{x=l} dl = \left(\frac{mg}{lAY}\right)\int_0^l x\,dx$$

or $$\Delta l = \frac{mgl}{2AY}$$ **Ans.**



Example 2 *A rod PQ of mass m, area of cross section A, length l and Young's modulus of elasticity Y is lying on a smooth table as shown in figure. A force F is applied at P. Find*

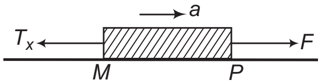
(a) tension at a distance x from end P,

(b) longitudinal stress at this point,

(c) total change in length and

(d) total strain in the rod.

Solution (a) Acceleration of the rod, $a = \frac{F}{m}$



$$F - T_x = (m_{PM})\,a = \left(\frac{m}{l}x\right)\left(\frac{F}{m}\right)$$

$$\therefore \quad T_x = F\left(1 - \frac{x}{l}\right) \qquad \textbf{Ans.}$$

(b) Stress $$\sigma = \frac{F}{A} = \frac{T_x}{A} = \frac{F}{A}\left(1 - \frac{x}{l}\right) \qquad \textbf{Ans.}$$

(c) Change in length $$\Delta l = \int_0^l \frac{T_x dx}{AY}$$

$$= \int_0^l \frac{F\left(1 - \frac{x}{l}\right) dx}{AY}$$

$$\Delta l = \frac{Fl}{2AY} \qquad \textbf{Ans.}$$

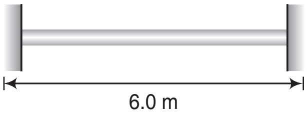
(d) Strain $$= \frac{\Delta l}{l} = \frac{F}{2AY} \qquad \textbf{Ans.}$$

Type 2. *Based on thermal stresses.*

Concept

As discussed in article 15.7, if temperature of a rod is increased or decreased, it has a tendency to expand or contract. If rod is not fixed from its two ends and it is free to expand or contract then no stresses will be developed in it. If rod is fixed from its two ends then it means rod is not allowed to expand or contract. So stresses are developed. If temperature is decreased, then its natural length is less but it is fixed from two ends. So, we can assume that it has been stretched by Δl from its natural length $l - \Delta l (\approx l)$. So, tensile stresses will be developed. Similarly, compressive stresses are developed if temperature is increased.

Example 3 *A steel rod of length 6.0 m and diameter 20 mm is fixed between two rigid supports. Determine the stress in the rod, when the temperature increases by $80^\circ C$ if*



(a) the ends do not yield *(b) the ends yield by 1 mm.*

Take $Y = 2.0 \times 10^6 \ kg/cm^2$ and $\alpha = 12 \times 10^{-6}$ per°C.

Solution Given, length of the rod $l = 6\text{ m} = 600\text{ cm}$

Diameter of the rod $d = 20\text{ mm} = 2\text{ cm}$

Increase in temperature $t = 80°\text{C}$

Young's modulus

$$Y = 2.0 \times 10^6\ \text{kg/cm}^2$$

and thermal coefficient of linear expansion $\alpha = 12 \times 10^{-6}$ per°C

(a) When the ends do not yield

Let, $\sigma_1 =$ stress in the rod

Using the relation $\sigma = \alpha t Y$

$$\therefore \quad \sigma_1 = (12 \times 10^{-6})(80)(2 \times 10^6)$$

$$= 1920\ \text{kg/cm}^2$$ **Ans.**

(b) When the ends yield by 1 mm.

Increase in length due to increase in temperature $\Delta l = l\alpha t$

of this 1 mm or 0.1 cm is allowed to expand. Therefore, net compression in the rod

$$\Delta l_{\text{net}} = (l\alpha t - 0.1)$$

or compressive strain in the rod,

$$\varepsilon = \frac{\Delta l_{\text{net}}}{l} = \left(\alpha t - \frac{0.1}{l}\right)$$

$$\therefore \quad \text{stress } \sigma_2 = Y\varepsilon = Y\left(\alpha t - \frac{0.1}{l}\right)$$

Substituting the values,

$$\sigma_2 = 2 \times 10^6 \left(12 \times 10^{-6} \times 80 - \frac{0.1}{600}\right)$$

$$= 1587\ \text{kg/cm}^2$$ **Ans.**

Note *For more examples of thermal stresses, students can refer the topic thermal expansion.*

Type 3. *Based on breaking stress.*

Concept

Every material has a limit of maximum stress which can be applied to this. This is called breaking stress. Material breaks beyond this.

Now, the maximum force which can be applied across it depends on its area of cross-section.

$$\sigma_m = \frac{F_m}{A} \qquad (\sigma_m = \text{breaking stress})$$

$$\therefore \quad \text{Maximum force } F_m = (\sigma_m)A$$

Example 4 *If the elastic limit of copper is* $1.5 \times 10^8\ N/m^2$, *determine the minimum diameter a copper wire can have under a load of* 10.0 *kg, if its elastic limit is not to be exceeded.*

Solution $\dfrac{F}{A_{\min}} = \sigma_m$

$$\therefore \quad \frac{F}{\left(\dfrac{\pi d_{\min}^2}{4}\right)} = \sigma_m \quad \text{or} \quad d_{\min} = \sqrt{\frac{4F}{\pi\,\sigma_m}}$$

$$= \sqrt{\frac{4 \times 10 \times 9.8}{3.14 \times 1.5 \times 10^8}} = 9.1 \times 10^{-4}\ \text{m} = 0.91\ \text{mm} \qquad \textbf{Ans.}$$

Example 5 *Find the greatest length of steel wire that can hang vertically without breaking. Breaking stress of steel* = $8.0 \times 10^8\ N/m^2$. *Density of steel* = $8.0 \times 10^3\ kg/m^3$. *Take* $g = 10\ m/s^2$.

Solution Let l be the length of the wire that can hang vertically without breaking. Then, the stretching force on it is equal to its own weight. If therefore, A is the area of cross-section and ρ the density, then

$$\text{Maximum stress } (\sigma_m) = \frac{\text{weight}}{A} \qquad \left(\text{Stress} = \frac{\text{force}}{\text{area}}\right)$$

or
$$\sigma_m = \frac{(Al\rho)g}{A}$$

$$\therefore \quad l = \frac{\sigma_m}{\rho g}$$

Substituting the values
$$l = \frac{8.0 \times 10^8}{(8.0 \times 10^3)(10)} = 10^4\ \text{m} \qquad \textbf{Ans.}$$

Type 4. *Based on change in density due to change in pressure.*

Concept

As discussed in extra touch points, if extra pressure Δp is applied on a body its volume decreases without change in its mass. So, its density increases. If $\Delta p << B$, where B is the bulk modulus, then increase in density is given by $\Delta\rho = \dfrac{\rho\Delta p}{B}$

Example 6 *Bulk modulus of water is* $2.3 \times 10^9\ N/m^2$. *Taking average density of water* $\rho = 10^3\ kg/m^3$, *find increase in density at a depth of* 1*km. Take* $g = 10\ m/s^2$

Solution Pressure increases with depth of a liquid. At a depth 'h' below the water surface increase in pressure is given by $\Delta p = \rho g h$

Using the equation,
$$\Delta\rho = \rho\frac{\Delta p}{B}$$

we get
$$\Delta\rho = \frac{\rho\,(\rho g h)}{B} = \frac{\rho^2 g h}{B}$$

Substituting the values we have,

$$\Delta\rho = \frac{(10^3)^2(10)\,(10^3)}{2.3 \times 10^9} = 4.33\ \text{kg/m}^3 \qquad \textbf{Ans.}$$

Miscellaneous Examples

Example 7 *The pressure of a medium is changed from* 1.01×10^5 *Pa to* 1.165×10^5 *Pa and change in volume is 10% keeping temperature constant. The bulk modulus of the medium is*

(a) 204.8×10^5 *Pa* *(b)* 102.4×10^5 *Pa* *(c)* 51.2×10^5 *Pa* *(d)* 1.55×10^5 *Pa*

Solution From the definition of bulk modulus, $B=\dfrac{-\Delta p}{(\Delta V/V)}$

Substituting the values, we have

$$B=\frac{(1.165-1.01)\times10^5}{(10/100)}=1.55\times10^5\ \text{Pa}$$

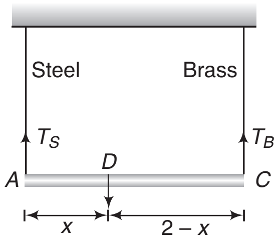
Therefore, the correct option is (d).

Example 8 *A light rod of length* 2.00 *m is suspended from the ceiling horizontally by means of two vertical wires of equal length tied to its ends. One of the wires is made of steel and is of cross-section* $10^{-3}\ m^2$ *and the other is of brass of cross-section* $2\times10^{-3}\ m^2$. *Find out the position along the rod at which a weight may be hung to produce,*

(a) equal stresses in both wires *(b) equal strains on both wires.*

Young's modulus for steel is $2\times10^{11}\ N/m^2$ *and for brass is* $10^{11}\ N/m^2$.

Solution (a) Given, stress in steel = stress in brass



$$\therefore \quad \frac{T_S}{A_S}=\frac{T_B}{A_B}$$

$$\therefore \quad \frac{T_S}{T_B}=\frac{A_S}{A_B}$$

$$=\frac{10^{-3}}{2\times10^{-3}}=\frac{1}{2} \quad \ldots\text{(i)}$$

As the system is in equilibrium, taking moments about D, we have

$$T_S\cdot x=T_B(2-x)$$

$$\therefore \quad \frac{T_S}{T_B}=\frac{2-x}{x} \quad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we get $x=1.33\,\text{m}$ **Ans.**

(b) Strain $=\dfrac{\text{Stress}}{Y}$

Given, strain in steel = strain in brass

$$\therefore \quad \frac{T_S/A_S}{Y_S}=\frac{T_B/A_B}{Y_B}$$

$$\therefore \quad \frac{T_S}{T_B}=\frac{A_SY_S}{A_BY_B}=\frac{(1\times10^{-3})(2\times10^{11})}{(2\times10^{-3})(10^{11})}=1 \quad \ldots\text{(iii)}$$

From Eqs. (ii) and (iii), we have $x=1.0$ m **Ans.**

Example 9 *A sphere of radius* $0.1\,m$ *and mass* 8π *kg is attached to the lower end of a steel wire of length* 5.0 *m and diameter* 10^{-3} *m. The wire is suspended from* 5.22 *m high ceiling of a room. When the sphere is made to swing as a simple pendulum, it just grazes the floor at its lowest point. Calculate the velocity of the sphere at the lowest position. Young's modulus of steel is* $1.994 \times 10^{11}\,N/m^2$.

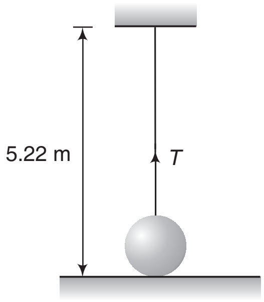
Solution Let Δl be the extension of wire when the sphere is at mean position. Then, we have

$$l + \Delta l + 2r = 5.22$$

or

$$\begin{aligned} \Delta l &= 5.22 - l - 2r \\ &= 5.22 - 5 - 2 \times 0.1 \\ &= 0.02 \text{ m} \end{aligned}$$

Let T be the tension in the wire at mean position during oscillations, then



$$Y = \frac{T/A}{\Delta l/l}$$

$$\therefore \quad T = \frac{YA\Delta l}{l} = \frac{Y\pi r^2 \Delta l}{l}$$

Substituting the values, we have

$$T = \frac{(1.994 \times 10^{11}) \times \pi \times (0.5 \times 10^{-3})^2 \times 0.02}{5}$$

$$= 626.43 \text{ N}$$

The equation of motion at mean position is,

$$T - mg = \frac{mv^2}{R} \qquad \text{...(i)}$$

Here, $R = 5.22 - r = 5.22 - 0.1 = 5.12$ m

and $m = 8\pi$ kg $= 25.13$ kg

Substituting the proper values in Eq. (i), we have

$$(626.43) - (25.13 \times 9.8) = \frac{(25.13)\,v^2}{5.12}$$

Solving this equation, we get

$$v = 8.8 \text{ m/s}$$ **Ans.**

Example 10 *A thin ring of radius R is made of a material of density ρ and Young's modulus Y. If the ring is rotated about its centre in its own plane with angular velocity ω, find the small increase in its radius.*

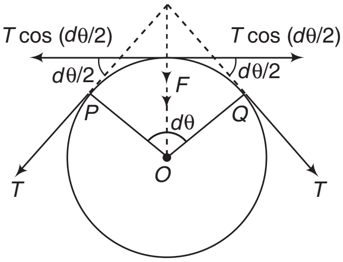
Solution Consider an element PQ of length dl. Let T be the tension and A the area of cross-section of the wire.

$$\text{Mass of element } dm = \text{volume} \times \text{density}$$
$$= A(dl)\rho$$

The component of T, towards the centre provides the necessary centripetal force to portion PQ.

$$\therefore \qquad F = 2T\sin\left(\frac{d\theta}{2}\right) = (dm)R\omega^2 \qquad \text{...(i)}$$

For small angles $$\sin\frac{d\theta}{2} \approx \frac{d\theta}{2} = \frac{(dl/R)}{2}$$



or $$d\theta = \frac{dl}{R}$$

Substituting in Eq. (i), we have

$$T \cdot \frac{dl}{R} = A(dl)\rho R\omega^2$$

or $$T = A\rho\omega^2R^2$$

Let ΔR be the increase in radius.

$$\text{Longitudinal strain} = \frac{\Delta l}{l} = \frac{\Delta(2\pi R)}{2\pi R} = \frac{\Delta R}{R}$$

Now, $$Y = \frac{T/A}{\Delta R/R}$$

$$\therefore \qquad \Delta R = \frac{TR}{AY}$$

$$= \frac{(A\rho\omega^2R^2)R}{AY}$$

or $$\Delta R = \frac{\rho\omega^2R^3}{Y}$$ **Ans.**

Exercises

LEVEL 1

Assertion and Reason

Directions : *Choose the correct option.*

(*a*) *If both **Assertion** and **Reason** are true and the **Reason** is correct explanation of the **Assertion.***

(*b*) *If both **Assertion** and **Reason** are true but **Reason** is not the correct explanation of **Assertion.***

(*c*) *If **Assertion** is true, but the **Reason** is false.*

(*d*) *If **Assertion** is false but the **Reason** is true.*

1. Assertion : Steel is more elastic than rubber.

Reason : For same strain, steel requires more stress to be produced in it.

2. Assertion : If pressure is increased, bulk modulus of gases will increase.

Reason : With increase in pressure, temperature of gas also increases.

3. Assertion : From the relation $Y = \frac{Fl}{A\Delta l}$, we can say that, if length of a wire is doubled, its Young's modulus of elasticity will also becomes two times.

Reason : Modulus of elasticity is a material property.

4. Assertion : Bulk modulus of elasticity can be defined for all three states of matter, solid liquid and gas.

Reason : Young's modulus is not defined for liquids and gases.

5. Assertion : Every wire is like a spring, whose spring constant, $K \propto \frac{1}{l}$ where l is length of wire.

Reason : It follows from the relation

$$K = \frac{YA}{l}$$

6. Assertion : Ratio of stress and strain is always constant for a substance.

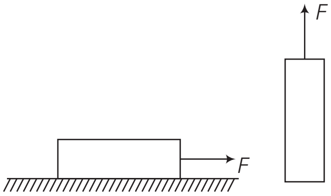
Reason : This ratio is called modulus of elasticity.

7. Assertion : Ratio of isothermal bulk modulus and adiabatic bulk modulus for a monoatomic gas at a given pressure is $\frac{3}{5}$.

Reason : This ratio is equal to

$$\gamma = \frac{C_p}{C_V}.$$

8. **Assertion:** A uniform elastic rod lying on smooth horizontal surface is pulled by a constant horizontal force of magnitude F as shown in the figure. Another identical elastic rod is pulled vertically upwards by a constant vertical force of magnitude F as shown in the figure. The extensions in both the rods will be same.



Reason: In a uniform elastic rod, the extension depends only on forces acting at the ends of rods.

9. **Assertion:** Identical springs of steel and copper are equally stretched. More work will be done on the steel spring.

Reason: Steel is more elastic than copper.

Objective Questions

Single Correct Option

1. The bulk modulus for an incompressible liquid is

(a) zero	(b) unity
(c) infinity	(d) between 0 and 1

2. The Young's modulus of a wire of length (L) and radius (r) is Y. If the length is reduced to $\frac{L}{2}$ and radius $\frac{r}{2}$, then its Young's modulus will be

(a) $\frac{Y}{2}$	(b) Y
(c) $2Y$	(d) $4Y$

3. The maximum load that a wire can sustain is W. If the wire is cut to half its value, the maximum load it can sustain is

(a) W	(b) $\frac{W}{2}$
(c) $\frac{W}{4}$	(d) $2W$

4. Identify the case when an elastic metal rod does not undergo elongation
   (a) it is pulled with a constant acceleration on a smooth horizontal surface
   (b) it is pulled with constant velocity on a rough horizontal surface
   (c) it is allowed to fall freely
   (d) All of the above

5. Vessel of 1×10^{-3} m^3 volume contains an oil. If a pressure of 1.2×10^5 N/m^2 is applied on it, then volume decreases by 0.3×10^{-3} m^3. The bulk modulus of oil is

(a) 6×10^{10} N/m^2	(b) 4×10^5 N/m^2
(c) 2×10^7 N/m^2	(d) 1×10^6 N/m^2

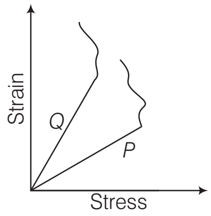
6. A load of 4 kg is suspended from a ceiling through a steel wire of length 20 m and radius 2 mm. It is found that the length of the wire increases by 0.031 mm, as equilibrium is achieved. If $g = 3.1 \times \pi \text{ ms}^{-2}$, the value of Young's modulus of the material of the wire (in Nm^{-2}) is

(a) 2×10^{12}
(b) 4×10^{11}
(c) 2×10^{11}
(d) 0.02×10^{9}

7. A wire of length 1m and radius 1mm is subjected to a load. The extension is x. The wire is melted and then drawn into a wire of square cross-section of side 2 mm. Its extension under the same load will be

(a) $\dfrac{\pi^2 x}{8}$
(b) $\dfrac{\pi^2 x}{16}$
(c) $\dfrac{\pi^2 x}{2}$
(d) $\dfrac{x}{2\pi}$

8. Figure shows the stress-strain curve of two metals P and Q. From the graph, it can be concluded that



(a) P has greater Young's modulus and lesser ductility
(b) Q has greater Young's modulus and lesser ductility
(c) P has greater Young's modulus and greater ductility
(d) Q has greater Young's modulus and greater ductility

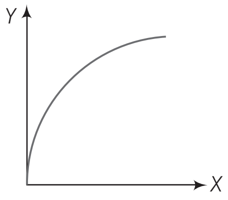
9. The bulk modulus of water is $2.0 \times 10^9 \text{ N/m}^2$. The pressure required to increase the density of water by 0.1% is

(a) $2.0 \times 10^3 \text{ N/m}^2$
(b) $2.0 \times 10^6 \text{ N/m}^2$
(c) $2.0 \times 10^5 \text{ N/m}^2$
(d) $2.0 \times 10^7 \text{ N/m}^2$

10. If the work done in stretching a wire by 1 mm is 2 J, then work necessary for stretching another wire of same material but with double radius of cross-section and half of the length by 1 mm is

(a) 8 J
(b) 16 J
(c) 4 J
(d) 32 J

11. The graph shows the behaviour of a steel wire in the region for which the wire obeys Hooke's law. The graph is a parabola. The variables X and Y-axes, respectively can be [stress (σ), strain (ε) and elastic potential energy (U)]



(a) U, σ
(b) U, ε
(c) σ, ε
(d) None of these

12. Depth of sea is maximum at Mariana Trench in West Pacific Ocean. Trench has a maximum depth of about 11 km. At bottom of trench water column above it exerts 1000 atm pressure. Percentage change in density of sea water at such depth will be around

(Given, $B = 2 \times 10^9$ Nm^{-2} and $p_{\text{atm}} = 1 \times 10^5$ Nm^{-2})

(a) about 5% (b) about 10%
(c) about 3% (d) about 7%

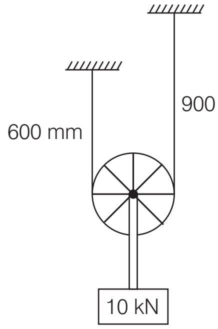
13. One end of a horizontal thick copper wire of length $2L$ and radius $2R$ is welded to an end of another horizontal thin copper wire of length L and radius R. When the arrangement is stretched by applying forces at two ends, the ratio of the elongation in the thin wire to that in the thick wire is

(a) 0.25 (b) 0.50
(c) 2.00 (d) 4.00

14. An air filled balloon is at a depth of 1km below the water level in an ocean. The normal stress of the balloon (in Pa) is
(Given, $\rho_{\text{water}} = 10^3$ kgm^{-3}, $g = 9.8$ ms^{-2} and $p_{\text{atm}} = 10^5$ Pa)

(a) 10^6 (b) 9.9×10^5
(c) 9.9×10^7 (d) 9.9×10^6

15. A load of 10 kN is supported from a pulley, which in turn is supported by a rope of cross-sectional area 10^3 mm^2 and modulus of elasticity 10^3 Nmm^{-2} as shown in the figure. Neglecting friction at the pulley, then downward deflection of the load (in mm) is



(a) 3.75 (b) 4.25 (c) 2.75 (d) 4.00

16. A body of mass 3.14 kg is suspended from one end of a wire of length 10 m. The radius of cross-section of the wire is changing uniformly from 5×10^{-4} m at the top (i.e. point of suspension) to 9.8×10^{-4} m at the bottom. Young's modulus of elasticity is 2×10^{11} N/m^2. The change in length of the wire is

(a) 4×10^{-3} m (b) 3×10^{-3} m
(c) 10^{-3} m (d) 2×10^{-3} m

Subjective Questions

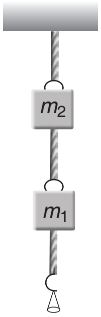
1. What is the density of lead under a pressure of 2.0×10^8 N/m^2, if the bulk modulus of lead is 8.0×10^9 N/m^2 and initially the density of lead is 11.4 g/cm^3?

2. A cylindrical steel wire of 3 m length is to stretch no more than 0.2 cm when a tensile force of 400 N is applied to each end of the wire. What minimum diameter is required for the wire ?
$Y_{\text{steel}} = 2.1 \times 10^{11}$ N/m^2

3. The elastic limit of a steel cable is $3.0 \times 10^8 \text{ N/m}^2$ and the cross-section area is 4 cm^2. Find the maximum upward acceleration that can be given to a 900 kg elevator supported by the cable if the stress is not to exceed one-third of the elastic limit.

4. Find the increment in the length of a steel wire of length 5 m and radius 6 mm under its own weight. Density of steel = 8000 kg/m^3 and Young's modulus of steel = $2 \times 10^{11} \text{ N/m}^2$. What is the energy stored in the wire ? (Take $g = 9.8 \text{ m/s}^2$)

5. Two wires shown in figure are made of the same material which has a breaking stress of $8 \times 10^8 \text{ N/m}^2$. The area of cross-section of the upper wire is 0.006 cm^2 and that of the lower wire is 0.003 cm^2. The mass $m_1 = 10 \text{ kg}$, $m_2 = 20$ kg and the hanger is light. Find the maximum load that can be put on the hanger without breaking a wire. Which wire will break first if the load is increased ? (Take $g = 10 \text{ m/s}^2$)



6. A steel wire and a copper wire of equal length and equal cross-sectional area are joined end to end and the combination is subjected to a tension. Find the ratio of

(a) the stresses developed in the two wires,
(b) the strains developed. (Y of steel $= 2 \times 10^{11} \text{ N/m}^2$ and Y of copper $= 1.3 \times 10^{11} \text{ N/m}^2$)

7. Calculate the approximate change in density of water in a lake at a depth of 400 m below the surface. The density of water at the surface is 1030 kg/m^3 and bulk modulus of water is $2 \times 10^9 \text{ N/m}^2$.

8. In taking a solid ball of rubber from the surface to the bottom of a lake of 180 m depth, reduction in the volume of the ball is 0.1%. The density of water of the lake is $1 \times 10^3 \text{ kg/m}^3$. Determine the value of the bulk modulus of elasticity of rubber. ($g = 9.8 \text{ m/s}^2$)

LEVEL 2

Single Correct Option

1. A wire elongates by l units, when a load w is suspended from it. If the wire gets over a pulley (equally on both the sides) and two weights w each are hung at the two ends, the elongation of wire (in units) will be

(a) zero
(b) $\frac{l}{2}$
(c) l
(d) $2l$

2. Maximum stress that can be applied to a wire which supports on elevator is σ. Mass of elevator is m and it is moved upwards with an acceleration of $g/2$. Minimum diameter of wire (Neglecting weight of wire) must be

(a) $\sqrt{\dfrac{2mg}{\pi\sigma}}$ (b) $\sqrt{\dfrac{3mg}{2\pi\sigma}}$

(c) $\sqrt{\dfrac{5mg}{2\pi\sigma}}$ (d) $\sqrt{\dfrac{6mg}{\pi\sigma}}$

3. A bob of mass 10 kg is attached to a wire 0.3 m long. Its breaking stress is 4.8×10^7 N/m^2. The area of cross-section of the wire is 10^{-6} m^2. What is the maximum angular velocity with which it can be rotated in a horizontal circle?

(a) 8 rad/s (b) 4 rad/s

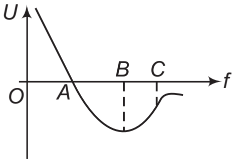
(c) 2 rad/s (d) 1 rad/s

4. A uniform steel rod of cross-sectional area A and length L is suspended so that it hangs vertically. The stress at the middle point of the rod is

(a) $\frac{1}{2}\rho g L$ (b) $\frac{1}{4}\rho g L$

(c) $\rho g L$ (d) None of these

5. The potential energy U of diatomic molecules as a function of separation r is shown in figure. Identify the correct statement.



(a) The atoms are in equilibrium if $r = OA$

(b) The force is repulsive only if r lies between A and B

(c) The force is attractive if r lies between A and B

(d) The atoms are in equilibrium if $r = OB$

6. The length of a steel wire is l_1 when the stretching force is T_1 and l_2 when the stretching force is T_2. The natural length of the wire is

(a) $\dfrac{l_1T_1 + l_2T_2}{T_1 + T_2}$ (b) $\dfrac{l_2T_1 + l_1T_2}{T_1 + T_2}$

(c) $\dfrac{l_2T_1 - l_1T_2}{T_1 - T_2}$ (d) $\dfrac{l_1T_1 - l_2T_2}{T_1 - T_2}$

7. A mass m is suspended from a wire. Change in length of the wire is Δl. Now the same wire is stretched to double its length and the same mass is suspended from the wire. The change in length in this case will become (it is assumed that elongation in the wire is within the proportional limit)

(a) Δl (b) $2\Delta l$ (c) $4\Delta l$ (d) $8\Delta l$

8. A uniform metal rod fixed at its ends of 2 mm^2 cross-section is cooled from 40°C to 20°C. The coefficient of the linear expansion of the rod is 12×10^{-6} per degree celsius and its Young's modulus of elasticity is 10^{11} N/m^2. The energy stored per unit volume of the rod is

(a) 2880 J/m^3 (b) 1500 J/m^3

(c) 5760 J/m^3 (d) 1440 J/m^3

9. A rod of length 1000 mm and coefficient of linear expansion $\alpha = 10^{-4}$ per degree celsius is placed in horizontal smooth surface symmetrically between fixed walls separated by 1001 mm. The Young's modulus of rod is 10^{11} N/m^2. If the temperature is increased by 20°C, then the stress developed in the rod is (in N/m^2)

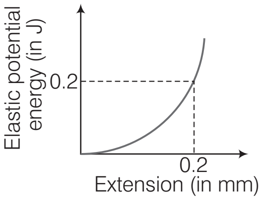
(a) 10^5 (b) 10^8
(c) 10^7 (d) 10^6

10. A uniform elastic plank moves due to a constant force F_0 applied at one end whose area is S. The Young's modulus of the plank is Y. The strain produced in the direction of force is

(a) $\frac{F_0}{2SY}$ (b) $\frac{F_0}{SY}$ (c) $\frac{2F_0}{SY}$ (d) $\frac{\sqrt{2}F_0}{SY}$

More than One Correct Options

1. Figure shows the graph of elastic potential energy (U) stored *versus* extension, for a steel wire ($Y = 2 \times 10^{11}$ Pa) of volume 200 cc. If area of cross-section A and original length L, then



(a) $A = 10^{-4}$ m^2 (b) $A = 10^{-3}$ m^2 (c) $L = 1.5$ m (d) $L = 2$ m

2. A metal wire of length L, area of cross-section A and Young's modulus Y is stretched by a variable force F such that F is always slightly greater than the elastic forces of resistance in the wire. When the elongation of the wire is l

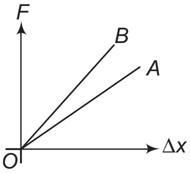
(a) the work done by F is $\frac{YAl^2}{2L}$

(b) the work done by F is $\frac{YAl^2}{L}$

(c) the elastic potential energy stored in the wire is $\frac{YAl^2}{2L}$

(d) the elastic potential energy stored in the wire is $\frac{YAl^2}{4L}$

3. Two wires A and B of same length are made of same material. The figure represents the load F *versus* extension Δx graph for the two wires. Then



(a) The cross sectional area of A is greater than that of B
(b) The elasticity of B is greater than that of A
(c) The cross-sectional area of B is greater than that of A
(d) The elasticity of A is greater than that of B

4. A body of mass M is attached to the lower end of a metal wire, whose upper end is fixed. The elongation of the wire is l.

(a) Loss in gravitational potential energy of M is Mgl

(b) The elastic potential energy stored in the wire is Mgl

(c) The elastic potential energy stored in the wire is $\frac{1}{2}Mgl$

(d) Heat produced is $\frac{1}{2}Mgl$

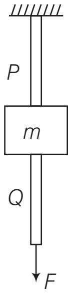
5. Two light wires P and Q shown in the figure are made of same material and have radii r_P and r_Q, respectively. The block between them has a mass m. When the force $F = \frac{mg}{3}$, then one of the wires breaks. Choose the correct option(s).

(a) P breaks, if $r_P = r_Q$

(b) P breaks, if $r_P < 2r_Q$

(c) Either P or Q may break, if $r_P = 2r_Q$

(d) To predict, which wire will break, the lengths of P and Q must be known



6. Two wires A and B have equal lengths and are made of the same material, but diameter of wire A is twice that of wire B. Then, for a given load,

(a) the extension of B will be four times that of A

(b) the extensions of A and B will be equal

(c) the strain in B is four times that in A

(d) the strains in A and B will be equal

7. A light rod of length 2 m is suspended from a ceiling horizontally by means of two vertical wires of equal length tied to its ends. One of the wires is made of steel and is of cross-section 10^{-3} m^2 and the other is of brass of cross-section 2×10^{-3} m^2. x is the distance from steel wire end, at which a weight may be hung. $Y_{\text{steel}} = 2 \times 10^{11}$ Pa and $Y_{\text{brass}} = 10^{11}$ Pa

Which of the following statement(s) is/are correct?

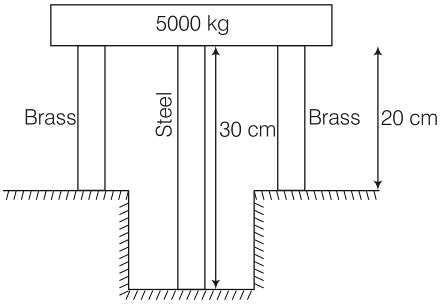
(a) $x = 1.2$ m, if the strains of both the wires are to be equal

(b) $x = 1.42$ m, if the stresses of both the wires are to be equal

(c) $x = 1$ m, if the strains of both the wires are to be equal

(d) $x = 1.33$ m, if the stresses of both the wires are to be equal

8. A steel rod of cross-sectional area 16 cm^2 and two brass rods each of cross-sectional area 10 cm^2 together support a load of 5000 kg as shown in the figure. (Given, $Y_{\text{steel}} = 2 \times 10^6$ kg cm^{-2} and $Y_{\text{brass}} = 10^6$ kg cm^{-2}). Choose the correct option(s).



(a) Stress in brass rod = 121 kg cm^{-2}

(b) Stress in steel rod = 161 kg cm^{-2}

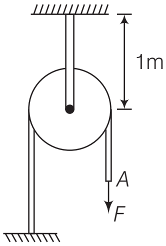
(c) Stress in brass rod = 141 kg cm^{-2}

(d) Stress in steel rod = 141 kg cm^{-2}

Comprehension Based Questions

Passage 1 (Q. Nos. 1 to 3)

The axle of a pulley of mass 1 kg is attached to the end of an elastic string of length 1 m, cross-sectional area 10^{-3} m^2 *and Young's modulus* 2×10^5 Nm^{-2}, *whose other end is fixed to the ceiling. A rope of negligible mass is placed on the pulley such that its left end is fixed to the ground and its right end is hanging freely, from the pulley which is at rest in equilibrium. Now, the free end A of the rope is subjected to pulling with constant force* $F = 10\,N$. *Friction between the rope and the pulley can be neglected.* (*Given,* $g = 10\ ms^{-2}$)



1. The elongation of the string before applying force is
(a) 50 cm (b) 5 cm (c) 0.5 cm (d) 0.05 cm

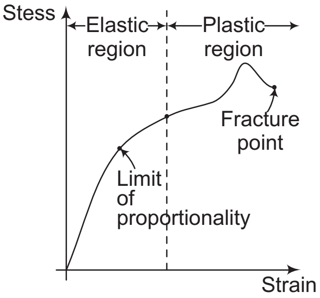
2. The greatest elongation of the string is
(a) 35 cm (b) 30 cm (c) 25 cm (d) 20 cm

3. The maximum displacement of point A after applying F is
(a) 70 cm (b) 60 cm (c) 40 cm (d) 50 cm

Passage 2 (Q. Nos. 4 to 6)

On gradual loading, stress-strain relationship for a metal wire is as follows.

Within proportionality limit, stress $\propto$ *strain or,* $\dfrac{Stress}{Strain}$ = *a constant for the material of wire.*



4. Two wires of same material have length and radius (L, r) and $\left(2L, \dfrac{r}{2}\right)$. The ratio of their Young's modulii is
(a) 1 : 2 (b) 2 : 3
(c) 2 : 1 (d) 1: 1

5. Just on crossing the yield region, the material will have
(a) increased and breaking stress (b) reduced and breaking stress
(c) constant stress (d) None of these

6. If $\frac{\text{Stress}}{\text{Strain}}$ is x in elastic region and y in the region of yield, then

(a) $x > y$ (b) $x = y$ (c) $x < y$ (d) $x = 2y$

Match the Columns

1. Match the following two columns. (dimension wise)

Column I	Column II
(a) Stress	(p) coefficient of friction
(b) Strain	(q) relative density
(c) Modulus of elasticity	(r) energy density
(d) Force constant of a wire	(s) None

2. A wire of length l, area of cross section A and Young's modulus of elasticity Y is stretched by a longitudinal force F. The change in length is Δl. Match the following two columns.

Note *In column I, corresponding to every option, other factors remain constant.*

Column I	Column II
(a) F is increased	(p) Δl will increase
(b) l is increased	(q) stress will increase
(c) A is increased	(r) Δl will decrease
(d) Y is increased	(s) stress will decrease

3. In Column I, a uniform bar of uniform cross-sectional area under the application of forces is shown in the figure and in Column II, some effects/phenomena are given. Match the two columns.

Column I	Column II
(a) 	(p) Uniform stresses are developed in the rod.
(b) 	(q) Non-uniform stresses are developed in the rod.
(c) 	(r) Compressive stresses are developed in the rod.
(d) 	(s) Tensile stresses are developed in the rod.

Subjective Questions

1. A solid sphere of radius R made of a material of bulk modulus B is surrounded by a liquid in a cylindrical container. A massless piston of area A (the area of container is also A) floats on the surface of the liquid. When a mass M is placed on the piston to compress the liquid, fractional change in radius of the sphere is $\frac{Mg}{\alpha AB}$. Find the value of α.

2. A 0.1 kg mass is suspended from a wire of negligible mass. The length of the wire is 1 m and its cross-sectional area is $4.9 \times 10^{-7}\ \text{m}^2$. If the mass is pulled a little in the vertically downward direction and released, it performs SHM with angular frequency 140 rad s^{-1}. If the Young's modulus of the material of the wire is $p \times 10^9\ \text{Nm}^{-2}$, find the value of p.

3. A wire having a length L and cross-sectional area A is suspended at one of its ends from a ceiling. Density and Young's modulus of material of the wire are ρ and Y, respectively. Its strain energy due to its own weight is $\dfrac{\rho^2 g^2 A L^3}{\alpha Y}$. Find the value of α.

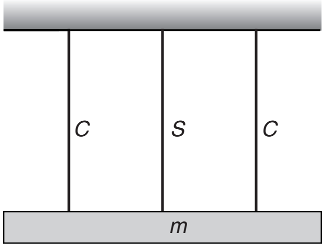
4. A wire of length 3 m, diameter 0.4 mm and Young's modulus $8 \times 10^{10}\ \text{N/m}^2$ is suspended from a point and supports a heavy cylinder of volume $10^{-3}\ \text{m}^3$ at its lower end. Find the decrease in length when the metal cylinder is immersed in a liquid of density 800 kg/m^3.

5. A sphere of radius 10 cm and mass 25 kg is attached to the lower end of a steel wire of length 5 m and diameter 4 mm which is suspended from the ceiling of a room. The point of support is 521 cm above the floor. When the sphere is set swinging as a simple pendulum, its lowest point just grazes the floor. Calculate the velocity of the ball at its lowest position ($Y_{\text{steel}} = 2 \times 10^{11}\ \text{N/m}^2$).

6. A uniform ring of radius R and made up of a wire of cross-sectional radius r is rotated about its axis with a frequency f. If density of the wire is ρ and Young's modulus is Y. Find the fractional change in radius of the ring.

7. A 6 kg weight is fastened to the end of a steel wire of unstretched length 60 cm. It is whirled in a vertical circle and has an angular velocity of 2 rev/s at the bottom of the circle. The area of cross-section of the wire is 0.05 cm^2. Calculate the elongation of the wire when the weight is at the lowest point of the path. Young's modulus of steel = $2 \times 10^{11}\ \text{N/m}^2$.

8. A homogeneous block with a mass m hangs on three vertical wires of equal length arranged symmetrically. Find the tension of the wires if the middle wire is of steel and the other two are of copper. All the wires have the same cross-section. Consider the modulus of elasticity of steel to be double than that of copper.



9. A uniform copper bar of density ρ, length L, cross-sectional area S and Young's modulus Y is moving horizontally on a frictionless surface with constant acceleration a_0. Find
(a) the stress at the centre of the wire,
(b) total elongation of the wire.

10. A 5 m long cylindrical steel wire with radius 2×10^{-3} m is suspended vertically from a rigid support and carries a bob of mass 100 kg at the other end. If the bob gets snapped, calculate the change in temperature of the wire ignoring radiation losses. (Take $g = 10\ \text{m/s}^2$)
(For the steel wire, Young's modulus = $2.1 \times 10^{11}\ \text{N/m}^2$; Density = 7860 kg/m^3;
Specific heat = 420 J/kg-°C).

16.1 Definition of a Fluid

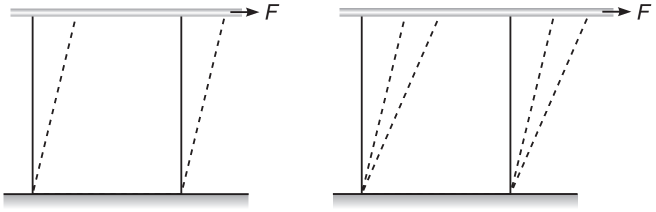
Fluid mechanics deals with the behaviour of fluids at rest and in motion. A fluid is a substance that deforms continuously under the application of a shear (tangential) stress no matter how small the shear stress may be.

Thus, fluids comprise the liquid and gas (or vapour) phases of the physical forms in which matter exists. The distinction between a fluid and the solid state of matter is clear if you compare fluid and solid behaviour. A solid deforms when a shear stress is applied but it does not continue to increase with time. However, if a shear stress is applied to a fluid, the deformation continues to increase as long as the stress is applied. We may alternatively define a fluid as a substance that **cannot sustain a shear stress when at rest.**



(a) Solid (b) Fluid

Fig. 16.1 Behaviour of a solid and a fluid, under the action of a constant shear force

Ideal Fluid

An ideal liquid is incompressible and non-viscous in nature. An incompressible liquid means the density of the liquid is constant, it is independent of the variations in pressure. A non-viscous liquid means that, parts of the liquid in contact do not exert any tangential force on each other. Thus, there is no friction between the adjacent layers of a liquid. The force by one part of the liquid on the other part is **perpendicular to the surface of contact.**

16.2 Density of a Liquid

Density (ρ) of any substance is defined as the mass per unit volume or

$$\rho = \frac{\text{mass}}{\text{volume}} \quad \text{or} \quad \boxed{\rho = \frac{m}{V}}$$

Relative Density (RD)

In case of a liquid, sometimes an another term **Relative Density** (RD) is defined. It is the ratio of density of the substance to the density of water at 4°C. Hence,

$$\boxed{\text{RD} = \frac{\text{Density of substance}}{\text{Density of water at } 4^\circ\text{C}}}$$

RD is a pure ratio. So, it has no units. It is also sometimes referred as specific gravity. Density of water at 4°C in CGS is 1 g/cm^3. Therefore, numerically the RD and density of substance (in CGS) are equal. In SI units, the density of water at 4°C is 1000 kg/m^3.

Density of a Mixture of two or more Liquids

Here, we have two cases:

Case 1 Suppose two liquids of densities ρ_1 and ρ_2 having masses m_1 and m_2 are mixed together. Then, the density of the mixture will be

$$\rho = \frac{\text{Total mass}}{\text{Total volume}} = \frac{(m_1 + m_2)}{(V_1 + V_2)}$$

$$= \frac{(m_1 + m_2)}{\left(\dfrac{m_1}{\rho_1} + \dfrac{m_2}{\rho_2}\right)}$$

If $m_1 = m_2$, then

$$\rho = \frac{2\rho_1\rho_2}{\rho_1 + \rho_2}$$

Case 2 If two liquids of densities ρ_1 and ρ_2 having volumes V_1 and V_2 are mixed, then the density of the mixture is,

$$\rho = \frac{\text{Total mass}}{\text{Total volume}} = \frac{m_1 + m_2}{V_1 + V_2}$$

$$= \frac{\rho_1 V_1 + \rho_2 V_2}{V_1 + V_2}$$

If $V_1 = V_2$, then

$$\rho = \frac{\rho_1 + \rho_2}{2}$$

Effect of Temperature on Density

As the temperature of a liquid is increased, the mass remains the same while the volume is increased and hence, the density of the liquid decreases $\left(\text{as } \rho \propto \dfrac{1}{V}\right)$. Thus,

$$\frac{\rho'}{\rho} = \frac{V}{V'} = \frac{V}{V + dV} = \frac{V}{V + V\gamma\Delta\theta}$$

or

$$\frac{\rho'}{\rho} = \frac{1}{1 + \gamma\Delta\theta}$$

Here, $\gamma =$ thermal coefficient of volume expansion

and $\Delta\theta =$ rise in temperature

$\therefore$

$$\boxed{\rho' = \frac{\rho}{1 + \gamma\Delta\theta}}$$

We can also write

$$\rho' = \rho(1 + \gamma\Delta\theta)^{-1}$$

or

$$\boxed{\rho' \approx \rho(1 - \gamma\Delta\theta)} \qquad (\text{if } \gamma\Delta\theta << 1)$$

Effect of Pressure on Density

As pressure is increased, volume decreases and hence density will increase. Thus,

$$\rho \propto \frac{1}{V}$$

$$\therefore \qquad \frac{\rho'}{\rho} = \frac{V}{V'} = \frac{V}{V+dV} = \frac{V}{V - \left(\frac{dp}{B}\right)V}$$

or

$$\frac{\rho'}{\rho} = \frac{1}{1 - \frac{dp}{B}}$$

Here, $dp =$ change in pressure

and $B =$ bulk modulus of elasticity of the liquid

Therefore,

$$\boxed{\rho' = \frac{\rho}{1 - \frac{dp}{B}}}$$

$$\Rightarrow \qquad \rho' = \rho\left(1 - \frac{dp}{B}\right)^{-1}$$

or

$$\rho' \approx \rho\left(1 + \frac{dp}{B}\right) \qquad (\text{if } dp << B)$$

Further,

$$\boxed{\rho' - \rho = \Delta\rho = \frac{\rho(dp)}{B} \text{ or } \frac{\rho(\Delta p}{B}}$$

Example 16.1 *Relative density of an oil is* 0.8. *Find the absolute density of oil in CGS and SI units.*

Solution Density of oil (in CGS) = (RD) g/cm^3

$$= 0.8 \text{ g/cm}^3$$

$$= 800 \text{ kg/m}^3$$

Ans.

16.3 Pressure in a Fluid

When a fluid (either liquid or gas) is at rest, it exerts a force perpendicular to any surface in contact with it, such as a container wall or a body immersed in the fluid.While the fluid as a whole is at rest, the molecules that makes up the fluid are in motion, the force exerted by the fluid is due to molecules colliding with their surroundings.

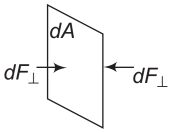


Fig. 16.2

If we think of an imaginary surface within the fluid, the fluid on the two sides of the surface exerts equal and opposite forces on the surface, otherwise the surface would accelerate and the fluid would not remain at rest.

Consider a small surface of area dA centered on a point on the fluid, the normal force exerted by the fluid on each side is $dF_\perp$. The pressure p is defined at that point as the normal force per unit area, i.e.

$$\boxed{p = \frac{dF_\perp}{dA}}$$

If the pressure is the same at all points of a finite plane surface with area A, then

$$p = \frac{F_\perp}{A}$$

where, $F_\perp$ is the normal force on one side of the surface. The SI unit of pressure is pascal, where

$$1 \text{ pascal} = 1 \text{ Pa} = 1.0 \text{ N/m}^2$$

One unit used principally in meterology is the Bar which is equal to 10^5 Pa.

$$1 \text{ Bar} = 10^5 \text{ Pa}$$

Atmospheric Pressure (p_0)

It is pressure of the earth's atmosphere. This changes with weather and elevation. Normal atmospheric pressure at sea level (an average value) is 1.013×10^5 Pa. Thus,

$$1 \text{ atm} = 1.013 \times 10^5 \text{ Pa}$$

Note *Fluid pressure acts perpendicular to any surface in the fluid no matter how that surface is oriented. Hence, pressure has no intrinsic direction of its own, it is a scalar. By contrast, force is a vector with a definite direction.*

Absolute Pressure and Gauge Pressure

The excess pressure above atmospheric pressure is usually called gauge pressure and the total pressure is called absolute pressure. Thus,

$$\boxed{\text{Gauge pressure} = \text{absolute pressure} - \text{atmospheric pressure}}$$

Absolute pressure is always greater than or equal to zero. While gauge pressure can be negative also.

Variation in Pressure with Depth

If the weight of the fluid can be neglected, the pressure in a fluid is the same throughout its volume. But often the fluid's weight is not negligible and under such condition pressure increases with increasing depth below the surface.

Let us now derive a general relation between the pressure p at any point in a fluid at rest and the elevation y of that point. We will assume that the density ρ and the acceleration due to gravity g are the same throughout the fluid. If the fluid is in equilibrium, every volume element is in equilibrium.

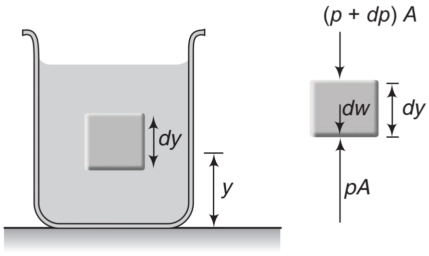

Fig. 16.3

Consider a thin element of fluid with height dy. The bottom and top surfaces each have area A, and they are at elevations y and $y + dy$ above some reference level where $y = 0$. The weight of the fluid element is

$$dw = (\text{volume})\ (\text{density})\ (g) = (A\ dy)(\rho)(g) \quad \text{or} \quad dw = \rho g A dy$$

What are the other forces in y-direction on this fluid element? Call the pressure at the bottom surface p, the total y-component of upward force is pA. The pressure at the top surface is $p + dp$ and the total y-component of downward force on the top surface is $(p + dp)A$. The fluid element is in equilibrium, so the total y-component of force including the weight and the forces at the bottom and top surfaces must be zero.

$$\Sigma F_y = 0$$

$$\therefore \quad pA - (p + dp)A - \rho g A\, dy = 0$$

or
$$\boxed{\frac{dp}{dy} = -\rho g} \qquad \ldots\text{(i)}$$

This equation shows that when y increases, p decreases, i.e. as we move upward in the fluid, pressure decreases.

If p_1 and p_2 be the pressures at elevations y_1 and y_2 and if ρ and g are constant, then integrating Eq. (i), we get

$$\int_{p_1}^{p_2} dp = -\rho g \int_{y_1}^{y_2} dy$$

or
$$\boxed{p_2 - p_1 = -\rho g (y_2 - y_1)} \qquad \ldots\text{(ii)}$$

It is often convenient to express Eq. (ii) in terms of the depth below the surface of a fluid. Take point 1 at depth h below the surface of fluid and let p represents pressure at this point. Take point 2 at the surface of the fluid, where the pressure is p_0 (subscript zero for zero depth). The depth of point 1 below the surface is,

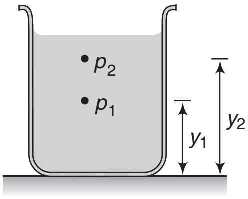

Fig. 16.4

$$h = y_2 - y_1$$

and Eq. (ii) becomes
$$p_0 - p = -\rho g (y_2 - y_1) = -\rho g h$$

$$\therefore \quad \boxed{p = p_0 + \rho g h} \qquad \ldots\text{(iii)}$$

Thus, pressure increases linearly with depth, if ρ and g are uniform. A graph between p and h is shown below.

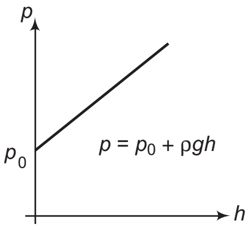

Fig. 16.5

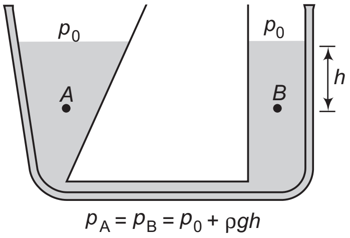

Fig. 16.6

Further, the pressure is the same at any two points at the same level in the fluid. The shape of the container does not matter.

Pascal's Law

Pascal's law or the **principle of transmission of fluid-pressure** is a principle in fluid mechanics that states that pressure exerted anywhere in a confined incompressible fluid is transmitted equally in all directions throughout the fluid.

The simplest instance of this is stepping on a balloon; the balloon bulges out on all sides under the foot and not just on one side. This is precisely what Pascal's law is all about – the air which is the fluid in this case, was confined by the balloon and you applied pressure with your foot causing it to get displaced uniformly.

A well known application of Pascal's law is the hydraulic lift used to support or lift heavy objects. It is schematically illustrated in figure.

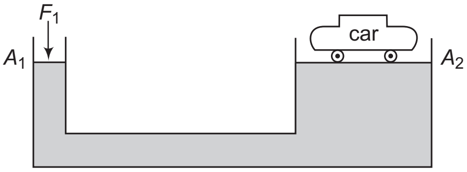

Fig. 16.7

A piston with small cross section area A_1 exerts a force F_1 on the surface of a liquid such as oil. The applied pressure $p = \frac{F_1}{A_1}$ is transmitted through the connecting pipe to a larger piston of area A_2. The applied pressure is the same in both cylinders, so

$$p = \frac{F_1}{A_1} = \frac{F_2}{A_2}$$

or

$$F_2 = \frac{A_2}{A_1} . F_1$$

Now, since $A_2 > A_1$, therefore, $F_2 > F_1$. Thus, hydraulic lift is a force multiplying device with a multiplication factor equal to the ratio of the areas of the two pistons. Dentist's chairs, car lifts and jacks, many elevators and hydraulic brakes all use this principle.

Extra Points to Remember

- At same point on a fluid pressure is same in all directions. In the figure,

$$p_1 = p_2 = p_3 = p_4$$

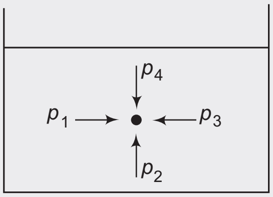

Fig. 16.8

- Forces acting on a fluid in equilibrium have to be perpendicular to its surface. Because it cannot sustain the shear stress.

- In the **same liquid** pressure will be same at all points at the same level (provided their speeds are same).

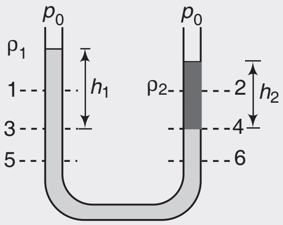

Fig. 16.9

For example, in the figure $p_1 \neq p_2$, $p_3 = p_4$ and $p_5 = p_6$

Further, $p_3 = p_4$

$\therefore$ $P_0 + \rho_1 g h_1 = P_0 + \rho_2 g h_2$

or $\rho_1 h_1 = \rho_2 h_2$ or $\boxed{h \propto \frac{1}{\rho}}$

- **Barometer** It is a device used to measure atmospheric pressure.

  In principle, any liquid can be used to fill the barometer, but mercury is the substance of choice because its great density makes possible an instrument of reasonable size.

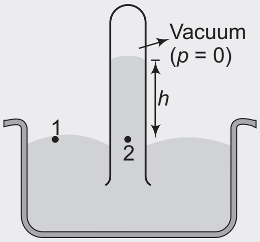

Fig. 16.10

$$p_1 = p_2$$

Here, p_1 = atmospheric pressure (p_0)

and $p_2 = 0 + \rho g h = \rho g h$

Here, ρ = density of mercury

$\therefore$ $p_0 = \rho g h$

Thus, the mercury barometer reads the atmospheric pressure (p_0) directly from the height of the mercury column. For example, if the height of mercury in a barometer is 760 mm, then atmospheric pressure will be

$$p_0 = \rho g h = (13.6 \times 10^3)(9.8)(0.760) = 1.01 \times 10^5 \text{ N/m}^2$$

- **Manometer** It is a device used to measure the pressure of a gas inside a container.

  The U-shaped tube often contains mercury.

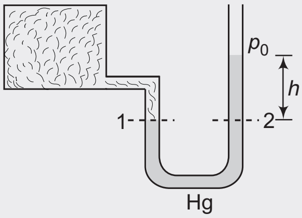

Fig. 16.11

$$\boxed{p_1 = p_2}$$

Here, p_1 = pressure of the gas in the container (p)

and p_2 = atmospheric pressure (p_0) + $\rho g h$

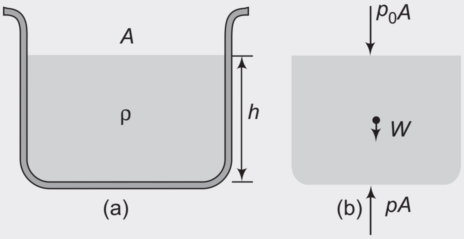
$\therefore$ $\boxed{p = p_0 + h\rho g}$

This can also be written as $\boxed{p - p_0 = \text{gauge pressure} = h\rho g}$

Here, ρ is the density of the liquid used in U-tube.

Thus, by measuring h we can find absolute (or gauge) pressure in the vessel.

- **Free body diagram of a liquid** The free body diagram of the liquid (showing the vertical forces only) is shown in Fig. 16.12 (b). For the equilibrium of liquid,



(a) (b)

Fig. 16.12

net downward force = net upward force

$\therefore$ $p_0 A + W = pA$ here, $W = \rho g h A$ $\therefore$ $p = p_0 + \rho g h$

Example 16.2 *For the arrangement shown in the figure, what is the density of oil ?*

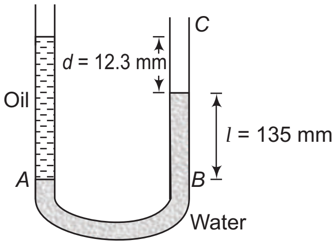


Fig. 16.13

Solution $p_B = p_A$

∴ $p_0 + \rho_w gl = p_0 + \rho_{\text{oil}} (l + d) g$

⇒ $\rho_{\text{oil}} = \dfrac{\rho_w l}{l + d} = \dfrac{(1000)(135)}{(135 + 12.3)} = 916 \text{ kg/m}^3$ **Ans.**

Example 16.3 *A U-tube of uniform cross-sectional area and open to the atmosphere is partially filled with mercury. Water is then poured into both arms. If the equilibrium configuration of the tube is as shown in figure with $h_2 = 1.0$ cm, determine the value of h_1.*

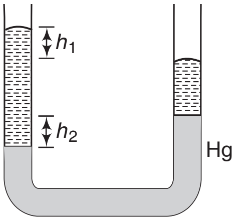

Fig. 16.14

Solution $p_1 = p_2$

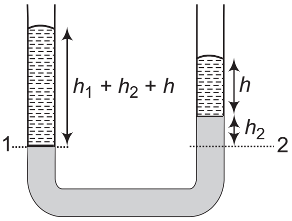

Fig. 16.15

∴ $p_0 + \rho_w g (h_1 + h_2 + h) = p_0 + \rho_w gh + \rho_{\text{Hg}} gh_2$

∴ $$h_1 = \frac{(\rho_{\text{Hg}} - \rho_w) h_2}{\rho_w}$$

$$= \frac{(13.6 - 1)(1.0)}{1}$$

$$= 12.6 \text{ cm}$$ **Ans.**

Example 16.4 *A U-shaped tube open to the air at both ends contains some mercury. A quantity of water is carefully poured into the left arm of the U-shaped tube until the vertical height of the water column is 15.0 cm.*

(a) What is the gauge pressure at the water mercury interface ?

(b) Calculate the vertical distance h from the top of the mercury in the right hand arm of the tube to the top of the water in the left-hand arm.

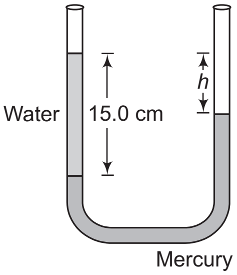

Fig. 16.16

Solution (a) Gauge pressure $= \rho_w g h_w$

$$= (10^3)(9.8)(0.15)$$

$$= 1470 \text{ N/m}^2$$ **Ans.**

(b) Let us calculate pressure or two sides at the level of water and mercury interface.

$$p_0 + \rho_w g\, h_w = p_0 + \rho_{\text{Hg}}\, g h_{\text{Hg}}$$

$$\rho_w h_w = \rho_{\text{Hg}}\, h_{\text{Hg}}$$

$$\therefore \quad (1)(15) = (13.6)(15 - h)$$

$$h = 13.9 \text{ cm}$$ **Ans.**

Example 16.5 *For the system shown in figure, the cylinder on the left, at L, has a mass of 600 kg and a cross-sectional area of 800 cm^2. The piston on the right, at S, has cross-sectional area 25 cm^2 and negligible weight. If the apparatus is filled with oil ($\rho = 0.78$ g/cm^3), what is the force F required to hold the system in equilibrium?*

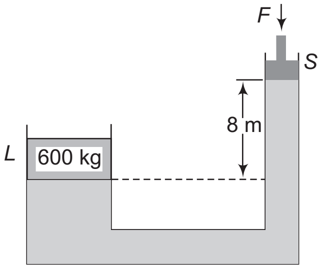

Fig. 16.17

Solution Let A_1 = area of cross-section on LHS and

A_2 = area of cross-section on RHS

Equating the pressure on two sides of the dotted line.

Then, $$\frac{F}{A_2} + \rho g h = \frac{Mg}{A_1} \qquad (M = 600 \text{ kg})$$

$$\therefore \quad F = A_2 \left[\frac{Mg}{A_1} - \rho g h\right]$$

$$= (25 \times 10^{-4}) \left[\frac{600 \times 9.8}{800 \times 10^{-4}} - 780 \times 9.8 \times 8\right]$$

$$= 31 \text{ N}$$ **Ans.**

INTRODUCTORY EXERCISE 16.1

1. Water and oil are poured into the two limbs of a U-tube containing mercury. The interfaces of the mercury and the liquids are at the same height in both limbs.

   Determine the height of the water column h_1 if that of the oil $h_2 = 20$ cm. The density of the oil is 0.9.

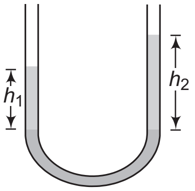

Fig. 16.18

2. The liquids shown in figure in the two arms are mercury (specific gravity = 13.6) and water. If the difference of heights of the mercury columns is 2 cm, find the height h of the water column.

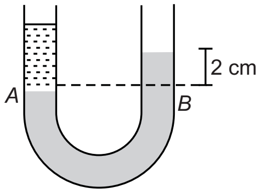

Fig. 16.19

3. The heights of mercury surfaces in the two arms of the manometer shown in Fig.16.20 are 2 cm and 8 cm. Atmospheric pressure is $1.01 \times 10^5 \text{Nm}^{-2}$.

   Find (a) the pressure of the gas in the cylinder and (b) the pressure of mercury at the bottom of the U tube.

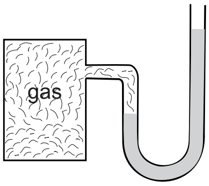

Fig. 16.20

4. A cylinderical vessel containing a liquid is closed by a smooth piston of mass m as shown in the Fig. 16.21. The area of cross section of the piston is A. If the atmospheric pressure is p_0, find the pressure of the liquid just below the piston.

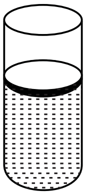

Fig. 16.21

5. The area of cross section of the two arms of a hydraulic press are 1 cm^2 and 10 cm^2 respectively (Fig.16.22). A force of 5 N is applied on the water in the thinner arm. What force should be applied on the water in the thicker arm so that the water may remain in equilibrium?

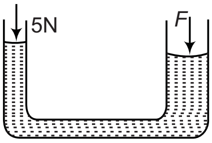

Fig. 16.22

6. The area of cross section of the wider tube shown in Fig. (16.23) is 900 cm^2. If the body standing on the position weighs 45 kg, find the difference in the levels of water in the two tubes.

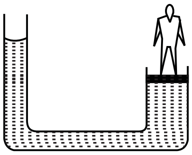

Fig. 16.23

16.4 Pressure Difference in Accelerating Fluids

If fluids are at rest then pressure does not change in horizontal direction.

It changes only in vertical direction.

At a height difference 'h', difference in pressure (or change in pressure) is

Pressure increases with depth. So, $\Delta p = +\rho gh$ in moving downwards and $\Delta p = -\rho gh$ in moving upwards.

If fluids are accelerated then pressure changes in both horizontal and vertical directions.

In Horizontal Direction

(i) Pressure decreases in the direction of acceleration.

(ii) At a horizontal distance x change in pressure is

(a = horizontal acceleration)

Take $\Delta p = +\rho ax$, while moving in opposite direction of acceleration. Because pressure increases in the opposite direction of acceleration and take $\Delta P = -\rho ax$ while moving in the direction of acceleration.

In Vertical Direction

Instead of 'g' in the equation, $\Delta p = \pm \rho gh$ take effective value of g or g_e. Thus,

Here, $g_e = g$ if vertical acceleration of fluid is zero.

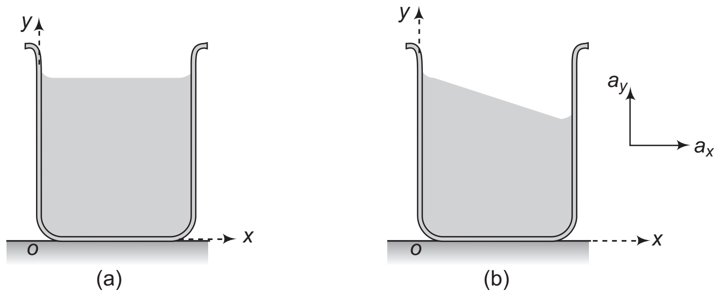
$g_e = g + a$ if vertical acceleration of fluid 'a' is upwards and

$g_e = g - a$ if vertical acceleration 'a' is downwards.

In equation form, all above statements can be explained as below.

Consider a liquid kept at rest in a beaker as shown in Fig. 16.24 (a). In this case, we know that pressure do not change in horizontal direction (x-direction), it decreases upwards along y-direction. So, we can write the equations,

$$\boxed{\frac{dp}{dx} = 0 \qquad \text{and} \qquad \frac{dp}{dy} = -\rho g} \qquad \text{...(i)}$$



(a) (b)

Fig. 16.24

But, suppose the beaker is accelerated and it has components of acceleration a_x and a_y in x and y directions respectively, then the pressure decreases along both x and y-directions. The above equations in that case become,

$$\boxed{\begin{aligned}\frac{dp}{dx} &= -\rho a_x \\ \text{and} \quad \frac{dp}{dy} &= -\rho(g + a_y)\end{aligned}} \qquad \text{...(ii)}$$

These equations can be derived as under :

Consider a beaker filled with some liquid of density ρ accelerating upwards with an acceleration a_y along positive y-direction. Let us draw the free body diagram of a small element of fluid of area A and length dy as shown in figure.

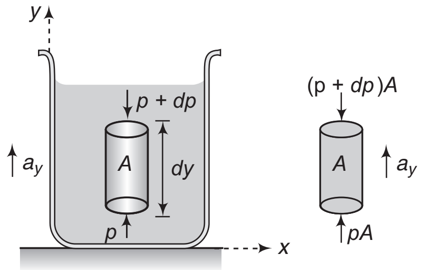


Fig. 16.25

Equation of motion for this fluid element is,

$$pA - W - (p + dp)A = (\text{mass})(a_y) \quad \text{or} \quad -W - (dp)A = (A\rho\, dy)(a_y)$$

$$\text{or} \quad -(A\rho g\, dy) - (dp)A = (A\rho\, dy)(a_y) \quad \text{or} \quad \frac{dp}{dy} = -\rho(g + a_y)$$

Similarly, if the beaker moves along positive x-direction with an acceleration a_x, the equation of motion for the fluid element shown in figure is,

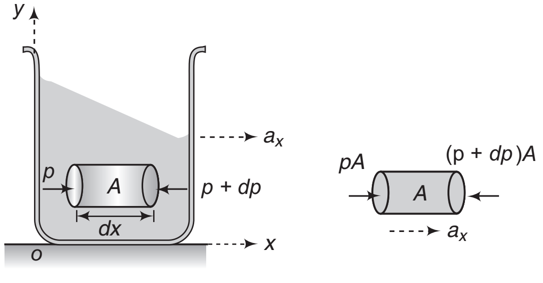

Fig. 16.26

$$pA - (p + dp)A = (\text{mass})(a_x)$$

$$\text{or} \qquad -(dp)A = (A\rho\, dx)a_x$$

$$\text{or} \qquad \frac{dp}{dx} = -\rho a_x$$

Note *(i)* $\frac{dp}{dx} = -\rho a_x$, $\Delta p = -\rho a_x x$ = *pressure difference in a horizontal distance x.*

Here, negative sign implies that pressure decreases with x or in the direction of acceleration.

(ii) In Fig. 16.26, pressure on left hand side of the fluid element should be more than the pressure on right hand side of this element. This is because this element is accelerated only due to this pressure difference.

(iii) $\frac{dp}{dy} = -\rho (g + a_y)$

$\Rightarrow$ $\Delta p = -\rho (g + a_y)\, y$

or $\Delta p = -\rho g_e h$

Here, negative sign implies that pressure decreases with 'y' or in moving upwards.

Free Surface of a Liquid Accelerated in Horizontal Direction

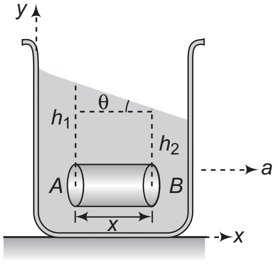

Fig. 16.27

Consider a liquid placed in a beaker which is accelerating horizontally with an acceleration '*a*'. Let *A* and *B* be two points in the liquid at a separation *x* in the same horizontal line. As we have seen in this case

$$\frac{dp}{dx} = -\rho a$$

or $$dp = -\rho a\, dx$$

Integrating this with proper limits, we get

$$p_A - p_B = \rho a x \qquad \ldots\text{(iii)}$$

Further, $$p_A = p_0 + \rho g h_1$$

and $$p_B = p_0 + \rho g h_2$$

Substituting in Eq. (iii), we get

$$\rho g (h_1 - h_2) = \rho a x$$

$\therefore$ $$\frac{h_1 - h_2}{x} = \frac{a}{g} = \tan\theta$$

$\therefore$ $$\boxed{\tan\theta = \frac{a}{g}}$$

Pressure Difference in Rotating Fluids

In a rotating fluid (also accelerating) pressure increases in moving away from the rotational axis. At a distance '*x*' from the rotational axis, pressure difference is

$$\boxed{\Delta p = \pm \frac{\rho \omega^2 x^2}{2}}$$

Take $\Delta p = +\frac{\rho \omega^2 x^2}{2}$ in moving away from the rotational axis, as pressure increases in this direction

and take $\Delta p = -\frac{\rho \omega^2 x^2}{2}$ in moving towards the rotational axis.

Proof

Suppose that liquid of density ρ kept inside a tube of area of cross-section A is rotating with an angular velocity 'ω' as shown.

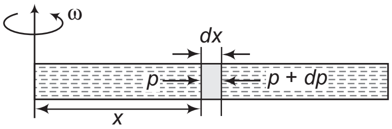

Fig. 16.28

Consider a small element of length 'dx' at a distance x from the axis of rotation. Mass of this element is,

$$dm = (\text{density})\,(\text{volume})$$

or $$dm = (\rho\, A dx)$$

This element is rotating in a circle of radius 'x'. So, this is accelerated towards centre with a centripetal acceleration

$$a = x\omega^2 \qquad (\text{as } a = R\omega^2)$$

To provide this acceleration, pressure on right hand side of the element should be more.

∴ $$(p+dp)A-(p)A = (dm)\,a = (\rho\, Adx)\,(x\omega^2)$$

or $$dp = (\rho\, x\,\omega^2)\,dx$$

∴ $$\Delta p = \int_0^x (\rho\omega^2)\,xdx$$

or $$\Delta p = \frac{\rho\,\omega^2 x^2}{2}$$ **Hence proved**.

Example 16.6 *A closed container shown in figure is filled with water* $(\rho = 10^3\,kg/m^3)$

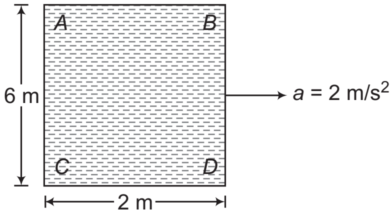

Fig. 16.29

This is accelerated in horizontal direction with an acceleration, $a = 2\,m/s^2$. *Find (a)* $p_C - p_D$ *and (b)* $p_A - p_D$

Solution (a) In horizontal direction, pressure decreases in the direction of acceleration.

Thus, $$p_C > p_D$$

or $$p_C - p_D = +\rho\, ax$$

Substituting the values, we have

$$p_C - p_D = (10^3)(2)(2)$$

or $$p_C - p_D = 4.0 \times 10^3 \text{ N/m}^2$$ **Ans.**

(b) In vertical direction, pressure increases with depth.

$\therefore$ $$p_C > p_A$$

or $$p_A - p_C = -\rho g h \qquad (g_e = g)$$

$$= -(10^3)(10)(6)$$

$$= -60 \times 10^3 \text{ N/m}^2$$

Now, $$p_A - p_D = (p_A - p_C) + (p_C - p_D)$$

$$= (-60 \times 10^3) + (4.0 \times 10^3)$$

$$= -56 \times 10^3 \text{ N/m}^2$$

$$= -5.6 \times 10^4 \text{ N/m}^2$$ **Ans.**

Note *Container is closed. So, nowhere inside the container pressure is atmospheric pressure p_0.*

Example 16.7 *A closed tube is filled with*

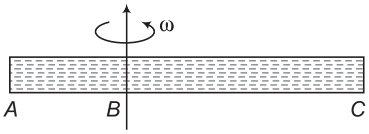

Fig. 16.30

$$AB = 2 \text{ m}$$
$$BC = 4 \text{ cm}$$

water ($\rho = 10^3$ *kg/m*^{3}). *It is rotating about an axis shown in figure with an angular velocity* $\omega = 2$ *rad/s. Find,* $p_A - p_C$.

Solution Pressure decreases in moving towards the axis of rotation and increases in moving away from the axis $\left(\Delta p = \pm \frac{\rho \omega^2 x^2}{2}\right)$

$\therefore$ $$p_A > p_B \text{ and } p_B < p_C$$

$$p_A - p_C = (p_A - p_B) + (p_B - p_C)$$

$$= \left(+\frac{\rho \omega^2 x_1^2}{2}\right) + \left(\frac{-\rho \omega^2 x_2^2}{2}\right)$$

Here, $$x_1 = AB = 2 \text{ m}$$

and $$x_2 = BC = 4 \text{ m}$$

Substituting the values we have,

$$p_A - p_C = \frac{(10^3)(2)^2\,(2)^2}{2} - \frac{(10^3)(2)^2\,(4)^2}{2}$$

$$= -2.4 \times 10^3\ \text{N/m}^2$$ **Ans.**

Example 16.8 *A liquid of density* ρ *is in a bucket that spins with angular velocity 'ω' as shown in figure. Prove that the free surface of the liquid has a parabolic shape. Find equation of this.*

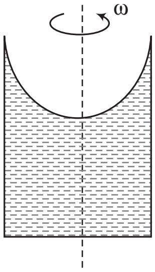

Fig. 16.31

Solution In the figure shown, suppose the coordinates of point M are (x, y) with respect to the coordinate axes.

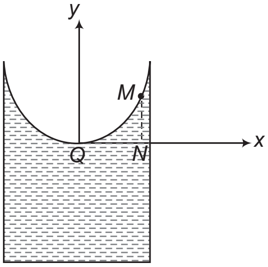

Fig. 16.32

Then, $MN = y,\ NQ = x$

Points M and Q are open to atmosphere.

$\therefore$ $p_M = p_Q =$ atmospheric pressure p_0

Now, $p_M - p_N = -\rho g y$

$\Rightarrow$ $p_0 - p_N = -\rho g y$ ...(i)

$$p_N - p_Q = \frac{\rho\omega^2 x^2}{2}$$

$\therefore$ $$p_N - p_0 = \frac{\rho\omega^2 x^2}{2}$$ ...(ii)

Adding Eqs. (i) and (ii), we have

$$0 = -\rho g y + \frac{\rho \omega^2 x^2}{2}$$

$$y = \frac{\omega^2 x^2}{2g}$$

This is the required equation of free surface of the liquid and we can see that this is an equation of a parabola.

INTRODUCTORY EXERCISE 16.2

1. In example 16.6, which point has the maximum pressure and which has the minimum pressure.
2. A cubical closed vessel of side 5 m filled with a liquid is accelerated with an acceleration a. Find the value of a so that pressure at mid point M of AC is equal to pressure at N.

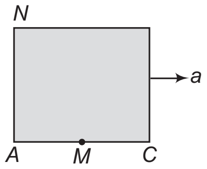

Fig. 16.33

3. Water $(\rho = 10^3\ \text{kg/m}^3)$ is filled in tube AB as shown in figure. $\omega = 10$ rad/s. Tube is open at end A. Atmospheric pressure is $p_0 = 10^5\ \text{N/m}^2$. Find absolute pressure at end B.

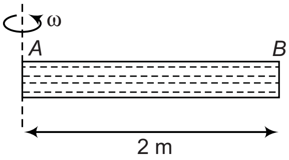

Fig. 16.34

16.5 Archimedes' Principle

If a heavy object is immersed in water, it seems to weightless than when it is in air. This is because the water exerts an upward force called **buoyant force.** It is equal to the weight of the fluid displaced by the body.

A body wholly or partially submerged in a fluid is buoyed up by a force equal to the weight of the displaced fluid.

This result is known as **Archimedes' principle.**

Thus, the magnitude of buoyant force (F) is given by,

$$\boxed{F = V_i \rho_L g}$$

Here, V_i = immersed volume of solid, ρ_L = density of liquid

and g = acceleration due to gravity

Proof

Consider an arbitrarily shaped body of volume V placed in a container filled with a fluid of density ρ_L. The body is shown completely immersed, but complete immersion is not essential to the proof. To begin with, imagine the situation before the body was immersed. The region now occupied by the body was filled with fluid, whose weight was $V\rho_L g$. Because the fluid as a whole was in hydrostatic equilibrium, the net upwards force (due to difference in pressure at different depths) on the fluid in that region was equal to the weight of the fluid occupying that region.

Now, consider what happens when the body has displaced the fluid. The pressure at every point on the surface of the body is unchanged from the value at the same location when the body was not present. This is because the pressure at any point depends only on the depth of that point below the fluid surface. Hence, the net force exerted by the surrounding fluid on the body is exactly the same as that exerted on the region before the body was present. But we know the latter to be $V\rho_L g$, the weight of the displaced fluid. Hence, this must also be the buoyant force exerted on the body. Archimedes' principle is thus proved.

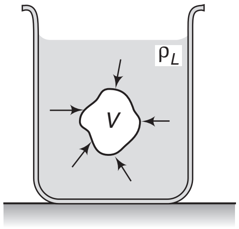

Fig. 16.35

Law of Floatation

Consider an object of volume V and density ρ_S floating in a liquid of density ρ_L. Let V_i be the volume of object immersed in the liquid.

For equilibrium of object,

$$\text{Weight} = \text{Upthrust}$$

$$\therefore \quad V\rho_S g = V_i \rho_L g$$

$$\therefore \quad \frac{V_i}{V} = \frac{\rho_S}{\rho_L} \qquad \ldots\text{(i)}$$

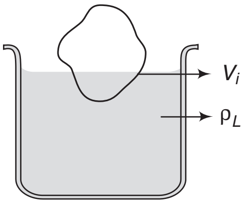

Fig. 16.36

This is the fraction of volume immersed in liquid.

Percentage of volume immersed in liquid $= \dfrac{V_i}{V} \times 100 = \dfrac{\rho_S}{\rho_L} \times 100$

Three possibilities may now arise:

(i) If $\rho_S < \rho_L$, only fraction of body will be immersed in the liquid. This fraction will be given by the above equation.

(ii) If $\rho_S = \rho_L$, the whole of the rigid body will be immersed in the liquid. Hence, the body remains floating in the liquid wherever it is left.

(iii) If $\rho_S > \rho_L$, the body will sink.

Buoyant Force in Accelerating Fluids

Suppose a body is dipped inside a liquid of density ρ_L placed in an elevator moving with an acceleration **a**. The buoyant force F in this case becomes,

$$\boxed{F = V\rho_L g_{\text{eff}}} \qquad (V = \text{immersed volume of solid or } V_i)$$

Here, $$g_{\text{eff}} = |\mathbf{g} - \mathbf{a}|$$

For example, if the lift has an upward acceleration a, the value of g_{eff} is $g + a$ and if it has a downward acceleration a, the g_{eff} is $g - a$. In a freely falling lift g_{eff} is zero (as $a = g$) and hence, net buoyant force is zero. This is why, in a freely falling vessel filled with some liquid, the air bubbles do not rise up (which otherwise move up due to buoyant force). The above result can be derived as follows.

Suppose a body is dipped inside a liquid of density ρ_L in an elevator moving up with an acceleration a. As was done earlier also, replace the body into the liquid by the same liquid of equal volume. The replaced liquid is at rest with respect to the elevator. Thus, this replaced liquid is also moving up with an acceleration a together with the rest of the liquid.

The forces acting on the replaced liquid are,

(i) the buoyant force F and

(ii) the weight mg of the substituted liquid.

From Newton's second law,

$$F - mg = ma \quad \text{or} \quad F = m(g + a)$$

Here, $m = V\rho_L$

$$\therefore \qquad F = V\rho_L (g + a) = V\rho_L g_{\text{eff}}$$

where $$g_{\text{eff}} = g + a$$

Extra Points to Remember

- In weight of a solid, take total volume of solid, density of solid and g. In upthrust (or buoyant force) take immersed volume of solid, density of liquid and g_{eff}. Thus,

$$\boxed{\begin{aligned} W &= V\rho_s g \\ F &= V_i \rho_L g_{\text{eff}} \end{aligned}}$$

- Upthrust force also makes a pair of equal and opposite forces. On solid it is upwards and on liquid, it is downwards.

Example 16.9 *Density of ice is* $900\ kg/m^3$. *A piece of ice is floating in water of density* $1000\ kg/m^3$. *Find the fraction of volume of the piece of ice outside the water.*

Solution Let V be the total volume and V_i the volume of ice piece immersed in water. For equilibrium of ice piece,

$$\text{weight} = \text{upthrust}$$

$$\therefore \qquad V\rho_i g = V_i \rho_w g$$

Here, $$\rho_i = \text{density of ice} = 900\ \text{kg/m}^3$$

and $$\rho_w = \text{density of water} = 1000\ \text{kg/m}^3$$

Substituting in above equation, we get

$$\frac{V_i}{V} = \frac{900}{1000} = 0.9$$

i.e. the fraction of volume outside the water,

$$f = 1 - 0.9 = 0.1$$ **Ans.**

Example 16.10 *A metallic sphere floats in an immiscible mixture of water* $(\rho_w = 10^3\ kg/m^3)$ *and a liquid* $(\rho_L = 13.5 \times 10^3\ kg/m^3)$ *such that its* $\frac{4}{5}$ *th volume is in water and* $\frac{1}{5}$ *th volume in the liquid. Find the density of metal.*

Solution Total upthrust = weight of metal sphere

$$\therefore \qquad \left(\frac{4}{5}V\right)(10^3)g + \left(\frac{1}{5}V\right)(13.5 \times 10^5)g = (V)(\rho_{\text{metal}})(g)$$

$$\therefore \qquad \rho_{\text{metal}} = 3.5 \times 10^3\ \text{kg/m}^3$$ **Ans.**

Example 16.11 *A block of mass 1 kg and density* $0.8\ g/cm^3$ *is held stationary with the help of a string as shown in figure. The tank is accelerating vertically upwards with an acceleration* $a = 1.0\ m/s^2$. *Find*

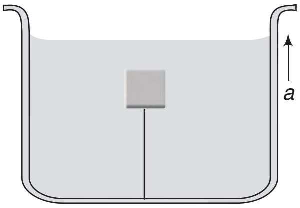

Fig. 16.37

(a) the tension in the string,
(b) if the string is now cut find the acceleration of block.
(Take $g = 10\ m/s^2$ *and density of water =* $10^3\ kg/m^3$*).*

Solution (a) Free body diagram of the block is shown in Fig. 16.38.

In the figure,

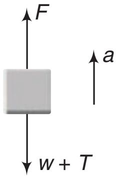

Fig. 16.38

$$F = \text{upthrust force}$$

$$= V\rho_\omega(g + a)$$

$$= \left(\frac{\text{mass of block}}{\text{density of block}}\right)\rho_\omega\ (g + a)$$

$$= \left(\frac{1}{800}\right)(1000)(10 + 1) = 13.75\ \text{N}$$

$$w = mg = 10\ \text{N}$$

Equation of motion of the block is,

$$F - T - w = ma$$

$$\therefore \quad 13.75 - T - 10 = 1 \times 1$$

$$\therefore \quad T = 2.75 \text{ N}$$ **Ans.**

(b) When the string is cut, $T = 0$

$$\therefore \quad a = \frac{F - w}{m}$$

$$= \frac{13.75 - 10}{1}$$

$$= 3.75 \text{ m/s}^2$$ **Ans.**

Example 16.12 *The tension in a string holding a solid block below the surface of a liquid (of density greater than that of solid) as shown in figure is T_0 when the system is at rest. What will be the tension in the string if the system has an upward acceleration a ?*

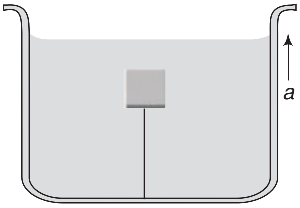

Fig. 16.39

Solution Let m be the mass of block.

Initially for the equilibrium of block,

$$F = T_0 + mg \qquad \text{...(i)}$$

Here, F is the upthrust on the block.

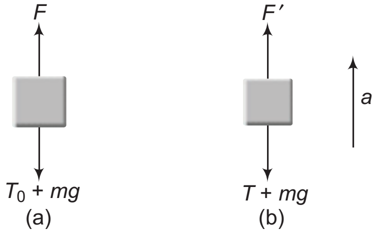

Fig. 16.40

When the lift is accelerated upwards, g_{eff} becomes $g + a$ instead of g. Hence,

$$F' = F\left(\frac{g + a}{g}\right) \qquad \text{...(ii)}$$

From Newton's second law,

$$F' - T - mg = ma \qquad \ldots\text{(iii)}$$

Solving Eqs. (i), (ii) and (iii), we get

$$T = T_0\left(1 + \frac{a}{g}\right) \qquad \textbf{Ans.}$$

INTRODUCTORY EXERCISE 16.3

1. A block of material has a density ρ_1 and floats three-fourth submerged in a liquid of unknown density. Show that the density ρ_2 of the unknown liquid is given by $\rho_2 = \frac{4}{3}\rho_1$.
2. A block of wood weighing 71.2 N and of specific gravity 0.75 is tied by a string to the bottom of a tank of water in order to have the block totally immersed. What is the tension in the string?
3. A beaker when partly filled with water has total mass 20.00 g. If a piece of metal with density $3.00\ \text{g/cm}^3$ and volume $1.00\ \text{cm}^3$ is suspended by a thin string, so that it is submerged in the water but does not rest on the bottom of the beaker, how much does the beaker then appear to weigh if it is resting on a scale?
4. A small block of wood of density $0.4 \times 10^3\ \text{kg/m}^3$ is submerged in water at a depth of 2.9 m. Find
   (a) the acceleration of the block towards the surface when the block is released and
   (b) the time for the block to reach the surface. Ignore viscosity.

16.6 Flow of Fluids

Steady Flow

If the velocity of fluid particles at any point does not vary with time, the flow is said to be steady. Steady flow is also called streamlined or laminar flow. The velocity at different points may be different. Hence, in the figure,

$$\mathbf{v}_1 = \text{constant},\ \mathbf{v}_2 = \text{constant},\ \mathbf{v}_3 = \text{constant but } \mathbf{v}_1 \neq \mathbf{v}_2 \neq \mathbf{v}_3$$

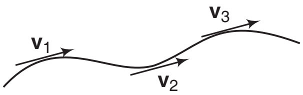

Fig 16.41

Principle of Continuity

It states that, when an incompressible and non-viscous liquid flows in a stream lined motion through a tube of non-uniform cross-section, then the product of the area of cross section and the velocity of flow is same at every point in the tube.

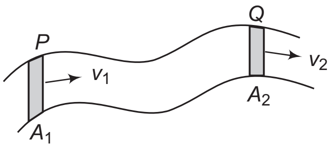

Fig. 16.42

Thus, $\boxed{A_1 v_1 = A_2 v_2}$ or $Av = \text{constant}$ or $v \propto \frac{1}{A}$

This is basically the law of conservation of mass in fluid dynamics.

Proof

Let us consider two cross sections P and Q of area A_1 and A_2 of a tube through which a fluid is flowing. Let v_1 and v_2 be the speeds at these two cross sections. Then, being an incompressible fluid, mass of fluid going through P in a time interval Δt = mass of fluid passing through Q in the same interval of time Δt.

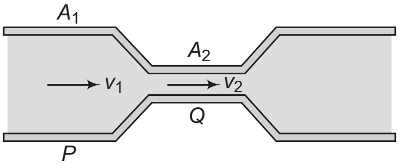

Fig. 16.43

$\therefore$ $$A_1 v_1 \rho \Delta t = A_2 v_2 \rho \, \Delta t$$

or $$A_1 v_1 = A_2 v_2$$ **Proved.**

Therefore, the velocity of the liquid is smaller in the wider parts of the tube and larger in the narrower parts.

or $$v_2 > v_1 \quad \text{as} \quad A_2 < A_1$$

Note *The product Av is the volume flow rate* $\frac{dV}{dt}$*, the rate at which volume crosses a section of the tube.*

Hence,

$$\boxed{\frac{dV}{dt} = \text{volume flow rate} = Av}$$

The mass flow rate is the mass flow per unit time through a cross-section. This is equal to density (ρ) times the volume flow rate $\frac{dV}{dt}$.

We can generalize the continuity equation for the case in which the fluid is not incompressible. If ρ_1 and ρ_2 are the densities at sections 1 and 2 then,

$$\rho_1 A_1 v_1 = \rho_2 A_2 v_2$$

So, this is the continuity equation for a compressible fluid.

Bernoulli's Equation

Bernoulli's equation relates the pressure, flow speed and height for flow of an ideal (incompressible and non-viscous) fluid. The pressure of a fluid depends on height as in the static situation and it also depends on the speed of flow.

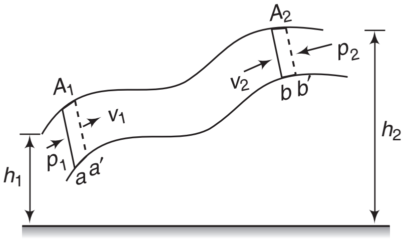

Fig. 16.44

The dependence of pressure on speed can be understood from the continuity equation. When an incompressible fluid flows along a tube with varying cross section, its speed must change, and so, an element of fluid must have an acceleration. If the tube is horizontal, the force that causes this acceleration has to be applied by the surrounding fluid. This means that the pressure must be different in regions of different cross section.

When a horizontal flow tube narrows and a fluid element speeds up, it must be moving towards a region of lower pressure in order to have a net forward force to accelerate it. If the elevation also changes, this causes additional pressure difference.

To derive Bernoulli's equation, we apply the work-energy theorem to the fluid in a section of the fluid element. Consider the element of fluid that at some initial time lies between two cross sections *a* and *b*. The speeds at the lower and upper ends are v_1 and v_2. In a small time interval, the fluid that is initially at *a* moves to a' a distance $aa' = ds_1 = v_1\ dt$ and the fluid that is initially at *b* moves to b' a distance $bb' = ds_2 = v_2\ dt$. The cross-section areas at the two ends are A_1 and A_2 as shown. The fluid is incompressible, hence, by the continuity equation, the volume of fluid dV passing through any cross-section during time dt is the same.

That is, $$dV = A_1 ds_1 = A_2 ds_2$$

Work Done on the Fluid Element

Let us calculate the work done on this fluid element during time interval *dt*. The pressure at the two ends are p_1 and p_2, the force on the cross section at *a* is $p_1 A_1$ and the force at *b* is $p_2 A_2$. The net work done dW on the element by the surrounding fluid during this displacement is,

$$dW = p_1 A_1 ds_1 - p_2 A_2 ds_2 = (p_1 - p_2) dV \qquad \text{...(i)}$$

The second term is negative, because the force at *b* opposes the displacement of the fluid.

This work dW is due to forces other than the conservative force of gravity, so it equals the change in total mechanical energy (kinetic plus potential). The mechanical energy for the fluid between sections *a* and *b* does not change.

Change in Potential Energy

At the beginning of *dt* the potential energy for the mass between *a* and a' is $dmgh_1 = \rho dVgh_1$. At the end of *dt* the potential energy for the mass between *b* and b' is $dmgh_2 = \rho dVgh_2$. The net change in potential energy dU during *dt* is,

$$dU = \rho(dV)g(h_2 - h_1) \qquad \text{...(ii)}$$

Change in Kinetic Energy

At the beginning of *dt* the fluid between *a* and a' has volume $A_1 ds_1$, mass $\rho A_1 ds_1$ and kinetic energy $\frac{1}{2}\rho(A_1 ds_1)v_1^2$. At the end of *dt* the fluid between *b* and b' has kinetic energy $\frac{1}{2}\rho(A_2 ds_2)v_2^2$. The net change in kinetic energy dK during time *dt* is,

$$dK = \frac{1}{2}\rho(dV)(v_2^2 - v_1^2) \qquad \text{...(iii)}$$

Combining Eqs. (i), (ii) and (iii) in the energy equation,

$$dW = dK + dU$$

We obtain,

$$(p_1 - p_2)dV = \frac{1}{2}\rho dV(v_2^2 - v_1^2) + \rho(dV)g(h_2 - h_1)$$

or
$$p_1 - p_2 = \frac{1}{2}\rho(v_2^2 - v_1^2) + \rho g(h_2 - h_1) \qquad \ldots\text{(iv)}$$

This is Bernoulli's equation. It states that the work done on a unit volume of fluid by the surrounding fluid is equal to the sum of the changes in kinetic and potential energies per unit volume that occur during the flow. We can also express Eq. (iv) in a more convenient form as,

$$\boxed{p_1 + \rho g h_1 + \frac{1}{2}\rho v_1^2 = p_2 + \rho g h_2 + \frac{1}{2}\rho v_2^2} \qquad \text{Bernoulli's equation}$$

The subscripts 1 and 2 refer to any two points along the flow tube, so we can also write

$$\boxed{p + \rho g h + \frac{1}{2}\rho v^2 = \text{constant}}$$

✓ Extra Points to Remember

- In Bernoulli's equation, there are three terms; p, $\frac{1}{2}\rho v^2$ and $\rho g h$. Under following three cases, this equation reduces to a two term Bernoulli.

Case 1 If all points are open to atmosphere then pressure at every point may be assumed to be constant $(= p_0)$ and the Bernoulli equation can be written as,

$$\frac{1}{2}\rho v^2 + \rho g h = \text{constant}$$

At greater heights 'h', speed 'v' will be less as ρ and g are constants.

Case 2 If the liquid is passing through a pipe of uniform cross-section, then from continuity equation (Av=constant), speed v is same at all points. Therefore, the Bernoulli equation becomes,

$$p + \rho g h = \text{constant}$$

or
$$p_1 + \rho g h_1 = p_2 + \rho g h_2$$

or
$$p_1 - p_2 = \rho g (h_2 - h_1)$$

This is the pressure relation we have already derived for a fluid at rest or pressure decreases with height of liquid and increases with depth of liquid.

Case 3 If a liquid is flowing in a horizontal pipe, then height 'h' of the liquid at every point may be assumed to be constant. So, the two term Bernoulli becomes,

$$p + \frac{1}{2}\rho v^2 = \text{constant}$$

From this equation, we may conclude that pressure decreases at a point where speed increases.

Example 16.13 *Water is flowing through a horizontal tube of non-uniform cross section. At a place, the radius of the tube is* 1.0 *cm and the velocity of water is* 2 *m/s. What will be the velocity of water where the radius of the pipe is* 2.0 *cm*?

Solution Using equation of continuity, $A_1 v_1 = A_2 v_2$

$$v_2 = \left(\frac{A_1}{A_2}\right) v_1$$

or $$v_2 = \left(\frac{\pi r_1^2}{\pi r_2^2}\right) v_1 = \left(\frac{r_1}{r_2}\right)^2 v_1$$

Substituting the values, we get

$$v_2 = \left(\frac{1.0 \times 10^{-2}}{2.0 \times 10^{-2}}\right)^2 (2)$$

or $$v_2 = 0.5 \text{ m/s}$$ **Ans.**

Example 16.14 *Calculate the rate of flow of glycerine of density* 1.25×10^3 *kg/m*^{3} *through the conical section of a pipe, if the radii of its ends are* 0.1 *m and* 0.04 *m and the pressure drop across its length is* 10 *N/m*^{2}.

Solution From continuity equation,

$$A_1 v_1 = A_2 v_2$$

or $$\frac{v_1}{v_2} = \frac{A_2}{A_1} = \frac{\pi r_2^2}{\pi r_1^2} = \left(\frac{r_2}{r_1}\right)^2$$

$$= \left(\frac{0.04}{0.1}\right)^2 = \frac{4}{25} \qquad \text{...(i)}$$

From Bernoulli's equation,

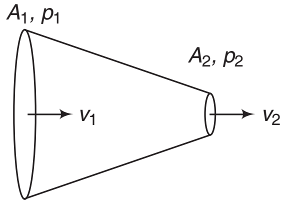

Fig. 16.45

$$p_1 + \frac{1}{2}\rho v_1^2 = p_2 + \frac{1}{2}\rho v_2^2 \text{ or } v_2^2 - v_1^2 = \frac{2(p_1 - p_2)}{\rho}$$

or $$v_2^2 - v_1^2 = \frac{2 \times 10}{1.25 \times 10^3} = 1.6 \times 10^{-2} \text{ m}^2/\text{s}^2 \qquad \text{...(ii)}$$

Solving Eqs. (i) and (ii), we get $v_2 \approx 0.128$ m/s

∴ Rate of volume flow through the tube

$$Q = A_2 v_2 = (\pi r_2^2) v_2$$

$$= \pi (0.04)^2 (0.128)$$

$$= 6.43 \times 10^{-4} \text{ m}^3/\text{s}$$ **Ans.**

Example 16.15 *Water is flowing smoothly through a closed-pipe system. At one point the speed of the water is 3.0 m/s, while at another point 1.0 m higher the speed is 4.0 m/s. If the pressure is 20 kPa at the lower point, what is the pressure at the upper point ? What would the pressure at the upper point be if the water were to stop flowing and the pressure at the lower point were 18 kPa ?*

Solution (i)
$$p_1 + \frac{1}{2}\rho v_1^2 + \rho g h_1 = p_2 + \frac{1}{2}\rho v_2^2 + \rho g h_2$$

$$(20 \times 10^3) + \frac{1}{2} \times 10^3 \times (3)^2 + 0 = p_2 + \frac{1}{2} \times 10^3 \times (4)^2 + 10^3 \times 10 \times 1$$

$$\therefore \quad p_2 = 6.5 \times 10^3 \text{ N/m}^2$$

$$= 6.5 \text{ kPa}$$ **Ans.**

(ii) Again applying the same equation, we have

$$(18 \times 10^3) + 0 + 0 = p_2 + 0 + (10^3)(10)(1)$$

$$\Rightarrow \quad p_2 = 8 \times 10^3 \text{ N/m}^2$$

$$= 8 \text{ kPa}$$ **Ans.**

INTRODUCTORY EXERCISE 16.4

1. Water flows through a tube shown in figure. The areas of cross section at A and B are 1 cm^2 and 0.5 cm^2 respectively. The height difference between A and B is 5 cm. If the speed of water at A is 10 cms^{-1}, find (a) the speed at B and (b) the difference in pressures at A and B.

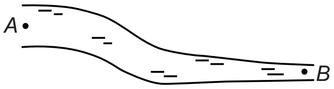

Fig. 16.46

2. Water flows through a horizontal tube of variable cross section as shown in figure. The area of cross section at A and B are 4 mm^2 and 2 mm^2 respectively. If 1 cc of water enters per second through A, find (a) the speed of water at A, (b) the speed of water at B and (c) the pressure difference $p_A - p_B$.

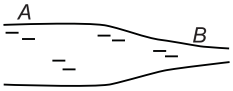

Fig. 16.47

3. Water from a tap emerges vertically downwards with an initial speed of 1.0 m/s. The cross-sectional area of tap is 10^{-4} m^2. Assume that the pressure is constant throughout the stream of water and that the flow is steady, the cross-sectional area of stream 0.15 m below the tap is **(JEE 1998)**

(a) 5.0×10^{-4} m^2 (b) 1.0×10^{-4} m^2

(c) 5.0×10^{-5} m^2 (d) 2.0×10^{-5} m^2

4. A horizontal pipeline carries water in a streamline flow. At a point along the pipe, where the cross-sectional area is 10 cm^2, the water velocity is 1 ms^{-1} and the pressure is 2000 Pa. The pressure of water at another point where the cross-sectional area is 5 cm^2, is ......Pa. (Density of water = 10^3 kg-m^3) **(JEE 1994)**

16.7 Application Based on Bernaulli's Equation

Atomizer or Spray Gun

Fig. 16.48 shows the essential parts of spray gun. When the piston is pressed, the air rushes out of the horizontal tube *B* decreasing the pressure to p_2 which is less than the pressure p_1 in the container. As a result, the liquid rises up in the vertical tube *A*. When it collides with the high speed air in tube *B*, it breaks up into a fine spray. Filter pumps, bunsen burner and sprayers used for perfumes or to spray insecticides work on the same principle.

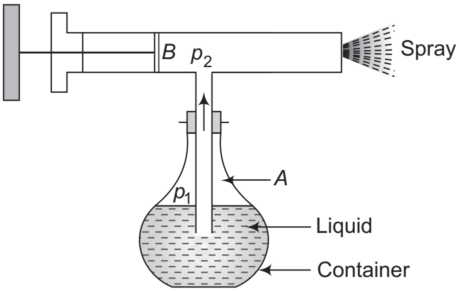

Fig. 16.48

Principle of Lifting of an Aircraft

We all know that airplanes fly. This is a result of a lift force acting on the wings of the aircraft. Lift can be generated when an asymmetric object moves through a fluid. The asymmetry of the object requires the fluid particles to travel different distances along different paths as they pass around the object. The molecules will either speed up or slowdown in order to remain even with the fluid molecules on the other side. For example, in Fig. 16.49, the air particles passing along the top of the body must travel a greater distance than those travelling below.

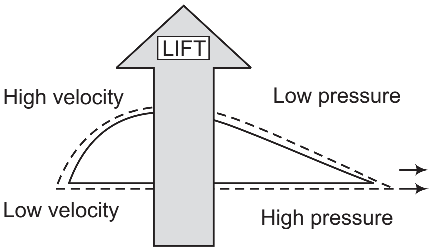

Fig. 16.49. The principle of lift of an aircraft

In order to arrive at the other side of the foil at the same time, these particles must travel more quickly than those travelling below the foil. The difference in the velocities of the fluid molecules results in a pressure difference according to the Bernoulli principle: high velocities are associated with relatively low pressure regions, while low velocities are associated with relatively high pressure regions. This pressure difference produces a force in upward direction.

Magnus Effect and Spinning of a Ball

Spinning objects can also generate force. When an object spins in a fluid medium, the fluid boundary layer spins along with the object. This results in a difference in velocity on two sides. A pressure difference is created from one side of the object to the other and the object curves towards the area of low pressure. This influence of rotation of an object on its flight path is termed the magnus effect. This magnus force changes the path of a rotating cricket ball. This is called spinning of ball.

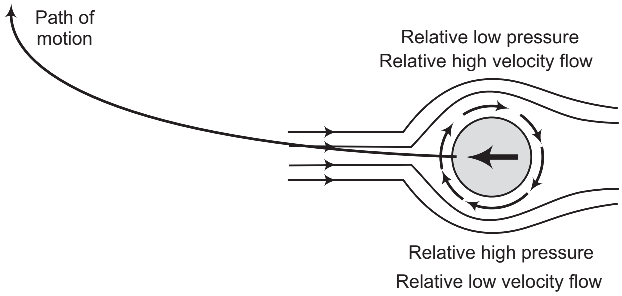

Fig. 16.50. The magnus effect

Blowing Off the Roof during Wind Storm

During certain wind storm or cyclone, the roofs of some houses are blown off without damaging the other parts of the house. The high wind blowing over the roof creates a low pressure p_2 in accordance with Bernoulli's principle. The pressure p_1 below the roof is equal to the atmospheric pressure which is larger than p_2. The difference of pressure $(p_1 - p_2)$ causes an upward thrust and the roof is lifted up. Once the roof is lifted up, it is blown off with the wind.

Venturimeter

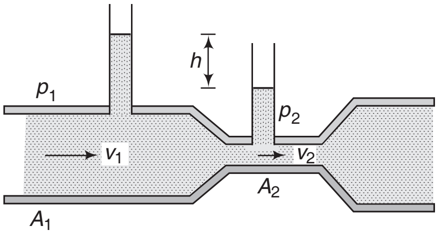

Fig. 16.51

Figure shows a venturimeter used to measure flow speed in a pipe of non-uniform cross-section. We apply Bernoulli's equation to the wide and narrow parts of the pipe, with $h_1 = h_2$

$$p_1 + \frac{1}{2}\rho v_1^2 = p_2 + \frac{1}{2}\rho v_2^2$$

From the continuity equation $v_2 = \dfrac{A_1 v_1}{A_2}$

Substituting and rearranging, we get

$$p_1 - p_2 = \frac{1}{2}\rho v_1^2 \left(\frac{A_1^2}{A_2^2} - 1\right) \qquad \ldots\text{(i)}$$

Because A_1 is greater than A_2, v_2 is greater than v_1 and hence the pressure p_2 is less than p_1. A net force to the right accelerates the fluid as it enters the narrow part of the tube (called throat) and a net force to the left slows as it leaves.

The pressure difference is also equal to ρgh, where h is the difference in liquid level in the two tubes. Substituting in Eq. (i), we get

$$\boxed{v_1 = \sqrt{\dfrac{2gh}{\left(\dfrac{A_1}{A_2}\right)^2 - 1}}}$$

Note *The discharge or volume flow rate can be obtained as,*

$$\frac{dV}{dt} = A_1 v_1 = A_1 \sqrt{\frac{2gh}{\left(\dfrac{A_1}{A_2}\right)^2 - 1}}$$

Speed of Efflux

Suppose, the surface of a liquid in a tank is at a height h from the orifice O on its sides, through which the liquid issues out with velocity v. The speed of the liquid coming out is called the speed of efflux. If the dimensions of the tank be sufficiently large, the velocity of the liquid at its surface may be taken to be zero. Applying Bernoulli's equation at the surface and just outside the orifice.

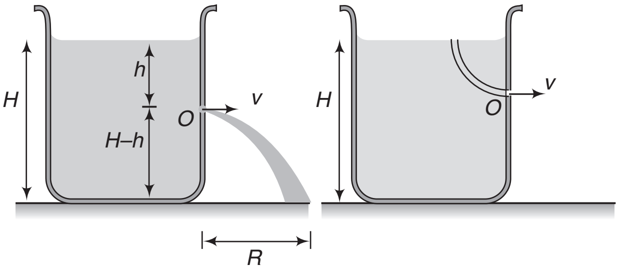

Fig. 16.52

$$\frac{1}{2}\rho v^2 + \rho gh + p = \text{constant}$$

with $h = 0$ at the orifice, we have

$$\rho gh + p_0 = \frac{1}{2}\rho v^2 + p_0 \quad \text{or} \quad \boxed{v = \sqrt{2gh}}$$

Evangelista Torricelli show that this velocity is the same as the liquid will attain in falling freely through the vertical height (h) from the surface to the orifice. This is known as **Torricelli's theorem** and may be stated as, "*The velocity of efflux of a liquid issuing out of an orifice is the same as it would attain if allowed to fall freely through the vertical height between the liquid surface and orifice.*"

Range (*R*)

Let us find the range R on the ground.

Considering the vertical motion of the liquid,

$$(H - h) = \frac{1}{2} gt^2 \quad \text{or} \quad \boxed{t = \sqrt{\frac{2(H-h)}{g}}}$$

Now, considering the horizontal motion,

$$R = vt$$

or $$R = (\sqrt{2gh})\left(\sqrt{\frac{2(H-h)}{g}}\right)$$

or $$\boxed{R = 2\sqrt{h(H-h)}}$$

From the expression of R, following conclusions can be drawn,

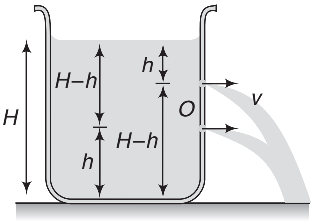

Fig. 16.53

(i) $R_h = R_{H-h}$ as $R_h = 2\sqrt{h(H-h)}$ and $R_{H-h} = 2\sqrt{(H-h)h}$

This is shown in Fig. 16.53.

(ii) R is maximum at $h = \frac{H}{2}$ and $R_{\max} = H$.

Proof $$R^2 = 4(Hh - h^2)$$

For R to be maximum, $\frac{dR^2}{dh} = 0$ or $H - 2h = 0$ or $h = \frac{H}{2}$

That is, R is maximum at $h = \frac{H}{2}$

and $$R_{\max} = 2\sqrt{\frac{H}{2}\left(H - \frac{H}{2}\right)} = H$$ **Hence Proved.**

Time Taken to Empty a Tank

We are here interested in finding the time required to empty a tank if a hole is made at the bottom of the tank.

Consider a tank filled with a liquid of density ρ upto a height H. A small hole of area of cross section a is made at the bottom of the tank. The area of cross-section of the tank is A.

Let at some instant of time the level of liquid in the tank is y. Velocity of efflux at this instant of time would be,

$$v = \sqrt{2gy}$$

Now, at this instant volume of liquid coming out of the hole per second is $\left(\frac{dV_1}{dt}\right)$.

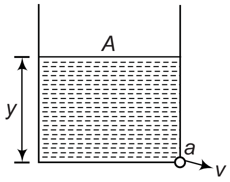

Fig. 16.54

Volume of liquid coming down in the tank per second is $\left(\frac{dV_2}{dt}\right)$.

$$\frac{dV_1}{dt} = \frac{dV_2}{dt}$$

$$\therefore \qquad av = A\left(-\frac{dy}{dt}\right)$$

$$\therefore \qquad a\sqrt{2gy} = A\left(-\frac{dy}{dt}\right)$$

or
$$\int_0^t dt = -\frac{A}{a\sqrt{2g}}\int_H^0 y^{-1/2}\,dy \qquad \text{...(i)}$$

$$\therefore \qquad t = \frac{2A}{a\sqrt{2g}}[\sqrt{y}]_0^H$$

$$\therefore \qquad \boxed{t = \frac{A}{a}\sqrt{\frac{2H}{g}}}$$

Example 16.16 *Water flows through a horizontal tube as shown in figure . If the difference of heights of water column in the vertical tubes is 2 cm and the areas of cross-section at A and B are* 4cm^2 *and* $2\,\text{cm}^2$ *respectively. Find the rate of flow of water across any section.*

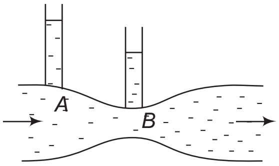

Fig. 16.55

Solution Applying Bernoulli's equation at A and B

$$p_A + \frac{1}{2}\rho v_A^2 + \rho g h_A = p_B + \frac{1}{2}\rho v_B^2 + \rho g h_B \qquad (h_A = h_B)$$

or
$$\frac{1}{2}\rho v_B^2 - \frac{1}{2}\rho v_A^2 = \rho g\ (h_A - h_B)$$

or
$$v_B^2 - v_A^2 = 2g\,(h_A - h_B)$$
$$= 2 \times 10 \times 0.02$$

or
$$v_B^2 - v_A^2 = 0.4\ \text{m}^2/\text{s}^2 \qquad \text{...(i)}$$

$$v_A A_A = v_B A_B$$

or
$$4v_A = 2v_B$$

$$\therefore \qquad v_B = 2v_A \qquad \text{...(ii)}$$

Solving Eqs. (i) and (ii), we get

$$v_A = 0.363\ \text{m/s}$$

Volume flow rate $= v_A A_A$

$$= (0.365)\,(4 \times 10^{-4})$$
$$= 1.46 \times 10^{-4}\ \text{m}^3/\text{s} = 146\,\text{cm}^3/\text{s}$$ **Ans.**

Example 16.17 *Water flows through the tube as shown in figure. The areas of cross-section of the wide and the narrow portions of the tube are* $5\ cm^2$ *and* $2\,cm^2$ *respectively. The rate of flow of water through the tube is* $500\ cm^3/s$*. Find the difference of mercury levels in the U-tube.*

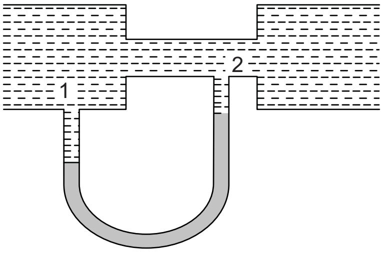

Fig. 16.56

Solution Applying continuity equation

$$A_1v_1 = A_2v_2 = \text{rate of flow of water}$$

$$5v_1 = 2v_2 = 500\,\text{cm}^3/\text{s}$$

$$\therefore \qquad v_1 = 100\ \text{cm/s} = 1.0\ \text{m/s}$$

$$v_2 = 250\,\text{cm/s} = 2.5\ \text{m/s}$$

Now, applying Bernoulli's equation at 1 and 2

$$p_1 + \frac{1}{2}\rho_w v_1^2 + \rho_w g h_1 = p_2 + \frac{1}{2}\rho_w v_2^2 + \rho_w g h_2 \qquad (h_1 = h_2)$$

$$\Rightarrow \qquad \frac{1}{2}\rho_w (v_2^2 - v_1^2) = p_1 - p_2 = \rho_{\text{Hg}} g h_{\text{Hg}}$$

$$\text{or} \qquad \frac{1}{2}\rho_w\ (v_2^2 - v_1^2) = \rho_{\text{Hg}}\ g\ h_{\text{Hg}}$$

$$\therefore \qquad h_{\text{Hg}} = \frac{\rho_w\ (v_2^2 - v_1^2)}{2\ \rho_{\text{Hg}}\ g}$$

$$= \frac{10^3\ (6.25 - 1)}{2 \times 13.6 \times 10^3 \times 9.8}$$

$$= 0.0196\,\text{m}$$

$$= 1.96\,\text{cm}$$ **Ans**

Example 16.18 *A tank is filled with a liquid upto a height H. A small hole is made at the bottom of this tank. Let* t_1 *be the time taken to empty first half of the tank and* t_2 *the time taken to empty rest half of the tank. Then find* $\frac{t_1}{t_2}$.

Solution Substituting the proper limits in Eq. (i), derived in the theory, we have

$$\int_0^{t_1} dt = -\frac{A}{a\sqrt{2g}} \int_H^{H/2} y^{-1/2}\ dy$$

or $$t_1 = \frac{2A}{a\sqrt{2g}}[\sqrt{y}]_{H/2}^{H}$$

or $$t_1 = \frac{2A}{a\sqrt{2g}}\left[\sqrt{H} - \sqrt{\frac{H}{2}}\right]$$

or $$t_1 = \frac{A}{a}\sqrt{\frac{H}{g}}\,(\sqrt{2} - 1) \qquad \text{...(ii)}$$

Similarly, $$\int_0^{t_2} dt = -\frac{A}{a\sqrt{2g}}\int_{H/2}^{0} y^{-1/2}\,dy$$

or $$t_2 = \frac{A}{a}\sqrt{\frac{H}{g}} \qquad \text{...(iii)}$$

From Eqs. (ii) and (iii), we get

$$\frac{t_1}{t_2} = \sqrt{2} - 1$$

or $$\frac{t_1}{t_2} = 0.414$$ **Ans.**

Note *From the above example we can see that* $t_1 < t_2$. *This is because initially the pressure is high and the liquid comes out with greater speed.*

INTRODUCTORY EXERCISE 16.5

1. There is a small hole at the bottom of tank filled with water. If total pressure at the bottom is 3 atm (1 atm $= 10^5$ Nm^{-2}), then find the velocity of water flowing from hole.

2. Liquid is filled in a container upto a height of H. A small hole is made at the bottom of the tank. Time taken to empty from H to $\frac{H}{3}$ is t_0. Find the time taken to empty the tank from $\frac{H}{3}$ to zero.

3. Water is filled in a cylindrical container to a height of 3 m. The ratio of the cross-sectional area of the orifice and the beaker is 0.1. The square of the speed of the liquid coming out from the orifice is ($g = 10\,\text{m/s}^2$) **(JEE 2005)**

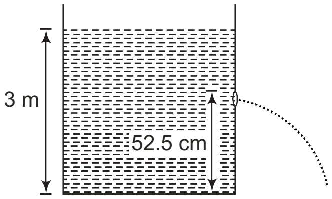

Fig. 16.57

(a) $50\,\text{m}^2/\text{s}^2$ (b) $50.5\,\text{m}^2/\text{s}^2$

(c) $51\,\text{m}^2/\text{s}^2$ (d) $52\,\text{m}^2/\text{s}^2$

16.8 Viscosity

Viscosity is internal friction in a fluid. Viscous forces oppose the motion of one portion of a fluid relative to the other.

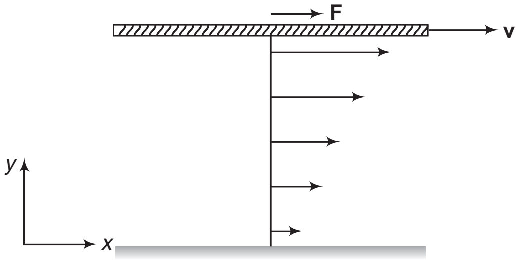

Fig. 16.58

The simplest example of viscous flow is motion of a fluid between two parallel plates.

The bottom plate is stationary and the top plate moves with constant velocity **v**. The fluid in contact with each surface has same velocity at that surface. The flow speeds of intermediate layers of fluid increase uniformly from bottom to top, as shown by arrows. So, the fluid layers slide smoothly over one another.

According to Newton, the frictional force F (or viscous force) between two layers depends upon the following factors,

(i) Force F is directly proportional to the area (A) of the layers in contact, i.e.

$$F \propto A$$

(ii) Force F is directly proportional to the velocity gradient $\left(\frac{dv}{dy}\right)$ between the layers. Combining these two, we have

$$F \propto A\frac{dv}{dy} \quad \text{or} \quad \boxed{F = -\eta A\frac{dv}{dy}}$$

Here, η is constant of proportionality and is called **coefficient of viscosity.** Its value depends on the nature of the fluid. The negative sign in the above equation shows that the direction of viscous force F is opposite to the direction of relative velocity of the layer.

The SI unit of η is N-s/m^2. It is also called decapoise or pascal second. Thus,

$$1 \text{ decapoise} = 1 \text{ N-s /m}^2 = 1 \text{ Pa-s} = 10 \text{ poise}$$

The SI unit of viscosity is sometimes referred to as the poiseuille (symbol Pl).

Thus, $1 \text{ Pl} = 1 \text{ N-s/m}^2$

Dimensions of η are $[\text{ML}^{-1}\text{T}^{-1}]$.

Coefficient of viscosity of water at 10°C is $\eta = 1.3 \times 10^{-3}$ N-s/m^2. Experiments show that coefficient of viscosity of a liquid decreases as its temperature rises.

Stoke's Law and Terminal Velocity

When an object moves through a fluid, it experiences a viscous force which acts in opposite direction of its velocity. The mathematics of the viscous force for an irregular object is difficult, we will consider here only the case of a small sphere moving through a fluid.

The formula for the viscous force on a sphere was first derived by the English physicist G. Stokes in 1843. According to him, a spherical object of radius r moving at velocity v experiences a viscous force given by

$$\boxed{F = 6\pi\eta r v} \qquad (\eta = \text{coefficient of viscosity})$$

This law is called **Stoke's law.**

Terminal Velocity (v_T)

Consider a small sphere falling from rest through a large column of viscous fluid. The forces acting on the sphere are,

(i) Weight w of the sphere acting vertically downwards

(ii) Upthrust F_t acting vertically upwards

(iii) Viscous force F_v acting vertically upwards, i.e. in a direction opposite to velocity of the sphere.

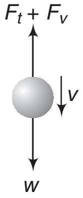

Fig. 16.59

Initially, $$F_v = 0 \qquad (\text{as } v = 0)$$

and $$w > F_t$$

and the sphere accelerates downwards. As the velocity of the sphere increases, F_v increases. Eventually a stage in reached when

$$w = F_t + F_v \qquad \ldots(\text{i})$$

After this net force on the sphere is zero and it moves downwards with a constant velocity called **terminal velocity** (v_T).

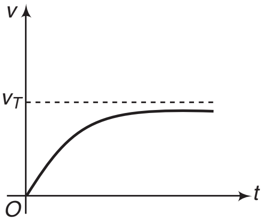

Fig. 16.60

Substituting proper values in Eq. (i) we have,

$$\frac{4}{3}\pi r^3 \rho g = \frac{4}{3}\pi r^3 \sigma g + 6\pi\eta r v_T \qquad \ldots(\text{ii})$$

Here, ρ = density of sphere, σ = density of fluid

and η = coefficient of viscosity of fluid

From Eq. (ii), we get $$\boxed{v_T = \frac{2}{9}\frac{r^2(\rho - \sigma)g}{\eta}}$$

Figure shows the variation of the velocity v of the sphere with time.

Extra Points to Remember

- Terminal velocity $v_T \propto r^2$
- If the fluid is air, then its density σ is negligible compared to density of sphere. So, in that case upthrust will be zero and terminal velocity will be

$$v_T = \frac{2}{9}\frac{r^2 \rho g}{\eta}$$

In this case, weight is equal to the viscous force when terminal velocity is attained.

- If density of fluid is greater than density of sphere ($\sigma > \rho$) then terminal velocity comes out to be negative.

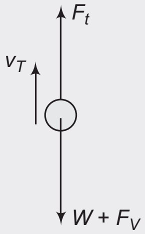

Fig. 16.61

So, in this case terminal velocity is upwards. In the beginning upthrust is greater than the weight. Viscous force in this case will be downwards.

$$v_T = \frac{2}{9}\frac{r^2(\sigma - \rho)g}{\eta}$$

When terminal velocity is attained,

$$F_t = W + F_v$$

This is the reason why, air bubbles rise up in water.

Example 16.19 *A plate of area 2 m^2 is made to move horizontally with a speed of 2 m/s by applying a horizontal tangential force over the free surface of a liquid. If the depth of the liquid is 1 m and the liquid in contact with the bed is stationary. Coefficient of viscosity of liquid is 0.01 poise. Find the tangential force needed to move the plate.*

Solution Velocity gradient $= \dfrac{\Delta v}{\Delta y} = \dfrac{2-0}{1-0} = 2\,\dfrac{\text{m/s}}{\text{m}}$

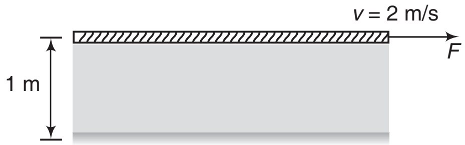

Fig. 16.62

From, Newton's law of viscous force,

$$|F| = \eta A \frac{\Delta v}{\Delta y}$$

$$= (0.01 \times 10^{-1})(2)(2)$$

$$= 4 \times 10^{-3} \text{ N.}$$

So, to keep the plate moving, a force of 4×10^{-3} N must be applied. **Ans.**

Example 16.20 *Two spherical raindrops of equal size are falling vertically through air with a terminal velocity of* 1 *m/s. What would be the terminal speed if these two drops were to coalesce to form a large spherical drop?*

Solution $$v_T \propto r^2 \qquad \text{...(i)}$$

Let r be the radius of small rain drops and R the radius of large drop.

Equating the volumes, we have

$$\frac{4}{3}\pi R^3 = 2\left(\frac{4}{3}\pi r^3\right)$$

$$\therefore \quad R = (2)^{1/3}.r \quad \text{or} \quad \frac{R}{r} = (2)^{1/3}$$

$$\therefore \quad \frac{v_T{}'}{v_T} = \left(\frac{R}{r}\right)^2 = (2)^{2/3}$$

$$\therefore \quad v_T{}' = (2)^{2/3}v_T = (2)^{2/3}(1.0)\ \text{m/s}$$

$$= 1.587\ \text{m/s}$$ **Ans.**

Example 16.21 *With what terminal velocity will an air bubble* 0.8 *mm in diameter rise in a liquid of viscosity* 0.15 *N-s/m*^{2} *and specific gravity* 0.9 *? Density of air is* 1.293 *kg/m*^{3}.

Solution The terminal velocity of the bubble is given by,

$$v_T = \frac{2}{9}\frac{r^2(\rho - \sigma)g}{\eta}$$

Here, $r = 0.4 \times 10^{-3}$ m, $\sigma = 0.9 \times 10^3$ kg/m^3, $\rho = 1.293$ kg/m^3, $\eta = 0.15$ N-s/m^2

and $g = 9.8$ m/s^2

Substituting the values, we have

$$v_T = \frac{2}{9} \times \frac{(0.4 \times 10^{-3})^2(1.293 - 0.9 \times 10^3) \times 9.8}{0.15}$$

$$= -0.0021\ \text{m/s}$$

or $$v_T = -\ 0.21\,\text{cm}$$ **Ans.**

Note *Here, negative sign implies that the bubble will rise up.*

Example 16.22 *A spherical ball of radius* 3.0×10^{-4} *m and density* 10^4 *kg/m*^{3} *falls freely under gravity through a distance h before entering a tank of water. If after entering the water the velocity of the ball does not change, find h. Viscosity of water is* 9.8×10^{-6} *N-s/m*^{2}.

Solution Before entering the water the velocity of ball is $\sqrt{2gh}$. If after entering the water this velocity does not change then this value should be equal to the terminal velocity. Therefore,

$$\sqrt{2gh} = \frac{2}{9}\frac{r^2(\rho - \sigma)g}{\eta}$$

$$\therefore \qquad h = \frac{\left\{\frac{2}{9}\frac{r^2(\rho-\sigma)g}{\eta}\right\}^2}{2g}$$

$$= \frac{2}{81} \times \frac{r^4(\rho-\sigma)^2 g}{\eta^2}$$

$$= \frac{2}{81} \times \frac{(3\times 10^{-4})^4 (10^4 - 10^3)^2 \times 9.8}{(9.8\times 10^{-6})^2}$$

$$= 1.65 \times 10^3 \text{ m}$$ **Ans.**

Example 16.23 *A small sphere falls from rest in a viscous liquid. Due to friction, heat is produced. Find the relation between the rate of production of heat and the radius of the sphere at terminal velocity.* **(JEE 2004)**

Solution Terminal velocity $v_T = \frac{2r^2 g}{9\eta}(\rho_S - \rho_L)$

and viscous force $F = 6\pi\eta r v_T$

Rate of production of heat (power) : as viscous force is the only dissipative force. Hence,

$$\frac{dQ}{dt} = Fv_T = (6\pi\eta r v_T)(v_T)$$

$$= 6\pi\eta r v_T^2$$

$$= 6\pi\eta r\left\{\frac{2}{9}\frac{r^2 g}{\eta}(\rho_S - \rho_L)\right\}^2$$

$$= \frac{8\pi g^2}{27\eta}(\rho_S - \rho_L)^2 r^5 \quad \text{or} \quad \frac{dQ}{dt} \propto r^5$$ **Ans.**

INTRODUCTORY EXERCISE 16.6

1. A typical riverborne silt particle has a radius of 20 μm and a density of 2×10^3 kg/m^3. The viscosity of water is 1.0 mPl. Find the terminal speed with which such a particle will settle to the bottom of a motionless volume of water.
2. Two equal drops of water are falling through air with a steady velocity v. If the drops coalesced, what will be the new velocity ?
3. A large wooden plate of area 10 m^2 floating on the surface of a river is made to move horizontally with a speed of 2 m/s by applying a tangential force. If the river is 1 m deep and the water in contact with the bed is stationary, find the tangential force needed to keep the plate moving. Coefficient of viscosity of water at the temperature of the river $= 10^{-2}$ poise.
4. The velocity of water in a river is 18 km/h near the surface. If the river is 5 m deep, find the shearing stress between the horizontal layers of water. The coefficient of viscosity of water $= 10^{-2}$ poise.

16.9 Surface Tension

A needle can made to float on a water surface if it is placed there carefully. The forces that support the needle are not buoyant forces but are due to surface tension. The surface of a liquid behaves like a membrane under tension. The molecules of the liquid exert attractive forces on each other. There is zero net force on a molecule inside the volume of the liquid.But a surface molecule has a net force towards inside of the liquid. Thus, the liquid tends to minimize its surface area, just as a stretched membrane does.

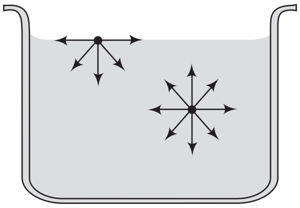

Fig. 16.63

Freely falling raindrops are spherical because a sphere has a smaller surface area for a given volume than any other shape. Hence, the surface tension can be defined as the *property of a liquid at rest by virtue of which its free surface behaves like a stretched membrane under tension and tries to occupy as small area as possible.*

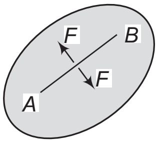

Fig. 16.64

Let an imaginary line *AB* be drawn in any direction in a liquid surface. The surface on either side of this line exerts a pulling force on the surface on the other side. This force is at right angles to the line *AB*. The magnitude of this force per unit length of *AB* is taken as a measure of the surface tension of the liquid. Thus, if *F* be the total force acting on either side of the line *AB* of length *L,* then the surface tension is given by,

$$T = \frac{F}{L}$$

Hence, the surface tension of a liquid is defined as the force per unit length in the plane of the liquid surface, acting at right angles on either side of an imaginary line drawn on that surface.

Examples of Surface Tension

Example 1 *Take a ring of wire and dip it in a soap solution. When the ring is taken out, a soap film is formed. Place a loop of thread gently on the soap film. Now, prick a hole inside the loop. The thread is radially pulled by the film surface outside and it takes a circular shape.*

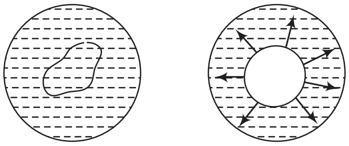

Fig. 16.65

Reason Before the pricking, there were surfaces both inside and outside the thread loop. Surfaces on both sides pull it equally and the net force is zero. Once the surface inside was punctured, the outside surface pulled the thread to take the circular shape so that area outside the loop becomes minimum (because for given perimeter area of circle is maximum).

Example 2 *A piece of wire is bent into a U-shape and a second piece of wire slides on the arms of the U. When the apparatus is dipped into a soap solution and removed, a liquid film is formed. The film exerts a surface tension force on the slider and if the frame is kept in a horizontal position, the slider quickly slides towards the closing arm of the frame. If the frame is kept vertical, one can have some weight to keep it in equilibrium. This shows that the soap surface in contact with the slider pulls it parallel to the surface.*

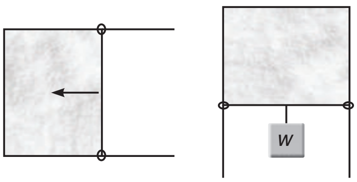

Fig. 16.66

Example 3 ***Needle supported on water surface*** *Take a greased needle of steel on a piece of blotting paper and place it gently over the water surface. Blotting paper soaks water and soon sinks down but the needle keeps floating. The floating needle causes a little depression. The forces F and F due to surface tension of the curved surface are inclined as shown in Fig.*16.67. *The vertical components of these two forces support the weight of the needle.*

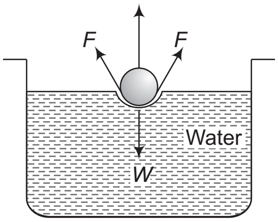

Fig. 16.67

Example 4 *Small mercury droplets are spherical and larger ones tend to flatten.*

Reason Small mercury droplets are spherical because the forces of surface tension tend to reduce their area to a minimum value and a sphere has minimum surface area for a given volume.

Fig. 16.68

Larger drops of mercury are flattened due to the large gravitational force acting on them. Here the shape is such that the sum of the gravitational potential energy and the surface potential energy must be minimum. Hence the centre of gravity moves down as low as possible. This explains flattening of the larger drops.

Example 5 *The hair of a painting brush cling together when taken out of water.*

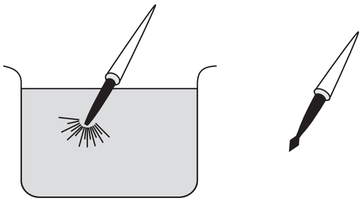

Fig. 16.69

Reason This is because the water films formed on them tend to contract to minimum area.

Note *The surface tension of a particular liquid usually decreases as temperature increases. To wash clothing thoroughly, water must be forced through the tiny spaces between the fibers. This requires increasing the surface area of the water ,which is difficult to do because of surface tension. Hence, hot water and soapy water is better for washing.*

Surface Energy

When the surface area of a liquid is increased, the molecules from the interior rise to the surface. This requires work against force of attraction of the molecules just below the surface. This work is stored in the form of potential energy. Thus, the molecules in the surface have some additional energy due to their position. This additional energy per unit area of the surface is called 'surface energy'. The surface energy is related to the surface tension as discussed below.

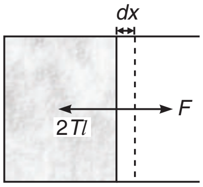

Fig. 16.70

Let a liquid film be formed on a wire frame and a straight wire of length *l* can slide on this wire frame as shown in figure. The film has two surfaces and both the surfaces are in contact with the sliding wire and hence, exert forces of surface tension on it. If *T* be the surface tension of the solution, each surface will pull the wire parallel to itself with a force *Tl*. Thus, net force on the wire due to both the surfaces is 2*Tl*. One has to apply an external force *F* equal and opposite to it to keep the wire in equilibrium.

Thus,

$$F = 2Tl$$

Now, suppose the wire is moved through a small distance *dx*, the work done by the force is,

$$dW = F\ dx = (2Tl)\ dx$$

But $(2l)\ (dx)$ is the total increase in area of both the surfaces of the film. Let it be dA. Then,

$$dW = T\ dA$$

or
$$\boxed{T = \frac{dW}{dA} \quad \text{or} \quad \frac{\Delta W}{\Delta A}}$$

Thus, the surface tension *T* can also be defined as the work done in increasing the surface area by unity.

Further, since there is no change in kinetic energy, the work done by the external force is stored as the potential energy of the new surface.

∴
$$\boxed{T = \frac{dU}{dA} \quad \text{or} \quad \frac{\Delta U}{\Delta A}} \qquad (\text{as } dW = dU)$$

Thus, the surface tension of a liquid is equal to the surface energy per unit surface area.

Excess Pressure inside a Bubble or Liquid Drop

Surface tension causes a pressure difference between the inside and outside of a soap bubble or a liquid drop.

Excess Pressure Inside Soap Bubble

A soap bubble consists of two spherical surface films with a thin layer of liquid between them. Because of surface tension, the film tend to contract in an attempt to minimize their surface area. But as the bubble contracts, it compresses the inside air, eventually increasing the interior pressure to a level that prevents further contraction.

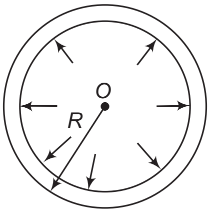

Fig. 16.71

We can derive an expression for the excess pressure inside a bubble in terms of its radius R and the surface tension T of the liquid.

Each half of the soap bubble is in equilibrium. The lower half is shown in figure. The forces at the flat circular surface where this half joins the upper half are

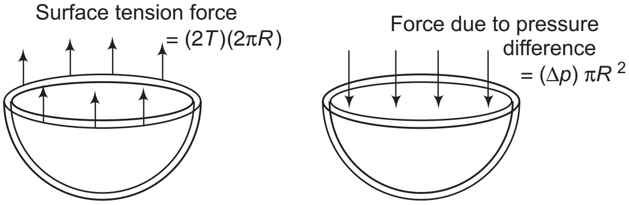

Fig. 16.72

(a) The upward force of surface tension. The total surface tension force for each surface (inner and outer) is $T(2\pi R)$, for a total of $(2T)(2\pi R)$.

(b) downward force due to pressure difference.

The magnitude of this force is $(\Delta p)(\pi R^2)$. In equilibrium these two forces have equal magnitude.

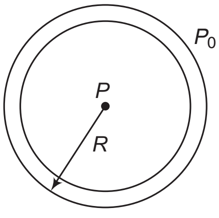

Fig. 16.73

$$\therefore \quad (2T)(2\pi R) = (\Delta P)(\pi R^2)$$

or
$$\boxed{\Delta p = \frac{4T}{R}}$$

Note *Suppose, the pressure inside the air bubble is P, then*

$$p - p_0 = \frac{4T}{R}$$

Excess Pressure Inside a Liquid Drop

A liquid drop has only one surface film. Hence, the surface tension force is $T(2\pi R)$, half that for a soap bubble. Thus, in equilibrium,

$$T(2\pi R) = \Delta p(\pi R^2)$$

or
$$\boxed{\Delta p = \frac{2T}{R}}$$

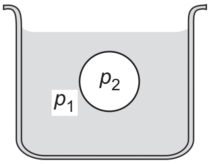

Fig. 16.74

Note (i) *If we have an air bubble inside a liquid, a single surface is formed. There is air on the concave side and liquid on the convex side. The pressure in the concave side (that is in the air) is greater than the pressure in the convex side (that is in the liquid) by an amount* $\frac{2T}{R}$.

$$\therefore \qquad \boxed{p_2 - p_1 = \frac{2T}{R}}$$

The above expression has been written by assuming P_1 *to be constant from all sides of the bubble. For small size bubbles this can be assumed.*

(ii) *From the above discussion, we can make a general statement. The pressure on the concave side of a spherical liquid surface is greater than the convex side by* $\frac{2T}{R}$.

Extra Points to Remember

- **Radius of curvature of a curve :**

  To describe the shape of a curved surface or interface, it is necessary to know the radii of curvature to a curve at some point. Consider the curve *AB* as shown in figure:

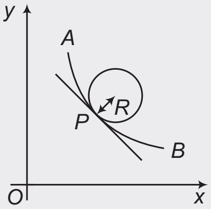

Fig. 16.75

  Let *P* be a point on this curve. The radius of curvature *R* of *AB* at *P* is defined as the radius of the circle which is tangent to the curve at point *P*.

- **Principal radii of curvature of a surface :**

  The spherical and cylindrical surfaces are rather simple cases for mathematical treatment. In many other cases however, the shapes are more complicated.

  Let us now consider a curved surface. At each point on a given surface, two radii of curvature (which are denoted by r_1 and r_2) are required to describe the shape.

  If we want to determine these radii at any point (say *P*), the normal to the surface at this point is drawn and a plane is constructed through the surface containing the normal. This will intersect the surface in a plane curve. The radius of curvature of the curve at point *P* is denoted by r_1. An infinite number of such planes can be constructed each of which intersects the surface at *P*. For each of these planes, a radius of curvature can be obtained.

  If we construct a second plane through the surface, containing the normal and perpendicular to the first plane, the second line of intersection and hence the second radius of curvature at point *P* (i.e., r_2) is obtained. These two radii define the curvature at *P* completely. It can be shown that $(1/r_1 + 1/r_2)$ called mean radius of curvature of the surface is constant, which is independent of the choice of the planes.

  An infinite set of such pairs of radii is possible. For standardization, the first plane is rotated around the normal until the radius of curvature in that plane reaches minimum. The other radius of curvature is therefore maximum. These are the principal radii of curvature (denoted by R_1 and R_2).

- **Young-Laplace Equation :**

  There exists a difference in pressure across a curved surface which is a consequence of surface tension. The pressure is greater on the concave side. The Laplace equation relates the pressure difference to the shape of the Young surface.

This difference in pressure is given by

$$\boxed{\Delta p = T\left(\frac{1}{R_1}+\frac{1}{R_2}\right)}$$

The simplified forms of spherical, cylindrical and planar surfaces are given below

For a spherical surface:

$$R_1 = R_2 = R \text{ (say), therefore } \Delta p = \frac{2T}{R}$$

For a cylindrical surface:

$$R_1 = R \text{ and } R_2 = \infty \text{, therefore } \Delta p = \frac{T}{R}$$

For a planer surface:

$$R_1 = R_2 = \infty \text{, therefore } \Delta p = 0$$

- As we know that molecules of a liquid reach to its surface after struggling with the net inward force acting on them from other liquid molecules. So, we can say that the surface molecules have some extra energy compared to inner molecules and every system has a tendency to keep its energy minimum. So, a liquid also has a tendency to keep its energy minimum by putting least number of molecules on the surface or by making its surface area minimum. This property of a liquid is called surface tension.
- Surface tension is a property of a liquid. It does not depend on the surface area.

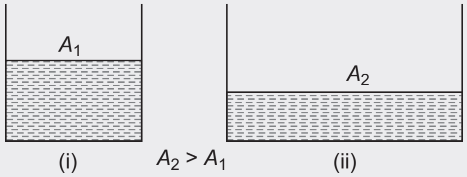

Fig. 16.76

For example, both containers have the same liquid under same conditions. $A_2 > A_1$ but surface tension will be same in both cases.

Example 16.24 *How much work will be done in increasing the diameter of a soap bubble from* 2 *cm to* 5 *cm ? Surface tension of soap solution is* 3.0×10^{-2} *N/m*.

Solution Soap bubble has two surfaces. Hence,

$$W = T\,\Delta A \qquad \left(T = \frac{\Delta W}{\Delta A}\right)$$

Here, $$\Delta A = 2[4\pi\{(2.5\times10^{-2})^2 - (1.0\times10^{-2})^2\}]$$

$$= 1.32\times10^{-2}\ \text{m}^2$$

$\therefore$ $$W = (3.0\times10^{-2})(1.32\times10^{-2})\ \text{J}$$

$$= 3.96\times10^{-4}\ \text{J}$$ **Ans.**

Example 16.25 *Calculate the energy released when* 1000 *small water drops each of same radius* 10^{-7} *m coalesce to form one large drop. The surface tension of water is* 7.0×10^{-2} *N/m.*

Solution Let r be the radius of smaller drops and R of bigger one. Equating the initial and final volumes, we have

$$\frac{4}{3}\pi R^3 = (1000)\left(\frac{4}{3}\pi r^3\right)$$

or $$R = 10r = (10)(10^{-7})\text{ m}$$

or $$R = 10^{-6}\text{ m}$$

Further, the water drops have only one free surface. Therefore,

$$\begin{aligned}\Delta A &= 4\pi R^2 - (1000)(4\pi r^2)\\ &= 4\pi\,[(10^{-6})^2 - (10^3)(10^{-7})^2]\\ &= -36\pi(10^{-12})\text{ m}^2\end{aligned}$$

Here, negative sign implies that surface area is decreasing. Hence, energy released in the process.

$$\begin{aligned}U = T|\Delta A| &= (7\times 10^{-2})(36\pi\times 10^{-12})\text{ J}\\ &= 7.9\times 10^{-12}\text{ J}\end{aligned}$$ **Ans.**

Example 16.26 *What should be the pressure inside a small air bubble of* 0.1 *mm radius situated just below the water surface. Surface tension of water* $= 7.2\times 10^{-2}$ *N/m and atmospheric pressure* $= 1.013\times 10^5$ *N/m*^{2}.

Solution Surface tension of water $T = 7.2\times 10^{-2}$ N/m

Radius of air bubble $R = 0.1\text{ mm} = 10^{-4}$ m

The excess pressure inside the air bubble is given by,

$$p_2 - p_1 = \frac{2T}{R}$$

∴ Pressure inside the air bubble,

$$p_2 = p_1 + \frac{2T}{R}$$

Substituting the values, we have

$$\begin{aligned}p_2 &= (1.013\times 10^5) + \frac{(2\times 7.2\times 10^{-2})}{10^{-4}}\\ &= 1.027\times 10^5\text{ N/m}^2\end{aligned}$$ **Ans.**

Example 16.27 *Two separate air bubbles (radii* 0.004 *m and* 0.002 *m) formed of the same liquid (surface tension* 0.07 *N/m) come together to form a double bubble. Find the radius and the sense of curvature of the internal film surface common to both the bubbles.*

Solution $p_1 = p_0 + \frac{4T}{r_1} \Rightarrow p_2 = p_0 + \frac{4T}{r_2}$

$$r_2 < r_1$$

∴ $$p_2 > p_1$$

i.e. pressure inside the smaller bubble will be more. The excess pressure

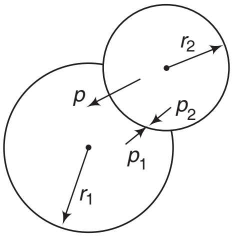

Fig. 16.77

$$p = p_2 - p_1 = 4T\left(\frac{r_1 - r_2}{r_1 r_2}\right) \qquad \ldots\text{(i)}$$

This excess pressure acts from concave to convex side, the interface will be concave towards smaller bubble and convex towards larger bubble. Let R be the radius of interface then,

$$p = \frac{4T}{R} \qquad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we get

$$R = \frac{r_1 r_2}{r_1 - r_2} = \frac{(0.004)(0.002)}{(0.004 - 0.002)}$$

$$= 0.004 \text{ m}$$ **Ans**

Example 16.28 *Under isothermal condition two soap bubbles of radii r_1 and r_2 coalesce to form a single bubble of radius r. The external pressure is p_0. Find the surface tension of the soap in terms of the given parameters.*

Solution As mass of the air is conserved,

$$\therefore \qquad n_1 + n_2 = n \qquad \text{(as } pV = nRT\text{)}$$

$$\therefore \qquad \frac{p_1 V_1}{RT_1} + \frac{p_2 V_2}{RT_2} = \frac{pV}{RT}$$

As temperature is constant,

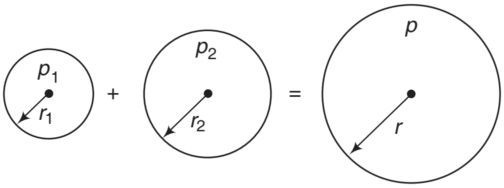

Fig. 16.78

$$T_1 = T_2 = T$$

$$\therefore \qquad p_1 V_1 + p_2 V_2 = pV$$

$$\therefore \qquad \left(p_0 + \frac{4S}{r_1}\right)\left(\frac{4}{3}\pi r_1^3\right) + \left(p_0 + \frac{4S}{r_2}\right)\left(\frac{4}{3}\pi r_2^3\right) = \left(p_0 + \frac{4S}{r}\right)\left(\frac{4}{3}\pi r^3\right)$$

Solving, this we get

$$S = \frac{p_0 (r^3 - r_1^3 - r_2^3)}{4(r_1^2 + r_2^2 - r^2)} \qquad \textbf{Ans.}$$

Note *To avoid confusion with the temperature, surface tension here is represented by S.*

Example 16.29 *Assume that a drop of liquid evaporates by decrease in its surface energy, so that its temperature remains unchanged. What should be the minimum radius of the drop for this to be possible? The surface tension is T, density of liquid is ρ and L is its latent heat of vaporization* **(2013 Main)**

(a) $\frac{\rho L}{T}$ (b) $\sqrt{\frac{T}{\rho L}}$ (c) $\frac{T}{\rho L}$ (d) $\frac{2T}{\rho L}$

Solution Decrease in surface energy = heat required in vaporization.

$$\therefore \qquad T(dS) = L(dm)$$

$$\therefore \qquad T(2)(4\pi r)\,dr = L(4\pi r^2\,dr)\rho$$

$$\therefore \qquad r = \frac{2T}{\rho L}$$

The correct options is (d).

INTRODUCTORY EXERCISE 16.7

1. A mercury drop of radius 1 cm is sprayed into 10^6 droplets of equal size. Calculate the increase in surface energy if surface tension of mercury is 35×10^{-3} N/m.
2. A water film is made between two straight parallel wires of length 10 cm each and at a distance of 0.5 cm from each other. If the distance between the wires is increased by 1 mm, how much work will be done? Surface tension of water $= 7.2 \times 10^{-2}$ N/m
3. A soap bubble of radius R has been formed at normal temperature and pressure under isothermal conditions. Compute the work done. The surface tension of soap solution is T.
4. A small air bubble of radius 'r' is at a depth 'h' below the water surface (density of water $= \rho$). Surface tension of water is T, atmospheric pressure is p_0. Find pressure inside the air bubble for the condition $r << h$.

16.10 Capillary Rise or Fall

Cohesive and Adhesive Forces

The force of attraction between the molecules of the same substance is called cohesion.

In case of solids, the force of cohesion is very large and due to this solids have definite shape and size. On the other hand, the force of cohesion in case of liquids is weaker than that of solids. Hence, liquids do not have definite shape but have definite volume. The force of cohesion is negligible in case of gases. Because of this fact, gases have neither fixed shape nor volume.

Examples

(i) Two drops of liquid coalesce into one when brought in mutual contact because of the cohesive force.

(ii) It is difficult to separate two sticky plates of glass wetted with water because a large force has to be applied against the cohesive force between the molecules of water.

(iii) It is very difficult to break a drop of mercury into small droplets because of large cohesive force between mercury molecules.

The force of attraction between molecules of different substance is called adhesion.

Examples

(i) Adhesive force enables us to write on the black board with a chalk.

(ii) Due to force of adhesion, water wets the glass plate.

(iii) Fevicol and gum are used in gluing two surfaces together because of adhesive force.

Contact Angle

When a liquid surface touches a solid surface, the shape of the liquid surface near the contact is generally curved. When a glass plate is immersed in water, the surface near the plate becomes concave. On the other hand, if glass plate is immersed in mercury, the surface is depressed near the plate.

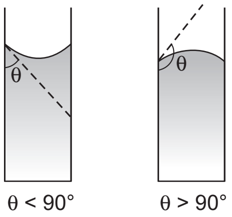

Fig. 16.79

The angle between the tangent planes at the solid surface and the liquid at the contact is called the contact angle. In this case the tangent plane to the solid surface is to be drawn towards the liquid and the tangent plane to the liquid is to be drawn away from the solid.

Those liquids which wet the walls of the container (say in case of water and glass) have meniscus concave upwards and their values of angle of contact is less than 90° (also called acute angle). However, those liquids which don't wet the walls of the container (say in case of mercury and glass) have meniscus convex upwards and their value of angle of contact is greater than 90° (also called obtuse angle). The angle of contact of mercury with glass is about 140°, whereas the angle of contact of water with glass is about 8°. But, for pure water, the angle of contact θ with glass is taken as 0°.

Shape of Liquid Meniscus

When the adhesive force (P) between solid and liquid molecules is more than the cohesive force (Q) between liquid-liquid molecules (as with water and glass), shape of the meniscus is concave and the angle of contact θ is less than 90°. In this case, the liquid wets or adheres to the solid surface. The resultant (R) of P and Q passes through the solid.

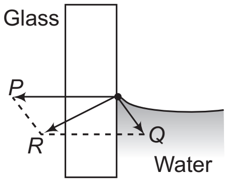

Fig. 16.80

On the other hand when $P < Q$ (as with glass and mercury), shape of the meniscus is convex and the angle of contact $\theta > 90°$. The resultant (R) of P and Q in this case passes through the liquid.

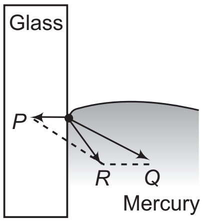

Fig. 16.81

Let us now see why the liquid surface bends near the contact with a solid. A liquid in equilibrium can not sustain tangential stress. The resultant force on any small part of the surface layer must be perpendicular to the surface at that point. Basically three forces are acting on a small part of the liquid surface near its contact with solid. These forces are,

(i) P, attraction due to the molecule of the solid surface near it

(ii) Q, attraction due to liquid molecules near this part and

(iii) The weight w of the part considered.

We have considered very small part, so weight of that part can be ignored for better understanding. As we have seen in the last figures, to make the resultant (R) of P and Q perpendicular to the liquid surface the surface becomes curved (convex or concave).

Capillarity

Surface tension causes elevation or depression of the liquid in a narrow tube. This effect is called capillarity. When a glass capillary tube (A tube of very small diameter is called a capillary tube) open at both ends is dipped vertically in water the water in the tube will rise above the level of water in the vessel as shown in figure (a). In case of mercury, the liquid is depressed in the tube below the level of mercury in the vessel as shown in figure (b).

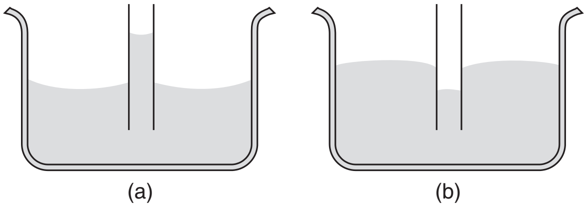

Fig. 16.82

When the contact angle is less than 90° the liquid rises in the tube. For a non-wetting liquid angle of contact is greater than 90° and the surface is depressed, pulled down by the surface tension forces.

Explanation

When a capillary tube is dipped in water, the water meniscus inside the tube is concave. The pressure just below the meniscus is less than the pressure just above it by $\frac{2T}{R}$, where T is the surface tension of water and R is the radius of curvature of the meniscus. The pressure on the surface of water is p_0, the atmospheric pressure. The pressure just below the plane surface of water outside the tube is also

p_0, but that just below the meniscus inside the tube is $p_0 - \frac{2T}{R}$. We know that pressure at all points in the same level of water must be the same. Therefore, to make up the deficiency of pressure $\frac{2T}{R}$ below the meniscus water begins to flow from outside into the tube. The rising of water in the capillary stops at a certain height *h.* In this position, the pressure of water column of height *h* becomes equal to $\frac{2T}{R}$, i.e.

$$h\rho g = \frac{2T}{R}$$

or
$$h = \frac{2T}{R\rho g}$$

If *r* is the radius of the capillary tube and θ the angle of contact, then

$$R = \frac{r}{\cos\theta}$$

$$\therefore \qquad \boxed{h = \frac{2T\cos\theta}{r\rho g}}$$

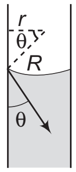

Fig. 16.83

Alternative Proof for the Formula of Capillary Rise

As we have already seen, when the contact angle is less than 90°, the total surface tension force just balances the extra weight of the liquid in the tube.

The water meniscus in the tube is along a circle of circumference $2\pi r$ which is in contact with the glass. Due to the surface tension of water, a force equal to *T* per unit length acts at all points of the circle. If the angle of contact is θ, then this force is directed inward at an angle θ from the wall of the tube.

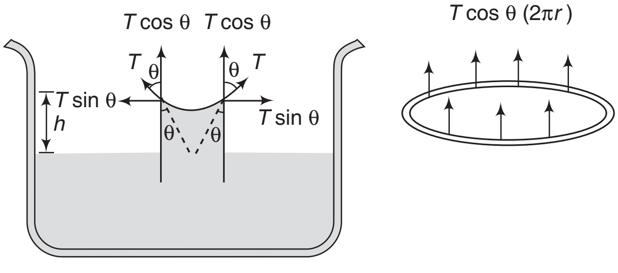

Fig. 16.84

In accordance with Newton's third law, the tube exerts an equal and opposite force *T* per unit length on the circumference of the water meniscus. This force which is directed outward, can be resolved into two components $T\cos\theta$ per unit length acting vertically upward and $T\sin\theta$ per unit length acting horizontally outward. Considering the entire circumference $2\pi r$, for each horizontal component $T\sin\theta$ there is an equal and opposite component and the two neutralise each other. The vertical components being in the same direction are added up to give a total upward force $(2\pi r)(T\cos\theta)$. It is this force which supports the weight of the water column so raised.

Thus,

$$(T\cos\theta)(2\pi r) = \text{Weight of the liquid column.}$$
$$= (\pi r^2 \rho g h) \qquad \ldots\text{(i)}$$

$$\therefore \qquad h = \frac{2T\cos\theta}{r\rho g}$$

The result has following notable features :

(i) If the contact angle θ is greater than 90°, the term $\cos\theta$ is negative and hence, h is negative. The expression then gives the depression of the liquid in the tube.

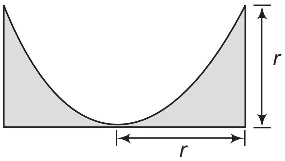

Fig. 16.85

(ii) The **correction** due to weight of the liquid contained in the meniscus can be made for contact angle $\theta = 0°$. The meniscus is then hemispherical. The volume of the shaded part is

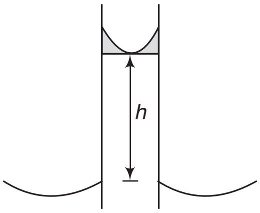

Fig. 16.86

$$V = (\pi r^2)(r) - \frac{1}{2}\left(\frac{4}{3}\pi r^3\right) = \frac{1}{3}\pi r^3$$

The weight of this shaded part is $\frac{1}{3}\pi r^3 \rho g$.

Therefore, we can write Eq. (i) as,

$$(T\cos 0°)(2\pi r) = \pi r^2 \rho g h + \frac{1}{3}\pi r^3 \rho g$$

or

$$\boxed{h = \frac{2T}{r\rho g} - \frac{r}{3}}$$

(iii) Suppose a capillary tube is held vertically in a liquid which has a concave meniscus, then capillary rise is given by,

$$h = \frac{2T\cos\theta}{r\rho g} = \frac{2T}{R\rho g} \qquad \left(\text{as } R = \frac{r}{\cos\theta}\right)$$

or

$$hR = \frac{2T}{\rho g} \qquad \ldots\text{(ii)}$$

When the length of the tube is greater than h, the liquid rises in the tube, so as to satisfy the above relation. But if the length of the tube is insufficient (i.e. less than h) say h', the liquid does not emerge in the form of a fountain from the upper end (because it will violate the law of conservation of energy) but the angle made by the liquid surface and hence, the R changes in such a way that the force $2\pi rT\cos\theta$ equals the weight of the liquid raised. Thus,

$$2\pi rT\cos\theta' = \pi r^2\rho gh'$$

$$h' = \frac{2T\cos\theta'}{r\rho g}$$

or

$$h' = \frac{2T}{R'\rho g}$$

or

$$h'R' = \frac{2T}{\rho g} \qquad \ldots\text{(iii)}$$

From Eqs. (ii) and (iii), we have

$$hR = h'R' = \frac{2T}{\rho g}$$

Practical Applications of Capillarity

1. The oil in a lamp rises in the wick by capillary action.
2. The tip of nib of a pen is split up, to make a narrow capillary so that the ink rises upto the tin or nib continuously.
3. If one end of the towel dips into a bucket of water and the other end hangs over the bucket, the towel soon becomes wet throughout, due to capillary action.
4. Ink is absorbed by the blotter due to capillary action.

Example 16.30 *A capillary tube whose inside radius is* 0.5 *mm is dipped in water having surface tension* 7.0×10^{-2} *N/m. To what height is the water raised above the normal water level? Angle of contact of water with glass is* 0°. *Density of water is* 10^3 *kg/m*^{3} *and* $g = 9.8$ *m/s*^{2}.

Solution $h = \frac{2T\cos\theta}{r\rho g}$

Substituting the proper values, we have

$$h = \frac{(2)(7.0\times10^{-2})\cos 0^\circ}{(0.5\times10^{-3})(10^3)(9.8)}$$

$$= 2.86\times10^{-2}\ \text{m} = 2.86\ \text{cm}$$ **Ans.**

Example 16.31 *A glass tube of radius* 0.4 *mm is dipped vertically in water. Find upto what height the water will rise in the capillary ? If the tube in inclined at an angle of* 60° *with the vertical, how much length of the capillary is occupied by water ? Surface tension of water* = 7.0×10^{-2} *N/m, density of water* = 10^3 *kg/m*^{3}.

Solution For glass-water, angle of contact $\theta = 0°$.

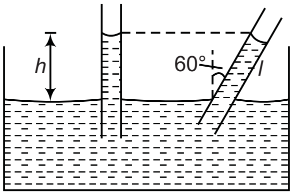

Fig. 16.87

Now,
$$h = \frac{2T\cos\theta}{r\rho g}$$

$$= \frac{(2)(7.0\times 10^{-2})\cos 0°}{(0.4\times 10^{-3})(10^3)(9.8)}$$

$$= 3.57\times 10^{-2}\ \text{m} = 3.57\,\text{cm}$$ **Ans.**

$$l = \frac{h}{\cos 60°} = \frac{3.57}{\frac{1}{2}} = 7.14\,\text{cm}$$ **Ans.**

Example 16.32 *Mercury has an angle of contact of* $120°$ *with glass. A narrow tube of radius* 1.0 *mm made of this glass is dipped in a trough containing mercury. By what amount does the mercury dip down in the tube relative to the liquid surface outside. Surface tension of mercury at the temperature of the experiment is* 0.5 *N/m and density of mercury is* 13.6×10^3 *kg/m*^{3}. *(Take* $g = 9.8\ m/s^2$*).*

Solution $h = \dfrac{2T\cos\theta}{r\rho g}$

Substituting the values, we get
$$h = \frac{2\times 0.5\times \cos 120°}{10^{-3}\times 13.6\times 10^3\times 9.8}$$

$$= -3.75\times 10^{-3}\ \text{m}$$

or
$$h = -3.75\ \text{mm}$$ **Ans.**

Note *Here, negative sign implies that mercury suffers capillary depression.*

Example 16.33 *If a* 5 *cm long capillary tube with* 0.1 *mm internal diameter open at both ends is slightly dipped in water having surface tension* 75 *dyne cm*$^{-1}$, *state whether (a) water will rise half way in the capillary, (b) Water will rise up to the upper end of capillary and (c) water will overflow out of the upper end of capillary? Explain your answer.*

Solution Given that surface tension of water, $T = 75$ dyne/cm

Radius $r = \dfrac{0.1}{2}\,\text{mm} = 0.05\,\text{mm} = 0.005\,\text{cm}$

Density $\rho = 1\,\text{gm/cm}^3$, angle of contact, $\theta = 0°$

Let h be the height to which water rises in the capillary tube. Then

$$h = \frac{2T\cos\theta}{r\rho g} = \frac{2\times 75\times\cos 0^\circ}{0.005\times 1\times 981}\text{ cm}$$

$$= 30.58\text{ cm}$$

But length of capillary tube is $h' = 5$ cm

(a) Because $h > \frac{h'}{2}$ therefore the first possibility does not exist.

(b) Because the tube is of insufficient length therefore the water will rise upto the upper end of the tube.

(c) The water will not overflow of the upper end of the capillary. It will rise only up to the upper end of the capillary.

The liquid meniscus will adjust its radius of curvature R' in such a way that

$$R'h' = Rh \qquad \left[\because hR = \frac{2T}{\rho g} = \text{constant}\right]$$

where, R is the radius of curvature that the liquid meniscus would possess if the capillary tube were of sufficient length.

$$\therefore \qquad R' = \frac{Rh}{h'} = \frac{rh}{h'} = \frac{0.005\times 30.58}{5} = 0.0306\text{ cm} \qquad \left[\because R = \frac{r}{\cos\theta} = \frac{r}{\cos 0^\circ} = r\right]$$

INTRODUCTORY EXERCISE 16.8

1. Water rises in a capillary tube to a height of 2.0 cm. In another capillary tube whose radius is one third of it, how much the water will rise?

2. Water rises up in a glass capillary upto a height of 9.0 cm, while mercury falls down by 3.4 cm in the same capillary. Assume angles of contact for water glass and mercury glass 0° and 135° respectively. Determine the ratio of surface tension of mercury and water ($\cos 135^\circ = -0.71$).

3. A tube of insufficient length is immersed in water (surface tension $= 0.7$ N/m) with 1 cm of it projecting vertically upwards outside the water. What is the radius of meniscus ?
Given, radius of tube $= 1$ mm.

4. A capillary tube is dipped in a liquid. Let pressures at points A, B and C be p_A, p_B and p_C respectively, then

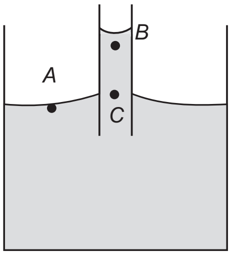

Fig. 16.88

(a) $p_A = p_B = p_C$ (b) $p_A = p_B < p_C$ (c) $p_A = p_C < p_B$ (d) $p_A = p_C > p_B$

Final Touch Points

1. **Application on Surface Tension**
   - (i) When the detergent materials are added to liquids, the angle of contact decreases and hence the wettability increases. On the other hand, when water proofing material is added to a fabric it increases the angle of contact, making the fabric water-repellant.
   - (ii) Surface tension of all lubricating oils and paints is kept low so that they spread over a large area.
   - (iii) Oil spreads over the surface of water because the surface tension of oil is less than the surface tension of cold water.

2. **Effect of Temperature and Impurities on Surface Tension**

   The surface tension of a liquid decreases with the rise in temperature and *vice-versa*. Surface tension becomes zero at a critical temperature. It is for this reason that hot soup tastes better. Surface tension of a liquid changes appreciably with addition of impurities. For example, surface tension of water increases with addition of highly soluble substances like Nacl, $ZnSO_4$ etc. On the other hand surface tension of water gets reduced with addition of sparingly soluble substances like phenol, soap etc.

3. **Laminar and Turbulent Flow, Reynolds Number**

   When a liquid flowing in a pipe is observed carefully, it will be seen that the pattern of flow becomes more disturbed as the velocity of flow increases. Perhaps this phenomenon is more commonly seen in a river or stream. When the flow is slow the pattern is smooth, but when the flow is fast, eddies develop and swirl in all directions.

   At the low velocities, flow is calm. This is called "laminar flow".

   In a series of experiments, **Reynolds** showed this by injecting a thin stream of dye into the fluid and finding that it ran in a smooth stream in the direction of the flow at low speeds. As the velocity of flow increased, he found that the smooth line of dye was broken up, at high velocities, the dye was rapidly mixed into the disturbed flow of the surrounding fluid. This is called **"turbulent flow".**

   After many experiments **Reynolds** saw that the expression

$$\frac{\rho u d}{\eta}$$

   where, ρ = density, u = mean velocity, d = diameter and η = viscosity would help in predicting the change in flow type. If the value is less than about 2000 then flow is laminar, if greater than 4000 then turbulent and in between these two in the transition zone.

   This value is known as the Reynolds number, R_e.

$$R_e = \frac{\rho u d}{\eta}$$

   Laminar flow: $R_e < 2000$, Transitional flow: $2000 < R_e < 4000$, Turbulent flow: $R_e > 4000$

   SI Units of Reynolds Number

$$\rho = \text{kg/m}^3,\ u = \text{m/s},\ d = m,\ \eta = \text{Ns/m}^2 = \text{kg/ms}$$

$$R_e = \frac{\rho u d}{\eta} = \frac{(\text{kg/m}^3)(\text{m/s})(\text{m})}{(\text{kg/ms})} = 1$$

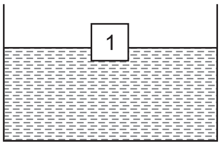
   i.e. it has no units. A quantity that has no units is known as a non-dimensional (or dimensionless) quantity. Thus, the Reynolds number, R_e is a non-dimensional number.

Solved Examples

TYPED PROBLEMS

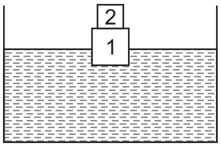
Type 1. *Based on Law of Floatation.*

Concept



(i)

⇓



(ii)

Whenever a block floats in a liquid (density of block should be less than density of liquid), there is one single equation.

Weight of solid = Upthrust on solid

$$\therefore \qquad V\rho_s g = V_i \rho_l g$$

Here, V is total volume of solid and V_i is immersed volume of solid.

$$\therefore \qquad \boxed{\frac{V_i}{V} = f_i = \frac{\rho_s}{\rho_l}}$$

Here, f_1 is immersed fraction of volume of solid.

Further, in figure (i) immersed volume is less and in figure (ii) immersed volume is more. Upthrust on immersed volume in figure (i) is equal to weight of block-1 and upthrust on immersed volume in figure (ii) is equal to weight of both the blocks 1 and 2. In other words, we can also say that upthrust on extra immersed volume in figure (ii) is equal to extra weight. In equation form, we can write as

$$m_1 g = (V_i)_1 \rho_l g \quad \text{and} \quad (m_1 + m_2) g = (V_i)_2 \rho_l g$$

$$\text{or} \qquad m_2 g = [(V_i)_2 - (V_i)_1] \rho_l g \quad \text{or} \quad (\Delta m) g \quad \text{or} \quad \Delta w = (\Delta V_i) \rho_l g$$

Note *If fluid is accelerated, then in the expression of upthrust g is replaced be g_{eff}.*

Example 1 *A block of wood floats in a bucket of water placed in a lift. Will the block sink more or less if the lift starts accelerating up?*

Solution Under nromal conditions, fraction of volume immersed under floating condition is

$$f_1 = \frac{\rho_s}{\rho_l} \qquad \text{...(i)}$$

If the lift starts accelerating up, then

$$\text{upthrust} - \text{weight} = ma$$

$$\therefore \qquad V_i \rho_l (g + a) - V\rho_s g = V\rho_s a$$

Solving this equation, we get

$$\frac{V_i}{V} = f_2 = \frac{\rho_s}{\rho_l} \qquad \text{...(ii)}$$

$$f_1 = f_2$$

So, the block neither sinks less nor more.

Note *From this example, we can make a general concept that by the acceleration of container, fraction (or percentage of volume immersed) does not change.*

Example 2 *A raft of wood (density $=600 kg/m^3$) of mass 120 kg floats in water. How much weight can be put on the raft to make it just sink?*

Solution Weight of raft + external weight = upthrust on 100% volume of raft

$$\therefore \qquad (120 + m)\, g = \left(\frac{120}{600}\right) \times 10^3 \times g$$

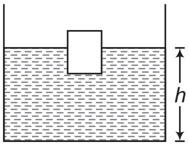
$$\therefore \qquad m = 80 \text{ kg}$$ **Ans.**

Note *Here immersed fraction used in upthrust is the total volume of solid* $\left(= \frac{m}{\rho} = \frac{120}{600} m^3\right)$.

Type 2. *Level Problems.*

Concept

Let us first note down the following four results:



(i) If ice is floating in water, then after melting of ice the level 'h' remains unchanged.

(ii) In floating to floating condition level 'h' remains unchanged.

For example Suppose some wooden blocks are floating in water kept inside a boat. If these wooden blocks are thrown into the water, then level will remain unchanged. This is because under both the conditions wooden blocks are floating.

(iii) In the floating to sink condition, level 'h' decreases.

For example In the above case if wooden blocks are replaced by stone pieces then level will fall. Because, initially stone pieces were floating (with the help of boat) but eventually those pieces will sink.

(iv) A solid is floating in a liquid of density ρ_1. After sometime, the solid melts and density (of solid) after melting (in liquid state) is suppose ρ_2, then there are following three cases :

Case 1 If $\rho_2 = \rho_1$, then level remains unchanged. Note that this is also result (i).

Case 2 If $\rho_2 < \rho_1$, then level will increase.

Case 3 If $\rho_2 > \rho_1$, then level will decrease.

Example 3 *A piece of ice is floating in a glass vessel filled with water. Then prove that level of water in the vessel remains unchanged after melting of ice .*

Note *This is result (i).*

Solution Let m be the mass of ice piece floating in water.

In equilibrium, weight of ice piece = upthrust

$$\text{or} \qquad mg = V_i \rho_w g$$

$$\text{or} \qquad V_i = \frac{m}{\rho_w} \qquad \text{...(i)}$$

Here, V_i is the volume of ice piece immersed in water.

When the ice melts, let V be the volume of water formed by m mass of ice. Then,

$$V = \frac{m}{\rho_w} \qquad \text{...(ii)}$$

From Eqs. (i) and (ii), we see that

$$V_i = V$$

Hence, the level will not change. **Ans.**

Example 4 *A piece of ice having a stone frozen in it floats in a glass vessel filled with water. How will the level of water in the vessel change when the ice melts?*

Note *This is result (iii).*

Solution Let, m_1 = mass of ice, m_2 = mass of stone

ρ_S = density of stone and ρ_w = density of water

In equilibrium, when the piece of ice floats in water,

weight of (ice + stone) = upthrust

or $$(m_1 + m_2)g = V_i\rho_w g$$

$\therefore$ $$V_i = \frac{m_1}{\rho_w} + \frac{m_2}{\rho_w} \qquad \text{...(i)}$$

Here, V_i = Volume of ice immersed

When the ice melts, m_1 mass of ice converts into water and stone of mass m_2 is completely submerged.

Volume of water formed by m_1 mass of ice,

$$V_1 = \frac{m_1}{\rho_w}$$

Volume of stone (which is also equal to the volume of water displaced)

$$V_2 = \frac{m_2}{\rho_S}$$

Since, $$\rho_S > \rho_w$$

Therefore, $$V_1 + V_2 < V_i$$

or the level of water will decrease. **Ans.**

Example 5 *A solid floats in a liquid of different material. Carry out an analysis to see whether the level of liquid in the container will rise or fall when the solid melts.*

Note *This is result (iv).*

Solution Let M = Mass of the floating solid

ρ_2 = density of liquid formed by the melting of the solid

ρ_1 = density of the liquid in which the solid is floating

The mass of liquid displaced by the solid is M. Hence, the volume of liquid displaced is $\frac{M}{\rho_1}$.

When the solid melts, the volume occupied by it is $\frac{M}{\rho_2}$. Hence, the level of liquid in container will rise or fall according as

$$\frac{M}{\rho_2} > \text{ or } < \frac{M}{\rho_1} \quad \text{i.e.} \quad \rho_2 < \text{ or } > \rho_1$$

There will be no change in the level if $\rho_1 = \rho_2$. In case of ice, floating in water $\rho_1 = \rho_2$ and hence, the level of water remains unchanged when ice melts.

Type 3. *Based on apparent weight or change in weight of a solid inside a liquid.*

Concept

If density of a solid is greater than density of liquid then it cannot float, it will sink. In this case, we hold the solid inside the liquid. Upthrust acts on its 100% volume and the solid is felt lighter. The equations are as under.

$w_{\text{app}} = w_{\text{actual}} -$ Upthrust on 100% volume or change in weight $\Delta w =$ Upthrust $= V \rho_l g$ ...(i)

From Eq. (i) we come across following two results:

(i) If the liquid in which solid is immersed, is water, then

$$\frac{\text{Weight in air}}{\text{Decrease in weight}} = \text{Relative density of body (RD)}$$

This can be shown as under

$$\frac{\text{Weight in air}}{\text{Decrease in weight}} = \frac{\text{Weight in air}}{\text{Upthrust in water}} = \frac{V\rho_S g}{V\rho_w g}$$

$$= \frac{\rho_S}{\rho_w} = \text{RD}$$

Hence proved.

(ii) Change in weight Δw is directly proportional to density of liquid or relative density of liquid. Thus,

$$\Delta w \propto \rho_l \text{ or } (\text{RD})_l \quad \Rightarrow \quad \frac{\Delta w_1}{\Delta w_2} = \frac{(\rho_l)_l}{(\rho_l)_2} = \frac{(\text{RD})_{l_1}}{(\text{RD})_{l_2}}$$

Note *In this case, 100% volume of solid remains immersed in the liquid, So V and g are same in two liquids in Eq. (i).*

Example 6 *A metallic sphere weighs 210 g in air, 180 g in water and 120 g in an unknown liquid. Find the density of metal and of liquid.*

Solution Relative density of metal

$$= \frac{\text{weight in air}}{\text{change in weight of water}} = \frac{210}{210 - 180} = 7$$

$\therefore$ Density of metal = 7 g/cm^2

Change in weight in a liquid = upthrust in liquid

$$= (V_{\text{solid}})(\rho_{\text{liquid}})\,g$$

or $$\Delta w \propto \rho_{\text{liquid}}$$

$\therefore$ $$\frac{\Delta w_l}{\Delta w_w} = \frac{\rho_l}{\rho_w}$$

or
$$\rho_l = \frac{\Delta w_l}{\Delta w_w}\rho_w$$
$$= \left(\frac{210-120}{210-180}\right)(1)\ \text{gm/cm}^3$$
$$= 3\ \text{g/cm}^3$$ **Ans.**

Example 7 *An ornament weighing 50 g in air weighs only 46 g is water. Assuming that some copper is mixed with gold to prepare the ornament. Find the amount of copper in it. Specific gravity of gold is 20 and that of copper is 10.*

Solution Let m be the mass of the copper in ornament. Then, mass of gold in it is $(50 - m)$.

Volume of copper $$V_1 = \frac{m}{10} \qquad \left(\text{volume} = \frac{\text{mass}}{\text{density}}\right)$$

and volume of gold $$V_2 = \frac{50-m}{20}$$

When immersed in water ($\rho_w = 1\ \text{g/cm}^3$)

Decrease in weight = upthrust

$\therefore$ $$(50-46)g = (V_1 + V_2)\rho_w g$$

or $$4 = \frac{m}{10} + \frac{50-m}{20} \quad \text{or} \quad 80 = 2m + 50 - m$$

$$m = 30\ \text{g}$$ **Ans.**

Example 8 *An iron casting containing a number of cavities weighs 6000 N in air and 4000 N in water. What is the volume of the cavities in the casting? Density of iron is $7.87\ g/cm^3$. Take $g = 9.8\ m/s^2$ and density of water $= 10^3\ kg/m^3$.*

Solution Let v be the volume of cavities and V the volume of solid iron. Then,

$$V = \frac{\text{mass}}{\text{density}} = \left(\frac{6000/9.8}{7.87 \times 10^3}\right) = 0.078\ \text{m}^3$$

Further, decrease in weight = upthrust

$\therefore$ $$(6000 - 4000) = (V + v)\rho_w g$$

or $$2000 = (0.078 + v) \times 10^3 \times 9.8$$

or $$0.078 + v \approx 0.2$$

$\therefore$ $$v = 0.12\ \text{m}^3$$ **Ans.**

Type 4. *Based on pressure equation.*

Concept

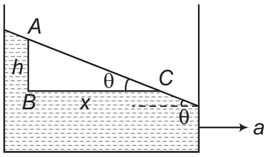
(i) If we wish to find pressure difference between two points A and B, then start from A, write pressure p_A and reach upto point B. Keep on writing increase or decrease in pressure and finally write pressure equal to p_B.

(ii) If fluids are at rest then there is no change in pressure in horizontal direction. In vertical direction write $(+\rho gh)$ while moving in downward direction and $(-\rho gh)$ while moving in upward direction (ρ = density of liquid).

(iii) If the fluid is accelerated, write $(+\rho ax)$ in horizontal direction opposite to horizontal acceleration 'a' and $(-\rho ax)$ in the same direction of acceleration. Here, x is the horizontal distance. In vertical direction, write $(\pm\rho g_e h)$. Here, g_e is the effective value of acceleration due to gravity.

(iv) If the fluid is rotating, write $\left(+\rho\frac{\omega^2x^2}{2}\right)$ while moving away from the axis and $\left(-\frac{\rho\omega^2x^2}{2}\right)$ in moving towards the axis.

Example 9 *A liquid kept in a container has a horizontal acceleration 'a' as shown in figure.*



Using the pressure equation along the path ABC find the angle θ.

Solution Writing pressure equation along the path ABC we have

$$p_A + \rho gh - \rho ax = p_C \qquad (\rho = \text{density of liquid})$$

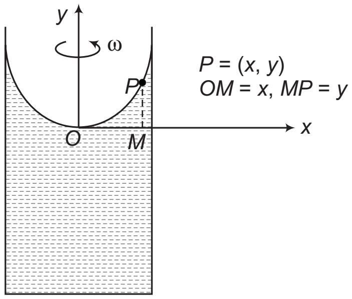
Points A and C are open to atmosphere.

$$\therefore \qquad p_A = p_C = p_0 = \text{atmosphere pressure}$$

$$\Rightarrow \qquad \rho gh - \rho ax = 0 \quad \text{or} \quad \frac{h}{x} = \frac{a}{g}$$

$$\Rightarrow \qquad \tan\theta = \frac{a}{g} \quad \text{or} \quad \theta = \tan^{-1}\left(\frac{a}{g}\right)$$ **Ans.**

Example 10 *A liquid of density 'ρ' is rotated with an angular speed 'ω' as shown in figure. Using the pressure equation concept find the equation of free surface of the liquid.*



Solution Writing pressure equation along the path PMO.

$$p_P + \rho gy - \frac{\rho\omega^2x^2}{2} = p_O$$

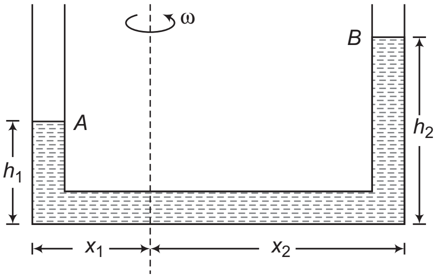
Points P and O are open to atmosphere.

So, pressures at these points are same (= atmospheric pressure). Therefore, the above equation becomes,

$$\rho gy - \frac{\rho \omega^2 x^2}{2} = 0 \quad \text{or} \quad y = \left(\frac{\omega^2}{2g}\right) x^2$$

This is the required parabolic equation of free surface of liquid.

Example 11



A liquid of density ρ is rotated by an angular speed ω as shown in figure, Using the concept of pressure equation, find a relation between h_1, h_2, x_1 and x_2.

Solution Writing pressure equation between points A and B, we have

$$p_A + \rho g h_1 - \frac{\rho \omega^2 x_1^2}{2} + \frac{\rho \omega^2 x_2^2}{2} - \rho g h_2 = p_B$$

Points A and B are open to atmosphere.

Therefore,

$$p_A = p_B = p_0 = \text{atmospheric pressure.}$$

Substituting the values in above equation we have,

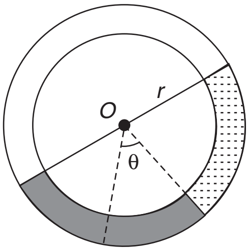
$$\rho g h_1 - \frac{\rho \omega^2 x_1^2}{2} + \frac{\rho \omega^2 x_2^2}{2} - \rho g h_2 = 0$$

On simplifying we get,

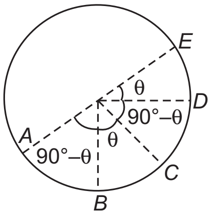
$$(h_2 - h_1) = \frac{\omega^2}{2g}\left(x_2^2 - x_1^2\right)$$

This is the desired relation between h_1, h_2, x_1 and x_2.

Example 12 *A small uniform tube is bent into a circle of radius r whose plane is vertical. Equal volumes of two fluids whose densities are* ρ *and* σ(ρ > σ) *fill half the circle. Find the angle that the radius passing through the interface makes with the vertical.*



Solution $h_{AB} = r - r\cos(90° - \theta) = r - r\sin\theta$



$$h_{BC} = r - r\cos\theta$$
$$h_{CD} = r\sin(90° - \theta) = r\cos\theta$$
$$h_{DE} = r\sin\theta$$

Writing pressure equation between points A and E we have

$$p_A + (r - r\sin\theta)\rho g - (r - r\cos\theta)\rho g - (r\cos\theta)(\sigma)\,g - (r\sin\theta)\,\sigma\,g = p_E$$

But $p_A = p_E = p_{\text{gas}}$

Solving this equation, we get

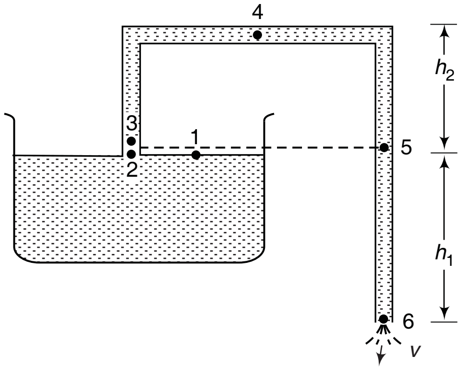
$$\tan\theta = \left(\frac{\rho - \sigma}{\rho - \sigma}\right)$$ **Ans.**

Type 5. *Based on concept of syphon.*

Concept

In the figure shown, $v_1 \approx v_2 = 0$

$$p_1 = p_2 = p_6 = p_0$$



Note *Point 3 is just above point 2.* $v_2 = 0$ *but* $v_3 = v$

If area of cross-section of pipe is uniform, then from continuity equation,

$$v_3 = v_4 = v_5 = v_6 = v \text{ (say)}$$

Applying Bernoulli's equation at 1 (or 2), 3, 4, 5 and 6, we have

$$p_0 + 0 + 0 = p_3 + \frac{1}{2}\rho v^2 + 0 = p_4 + \frac{1}{2}\rho v^2 + \rho g h_2$$
$$= p_5 + \frac{1}{2}\rho v^2 + 0 = p_0 + \frac{1}{2}\rho v^2 - \rho g h_1$$

From this equation, following conclusions can be made:

(i) $p_1 = p_2 = p_6 = p_0$

(ii) $p_3 = p_5 < p_0$

(iii) $v_1 = v_2 = 0$

(vi) $v_3 = v_4 = v_5 = v_6 = v$

(v) $v = \sqrt{2gh_1}$ so, h_1 should be greater than zero

(vi) $p_4 = p_0 - \rho g (h_1 + h_2)$

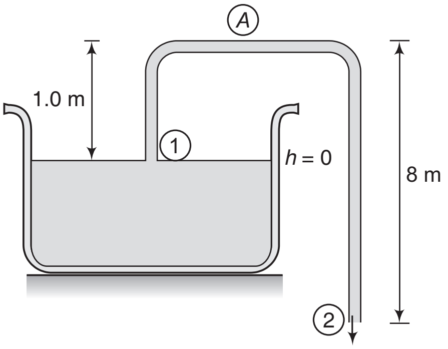
From the last equation we can see that p_4 decreases as $(h_1 + h_2)$ increases. Minimum value of pressure is at 4 or p_4 and this minimum value is zero and this will occur at,

$$0 = p_0 - \rho g (h_1 + h_2)_{\max}$$

Thus, $(h_1 + h_2)_{\max} = \dfrac{p_0}{\rho g}$ and simultaneously $h_1 > 0$

Thus, syphon will work when $h_1 > 0$ and $(h_1 + h_2) < \dfrac{p_0}{\rho g}$.

Example 13 *The U-tube acts as a water siphon. The bend in the tube is 1 m above the water surface. The tube outlet is 7 m below the water surface. The water issues from the bottom of the siphon as a free jet at atmospheric pressure. Determine the speed of the free jet and the minimum absolute pressure of the water in the bend. Given atmospheric pressure* $= 1.01 \times 10^5 N/m^2$, $g = 9.8\ m/s^2$ *and density of water* $= 10^3\ kg/m^3$.



Solution (a) Applying Bernoulli's equation between points (1) and (2)

$$p_1 + \frac{1}{2}\rho v_1^2 + \rho g h_1 = p_2 + \frac{1}{2}\rho v_2^2 + \rho g h_2$$

Since, area of reservoir >> area of pipe

$$v_1 \approx 0,$$

also $p_1 = p_2 =$ atmospheric pressure

So,
$$v_2 = \sqrt{2g(h_1 - h_2)}$$
$$= \sqrt{2 \times 9.8 \times 7}$$
$$= 11.7 \text{ m/s}$$

Ans.

(b) The minimum pressure in the bend will be at A. Therefore, applying Bernoulli's equation between (1) and (A)

$$p_1 + \frac{1}{2}\rho v_1^2 + \rho g h_1 = p_A + \frac{1}{2}\rho v_A^2 + \rho g h_A$$

Again, $v_1 \approx 0$ and from continuity equation $v_A = v_2$

or
$$p_A = p_1 + \rho g(h_1 - h_A) - \frac{1}{2}\rho v_2^2$$

Therefore, substituting the values, we have

$$p_A = (1.01 \times 10^5) + (1000)(9.8)(-1) - \frac{1}{2} \times (1000)(11.7)^2$$
$$= 2.27 \times 10^4 \text{ N/m}^2$$ **Ans.**

Type 6. *Based on pressure force and its torque.*

Concept

$$p = \frac{F}{A} \quad \Rightarrow \quad F = pA$$

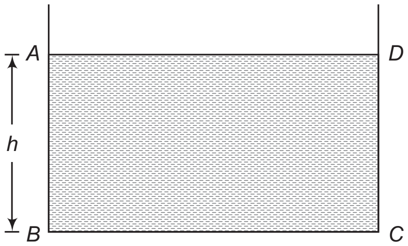
Let us call this force as the pressure force. Now, this force is calculated on a surface. If surface is horizontal then pressure is uniform at all points.

So, $F = pA$ can be applied directly. For calculation of torque, point of application of force is required. In the above case, point of application of force may be assumed at geometrical centre of the surface.

If the surface is vertical or inclined, pressure is non-uniform (it increases with depth) so pressure force and its torque can be obtained by integration. After finding force and torque by integration, we can also find point of application of this force by the relation.

$$r_\perp = \frac{\tau}{F} \qquad (\text{as } \tau = F \times r_\perp)$$

Example 14 *A liquid of density ρ is filled upto a height of 'h' in a container as shown in figure. Base of the container is a square of side L. Ignoring the atmospheric pressure find*



(a) pressure force F_1 on its base.

(b) torque of force F_1 about an axis passing through C and perpendicular to plane of paper.

(c) pressure force F_2 on the vertical side wall DC.

(d) torque of force F_2 about the same axis mentioned in part (b).

(e) point of application of force F_2.

Solution (a) Base is horizontal. So, we can directly apply

$$F_1 = pA = (\rho gh)(L)(L)$$

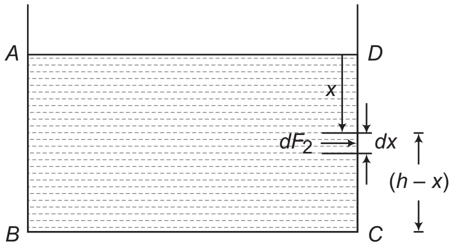
$$= \rho ghL^2 \qquad \textbf{Ans.}$$

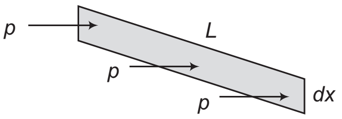
(b) Point of application of F_1 is at geometrical centre of base or at a perpendicular distance $\frac{L}{2}$ from the axis mentioned in the question.

$$\therefore \qquad \tau_{F_1} = F_1 \times r_\perp = (\rho ghL^2)\left(\frac{L}{2}\right)$$

$$= \frac{1}{2}\rho gh L^3 \qquad \textbf{Ans.}$$

(c) and (d) : Side wall is vertical. Pressure is non-uniform. So, force and torque both will be obtained by integration.





Pressure at depth x,

$$p = \rho gx$$

Area of small element shown in figure is

$$dA = L\,(dx)$$

$$\therefore \qquad dF_2 = (p)(dA) = (\rho gx)(L\,dx)$$

Perpendicular distance of this small force dF_2 from the axis mentioned in the question is $(h - x)$. Therefore, small torque of force dF_2 is

$$d\tau = (dF_2)(h - x)$$

$$= (\rho gx)(h - x)(L\,dx)$$

Now, $$F_2 = \int_{x=0}^{x=h} dF_2$$

and $$\tau_{F_2} = \int_{x=0}^{x=h} d\tau$$

Substituting the values and then integrating, we get

$$F_2 = \frac{\rho gLh^2}{2}$$

and $$\tau_{F_2} = \frac{\rho gLh^3}{6}$$

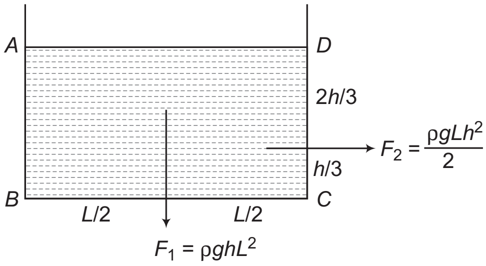
(e) For point of application of F_2, we can apply

$$r_\perp = \frac{\tau_{F_2}}{F_2} \qquad \text{(from } C\text{)}$$

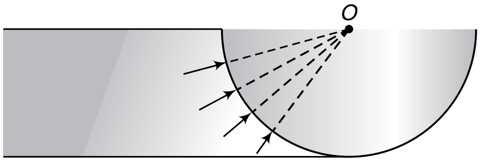
$$= \frac{(\rho gLh^3/6)}{(\rho gh^2L/2)} = \frac{h}{3}$$

Note that point of application of F_2 is below the centre, as pressure is not uniform. It is increasing with depth.

F_1 and F_2 and their points of application are shown in figure below.



Note



In the figure shown, torque of hydrostatic force about point O, the centre of a semicylindrical (or hemispherical) gate is zero as the hydrostatic force at all points passes through point O.

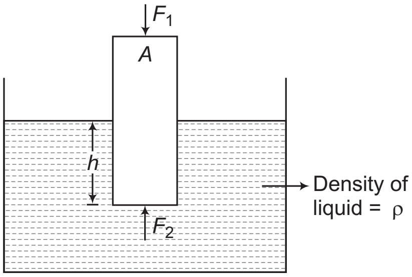
Type 7. *Based on the concept of pressure force and upthrust.*

Concept

(i) Pressure in a fluid (gas or a liquid) increases with depth. At a height (or depth) difference of h change in pressure is $\Delta p = \pm \rho g h$.

Here, ρ is the density of fluid. Now, density of air is almost negligible, so for small height differences it is almost constant $(= p_0)$. Therefore, value of atmospheric pressure is almost same everywhere. But this is not the case with a liquid, whose density is not negligible.

(ii) If a solid is floating in a liquid then net pressure force (including $p_0 A$) on this solid is upwards. This force is called upthrust and this is numerically equal to $V_i \rho_l g$ and in equilibrium this is equal to weight of the solid.

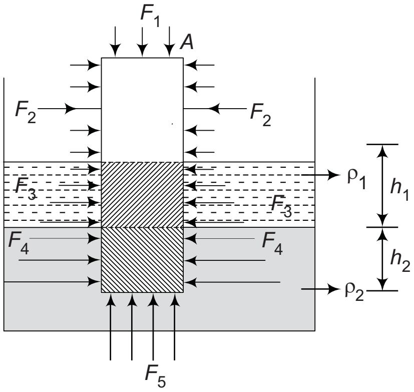


A plank of area of cross-section A is floating in a liquid of density ρ as shown in figure.

Net upward pressure force $= F_2 - F_1 = p_2 A - p_1 A$

$$= (p_0 + \rho gh) - p_0 A$$
$$= (hA)\rho g$$
$$= V_i \rho g \qquad (hA = \text{immersed volume})$$
$$= \text{upthrust}$$
$$= \text{weight of plank in equilibrium}$$

(iii) In some cases when a plank floats in two or more than two liquids then net force by a liquid on a plank is zero but immersed volume of plank on this liquid contributes in the upthrust.



A plank of area of cross-section A is floating in two liquids. h_1 height of the plank is immersed in first liquid and h_2 height in second liquid. Atmospheric pressures is constant at small height differences. So F_1 and F_2 forces shown in the figure can be obtained directly (= pressure × area). Inside the liquids pressure increases with depth. So, F_3 and F_4 will be obtained by integration as they are acting on vertical surfaces.

F_5 is acting on a horizontal surface so this force can also be obtained directly.

In the above figure

Net force on the plank by atmosphere $= F_1 = p_0 A$

Net force on the plank by liquid -1 = 0

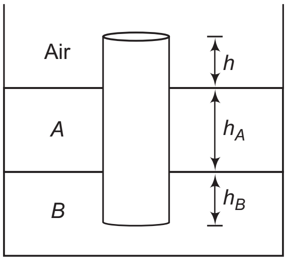
Net force on the plank by liquid - 2 $= F_5 = pA = (p_0 + \rho_1 gh_1 + \rho_2 gh_2) A$

Net upthrust pressure force on the plank $= F_5 - F_1$

$$= (h_1 A)\rho_1 g + (h_2 A)\rho_2 g$$
$$= (V_i)_1 \rho_1 g + (V_i)_2 \rho_2 g \qquad (V_i = \text{immersed volume})$$
$$= U_1 + U_2 \qquad (U = \text{upthrust})$$
$$= U_{\text{total}}$$
$$= \text{Weight of plank in equilibrium.}$$

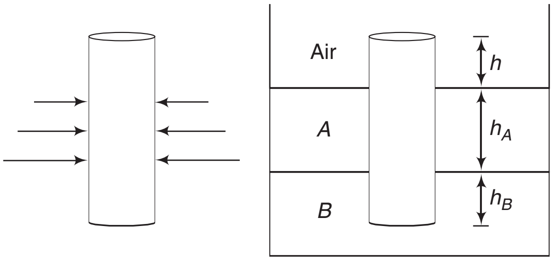
In this case, we can see that net force on plank by liquid-1 is zero, but immersed volume of plank in liquid-1 contributes in the upthrust $(= U_1)$.

Example 15 *A uniform solid cylinder of density* $0.8\ g/cm^3$ *floats in equilibrium in a combination of two non-mixing liquids A and B with its axis vertical. The densities of the liquids A and B are* $0.7\ g/cm^3$ *and* $1.2\ g/cm^3$*, respectively. The height of liquid A is* $h_A = 1.2$ *cm. The length of the part of the cylinder immersed in liquid B is* $h_B = 0.8$ *cm.* **(JEE 2002)**



(a) *Find the total force exerted by liquid A on the cylinder.*
(b) *Find h, the length of the part of the cylinder in air.*
(c) *The cylinder is depressed in such a way that its top surface is just below the upper surface of liquid A and is then released. Find the acceleration of the cylinder immediately after it is released.*

Solution (a) Liquid A is applying the hydrostatic force on cylinder uniformly from all the sides. So, net force is zero.



(b) In equilibrium

Weight of cylinder = Net upthrust on the cylinder

Let s be the area of cross-section of the cylinder, then

$$\text{weight} = (s)\,(h + h_A + h_B)\,\rho_{\text{cylinder}}\,g$$

and upthrust on the cylinder

$$= \text{upthrust due to liquid } A + \text{ upthrust due to liquid } B$$
$$= sh_A\rho_A g + sh_B\rho_B g$$

Equating these two,

$$s\,(h + h_A + h_B)\,\rho_{\text{cylinder}}\,g = sg(h_A\rho_A + h_B\rho_B)$$

or
$$(h + h_A + h_B)\,\rho_{\text{cylinder}} = h_A\rho_A + h_B\rho_B$$

Substituting,

$$h_A = 1.2 \text{ cm}, h_B = 0.8 \text{ cm and } \rho_A = 0.7 \text{ g/cm}^3$$
$$\rho_B = 1.2 \text{ g/cm}^3 \text{ and } \rho_{\text{cylinder}} = 0.8 \text{ g/cm}^3$$

In the above equation, we get $h = 0.25$ cm **Ans.**

(c) $$\text{Net upward force} = \text{extra upthrust} = sh\rho_B g$$

$\therefore$ $$\text{Net acceleration } a = \frac{\text{Force}}{\text{mass of cylinder}}$$

or $$a = \frac{sh\rho_B g}{s(h + h_A + h_B)\,\rho_{\text{cylinder}}}$$

or $$a = \frac{h\rho_B g}{(h + h_A + h_B)\,\rho_{\text{cylinder}}}$$

Substituting the values of h, h_A h_B, ρ_B and ρ_{cylinder},

we get, $$a = \frac{g}{6} \qquad \text{(upwards)}$$

Type 8. *Based on surface tension force.*

Concept

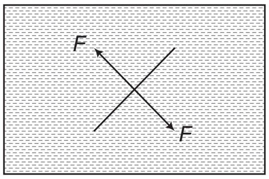
Surface tension is given by

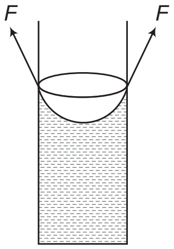
$$T = \frac{F}{l}$$

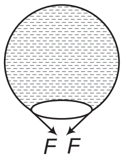
$\therefore$ Surface tension force, $F = Tl$

This force acts only on a line on free surface of the liquid. This force has a tendency to decrease the free surface of the liquid.

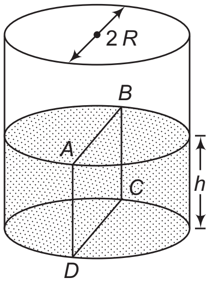
Following are given some figures for the direction of this force.







Example 16 Water is filled up to a height h in a beaker of radius R as shown in the figure. The density of water is ρ, the surface tension of water is T and the atmospheric pressure is p_0. Consider a vertical section $ABCD$ of the water column through a diameter of the beaker. The force on water on one side of this section by water on the other side of this section has magnitude **(JEE 2007)**



(a) $|2p_0Rh + \pi R^2\rho gh - 2RT|$

(b) $|2p_0Rh + R\rho gh^2 - 2RT|$

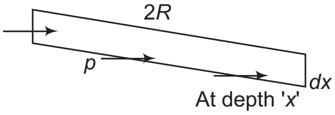
(c) $|p_0\pi R^2 + R\rho gh^2 - 2RT|$

(d) $|p_0\pi R^2 + R\rho gh^2 + 2RT|$

Solution Force from right hand side liquid on left hand side liquid.

(i) Due to surface tension force $= 2RT$ (towards right)

(ii) Due to liquid pressure force



$$= \int_{x=0}^{x=h} (p_0 + \rho g x)(2R \cdot dx)$$

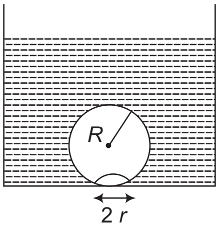
$$= (2p_0Rh + R\rho gh^2) \qquad \text{(towards left)}$$

$\therefore$ Net force is $|2p_0Rh + R\rho gh^2 - 2RT|$

$\therefore$ The correct option is (b).

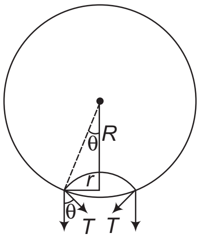
Example 17 *On heating water, bubbles beings formed at the bottom of the vessel detach and rise. Take the bubbles to be spheres of radius R and making a circular contact of radius r with the bottom of the vessel. If r <<R and the surface tension of water is T, value of r just before bubbles detach is (density of water is ρ_w)*

(JEE 2012 Main)



(a) $R^2\sqrt{\dfrac{\rho_w g}{3T}}$ (b) $R^2\sqrt{\dfrac{\rho_w g}{6T}}$ (c) $R^2\sqrt{\dfrac{\rho_w g}{T}}$ (d) $R^2\sqrt{\dfrac{3\rho_w g}{T}}$

Solution The bubble will detach if,



Buoyant force ≥ Surface tension force

$$\frac{4}{3}\pi R^3 \rho_w g \geq \int T \times dl \sin\theta$$

$$(\rho_w)\left(\frac{4}{3}\pi R^3\right) g \geq (T)(2\pi r)\sin\theta$$

Here, $\sin\theta = \dfrac{r}{R}$

Solving, $r = \sqrt{\dfrac{2\rho_w R^4 g}{3T}} = R^2\sqrt{\dfrac{2\rho_w g}{3T}}$

No option matches with the correct answer.

Passage (Ex. 18 to 20)

When liquid medicine of density ρ is to be put in the eye, it is done with the help of a dropper. As the bulb on the top of the dropper is pressed, a drop forms at the opening of the dropper. We wish to estimate the size of the drop.

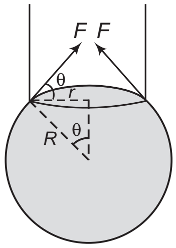
We first assume that the drop formed at the opening is spherical because that requires a minimum increase in its surface energy. To determine the size, we calculate the net vertical force due to the surface tension T when the radius of the drop is R. When this force becomes smaller than the weight of the drop, the drop gets detached from the dropper.

Example 18 *If the radius of the opening of the dropper is r, the vertical force due to the surface tension on the drop of radius R (assuming r << R) is*

(a) $2\pi rT$ (b) $2\pi RT$

(c) $\frac{2\pi r^2 T}{R}$ (d) $\frac{2\pi R^2 T}{r}$

Solution Vertical force due to surface tension,



$$F_v = F\sin\theta$$
$$= (T)(2\pi r)(r/R)$$
$$= \frac{2\pi r^2 T}{R}$$

∴ Correct option is (c).

Example 19 *If* $r = 5\times10^{-4}\ m, \rho = 10^3\ kg\ m^{-3}, g = 10\ ms^{-2}$, $T = 0.11\ Nm^{-1}$, *the radius of the drop when it detaches from the dropper is approximately*

(a) $1.4\times10^{-3}\ m$ (b) $3.3\times10^{-3}\ m$

(c) $2.0\times10^{-3}\ m$ (d) $4.1\times10^{-3}\ m$

Solution $\frac{2\pi r^2 T}{R} = mg = \frac{4}{3}\pi R^3\cdot\rho\cdot g$

$$\therefore \quad R^4 = \frac{3r^2T}{2\rho g} = \frac{3\times(5\times10^{-4})^2(0.11)}{2\times10^3\times10}$$
$$= 4.125\times10^{-12}\ \text{m}^4$$
$$\therefore \quad R = 1.425\times10^{-3}\text{m}$$
$$\approx 1.4\times10^{-3}\text{m}$$

∴ Correct option is (a).

Example 20 *After the drop detaches, its surface energy is*

(a) $1.4\times10^{-6}\ J$ (b) $2.7\times10^{-6}\ J$ (c) $5.4\times10^{-6}\ J$ (d) $8.1\times10^{-9}\ J$

Solution Surface energy,

$$E = (4\pi R^2)\,T$$
$$= (4\pi)(1.4\times10^{-3})^2(0.11)$$
$$= 2.7\times10^{-6}\text{J}$$

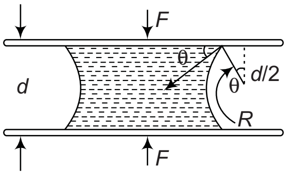
∴ Correct option is (b).

Type 9. *Based on force between two glass plates.*

Concept

When a small drop of water is placed between two glass plates put face to face, it forms a thin cylindrical film which is concave outward along its boundary. In article 16.9, we have seen that pressure difference on two sides of a cylindrical surface is

$$\Delta p = \frac{T}{R} \qquad \text{...(i)}$$



If d be the distance between the two plates and θ the angle of contact for water and glass, then, from the figure, $\cos\theta = \frac{\frac{1}{2}d}{R}$ or $\frac{1}{R} = \frac{2\cos\theta}{d}$.

Substituting for $\frac{1}{R}$ in Eq. (i), we get $\Delta p = \frac{2T}{d}\cos\theta$.

Angle θ can be taken zero for water and glass, i.e. $\cos\theta = 1$. Thus, the upper plate is pressed downward by the atmospheric pressure minus $\frac{2T}{d}$. Hence, the resultant downward pressure acting on the upper plate is $\frac{2T}{d}$. If A be the area of plate wetted by the film, the resultant force F pressing the upper plate downward is given by

$$F = \text{resultant pressure} \times \text{area} = \frac{2TA}{d}.$$

Example 21 *A drop of water of volume* $0.05\ cm^3$ *is pressed between two glass plates, as a consequence of which, it spreads and occupies an area of* $40\ cm^2$. *If the surface tension of water is 70 dyne/cm, find the normal force required to separate out the two glass plates in newton.*

Solution We have discussed above,

$$F = \frac{2AT}{d} = \frac{2A^2T}{Ad}$$

But, $Ad = \text{volume}$

$$\therefore \qquad F = \frac{2A^2T}{V}$$

Substituting the values we get,

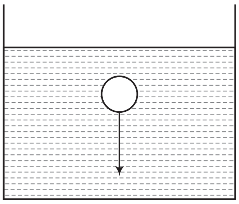
$$F = \frac{2 \times (40 \times 10^{-4})^2 \times (70 \times 10^{-3})}{0.05 \times 10^{-6}}$$

$$= 45\ \text{N}$$

Ans.

Miscellaneous Examples

Example 22 *A ball of volume V and density* ρ_1 *is moved downwards by a distance 'd' in liquid of density* ρ_2*. Find total change in potential energy of the system.*



Solution Decrease in potential energy of the ball.

$$= m_1 gh \qquad (m_1 = \text{mass of ball})$$

$$= (V\rho_1)\, gd$$

or
$$\Delta U_1 = -V\rho_1\, gd$$

When V volume of solid comes down, then it is replaced by V volume of liquid.

$\therefore$ Increase in potential energy of liquid :

$$= m_2 gh \qquad (m_2 = \text{mass of liquid of volume } V)$$

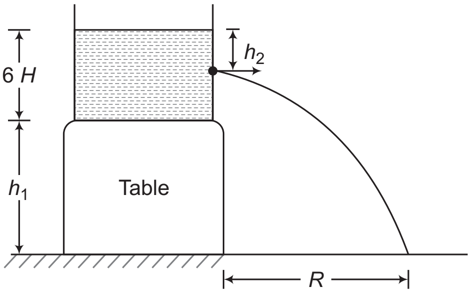
$$= (V\rho_2)\, gd$$

$\therefore$
$$\Delta U_2 = +V\rho_2 gd$$

Total change in potential energy,

$$\Delta U = \Delta U_1 + \Delta U_2 = V(\rho_2 - \rho_1)\, gd \qquad \textbf{Ans.}$$

Example 23 *In the figure shown find the value of* h_2 *for maximum range R if*



(a) $h_1 = 4H$ (b) $h_1 = 8H$

Also find the value of this maximum range in both cases.

Solution (a) $h_1 + 6H = 4H + 6H = 10H = h$ (say)

Maximum range will be obtained from

$$h_2 = \frac{h}{2} = 5H \qquad \textbf{Ans.}$$

and this maximum range will be,

$$R_{\max} = h = 10\,H \qquad \textbf{Ans.}$$

(b) In this case,

$$h = h_1 + 6H = 8H + 6H = 14H$$

$\frac{h}{2}$ or $7H$ point lies on the table. So, maximum range will be obtained from the bottommost point of the liquid container or $h_2 = 6H$ **Ans.**

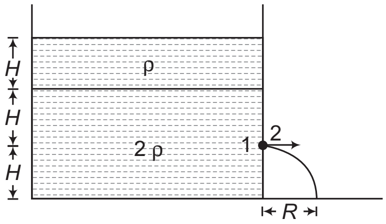
and this maximum range will be

$$R = 2\sqrt{h_2(h - h_2)}$$

$$= 2\sqrt{6H \times 8H} = 8\sqrt{3}H \qquad \textbf{Ans.}$$

Note *From top to centre range first increases and then from centre to bottom range then decreases. Therefore, in the second case range will be maximum from bottommost point of the liquid container.*

Example 24 *In the figure shown,*



find the range R.

Solution Applying Bernoulli's equation at points 1 and 2.

$$p_1 + \frac{1}{2}(2\rho)\,v_1^2 + (2\rho)\,gh_1 = p_2 + \frac{1}{2}(2\rho)\,v_2^2 + (2\rho)\,gh_2$$

Here, $v_1 \approx 0,\ v_2 = v,\ h_1 = h_2,\ p_2 = p_0$

and $p_1 = p_0 + \rho\,gH + 2\rho gH$

$$= p_0 + 3\rho gH$$

Substituting in the above equation we have,

$$p_0 + 3\rho gH = p_0 + \rho\,v^2$$

$\therefore$ $v = \sqrt{3\,gH}$

Now, this velocity is horizontal. So, time taken by the liquid to fall to the ground is free fall time or

$$t = \sqrt{\frac{2h}{g}} \qquad \text{(where, } h = H\text{)}$$

or

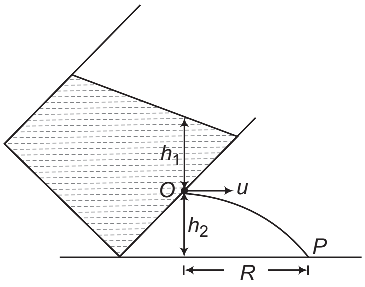
$$t = \sqrt{\frac{2H}{g}}$$

$\therefore$

$$R = vt = (\sqrt{3gH})\left(\sqrt{\frac{2H}{g}}\right)$$

$$= \sqrt{6}H \qquad \textbf{Ans.}$$

Example 25 *In the figure shown*



find v, t_{op} *and* R.

Solution $v = \sqrt{2 \times g \times \text{distance of orifice from top surface of liquid}}$ **Ans.**

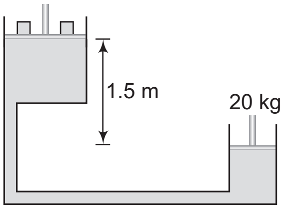
$$= \sqrt{2gh_1}$$

$$t_{op} = \text{free fall time} \qquad \text{(as } v \text{ is horizontal)}$$

$$= \sqrt{\frac{2h_2}{g}} \qquad \text{(where, } h_2 = \text{free fall height)}$$

$$R = v\,t_{op} = (\sqrt{2gh_1})\left(\sqrt{\frac{2h_2}{g}}\right) = 2\sqrt{h_1 h_2}$$ **Ans.**

Example 26 *Figure shows a hydraulic press with the larger piston of diameter 35 cm at a height of 1.5 m relative to the smaller piston of diameter 10 cm. The mass on the smaller piston is 20 kg. What is the force exerted on the load by the larger piston? The density of oil in the press is 750 kg/m*^{3}. *(Take* $g = 9.8\ m/s^2$*)*



Solution Pressure on the smaller piston $= \dfrac{20 \times 9.8}{\pi \times (5 \times 10^{-2})^2}$ N/m^2

Pressure on the larger piston $= \dfrac{F}{\pi \times (17.5 \times 10^{-2})^2}$ N/m^2

The difference between the two pressures $= h\rho g$

where $h = 1.5$ m

and $\rho = 750$ kg/m^3

Thus, $$\frac{20 \times 9.8}{\pi \times (5 \times 10^{-2})^2} - \frac{F}{\pi \times (17.5 \times 10^{-2})^2} = 1.5 \times 750 \times 9.8$$

which gives, $F = 1.3 \times 10^3$ N **Ans.**

Note *Atmospheric pressure is common to both pistons and has been ignored.*

Example 27 *A glass full of water upto a height of* 10 *cm has a bottom of area* 10 cm^2*, top of area* 30 cm^2 *and volume* 1 *litre.*

(a) Find the force exerted by the water on the bottom.

(b) Find the resultant force exerted by the sides of the glass on the water.

(c) If the glass is covered by a jar and the air inside the jar is completely pumped out, what will be the answers to parts (a) and (b).

(d) If a glass of different shape is used, provided the height, the bottom area, the top area and the volume are unchanged, will the answers to parts (a) and (b) change.

Take $g = 10\ m/s^2$*, density of water* $= 10^3\ kg/m^3$ *and atmospheric pressure* $= 1.01 \times 10^5\ N/m^2$

Solution (a) Force exerted by the water on the bottom

$$F_1 = (p_0 + \rho g h)A_1 \quad \text{...(i)}$$

Here, p_0 = atmospheric pressure $= 1.01 \times 10^5$ N/m^2

ρ = density of water $= 10^3$ k/gm^3

$g = 10$ m/s^2, $h = 10$ cm $= 0.1$ m

and A_1 = area of base $= 10$ cm^2 $= 10^{-3}$ m^2

Substituting in Eq. (i), we get

$$F_1 = (1.01 \times 10^5 + 10^3 \times 10 \times 0.1) \times 10^{-3}$$

or $F_1 = 102$ N (downwards) **Ans.**

(b) Force exerted by atmosphere on water

$$F_2 = (p_0)A_2$$

Here, A_2 = area of top $= 30$ cm^2 $= 3 \times 10^{-3}$ m^2

∴ $F_2 = (1.01 \times 10^5)(3 \times 10^{-3})$

$= 303$ N (downwards)

Force exerted by bottom on the water

$$F_3 = -F_1 \quad \text{or} \quad F_3 = 102 \text{ N (upwards)}$$

weight of water W = (volume)(density)(g) $= (10^{-3})(10^3)(10)$

$= 10$ N (downwards)

Let F be the force exerted by side walls on the water (upwards). Then, for equilibrium of water

Net upward force = net downward force

or $F + F_3 = F_2 + W$

∴ $F = F_2 + W - F_3 = 303 + 10 - 102$

or $F = 211$ N (upwards) **Ans.**

(c) If the air inside the jar is completely pumped out,

$F_1 = (\rho g h)A_1$ (as $p_0 = 0$)

$= (10^3)(10)(0.1)(10^{-3}) = 1$ N (downwards) **Ans.**

In this case, $F_2 = 0$

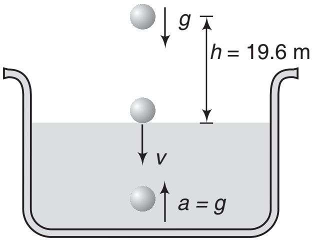
and $F_3 = 1$ N (upwards)

∴ $F = F_2 + W - F_3 = 0 + 10 - 1 = 9$ N (upwards) **Ans.**

(d) No, the answer will remain the same. Because the answers depend upon p_0, ρ, g, h, A_1 and A_2

Example 28 *A solid ball of density half that of water falls freely under gravity from a height of* 19.6 *m and then enters water. Upto what depth will the ball go. How much time will it take to come again to the water surface ? Neglect air resistance and viscosity effects in water. (Take* $g = 9.8\ m/s^2$*)*

Solution $v = \sqrt{2gh} = \sqrt{2 \times 9.8 \times 19.6} = 19.6\ \text{m/s}$



Let ρ be the density of ball and 2ρ the density of water. Net retardation inside the water,

$$a = \frac{\text{upthrust} - \text{weight}}{\text{mass}}$$

$$= \frac{V(2\rho)g - V(\rho)(g)}{V(\rho)}$$

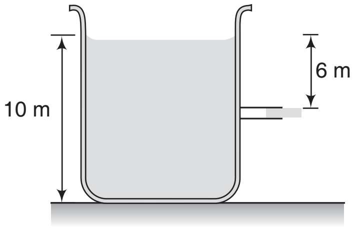
$$= g = 9.8\ \text{m/s}^2$$

Hence, the ball will go upto the same depth 19.6 m below the water surface. **Ans.**

Further, time taken by the ball to come back to water surface is,

$$t = 2\left(\frac{v}{a}\right) = 2\left(\frac{19.6}{9.8}\right) = 4\ \text{s}$$ **Ans.**

Example 29 *A fresh water on a reservoir is* 10 *m deep. A horizontal pipe* 4.0 *cm in diameter passes through the reservoir* 6.0 *m below the water surface as shown in figure. A plug secures the pipe opening.*



(a) Find the friction force between the plug and pipe wall.

(b) The plug is removed. What volume of water flows out of the pipe in 1 *h? Assume area of reservoir to be too large.*

Solution (a) Force of friction

= pressure difference on the sides of the plug × area of cross section of the plug

$= (\rho g h) A$

$= (10^3)(9.8)(6.0)(\pi)(2 \times 10^{-2})^2$

$= 73.9\ \text{N}$ **Ans.**

(b) Assuming the area of the reservoir to be too large,

Velocity of efflux

$$v = \sqrt{2gh} = \text{constant}$$

$$\therefore \qquad v = \sqrt{2 \times 9.8 \times 6} = 10.84 \text{ m/s}$$

Volume of water coming out per sec,

$$\frac{dV}{dt} = Av$$

$$= \pi (2 \times 10^{-2})^2 (10.84)$$

$$= 1.36 \times 10^{-2} \text{ m}^3/\text{s}$$

∴ The volume of water flowing through the pipe in 1 h

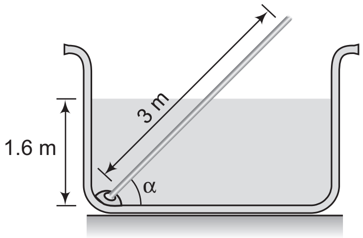
$$V = \left(\frac{dV}{dt}\right) t$$

$$= (1.36 \times 10^{-2})(3600)$$

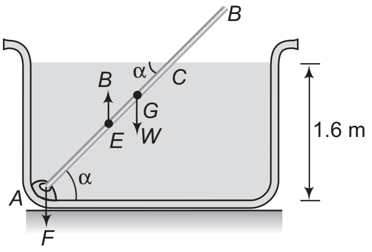
$$= 48.96 \text{ m}^3$$

Ans.

Example 30 *A wooden rod weighing 25 N is mounted on a hinge below the free surface of water as shown. The rod is 3 m long and uniform in cross section and the support is 1.6 m below the free surface. At what angle α rod is in equilibrium? The cross-section of the rod is $9.5 \times 10^{-4}\ m^2$ in area. Density of water is $1000\ kg/m^3$. Assume buoyancy to act at centre of immersion. $g = 9.8\ m/s^2$. Also find the reaction on the hinge in this position.*



Solution Let G be the mid-point of AB and E the mid point of AC (i.e. the centre of buoyancy)



$$AC = 1.6 \operatorname{cosec} \alpha$$

$$\text{Volume of } AC = (1.6 \times 9.5 \times 10^{-4}) \operatorname{cosec} \alpha$$

Weight of water displaced by AC

$$= (1.6 \times 9.5 \times 10^{-4} \times 10^3 \times 9.8) \operatorname{cosec} \alpha$$

$$= 14.896 \operatorname{cosec} \alpha$$

Hence, the buoyant force is 14.896 cosec α acting vertically upwards at E. While the weight of the rod is 25 N acting vertically downwards at G. Taking moments about A,

$$(14.896 \operatorname{cosec}\alpha)\,(AE\cos\alpha) = (25)(AG\cos\alpha)$$

or $$(14.896 \operatorname{cosec}\alpha)\left(\frac{1.6 \operatorname{cosec}\alpha}{2}\right) = 25 \times \frac{3}{2}$$

or $$\sin^2\alpha = 0.32$$

∴ $$\sin\alpha = 0.56$$

or $$\alpha = 34.3°$$ **Ans.**

Further, let F be the reaction at hinge in vertically downward direction. Then, considering the translatory equilibrium of rod in vertical direction we have,

$$F + \text{weight of the rod} = \text{upthrust}$$

∴ $$F = \text{upthrust} - \text{weight of the rod}$$

$$= 14.896 \operatorname{cosec}(34.3°) - 25$$

$$= 26.6 - 25$$

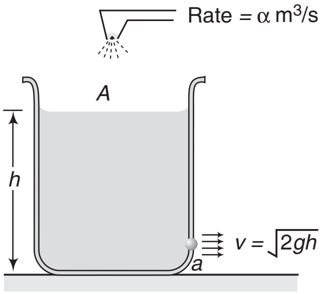
∴ $$F = 1.6\text{ N} \quad \text{(downwards)}$$ **Ans.**

Example 31 *A cylindrical tank of base area A has a small hole of area a at the bottom. At time $t = 0$, a tap starts to supply water into the tank at a constant rate $\alpha\ m^3/s$.*

(a) what is the maximum level of water $h_{\max}$ in the tank?

(b) find the time when level of water becomes h ($< h_{\max}$).

Solution (a) Level will be maximum when



Rate of inflow of water = rate of outflow of water

i.e. $$\alpha = av$$

or $$\alpha = a\sqrt{2gh_{\max}}$$

⇒ $$h_{\max} = \frac{\alpha^2}{2ga^2}$$ **Ans.**

(b) Let at time t, the level of water be h. Then,

$$A\left(\frac{dh}{dt}\right) = \alpha - a\sqrt{2gh} \quad \text{or} \quad \int_0^h \frac{dh}{\alpha - a\sqrt{2gh}} = \int_0^t \frac{dt}{A}$$

Solving this, we get

$$t = \frac{A}{ag}\left[\frac{\alpha}{a}\ln\left\{\frac{\alpha - a\sqrt{2gh}}{\alpha}\right\} - \sqrt{2gh}\right]$$ **Ans.**

Exercises

LEVEL 1

Assertion and Reason

Directions : *Choose the correct option.*

(*a*) *If both **Assertion** and **Reason** are true and the **Reason** is correct explanation of the **Assertion.***

(*b*) *If both **Assertion** and **Reason** are true but **Reason** is not the correct explanation of **Assertion.***

(*c*) *If **Assertion** is true, but the **Reason** is false.*

(*d*) *If **Assertion** is false but the **Reason** is true.*

1. Assertion : Pressure is a vector quantity.

Reason : Pressure $P = \frac{F}{A}$. Here F, the force is a vector quantity.

2. Assertion : Surface tension $\left(T = \frac{F}{l}\right)$ is not a vector quantity.

Reason : Direction of force is specified.

3. Assertion : At depth h below the water surface pressure is p. Then at depth $2h$ pressure will be $2p$. (Ignore density variation).

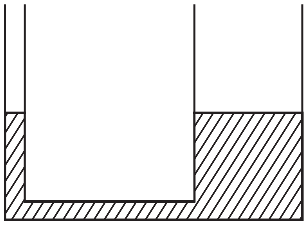
Reason : With depth pressure increases linearly.

4. Assertion : Weight of solid in air is w and in water is $\frac{2w}{3}$. Then relative density of solid is 3.0.

Reason : Relative density of any solid is given by

$$\text{RD} = \frac{\text{Weight in air}}{\text{Change in weight in water}}$$

5. Assertion : Water is filled in a U-tube of different cross-sectional area on two sides as shown in figure. Now equal amount of oil $(RD = 0.5)$ is poured on two sides. Level of water on both sides will remain unchanged.

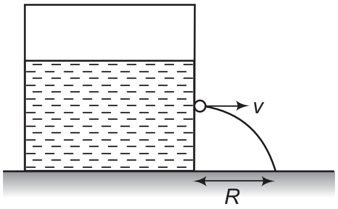


Reason : Same weight of oil poured on two sides will produce different pressures.

6. Assertion : An ideal fluid is flowing through a pipe. Speed of fluid particles is more at places where pressure is low.

Reason : Bernoulli's theorem can be derived from work-energy theorem.

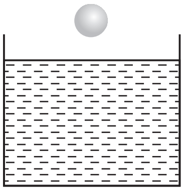
7. **Assertion :** In the figure shown v and R will increase if pressure above the liquid surface inside the chamber is increased.



Reason : Value of v or R is independent of density of liquid.

8. **Assertion :** A ball is dropped from a certain height above the free surface of an ideal fluid. When the ball enters the liquid it may accelerate or retard.

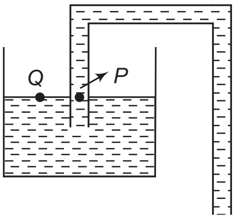
Reason : Ball accelerates or retards it all depends on the density of ball and the density of liquid.



9. **Assertion :** On moon, barometer height will be six times compared to the height on earth.

Reason : Value of g on moon's surface is $\frac{1}{6}$ the value of g on earth's surface.

10. **Assertion :** In the siphon shown in figure, pressure at P is equal to atmospheric pressure.



Reason : Pressure at Q is atmospheric pressure and points P and Q are at same levels.

11. **Assertion :** Force of buoyancy due to atmosphere on a small body is almost zero (or negligible).

Reason : If a body is completely submerged in a fluid, then buoyant force is zero.

Objective Questions

Single Correct Option

1. When a sphere falling in a viscous fluid attains a terminal velocity, then
   (a) the net force acting on the sphere is zero
   (b) the drag force balances the buoyant force
   (c) the drag force balances the weight of the sphere
   (d) the buoyant force balances the weight and drag force

2. Which one of the following represents the correct dimensions of the quantity : $x = \frac{\eta}{\rho}$, where $\eta =$ coefficient of viscosity and $\rho =$ the density of a liquid?

(a) $[ML^{-2}T^{-1}]$ (b) $[ML^{-4}T^{-2}]$

(c) $[ML^{-5}T^{-2}]$ (d) $[M^0L^2T^{-1}]$

3. Viscosity of liquids

(a) increases with increase in temperature

(b) is independent of temperature

(c) decreases with decrease in temperature

(d) decreases with increase in temperature

4. At critical temperature, the surface tension of a liquid

(a) is zero

(b) is infinity

(c) is same as that at any other temperature

(d) cannot be determined

5. A liquid will not wet the surface of a solid if the angle of contact is

(a) 0° (b) 45°

(c) 60° (d) >90°

6. The lower end of a capillary tube touches a liquid whose angle of contact is 110°,the liquid

(a) rises into the tube

(b) falls in the tube

(c) may rise or fall inside

(d) neither rises nor falls inside the tube

7. Two water droplets combine to form a large drop. In this process energy is

(a) liberated

(b) absorbed

(c) neither liberated nor absorbed

(d) sometimes liberated and sometimes absorbed

8. A number of small drops of mercury adiabatically coalesce to form a single drop. The temperature of the drop will

(a) increase (b) remain same

(c) decrease (d) depend on size

9. Two soap bubbles in vacuum of radius 3 cm and 4 cm coalesce to form a single bubble under isothermal conditions. Then the radius of bigger bubble is

(a) 7 cm (b) $\frac{12}{7}$ cm

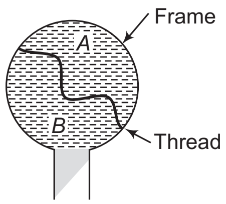
(c) 12 cm (d) 5 cm

10. A small ball (mass m) falling under gravity in a viscous medium experiences a drag force proportional to the instantaneous speed u such that $F_{\text{drag}} = ku$. Then the terminal speed of ball within viscous medium is

(a) $\frac{k}{mg}$ (b) $\frac{mg}{k}$

(c) $\sqrt{\frac{mg}{k}}$ (d) None of these

11. A thread is tied slightly loose to a wire frame as in figure and the frame is dipped into a soap solution and taken out. The frame is completely covered with the film. When the portion *A* is punctured with a pin, the thread



(a) becomes concave towards *A*
(b) becomes convex towards *A*
(c) either (a) or (b) depending on the size of *A* with respect to *B*
(d) remains in the initial position

12. A steel ball of mass m falls in a viscous liquid with terminal velocity v, then the steel ball of mass 8 m will fall in the same liquid with terminal velocity

(a) v (b) $4v$ (c) $8v$ (d) $16\sqrt{2}v$

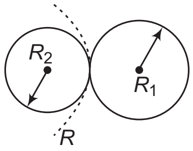
13. A liquid flows between two parallel plates along the x-axis. The difference between the velocity of two layers separated by the distance dy is dv. If A is the area of each plate, then Newton's law of viscosity may be written as

(a) $F = -\eta A\dfrac{dv}{dx}$ (b) $F = +\eta A\dfrac{dv}{dx}$
(c) $F = -\eta A\dfrac{dv}{dy}$ (d) $F = +\eta A\dfrac{dv}{dy}$

14. The work done to split a liquid drop of radius R into N identical drops is (take σ as the surface tension of the liquid)

(a) $4\pi R^2(N^{1/3}-1)\,\sigma$ (b) $4\pi R^2 N\sigma$
(c) $4\pi R^2(N^{1/2}-1)$ (d) None of these

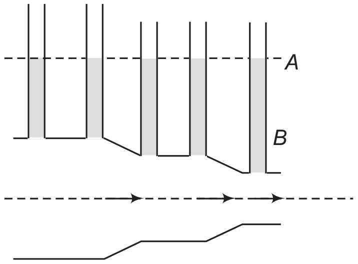
15. Two soap bubbles of different radii R_1 and $R_2(< R_1)$ coalesce to form an interface of radius R as shown in figure. The correct value of R is



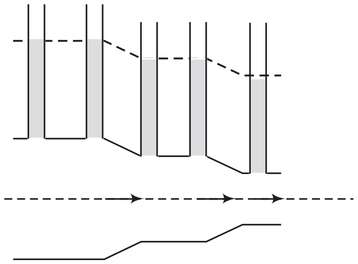
(a) $R = R_1 - R_2$ (b) $R = \dfrac{R_1 + R_2}{2}$
(c) $\dfrac{1}{R} = \dfrac{1}{R_2} - \dfrac{1}{R_1}$ (d) $\dfrac{1}{R} = \dfrac{1}{R_1} + \dfrac{1}{R_2}$

16. A viscous liquid flows through a horizontal pipe of varying cross-sectional area. Identify the option which correctly represents the variation of height of rise of liquid in each vertical tube

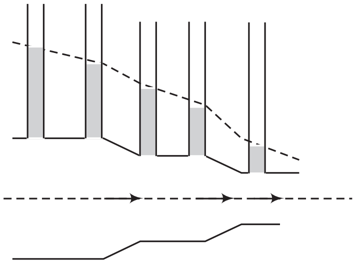
(a)



(b)



(c)



(d) None of these

17. The terminal velocity of a rain drop is 30 cm/s. If the viscosity of air is 1.8×10^{-5} Nsm^{-2}. The radius of rain drop is

(a) 1 μm
(b) 0.5 mm
(c) 0.05 mm
(d) 1 mm

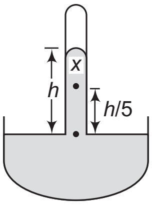
18. If a capillary tube is dipped and the liquid levels inside and outside the tube are same, then the angle of contact is

(a) zero
(b) 90°
(c) 45°
(d) Cannot be obtained

19. Uniform speed of 2 cm diameter ball is 20 cm/s in a viscous liquid. Then, the speed of 1 cm diameter ball in the same liquid is

(a) 5 cms^{-1}
(b) 10 cms^{-1}
(c) 40 cms^{-1}
(d) 80 cms^{-1}

20. The height of mercury barometer is h when the atmospheric pressure is 10^5 Pa.
The pressure at x in the shown diagram is



(a) 10^5 Pa
(b) 0.8×10^5 Pa
(c) 0.2×10^5 Pa
(d) 120×10^5 Pa

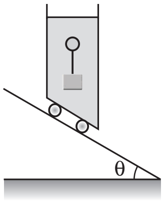
21. A body floats in water with its one-third volume above the surface. The same body floats in a liquid with one-third volume immersed. The density of the liquid is

(a) 9 times more than that of water
(b) 2 times more than that of water
(c) 3 times more than that of water
(d) 1.5 times more than that of water

22. A piece of ice is floating in a beaker containing thick sugar solution of water. As the ice melts, the total level of the liquid

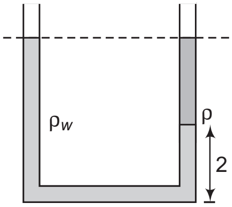
(a) increases
(b) decreases
(c) remains unchanged
(d) insufficient data

23. A body floats in completely immersed condition in water as shown in figure. As the whole system is allowed to slide down freely along the inclined surface, the magnitude of buoyant force



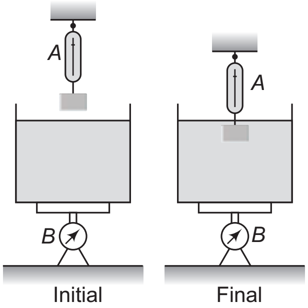
(a) remains unchanged
(b) increases
(c) decreases
(d) becomes zero

24. The figure represents a U-tube of uniform cross-section filled with two immiscible liquids. One is water with density ρ_w and the other liquid is of density ρ. The liquid interface lies 2 cm above the base. The relation between ρ and ρ_w is



(a) $\rho = \rho_w$ (b) $\rho = 1.02\,\rho_w$ (c) $\rho = 1.2\,\rho_w$ (d) None of these

25. For the arrangement shown in figure, initially the balance A and B reads F_1 and F_2 respectively and $F_1 > F_2$. Finally when the block is immersed in the liquid then the readings of balance A and B are f_1 and f_2 respectively. Identify the statement which is **not always** (where, F is some force) **correct** statement.



(a) $f_1 > f_2$
(b) $F_1 + F > F_2 + F$
(c) $f_1 + f_2 = F_1 + F_2$
(d) None of these

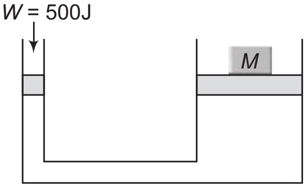
26. When a tap is closed, the manometer attached to the pipe reads 3.5×10^5 Nm^{-2}. When the tap is opened, the reading of manometer falls to 3.0×10^5 Nm^{-2}. The velocity of water in the pipe is

(a) 0.1 ms^{-1}
(b) 1 ms^{-1}
(c) 5 ms^{-1}
(d) 10 ms^{-1}

27. A balloon of mass M descends with an acceleration a_0. The mass that must be thrown out in order to give the balloon an equal upward acceleration will be

(a) $\dfrac{Ma_0}{g}$ (b) $\dfrac{2Ma_0}{g}$ (c) $\dfrac{2Ma_0}{g + a_0}$ (d) $\dfrac{M\,(g + a_0)}{a_0}$

28. The hydraulic press shown in the figure is used to raise the mass M through a height of 0.5 cm by performing 500 J of work at the small piston. The diameter of the large piston is 10 cm, while that of the smaller one is 2 cm. The mass M is



(a) 100 kg (b) 10^6 kg (c) 10^3 kg (d) None of these

29. When equal volumes of two substances are mixed, the specific gravity of the mixture is 4. When equal weights of the same substances are mixed, the specific gravity of the mixture is 3. The specific gravities of the two substances could be

(a) 6 and 2
(b) 3 and 4
(c) 2.5 and 3.5
(d) 5 and 3

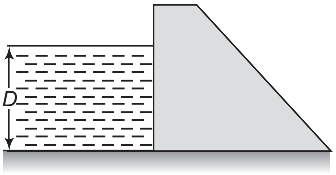
30. A block of ice of total area A and thickness 0.5 m is floating in water. In order to just support a man of mass 100 kg, the area A should be (the specific gravity of ice is 0.9)

(a) 2.2 m^2
(b) 1.0 m^2
(c) 0.5 m^2
(d) None of these

31. A piece of gold ($\rho = 19.3\ \mathrm{g/cm^3}$) has a cavity in it. It weights 38.2 g in air and 36.2 g in water. The volume of the cavity in gold is

(a) 0.2 cm^3
(b) 0.04 cm^3
(c) 0.02 cm^3
(d) 0.01 cm^3

32. Water stands at a depth D behind the vertical upstream face of a dam as shown in the figure. The force exerted on the dam by water per unit width is

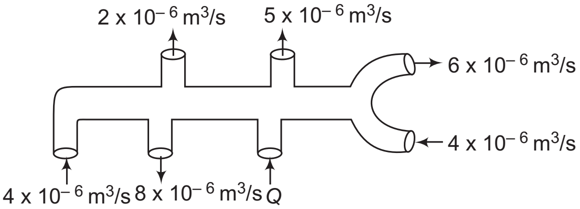


(a) $\frac{1}{3}\rho g D^2$
(b) $\frac{1}{2}\rho g D^2$
(c) $\frac{1}{3}\rho g D$
(d) $\frac{1}{2}(\rho g D)^2$

33. The volume of a liquid flowing per second out of an orifice at the bottom of a tank does not depend upon

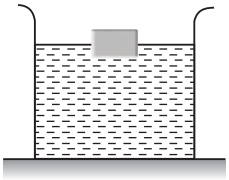
(a) the height of the liquid above the orifice
(b) the acceleration due to gravity
(c) the density of the liquid
(d) the area of the orifice

34. The pipe shows the volume flow rate of an ideal liquid at certain time and its direction. What is the value of Q in $\mathrm{m^3/s}$? (Assume steady state and equal area of cross section at each opening)



(a) 10×10^{-6}
(b) 11×10^{-6}
(c) 13×10^{-6}
(d) 18×10^{-6}

35. A uniform cube of mass M is floating on the surface of a liquid with three fourth of its volume immersed in the liquid (density = ρ). The length of the side of the cube is equal to



(a) $(4M/3\rho)^{2/3}$ (b) $(M/3\rho)^{2/3}$ (c) $(M/4\rho)^{2/3}$ (d) None of these

36. Water rises to a height of 10 cm in a certain capillary tube. An another identical tube when dipped in mercury the level of mercury is depressed by 3.42 cm. Density of mercury is 13.6 g/cc. The angle of contact for water in contact with glass is 0° and mercury in contact with glass is 135°. The ratio of surface tension of water to that of Hg is

(a) 1 : 3 (b) 1 : 4 (c) 1 : 5.5 (d) 1 : 6.5

37. A capillary glass tube records a rise of 20 cm when dipped in water. When the area of cross-section of the tube is reduced to half of the former value, water will rise to a height of

(a) $10\sqrt{2}$ cm (b) 10 cm (c) 20 cm (d) $20\sqrt{2}$ cm

38. A cylindrical vessel open at the top is 20 cm high and 10 cm in diameter. A circular hole of cross sectional area 1 cm^2 is cut at the centre of the bottom of the vessel. Water flows from a tube above it into the vessel at the rate of 10^2 cm^3/s. The height of water in the vessel under steady state is (Take $g = 10\ \text{m/s}^2$)

(a) 20 cm (b) 15 cm (c) 10 cm (d) 5 cm

39. A horizontal pipeline carries water in a streamline flow. At a point along the tube where the cross sectional area is 10^{-2} m^2, the water velocity is 2 m/s and the pressure is 8000 Pa. The pressure of water at another point where cross sectional area is 0.5×10^{-2} m^2 is

(a) 4000 Pa (b) 1000 Pa (c) 2000 Pa (d) 3000 Pa

40. Eight spherical rain drops of the same mass and radius are falling down with a terminal speed of 6 cms^{-1}. If they coalesce to form one big drop, what will be its terminal speed? Neglect the buoyancy due to air

(a) 1.5 cms^{-1} (b) 6 cms^{-1} (c) 24 cms^{-1} (d) 32 cms^{-1}

41. In a surface tension experiment with a capillary tube water rises upto 0.1 m. If the same experiment is repeated in an artificial satellite, which is revolving around the earth; water will rise in the capillary tube upto a height of

(a) 0.1 m (b) 0.2 m (c) 0.98 m (d) full length of tube

42. Two unequal soap bubbles are formed one on each side of a tube closed in the middle by a tap. What happens when the tap is opened to put the two bubbles in communication ?

(a) No air passes in any direction as the pressures are the same on two sides of the tap

(b) Larger bubble shrinks and smaller bubble increases in size till they become equal in size

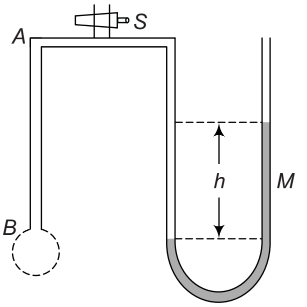
(c) Smaller bubble gradually collapses and the bigger one increases in size

(d) None of the above

43. A capillary tube of radius R is immersed in water and water rises in it to a height h. Mass of water in capillary tube is M. If the radius of the tube is doubled, mass of water that will rise in the capillary tube will be

(a) $2M$ (b) M (c) $\frac{M}{2}$ (d) $4M$

44. A tube of fine bore AB is connected to a manometer M as shown. The stop cock S controls the flow of air. AB is dipped into a liquid whose surface tension is T. On opening the stop cock for a while, a bubble is formed at B and the manometer level is recorded, showing a difference h in the levels in the two arms, if p be the density of manometer liquid and r the radius of curvature of the bubble, then the surface tension T of the liquid is given by



(a) $\rho\, hrg$ (b) $2\rho hgr$ (c) $4\rho hrg$ (d) $\frac{rh\rho g}{4}$

45. A vessel whose bottom has round holes with a diameter of $d = 0.1$ mm is filled with water. The maximum height of the water level h at which the water does not flow out, will be (The water does not wet the bottom of the vessel). [ST of water = 70 dyne/cm]

(a) $h = 24.0$ cm (b) $h = 25.0$ cm (c) $h = 26.0$ cm (d) $h = 28.0$ cm

46. A large number of liquid drops each of radius 'a' coalesce to form a single spherical drop of radius b. The energy released in the process is converted into kinetic energy of the big drop formed. The speed of big drop will be

(a) $\sqrt{\frac{6T}{\rho}\left[\frac{1}{a}-\frac{1}{b}\right]}$ (b) $\sqrt{\frac{4T}{\rho}\left[\frac{1}{a}-\frac{1}{b}\right]}$

(c) $\sqrt{\frac{8T}{\rho}\left[\frac{1}{a}-\frac{1}{b}\right]}$ (d) $\sqrt{\frac{5T}{\rho}\left[\frac{1}{a}-\frac{1}{b}\right]}$

47. A glass capillary tube (closed from top) of inner diameter 0.28 mm is lowered vertically into water in a vessel. The pressure in the capillary tube so that water level in the tube is same as that in the vessel in $\mathrm{N/m^2}$ is (surface tension of water $= 0.7\,\mathrm{N/m}$ and atmospheric pressure $= 10^5\,\mathrm{N/m^2}$)

(a) 10^3 (b) 99×10^3

(c) 100×10^3 (d) 101×10^3

48. A thin wire is bent in the form of a ring of diameter 3.0 cm. The ring is placed horizontally on the surface of soap solution and then raised up slowly. Upward force necessary to break the vertical film formed between the ring and the solution is

(a) $6\pi T$ dyne (b) $2\pi T$ dyne

(c) $4\pi T$ dyne (d) $3\pi T$ dyne

49. One end of a glass capillary tube with a radius $r = 0.05$ cm is immersed into water to a depth of $h = 2$ cm. Excess pressure required to blow an air bubble out of the lower end of the tube will be (S.T of water = 70 dyne/cm). Take $g = 980\ \mathrm{cm/s^2}$

(a) 2840 dyne/cm^2 (b) 5840 dyne/cm^2

(c) 7840 dyne/cm^2 (d) 4760 dyne/cm^2

Subjective Questions

Note *Question numbers 16, 17 and 29 are based on flow of viscous liquids. Engineering aspirants can skip those problems.*

1. A body of weight w_1 when floats in water displaces an amount of water w_2. Then $w_1 < w_2$. Is this statement true or false?

2. A weightless balloon is filled with water. What will be its apparent weight when weighed in water?

3. Two vessels A and B have same base area. Equal volumes of a liquid are poured in the two vessels to different heights h_A and $h_B (> h_A)$. In which vessel, the force on the base of vessel will be more?

4. The work done in blowing a bubble of volume V is W, then what is the work done in blowing a soap bubble of volume $2V$?

5. A man is sitting in a boat which is floating in a pond. If the man drinks some water from the pond, how will the level of water in the pond change?

6. A metal ball weighs 0.096 N . When suspended in water it has an apparent weight of 0.071 N. Find the density of the metal.

7. A block of wood has a mass of 25 g. When a 5 g metal piece with a volume of 2 cm^3 is attached to the bottom of the block, the wood barely floats in water. What is the volume V of the wood?

8. What is the minimum volume of a block of wood (density = $850\,\text{kg/m}^3$) if it is to hold a 50 kg woman entirely above the water when she stands on it ?

9. A cubical block of ice floating in water has to support a metal piece weighing 0.5 kg. What can be the minimum edge of the block so that it does not sink in water? Specific gravity of ice = 0.9.

10. When a cube of wood floats in water, 60% of its volume is submerged. When the same cube floats in an unknown fluid 85% of its volume is submerged. Find the densities of wood and the unknown fluid.

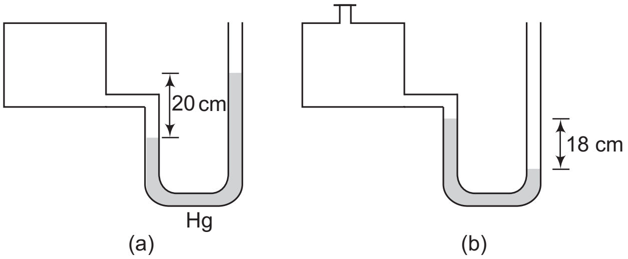
11. A glass tube of radius 0.8 cm floats vertical in water, as shown in figure. What mass of lead pellets would cause the tube to sink a further 3 cm?

12. A hydraulic automobile lift is designed to lift cars with a maximum mass of 3000 kg. The area of cross section of the piston carrying the load is $425\,\text{cm}^2$. What maximum pressure would the smaller piston have to bear?

13. A U-tube contains water and methylated spirit separated by mercury. The mercury columns in the two arms are in level with 10.0 cm of water in one arm and 12.5 cm of spirit in the other. What is the relative density of sprit?

14. In the above question, if 15.0 cm of water and spirit each are further, poured into the respective arms of the tube, what is the difference in the levels of mercury in the two arms?
(Relative density of mercury = 13.6)

15. A manometer reads the pressure of a gas in an enclosure as shown in figure (a) When some of the gas is removed by a pump, the manometer reads as in (b). The liquid used in the manometers is mercury and the atmospheric pressure is 76 cm of mercury.



(i) Give the absolute and gauge pressure of the gas in the enclosure for cases (a) and (b) in units of cm of mercury.

(ii) How would the levels change in case (b) if 13.6 cm of water are poured into the right limb of the manometer?

16. Water at 20°C is flowing in a pipe of radius 20.0 cm. The viscosity of water at 20°C is 1.005 centipoise. If the water's speed in the centre of the pipe is 3.00 m/s, what is water's speed:

(a) 10.0 cm from the centre of the pipe (half way between the centre and the walls)

(b) at the walls of the pipe?

17. Water at 20°C is flowing in a horizontal pipe that is 20.0 m long. The flow is laminar and the water completely fills the pipe. A pump maintains a gauge pressure of 1400 Pa, at a large tank at one end of the pipe. The other end of the pipe is open to the air, The viscosity of water at 20°C is 1.005 poise.

(a) If the pipe has diameter 8.0 cm, what is the volume flow rate?

(b) What gauge pressure must the pump provide to achieve the same volume flow rate for a pipe with a diameter of 4.0 cm?

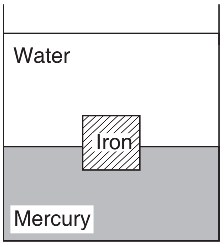
(c) For pipe in part (a) and the same gauge pressure maintained by the pump, what does the volume flow rate become if the water is at a temperature of 60°C (the viscosity of water at 60°C is 0.469 poise)?

18. An irregular piece of metal weighs 10.00 g in air and 8.00 g when submerged in water.

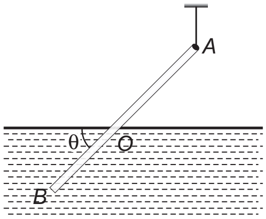
(a) Find the volume of the metal and its density.

(b) If the same piece of metal weighs 8.50 g when immersed in a particular oil, what is the density of the oil ?

19. A tank contains water on top of mercury. A cube of iron, 60 mm along each edge, is sitting upright in equilibrium in the liquids. Find how much of it is in each liquid. The densities of iron and mercury are $7.7 \times 10^3\ \text{kg/m}^3$ and $13.6 \times 10^3\ \text{kg/m}^3$ respectively.



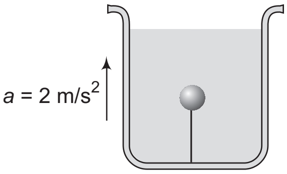
20. A uniform rod AB, 4 m long and weighing 12 kg, is supported at end A, with a 6 kg lead weight at B. The rod floats as shown in figure with one-half of its length submerged. The buoyant force on the lead mass is negligible as it is of negligible volume. Find the tension in the cord and the total volume of the rod.



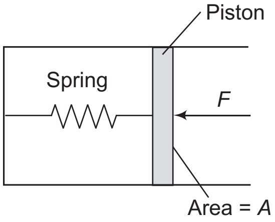
21. A solid sphere of mass $m = 2$ kg and density $\rho = 500\,\text{kg/m}^3$ is held stationary relative to a tank filled with water. The tank is accelerating upward with acceleration 2 m/s^2. Calculate

(a) Tension in the thread connected between the sphere and the bottom of the tank.

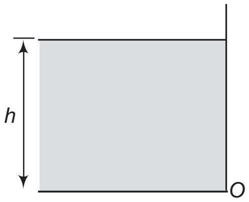
(b) If the thread snaps, calculate the acceleration of sphere with respect to the tank.
(Density of water = 1000 kg/m^3, $g = 10\,\text{m/s}^2$)



22. The pressure gauge shown in figure has a spring for which $k = 60$ N/m and the area of the piston is 0.50 cm^2. Its right end is connected to a closed container of gas at a gauge pressure of 30 kPa. How far will the spring be compressed if the region containing the spring is (a) in vacuum and (b) open to the atmosphere ? Atmospheric pressure is 101 kPa.



23. Water stands at a depth h behind the vertical face of a dam. It exerts a resultant horizontal force on the dam tending to slide it along its foundation and a torque tending to overturn the dam about the point O. Find



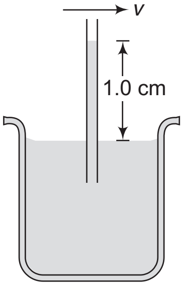
(a) horizontal force, (b) torque about O, (c) the height at which the resultant force would have to act to produce the same torque, l = cross-sectional length and ρ = density of water.

24. Mercury is poured into a U-tube in which the cross-sectional area of the left-hand limb is three times smaller than that of the right one. The level of the mercury in the narrow limb is a distance $l = 30\,\text{cm}$ from the upper end of the tube. How much will the mercury level rise in the right-hand limb if the left one is filled to the top with water ?

25. A water barrel stands on a table of height h. If a small hole is punched in the side of the barrel at its base, it is found that the resultant stream of water strikes the ground at a horizontal distance R from the barrel. What is the depth of water in the barrel ?

26. A pump is designed as a horizontal cylinder with a piston of area A and an outlet orifice of area a arranged near the cylinder axis. Find the velocity of out flow of the liquid from the pump if the piston moves with a constant velocity under the action of a constant force F. The density of the liquid is ρ.

27. When air of density $1.3\ \text{kg/m}^3$ flows across the top of the tube shown in the accompanying figure, water rises in the tube to a height of 1.0 cm. What is the speed of the air ?



28. The area of cross-section of a large tank is $0.5\ \text{m}^2$. It has an opening near the bottom having area of cross-section $1\ \text{cm}^2$. A load of 20 kg is applied on the water at the top. Find the velocity of the water coming out of the opening at the time when the height of water level is 50 cm above the bottom. (Take $g = 10\ \text{m/s}^2$)

29. What is the pressure drop (in mm Hg) in the blood as it passes through a capillary 1 mm long and $2\,\mu\text{m}$ in radius if the speed of the blood through the centre of the capillary is 0.66 mm/s ? (The viscosity of whole blood is 4×10^{-3} Pl).

30. A glass capillary sealed at the upper end is of length 0.11 m and internal diameter 2×10^{-5} m. The tube is immersed vertically into a liquid of surface tension 5.06×10^{-2} N/m. To what length has the capillary to be immersed so that the liquid levels inside and outside the capillary become the same ? What will happen to the water levels inside the capillary if the seal is now broken ?

31. A film of water is formed between two straight parallel wires each 10 cm long and at a separation 0.5 cm. Calculate the work required to increase 1 mm distance between them. Surface tension of water = 72×10^{-3} N/m.

32. A barometer contains two uniform capillaries of radii 1.44×10^{-3} m and 7.2×10^{-4}m. If the height of the liquid in the narrow tube is 0.2 m more than that in the wide tube, calculate the true pressure difference. Density of liquid $= 10^3\ \text{kg/m}^3$, surface tension $= 7.2 \times 10^{-3}$ N/m and $g = 9.8\ \text{m/s}^2$.

33. A liquid of specific gravity 1.5 is observed to rise 3.0 cm in a capillary tube of diameter 0.50 mm and the liquid wets the surface of the tube. Calculate the excess pressure inside a spherical bubble of 1.0 cm diameter blown from the same liquid. Angle of contact = 0°.

34. A glass U-tube is such that the diameter of one limb is 3.0 mm and that of the other is 6.0 mm. The tube is inverted vertically with the open ends below the surface of water in a beaker. What is the difference between the heights to which water rises in the two limbs? Surface tension of water is $0.07\,\text{Nm}^{-1}$. Assume that the angle of contact between water and glass is 0°.

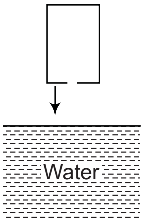
35. A minute spherical air bubble is rising slowly through a column of mercury contained in a deep jar. If the radius of the bubble at a depth of 100 cm is 0.1 mm, calculate its depth where its radius is 0.126 mm, given that the surface tension of mercury is 567 dyne/cm. Assume that the atmospheric pressure is 76 cm of mercury.

36. If a number of little droplets of water, each of radius r, coalesce to form a single drop of radius R, show that the rise in temperature will be given be

$$\frac{3T}{J}\left(\frac{1}{r}-\frac{1}{R}\right)$$

where, T is the surface tension of water and J is the mechanical equivalent of heat.

37. An empty container has a circular hole of radius r at its bottom. The container is pushed into water very slowly as shown. To what depth the lower surface of container (from surface of water) can be pushed into water such that water does not flow into the container ?

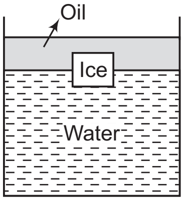


LEVEL 2

Objective Questions

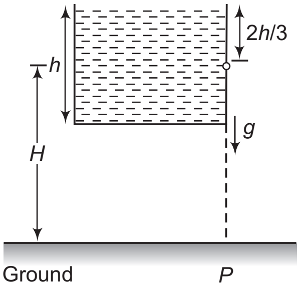
Single Correct Option

1. An ice cube is floating in water above which a layer of lighter oil is poured. As the ice melts completely, the level of interface and the upper most level of oil will respectively



(a) rise and fall
(b) fall and rise
(c) not change and no change
(d) not change and fall

2. An open vessel full of water is falling freely under gravity. There is a small hole in one face of the vessel as shown in the figure. The water which comes out from the hole at the instant when hole is at height H above the ground, strikes the ground at a distance of x from P.



Which of the following is correct for the situation described?

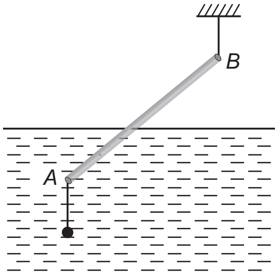
(a) The value of x is $2\sqrt{\dfrac{2hH}{3}}$

(b) The value of x is $\sqrt{\dfrac{4hH}{3}}$

(c) The value of x can't be computed from information provided

(d) The question is irrevalent as no water comes out from the hole

3. A uniform rod AB, 12 m long weighing 24 kg, is supported at end B by a flexible light string and a lead weight (of very small size) of 12 kg attached at end A.



The rod floats in water with one-half of its length submerged. For this situation, mark out the correct statement.
[Take $g = 10 \text{ m/s}^2$, density of water = 1000 kg/m^3]

(a) The tension in the string is 36 g

(b) The tension in the string is 12 g

(c) The volume of the rod is $6.4 \times 10^{-2} \text{ m}^3$

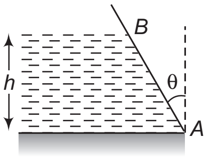
(d) The point of application of the buoyancy force is passing through C (centre of mass of rod)

4. A water hose pipe of cross-sectional area 5 cm^2 is used to fill a tank of 120 L. It has been observed that it takes 2 min to fill the tank. Now, a nozzle with an opening of cross-sectional area 1 cm^2 is attached to the hose. The nozzle is held so that water is projected horizontally from a point 1 m above the ground. The horizontal distance over which the water can be projected is (Take $g = 10 \text{ m/s}^2$)

(a) 3 m (b) 8 m

(c) 4.47 m (d) 8.64 m

5. The height of water in a vessel is h. The vessel wall of width b is at an angle θ to the vertical. The net force exerted by the water on the wall is

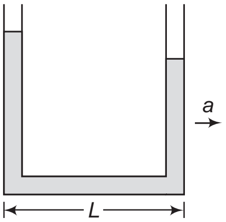


(a) $\frac{1}{3}\rho bh^2 g\cos\theta$ (b) $\frac{1}{2}bh^2\rho g$ (c) $\frac{1}{2}\rho bh^2 g\sec\theta$ (d) zero

6. A body of density ρ is dropped from rest from a height h into a lake of density σ $(\sigma > \rho)$. The maximum depth the body sinks inside the liquid is (neglect viscous effect of liquid)

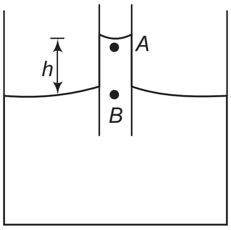
(a) $\frac{h\rho}{\sigma-\rho}$ (b) $\frac{h\sigma}{\sigma-\rho}$ (c) $\frac{h\rho}{\sigma}$ (d) $\frac{h\sigma}{\rho}$

7. A liquid stands at the plane level in the U-tube when at rest. If areas of cross-section of both the limbs are equal, what will be the difference in heights h of the liquid in the two limbs of U-tube, when the system is given an acceleration a in horizontal direction towards right as shown?



(a) $\frac{Lg}{a}$ (b) $\frac{La}{g}$ (c) $\frac{Lg^2}{a^2}$ (d) zero

8. A liquid of density ρ and surface tension σ rises in a capillary tube of inner radius R. The angle of contact between the liquid and the glass is θ. The point A lies just below the meniscus in the tube and the point B lies at the outside level of liquid in the beaker as shown in figure. The pressure at A is



(a) $p_B - \rho gh$ (b) $p_B - \frac{2\sigma\cos\theta}{R}$ (c) $p_{\text{atm}} - \frac{2\sigma\cos\theta}{R}$ (d) All of these

9. A large open tank has two holes in the wall. One is a square hole of side L at a depth h from the top and the other is a circular hole of radius R at a depth $4h$ from the top. When the tank is completely filled with water, quantities of water flowing out per second from both holes are the same. Then R is equal to

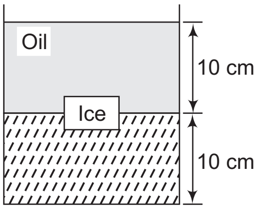
(a) $\frac{L}{\sqrt{2\pi}}$ (b) $2\pi L$ (c) L (d) $\frac{L}{2\pi}$

10. Two identical cylindrical vessels with their bases at the same level each, contain a liquid of density ρ. The area of either base is A but in one vessel the liquid height is h_1 and in the other liquid height is $h_2 (h_2 < h_1)$. If the two vessels are connected, the work done by gravity in equalizing the levels is

(a) $\frac{1}{2}(h_1 - h_2)^2 A\rho g$ (b) $\frac{1}{2}(h_1 + h_2) A\rho g$

(c) $\frac{1}{2}(h_1^2 - h_2^2) A\rho g$ (d) $\frac{1}{4}(h_1 - h_2)^2 A\rho g$

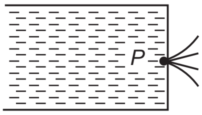
11. A cubical block of side 10 cm floats at the interface of an oil and water as shown in the figure. The density of oil is 0.6 g cm^{-3} and the lower face of ice cube is 2 cm below the interface. The pressure above that of the atmosphere at the lower face of the block is



(a) 200 Pa (b) 620 Pa

(c) 900 Pa (d) 800 Pa

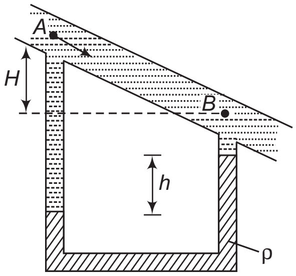
12. A leakage begins in water tank at position P as shown in the figure. The initial gauge pressure (pressure above that of the atmosphere) at P was 5×10^5 N/m^2. If the density of water is 1000 kg/m^3 the initial velocity with which water gushes out is approximately



(a) 3.2 ms^{-1} (b) 32 ms^{-1}

(c) 28 ms^{-1} (d) 2.8 ms^{-1}

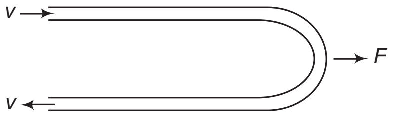
13. The figure shows a pipe of uniform cross-section inclined in a vertical plane. A U-tube manometer is connected between the points A and B. If the liquid of density ρ_0 flows with velocity v_0 in the pipe. Then the reading h of the manometer is



(a) $h = 0$ (b) $h = \frac{v_0^2}{2g}$

(c) $h = \frac{\rho_0}{\rho}\left(\frac{v_0^2}{2g}\right)$ (d) $h = \frac{\rho_0 H}{\rho - \rho_0}$

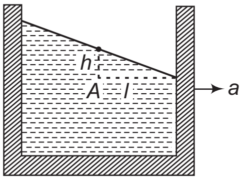
14. A horizontal tube of uniform cross-sectional area A is bent in the form of U as shown in figure. If the liquid of density ρ enters and leaves the tube with velocity v, then the external force F required to hold the bend stationary is



(a) $F = 0$ (b) $\rho A v^2$

(c) $2\rho A v^2$ (d) $\frac{1}{2}\rho A v^2$

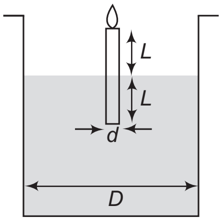
15. A rectangular container moves with an acceleration a along the positive direction as shown in figure. The pressure at the point A in excess of the atmospheric pressure p_0 is (take ρ as the density of liquid)



(a) $\rho g h$ (b) $\rho a l$

(c) $\rho\ (gh + al)$ (d) Both (a) and (b)

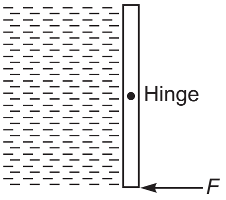
16. A candle of diameter d is floating on a liquid in a cylindrical container of diameter D $(D >> d)$ as shown in figure. It it is burning at the rate of 2 cm/h. Then, the top of the candle will



(a) remain at the same height (b) fall at the rate of 1 cm/h

(c) fall at the rate of 2 cm/h (d) go up at the rate of 1 cm/h

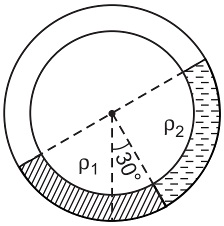
17. A square gate of size 1 m × 1 m is hinged at its mid point. A fluid of density ρ fills the space to the left of the gate. The force F required to hold the gate stationary is



(a) $\frac{\rho g}{3}$ (b) $\frac{1}{2}\rho g$

(c) $\frac{\rho g}{6}$ (d) None of these

18. A thin uniform circular tube is kept in a vertical plane. Equal volumes of two immiscible liquids whose densities are ρ_1 and ρ_2 fill half of the tube as shown. In equilibrium the radius passing through the interface makes an angle of 30° with vertical. The ratio of densities (ρ_1/ρ_2) is equal to

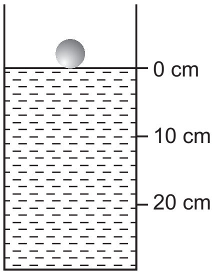


(a) $\dfrac{\sqrt{3}-1}{2-\sqrt{3}}$ (b) $\dfrac{\sqrt{3}+1}{2+\sqrt{3}}$ (c) $\dfrac{\sqrt{3}-1}{\sqrt{3}+1}$ (d) $\dfrac{\sqrt{3}+1}{\sqrt{3}-1}$

19. A plate moves normally with the speed v_1 towards a horizontal jet of water of uniform area of cross-section. The jet discharges water at the rate of volume V per second at a speed of v_2. The density of water is ρ. Assume that water splashes along the surface of the plate ar right angles to the original motion. The magnitude of the force acting on the plate due to the jet of water is

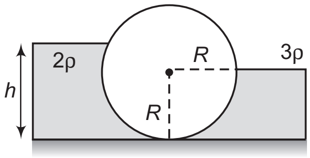
(a) $\rho V v_1$ (b) $\rho\left(\dfrac{V}{v_2}\right)(v_1+v_2)^2$ (c) $\dfrac{\rho V}{v_1+v_2}(v_1)^2$ (d) $\rho V(v_1+v_2)$

20. A spherical ball of density ρ and radius 0.003 m is dropped into a tube containing a viscous fluid up to the 0 cm mark as shown in the figure. Viscosity of the fluid = 1.26 N-s/m^2 and its density $\rho_L = \dfrac{\rho}{2} = 1260\ \text{kg/m}^3$. Assume that the ball reaches a terminal speed at 10 cm mark. The time taken by the ball to travel the distance between the 10 cm and 20 cm mark is ($g = 10\ \text{m/s}^2$)



(a) 2 s (b) 1 s
(c) 0.5 s (d) 5 s

21. In the figure shown, the heavy cylinder (radius R) resting on a smooth surface separates two liquids of densities 2ρ and 3ρ. The height h for the equilibrium of cylinder must be



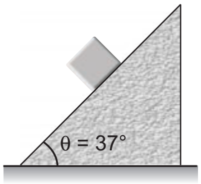
(a) $3R/2$ (b) $R\sqrt{\dfrac{3}{2}}$

(c) $R\sqrt{2}$ (d) None of these

22. A U-tube having horizontal arm of length 20 cm, has uniform cross-sectional area = 1 cm^2. It is filled with water of volume 60 cc. What volume of a liquid of density 4 g/cc should be poured from one side into the U-tube so that no water is left in the horizontal arm of the tube?

(a) 60 cc (b) 45 cc (c) 50 cc (d) 35 cc

23. A cubical block of side a and density ρ slides over a fixed inclined plane with constant velocity v. There is a thin film of viscous fluid of thickness t between the plane and the block. Then the coefficient of viscosity of the film will be



(a) $\frac{3\rho agt}{5v}$ (b) $\frac{4\rho agt}{5v}$ (c) $\frac{\rho agt}{v}$ (d) None of these

24. A spring balance reads 10 kg when a bucket of water is suspended from it. What will be the reading of the balance when an iron piece of mass 7.2 kg suspended by a string is immersed with half its volume inside the water in the bucket? Relative density of iron is 7.2.

(a) 10 kg (b) 10.5 kg (c) 13.6 kg (d) 17.2 kg

25. Three points A, B and C on a steady flow of a non-viscous and incompressible fluid are observed. The pressure, velocity and height of the points A, B and C are (2, 3, 1), (1, 2, 2) and (4, 1, 2) respectively. Density of the fluid is 1 kgm^{-3} and all other parameters are given in SI units. Then which of the following is correct? ($g = 10$ ms^{-2}).

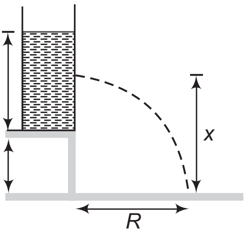
(a) Points A and B lie on the same stream line
(b) Points B and C lie on the same stream line
(c) Points C and A lie on the same stream line
(d) None of the above

26. A body of density ρ is dropped from rest from height h (from the surface of water) into a lake of density of water σ ($\sigma > \rho$). Neglecting all dissipative effects, the acceleration of body while it is in the lake is

(a) $g\left(\frac{\sigma}{\rho}-1\right)$ upwards (b) $g\left(\frac{\sigma}{\rho}-1\right)$ downwards

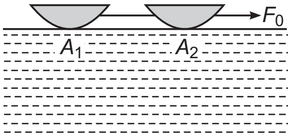
(c) $g\left(\frac{\sigma}{\rho}\right)$ upwards (d) $g\left(\frac{\sigma}{\rho}\right)$ downwards

27. A tank is filled up to a height $2H$ with a liquid and is placed on a platform of height H from the ground. The distance x from the ground where a small hole is punched to get the maximum range R is



(a) H (b) 1.25 H (c) 1.5 H (d) 2 H

28. Two boats of base areas A_1 and A_2, connected by a string are being pulled by an external force F_0. The viscosity of water is η and depth of the water body is H. When the system attains a constant speed, the tension in the thread will be



(a) $F_0\left(\frac{A_1}{A_2}\right)$ (b) $F_0\frac{A_2}{(A_1+A_2)}$ (c) $F_0\frac{A_1}{(A_1+A_2)}$ (d) $F_0\left(\frac{A_2}{A_1}\right)$

29. A U-tube is partially filled with water. Oil which does not mix with water is next poured into one side, until water rises by 25 cm on the other side. If the density of oil is 0.8 g/cm^3, the oil level will stand higher than the water level by

(a) 6.25 cm (b) 12.50 cm (c) 31.75 cm (d) 25 cm

30. There is a horizontal film of soap solution. On it a thread is placed in the form of a loop. The film is punctured inside the loop and the thread becomes a circular loop of radius R. If the surface tension of the soap solution be T, then the tension in the thread will be

(a) $\pi R^2/T$ (b) π^2R^2T

(c) $2\pi RT$ (d) $2RT$

31. A thin metal disc of radius r floats on a liquid surface and bends the surface downwards along the perimeter making an angle θ with vertical edge of the disc. If the disc displaces a weight of liquid w and surface tension of liquid is T, then the weight of metal disc is

(a) $2\pi rT + w$ (b) $2\pi rT\cos\theta - w$

(c) $2\pi rT\cos\theta + w$ (d) $w - 2\pi rT\cos\theta$

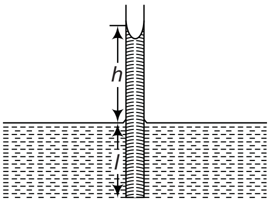
32. The radii of the two columns is U-tube are r_1, and $r_2 (> r_1)$. When a liquid of density ρ (angle of contact is 0°) is filled in it, the level difference of liquid in two arms is h. The surface tension of liquid is

(g = acceleration due to gravity)

(a) $\frac{\rho g h r_1 r_2}{2(r_2 - r_1)}$ (b) $\frac{\rho gh(r_2 - r_1)}{2r_1r_2}$

(c) $\frac{2(r_2 - r_1)}{\rho gh\, r_1r_2}$ (d) $\frac{\rho gh}{2(r_2 - r_1)}$

33. Water rises to a height h in a capillary tube lowered vertically into water to a depth l as shown in the figure. The lower end of the tube is now closed, the tube is then taken out of the water and opened again. The length of the water column remaining in the tube will be



(a) $2h$ if $l \ge h$ and $l + h$ if $l \le h$

(b) h if $l \ge h$ and $l + h$ if $l \le h$

(c) $4h$ if $l \ge h$ and $l - h$ if $l \le h$

(d) $\frac{h}{2}$ if $l \ge h$ and $l + h$ if $l \le h$

34. Two parallel glass plates are dipped partly in the liquid of density 'd' keeping them vertical. If the distance between the plates is 'x', Surface tension for liquid is T and angle of contact is θ then rise of liquid between the plates due to capillary will be

(a) $\frac{T\cos\theta}{xd}$ (b) $\frac{2T\cos\theta}{xdg}$ (c) $\frac{2T}{x\,dg\cos\theta}$ (d) $\frac{T\cos\theta}{x\,dg}$

35. Two identical spherical soap bubbles collapses. If V is the consequent change in volume of the contained air, S is the change in the total surface area and T is the surface tension of the soap solution, then (if p_0 is atmospheric pressure and assume temperature to remain same in all the bubbles).

(a) $3p_0V + 4ST = 0$
(b) $4p_0V + 3ST = 0$
(c) $p_0V + 4TS = 0$
(d) $4p_0V + ST = 0$

36. A cylinder with a movable piston contains air under a pressure p_1 and a soap bubble of radius 'r'. The pressure p_2 to which the air should be compressed by slowly pushing the piston into the cylinder for the soap bubble to reduce its size by half will be (The surface tension is σ, and the temperature T is maintained constant).

(a) $\left[8p_1 + \dfrac{24\sigma}{r}\right]$
(b) $\left[4p_1 + \dfrac{24\sigma}{r}\right]$
(c) $\left[2p_1 + \dfrac{24\sigma}{r}\right]$
(d) $\left[2p_1 + \dfrac{24\sigma}{r}\right]$

37. A thin metal ring of internal radius 8 cm and external radius 9 cm is supported horizontally from the pan of a balance so that it comes in contact with water in a glass vessel, If is found that an extra weight of 7.48 g is required to pull the ring out of water. The surface tension of water is ($g = 10\ \text{m/s}^2$)

(a) $80 \times 10^{-3}\ \text{N/m}$
(b) $25 \times 10^{-3}\ \text{N/m}$
(c) $45 \times 10^{-3}\ \text{N/m}$
(d) $70 \times 10^{-3}\ \text{N/m}$

More than One Correct Options

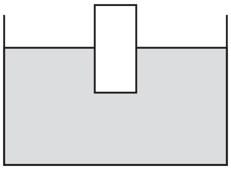
1. A large wooden plate of area 10 m^2 floating on the surface of a river is made to move horizontally with a speed of 2 m/s by applying a tangential force. River is 1 m deep and the water in contact with the bed is stationary. Then choose correct statement(s).
(coefficient of viscosity of water = 10^{-3} N-s/m^2)

(a) velocity gradient is $2\ \text{s}^{-1}$
(b) velocity gradient is $1\ \text{s}^{-1}$
(c) force required to keep the plate moving with constant speed is 0.02 N
(d) force required to keep the plate moving with constant speed is 0.01 N

2. Choose the correct options.

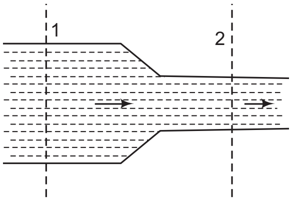
(a) Viscosity of liquids increases with temperature
(b) Viscosity of gases increases with temperature
(c) Surface tension of liquids decreases with temperature
(d) For angle of contact $\theta = 0°$, liquid neither rises nor falls on capillary

3. A plank is floating in a non-viscous liquid as shown. Choose the correct options.



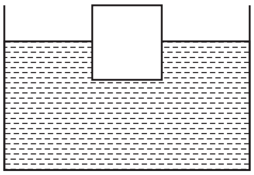
(a) Equilibrium of plank is stable in vertical direction
(b) For small oscillations of plank in vertical direction motion is simple harmonic
(c) Even if oscillations are large, motion is simple harmonic till it is not fully immersed
(d) On vertical displacement motion is periodic but not simple harmonic

4. A non-viscous incompressible liquid is flowing from a horizontal pipe of non-uniform cross section as shown. Choose the correct options.



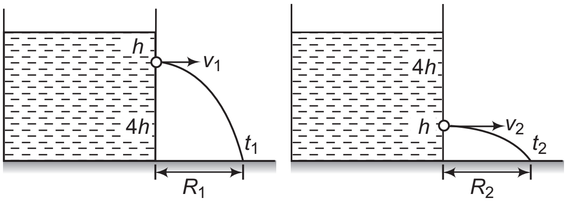
(a) speed of liquid at section-2 is more
(b) volume of liquid flowing per second from section-2 is more
(c) mass of liquid flowing per second at both the sections is same
(d) pressure at section-2 is less

5. A plank is floating in a liquid as shown. Fraction f of its volume is immersed. Choose the correct options.



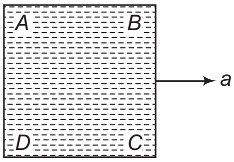
(a) If the system is taken to a place where atmospheric pressure is more, f will increase
(b) In above condition f will remain unchanged
(c) If temperature is increased and expansion of only liquid is considered f will increase
(d) If temperature is increased and expansion of only plank is considered f will decrease

6. In two figures,



(a) $v_1/v_2 = \frac{1}{2}$
(b) $t_1/t_2 = 2$
(c) $R_1/R_2 = 1$
(d) $v_1/v_2 = \frac{1}{4}$

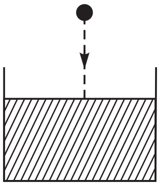
7. A liquid is filled in a container as shown in figure. Container is accelerated towards right. There are four points A, B, C and D in the liquid. Choose the correct options.



(a) $p_A > p_B$
(b) $p_C > p_A$
(c) $p_D > p_B$
(d) $p_A > p_C$

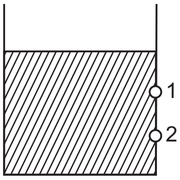
8. A ball of density ρ is dropped from a height on the surface of a non-viscous liquid of density 2ρ. Choose the correct options.

(a) Motion of ball is periodic but not simple harmonic
(b) Acceleration of ball in air and in liquid are equal
(c) Magnitude of upthrust in the liquid is two times the weight of ball
(d) Net force on ball in air and in liquid are equal and opposite

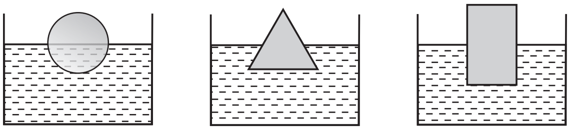


9. Two holes 1 and 2 are made at depths h and $16h$ respectively. Both the holes are circular but radius of hole-1 is two times.

(a) Initially equal volumes of liquid will flow from both the holes in unit time
(b) Initially more volume of liquid will flow from hole-2 per unit time
(c) After some time more volume of liquid will flow from hole-1 per unit time
(d) After some time more volume of liquid will flow from hole-2 per unit time



10. A solid sphere, a cone and a cylinder are floating in water. All have same mass, density and radius. Let f_1, f_2 and f_3 are the fraction of their volumes inside the water and h_1, h_2 and h_3 are the depths inside water. Then

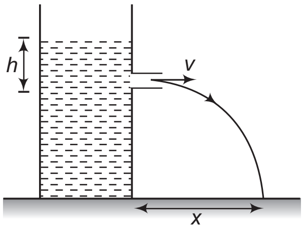


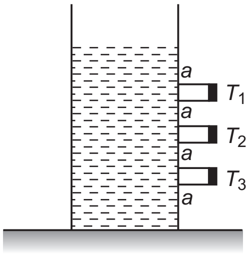
(a) $f_1 = f_2 = f_3$
(b) $f_3 > f_2 > f_1$
(c) $h_3 < h_1$
(d) $h_3 < h_2$

Comprehension Based Questions

Passage 1 (Q. Nos. 1 to 3)

The spouting can is something used to demonstrate the variation of pressure with depth. When the corks are removed from the tubes in the side of the can, water flows out with a speed that depends on the depth. In a certain can, three tubes T_1, T_2 and T_3 are set at equal distances 'a' above the base of the can. When water contained in this can is allowed to come out of the tubes, the distances on the horizontal surface are measured as x_1, x_2 and x_3.





1. Speed of efflux is

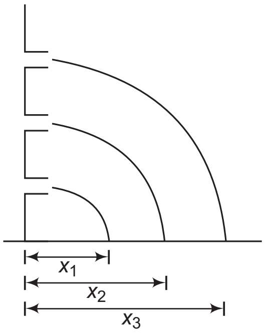
(a) $\sqrt{3gh}$
(b) $\sqrt{2gh}$
(c) $\sqrt{gh}$
(d) $\frac{1}{2}\sqrt{2gh}$

2. Distance x_3 is given by

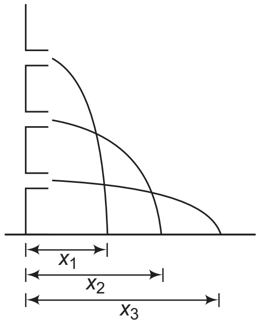
(a) $\sqrt{3}\,a$
(b) $\sqrt{2}\,a$
(c) $\frac{1}{2}\sqrt{3}\,a$
(d) $2\sqrt{3}\,a$

3. The correct sketch is

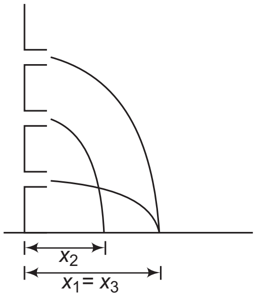
(a)



(b)



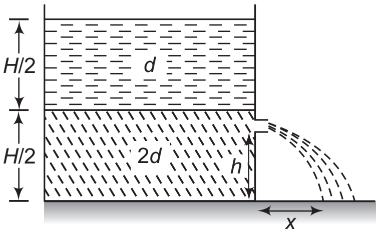
(c)



(d) None of these

Passage 2 (Q. Nos. 4 to 7)

A container of large uniform cross-sectional area A resting on a horizontal surface, holds two immiscible, non-viscous and incompressible liquids of densities d and $2d$ *each of height* $H/2$ *as shown in the figure. The lower density liquid is open to the atmosphere having pressure* P_0. *A homogeneous solid cylinder of length* $L (L < H/2)$ *and cross-sectional area* $A/5$ *is immersed such that it floats with its axis vertical at the liquid-liquid interface with length* $L/4$ *in the denser liquid.*



The cylinder is then removed and the original arrangement is restored. A tiny hole of area $s (s << A)$ *is punched on the vertical side of the container at a height* $h (h < H/2)$. *As a result of this, liquid starts flowing out of the hole with a range* x *on the horizontal surface.*

4. The density D of the material of the floating cylinder is

(a) $5d/4$ (b) $3d/4$ (c) $4d/5$ (d) $4d/3$

5. The total pressure with cylinder, at the bottom of the container is

(a) $p_0 + \frac{(6L + H)}{4} dg$ (b) $p_0 + \frac{(L + 6H)}{4} dg$

(c) $p_0 + \frac{(L + 3H)}{4} dg$ (d) $p_0 + \frac{(L + 2H)}{4} dg$

6. The initial speed of efflux without cylinder is

(a) $v=\sqrt{\frac{g}{3}[3H+4h]}$ (b) $v=\sqrt{\frac{g}{2}[4H-3h]}$

(c) $v=\sqrt{\frac{g}{2}[3H-4h]}$ (d) None of these

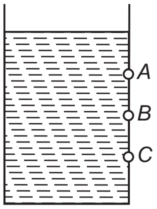
7. The initial value of x is

(a) $\sqrt{(3H+4h)\,h}$ (b) $\sqrt{(3h+4H)h}$

(c) $\sqrt{(3H-4h)\,h}$ (d) $\sqrt{(3H-3h)\,h}$

Match the Columns

1. Three holes A, B and C are made at depths 1m, 2 m and 5 m as shown. Total height of liquid in the container is 8 m. Let v is the speed with which liquid comes out of the hole and R the range on ground. Match the following two columns.

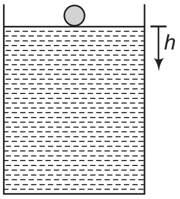


Column I	Column II
(a) v is maximum for	(p) hole A
(b) v is minimum for	(q) hole B
(c) R is maximum for	(r) hole C
(d) R is minimum for	(s) will depend on density of liquid

2. Match the following two columns.

Column I	Column II
(a) When temperature is increased	(p) Upthrust on a floating solid of constant volume will increase
(b) When density of liquid is increased	(q) Upthrust on a floating solid of constant volume will decrease
(c) When density of solid is increased	(r) Viscosity of gas will decrease
(d) When atmospheric pressure is increased	(s) None

3. A ball of density ρ is released from the surface of a liquid whose density varies with depth h as, $\rho_l = \alpha\, h$. Here α is a positive constant. Match the following two columns. (liquid is ideal)

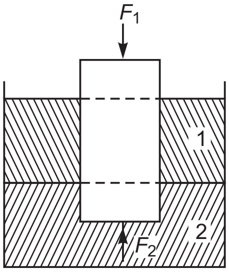


Column I	Column II
(a) Upthrust on ball	(p) will continuously decrease
(b) Speed of ball	(q) will continuously increase
(c) Net force on ball	(r) first increase then decrease
(d) Gravitational potential energy of ball	(s) first decrease then increase

4. Match the following two columns.

Column I	Column II
(a) Surface tension	(p) $[ML^{-1}T^{-2}]$
(b) Coefficient of viscosity	(q) $[L^3T^{-1}]$
(c) Energy density	(r) $[MT^{-2}]$
(d) Volume flow rate	(s) $[ML^{-1}T^{-1}]$

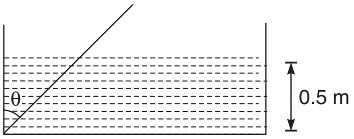
5. A cylinder of weight W is floating in two liquids as shown in figure. Net force on cylinder from top is F_1 and force on cylinder from the bottom is F_2. Match the following two columns.

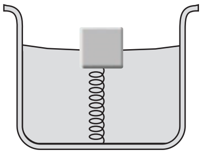


Column I	Column II
(a) Net force on cylinder from liquid-1	(p) Zero
(b) $F_2 - F_1$	(q) W
(c) Net force on cylinder from liquid-2	(r) Net upthrust
(d) Net force on cylinder from atmosphere	(s) None of these

Subjective Questions

1. A wooden plank of length 1 m and uniform cross-section is hinged at one end to the bottom of a tank as shown in figure. The tank is filled with water upto a height of 0.5 m. The specific gravity of the plank is 0.5. Find the angle θ that the plank makes with the vertical in the equilibrium position. (Exclude the case θ = 0)

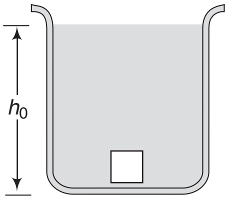




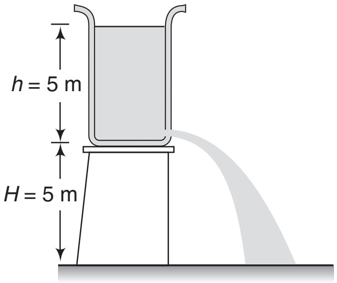
2. A cubical block of wood of edge 3 cm floats in water. The lower surface of the cube just touches the free end of a vertical spring fixed at the bottom of the pot. Find the maximum weight that can be put on the block without wetting the new weight. Density of wood = 800 kg/m^3 and spring constant of the spring = 50 N/m. (Take $g = 10\ \text{m/s}^2$)

3. Figure shows a container having liquid of variable density. The density of liquid varies as $\rho = \rho_0\left(4 - \dfrac{3h}{h_0}\right)$. Here, h_0 and ρ_0 are constants and h is measured from bottom of the container.

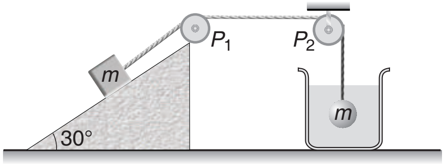
A solid block of small dimensions whose density is $\dfrac{5}{2}\rho_0$ and mass m is released from bottom of the tank. Prove that the block will execute simple harmonic motion. Find the frequency of oscillation.



4. A cylindrical tank 1 m in radius rests on a platform 5 m high. Initially the tank is filled with water to a height of 5 m. A plug whose area is $10^{-4}\ \text{m}^2$ is removed from an orifice on the side of the tank at the bottom. Calculate (a) initial speed with which the water flows from the orifice, (b) initial speed with which water strikes the ground, (c) time taken to empty the tank to half its original value. ($g = 10\ \text{m/s}^2$)

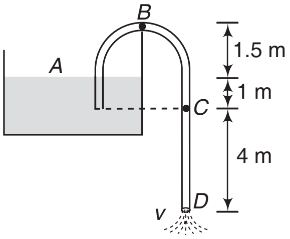


5. A block of mass m is kept over a fixed smooth wedge. Block is attached to a sphere of same mass through fixed massless pullies P_1 and P_2. Sphere is dipped inside the water as shown. If specific gravity of material of sphere is 2. Find the acceleration of sphere.



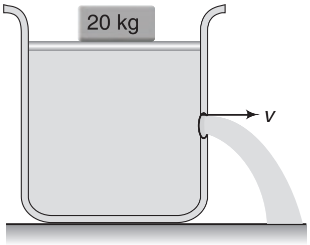
6. A cubic body floats on mercury with 0.25 fraction of its volume below the surface. What fraction of the volume of the body will be immersed in the mercury if a layer of water poured on top of the mercury covers the body completely ?

7. A siphon tube is discharging a liquid of specific gravity 0.9 from a reservoir as shown in the figure.

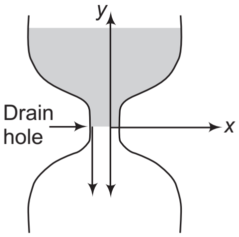


(a) Find the velocity of the liquid through the siphon.
(b) Find the pressure at the highest point *B*.
(c) Find the pressure at point *C*.

8. A long cylindrical tank of cross-sectional area $0.5\,\text{m}^2$ is filled with water. It has a small hole at a height 50 cm from the bottom. A movable piston of cross-sectional area almost equal to $0.5\,\text{m}^2$ is fitted on the top of the tank such that it can slide in the tank freely. A load of 20 kg is applied on the top of the water by piston, as shown in the figure. Calculate the speed of the water jet with which it hits the surface when piston is 1 m above the bottom. (Ignore the mass of the piston).



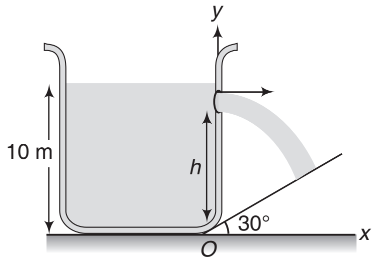
9. The shape of an ancient water clock jug is such that water level descends at a constant rate at all times. If the water level falls by 4 cm every hour, determine the shape of the jar, i.e. specify *x* as a function of *y*. The radius of drain hole is 2 mm and can be assumed to be very small compared to *x*.



10. A spring is attached to the bottom of an empty swimming pool, with the axis of the spring oriented vertically. An 8.00 kg block of wood ($\rho = 840\,\text{kg/m}^3$) is fixed to the top of the spring and compresses it. Then the pool is filled with water, completely covering the block. The spring is now observed to be stretched twice as much as it had been compressed. Determine the percentage of the block's total volume that is hollow. Ignore any air in the hollow space.

11. A rectangular tank of height 10 m filled with water, is placed near the bottom of a plane inclined at an angle 30° with horizontal. At height *h* from bottom a small hole is made (as shown in figure) such that the stream coming out from hole, strikes the inclined plane normally.

Calculate h.



12. A ball of density d is dropped onto a horizontal solid surface. It bounces elastically from the surface and returns to its original position in a time t_1. Next, the ball is released and it falls through the same height before striking the surface of a liquid of density d_L.

(a) If $d < d_L$, obtain an expression (in terms of d, t_1 and d_L) for the time t_2 the ball takes to come back to the position from which it was released.

(b) Is the motion of the ball simple harmonic ?

(c) If $d = d_L$, how does the speed of the ball depend on its depth inside the liquid ? Neglect all frictional and other dissipative forces. Assume the depth of the liquid to be large.

13. There is an air bubble of radius 1.0 mm in a liquid of surface tension 0.075 N/m and density 1000 kg/m^3. The bubble is at a depth of 10 cm below the free surface. By what amount is the pressure inside the bubble greater than the atmospheric pressure ? (Take $g = 9.8$ m/s^2)

14. A metal sphere of radius 1 mm and mass 50 mg falls vertically in glycerine. Find

(a) the viscous force exerted by the glycerine on the sphere when the speed of the sphere is 1 cm/s,

(b) the hydrostatic force exerted by the glycerine on the sphere and (c) the terminal velocity with which the sphere will move down without acceleration. Density of glycerine = 1260 kg/m^3 and its coefficient of viscosity at room temperature = 8.0 poise.

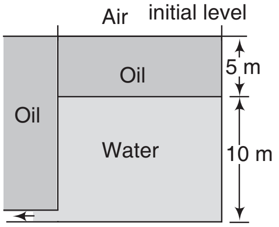
15. A wire forming a loop is dipped into soap solution and taken out, so that a film of soap solution is formed. A loop of 6.28 cm long thread is gently put on the film and the film is pricked with a needle inside the loop. The thread loop takes the shape of a circle. Find the tension in the thread. Surface tension of soap solution = 0.030 N/m.

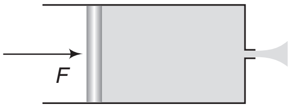
16. A cylindrical vessel is filled with water upto a height of 1 m. The cross-sectional area of the orifice at the bottom is (1/400) that of the vessel.

(a) What is the time required to empty the tank through the orifice at the bottom?

(b) What is the time required for the same amount of water to flow out if the water level in tank is maintained always at a height of 1 m from orifice?

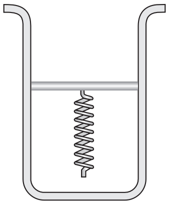
17. A tank having a small circular hole contains oil on top of water. It is immersed in a large tank of the same oil. Water flows through the hole. What is the velocity of this flow initially? When the flow stops, what would be the position of the oil-water interface in the tank from the bottom. The specific gravity of oil is 0.5.

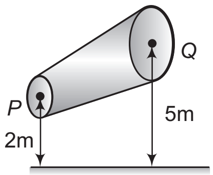




18. What work should be done in order to squeeze all water from a horizontally located cylinder (figure) during the time t by means of a constant force acting on the piston? The volume of water in the cylinder is equal to V, the cross-sectional area of the orifice is s, with s being considerably less than the piston area. The friction and viscosity are negligibly small. Density of water is ρ.

19. A cylinder is fitted with a piston, beneath which is a spring, as in the figure. The cylinder is open at the top. Friction is absent. The spring constant of the spring is 3600 N/m. The piston has a negligible mass and a radius of 0.025 m. (a) When air beneath the piston is completely pumped out, how much does the atmospheric pressure cause the spring to compress? (b) How much work does the atmospheric pressure do in compressing the spring?





20. A non-viscous liquid of constant density 1000 kg/m^3 flows in a streamline motion along a tube of variable cross-section. The tube is kept inclined in the vertical plane as shown in the figure. The area of cross-section of the tube at two points P and Q at heights of 2 m and 5 m are respectively 4×10^{-3} m^2 and 8×10^{-3} m^2. The velocity of the liquid at point P is 1 m/s. Find the work done per unit volume by the pressure and the gravity forces as the fluid flows from point P to Q. Take $g = 9.8 \text{ m/s}^2$.

21. A glass plate of length 10 cm, breadth 1.54 cm and thickness 0.20 cm weighs 8.2 gm in air. It is held vertically with the long side horizontal and the lower half under water. Find the apparent weight of the plate. Surface tension of water = 73 dyne per cm, $g = 980 \text{ cm/sec}^2$.

22. Two narrow bores of diameters 3.0 mm and 6.0 mm are joined together to form a U-shaped tube open at both ends. If the U-tube contains water, what is the difference in its levels in the two limbs of the tube? Surface tension of water at the temperature of the experiment is 7.3×10^{-2} Nm^{-1}. Take the angle of contact to be zero, and density of water to be $1.0 \times 10^3 \text{ kg/m}^3$ ($g = 9.8 \text{ ms}^{-2}$).

23. Two identical soap bubbles each of radius r and of the same surface tension T combine to form a new soap bubble of radius R. The two bubbles contain air at the same temperature. If the atmospheric pressure is p_0 then find the surface tension T of the soap solution in terms of p_0, r and R. Assume process is isothermal.

Note *Students are advised to attempt question numbers 24 and 25 after studying the chapter of electrostatics in class XII.*

24. A soap bubble of radius r and surface tension 'T' is given a potential of' V volt. Show that the new radius 'R' of the bubble is related to its initial radius by equation ,

$$p_0[R^3 - r^3] + 4T\,[R^2 - r^2] - \varepsilon_0 V^2 R/2 = 0$$

where, p_0 is the atmosphere pressure.

25. If the radius and surface tension of a spherical soap bubble are 'R' and 'T' respectively, then show that the charge required to double its radius would be, $8\pi R\,[\varepsilon_0 R\,[7p_0 R + 12T]]^{1/2}$, where p_0 is the atmospheric pressure.

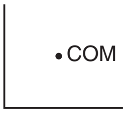
Hints & Solutions

11. Centre of Mass, Linear Momentum and Collision

INTRODUCTORY EXERCISE 11.1

2.

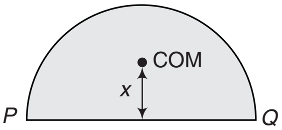


The COM of L-shaped rod shown in above figure is lying outside the body.

4. $x_{\text{CM}} = \dfrac{m_1x_1 + m_2x_2}{m_1 + m_2}$

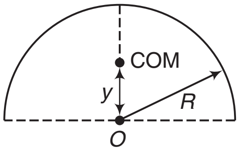
$x_1 = x_2 = 0 \;\Rightarrow\; x_{\text{CM}} = 0$

5.



$x < r/2$, as more mass is concentrated near the line PQ.

6.



All particles of semicircular ring lie at a distance R from origin O. But its COM distance y from O is less than R.

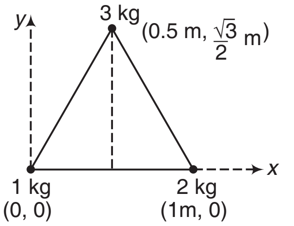
7.

$$x_{\text{CM}} = \frac{m_1x_1 + m_2x_2 + m_3x_3}{m_1 + m_2 + m_3}$$

$$= \frac{(1)(0) + (2)(1) + (3)(0.5)}{1 + 2 + 3} = \frac{7}{12}\text{ m}$$

$$y_{\text{CM}} = \frac{m_1y_1 + m_2y_2 + m_3y_3}{m_1 + m_2 + m_3}$$

$$= \frac{(1)(0) + (2)(0) + (3)\left(\dfrac{\sqrt{3}}{2}\right)}{1 + 2 + 3}$$



$$= \frac{\sqrt{3}}{4}\text{ m}$$

$$\therefore \quad d = \sqrt{x_{\text{CM}}^2 + x_{\text{CM}}^2}$$

$$= \frac{\sqrt{19}}{6}\text{ m} \qquad \textbf{Ans.}$$

8.

$$y_{\text{CM}} = \frac{A_1y_1 - A_2y_2}{A_1 - A_2}$$

$$= \frac{(\pi b^2/2)(4b/3\pi) - (\pi a^2/2)(4a/3\pi)}{(\pi b^2/2) - (\pi a^2/2)}$$

$$= \frac{4}{3\pi}\left[\frac{b^3 - a^3}{b^2 - a^2}\right]$$

$$= \frac{4}{3\pi}\left\{\frac{a^2 + ab + b^2}{a + b}\right\} \qquad \textbf{Ans.}$$

9.

$$x_{\text{CM}} = \frac{A_1x_1 - A_2x_2}{A_1 - A_2}$$

$$= \frac{(4a^2)(a) - (a^2)(3a/2)}{4a^2 - a^2} = \frac{5a}{6} \qquad \textbf{Ans.}$$

$$y_{\text{CM}} = \frac{A_1y_1 - A_2y_2}{A_1 - A_2}$$

$$= \frac{(4a^2)(a) - (a^2)(3a/2)}{4a^2 - a^2}$$

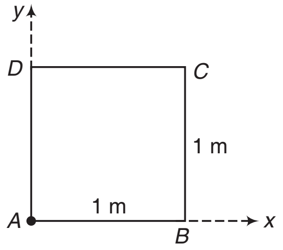
$$= \frac{5a}{6} \qquad \textbf{Ans.}$$

10.

$$x_{\text{CM}} = \frac{m_Ax_A + m_Bx_B + m_Cx_C + m_Dx_D}{m_A + m_B + m_C + m_D}$$

$$= \frac{(1)(0) + 2(1) + 3(1) + 4(0)}{1 + 2 + 3 + 4}$$

$$= 0.5\text{ m}$$



$$y_{\text{CM}} = \frac{m_Ay_A + m_By_B + m_Cy_C + m_Dy_D}{m_A + m_B + m_C + m_D}$$

$$= \frac{(1)(0) + 2(0) + 3(1) + 4(1)}{1 + 2 + 3 + 4} = 0.7\text{ m}$$

$$\therefore d^2 = x_{\text{CM}}^2 + y_{\text{CM}}^2$$

$$= 0.74\text{ m}^2 \qquad \textbf{Ans.}$$

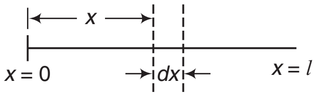
11. $d = \dfrac{A_1 d_1 + A_2 d_2}{A_1 + A_2}$

Here, d = distance of centre of mass from O.

$$\therefore \quad d = \frac{(a^2)(0) + \left(\dfrac{\pi}{4} a^2\right)(a)}{a^2 + (\pi/4)\,a^2}$$

$$= \left(\frac{\pi}{\pi + 4}\right) a$$

12.



Let A = area of cross section of rod.

$$x_{CM} = \frac{\int_0^l x\,dm}{\int_0^l dm} = \frac{\int_0^l (x)\,(A dx)\,\rho_0 \dfrac{x^2}{l^2}}{\int_0^l (A dx)\,\rho_0 \dfrac{x^2}{l^2}}$$

$$= \frac{3l}{4} \qquad \textbf{Ans.}$$

13. $x_{CM} = \dfrac{\int_0^L x\,dm}{\int_0^L dm} = \dfrac{\int_0^L (X)\,(Ax dx)}{\int_0^L (Ax dx)} = \dfrac{2}{3} L$ **Ans.**

INTRODUCTORY EXERCISE 11.2

1. $$x_{CM} = \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2}$$

$$= \frac{m_1 (x_i + vt)_1 + m_2 (x_i + vt)_2}{m_1 + m_2}$$

$$= \frac{(1)(10 - 6 \times 2) + (2)(12 + 4 \times 2)}{1 + 2}$$

$$= 12.67 \text{ m} \qquad \textbf{Ans.}$$

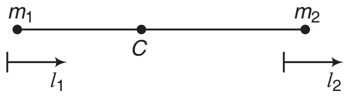
2. $$S_{CM} = \frac{m_1 S_1 + m_2 S_2}{m_1 + m_2}$$

$$= \frac{m_1 (v_1 t) + m_2 (v_2 t)}{m_1 + m_2}$$

$$= \frac{(1)(2)(1) + (2)(-1)(1)}{1 + 2}$$

$$= 0$$

3.



Displacement of centre of mass,

$$S_{CM} = \frac{m_1 l_1 + m_2 l_2}{m_1 + m_2} \qquad \textbf{Ans.}$$

4. (a) $$x_{CM} = \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2}$$

$$\Rightarrow \quad 3 = \frac{m_1(0) + (0.10)(12)}{m_1 + 0.1}$$

Solving this equation we get,

$$m_1 = 0.3 \text{ kg} \qquad \textbf{Ans.}$$

(b) $$\mathbf{P}_{CM} = m_{CM} \mathbf{v}_{CM}$$

$$= (0.1 + 0.3)(6\hat{\mathbf{j}})$$

$$= (2.4\hat{\mathbf{j}}) \text{ kg-m/s} \qquad \textbf{Ans.}$$

(c) $$\mathbf{P}_{CM} = \mathbf{P}_1 + \mathbf{P}_2$$

$$\therefore \quad (2.4\hat{\mathbf{j}}) = (0.3)\mathbf{v}_1 + (0.1)(0)$$

$$\therefore \quad \mathbf{v}_1 = (8\hat{\mathbf{j}}) \text{ m/s} \qquad \textbf{Ans.}$$

5. First stone gets 300 ms journey time and second stone gets 200 ms journey time.

(a) $$d_{CM} = \frac{m_1 d_1 + m_2 d_2}{m_1 + m_2}$$

$$= \frac{m_1\left(\dfrac{1}{2} g t_1^2\right) + m_2\left(\dfrac{1}{2} g t_2^2\right)}{m_1 + m_2}$$

$$= \frac{(m)\left(\dfrac{1}{2} \times 10 \times 0.3 \times 0.3\right) + 2m\left(\dfrac{1}{2} \times 10 \times 0.2 \times 0.2\right)}{m + 2m}$$

$$= 0.283 \text{ m}$$

$$\approx 28 \text{ cm} \qquad \textbf{Ans.}$$

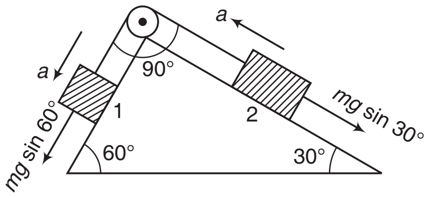
(b) $$v_{CM} = \frac{m_1 v_1 + m_2 v_2}{m_1 + m_2}$$

$$= \frac{m_1 (g t_1) + m_2 (g t_2)}{m_1 + m_2}$$

$$= \frac{(m)(10 \times 0.3) + (2m)(10 \times 0.2)}{m + 2m}$$

$$= 2.3 \text{ m/s} \qquad \textbf{Ans.}$$

6. $a = \dfrac{\text{Net pulling force}}{\text{Total mass}}$



$$= \frac{mg \sin 60° - mg \sin 30°}{2m}$$

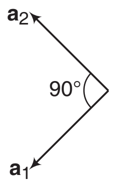
$$a = \left(\frac{\sqrt{3}-1}{4}\right) g$$

$$|\mathbf{a}_1| = |\mathbf{a}_2| = a$$

$$\therefore \quad |\mathbf{a}_1 + \mathbf{a}_2| = \sqrt{2}\, a \text{ at } 90°$$

$$\mathbf{a}_{\text{COM}} = \frac{m_1\mathbf{a}_1 + m_2\mathbf{a}_2}{m_1 + m_2}$$

$$= \frac{1}{2}(\mathbf{a}_1 + \mathbf{a}_2) \qquad (\text{as } m_1 = m_2)$$



$$\therefore \quad |\mathbf{a}_{\text{COM}}| = \frac{|\mathbf{a}_1 + \mathbf{a}_2|}{2}$$

$$= \frac{\sqrt{2}a}{2}$$

$$= \frac{a}{\sqrt{2}} = \left(\frac{\sqrt{3}-1}{4\sqrt{2}}\right) g \qquad \textbf{Ans.}$$

INTRODUCTORY EXERCISE 11.3

1. $\mathbf{p}_i = \mathbf{p}_f$

$$\therefore \quad (20)(20\hat{\mathbf{i}}) + 30(20\hat{\mathbf{j}}) + 40(20\hat{\mathbf{k}})$$

$$= (20)(0) + 30(10\hat{\mathbf{i}} + 20\hat{\mathbf{k}}) + 40\mathbf{v}$$

Solving this equation we get,

$$\mathbf{v} = (2.5\hat{\mathbf{i}} + 15\hat{\mathbf{j}} + 5\hat{\mathbf{k}}) \text{ cm/s} \qquad \textbf{Ans.}$$

2. $\mathbf{p}_i = \mathbf{p}_f$

$$\therefore \quad 0 = (25)(5) + (10)(v)$$

$$\text{or} \quad v = -12.5 \text{ m/s}$$

Negative sign implies that this velocity is opposite to the direction of velocity of boy. Two velocities are in opposite directions.

Hence, $|v_r|$ = Magnitude of relative velocity

$$= 12.5 + 5.0 = 17.5 \text{ m/s}$$

3. $p = \sqrt{2km}$

$$\text{or} \quad p \propto \sqrt{m}$$

$$\therefore \quad \frac{p_1}{p_2} = \sqrt{\frac{m_1}{m_2}} = \sqrt{\frac{1}{4}} = \frac{1}{2}$$

4. $\mathbf{p}_i = \mathbf{p}_f$

$$\therefore \quad 0 = (4)(1.4 \times 10^7) + (234)v$$

$$\therefore \quad v = -2.4 \times 10^5 \text{m/s}$$

Here, negative sign implies that this velocity is opposite to the direction of velocity of alpha particle.

5. $\mathbf{p}_i = \mathbf{p}_f$

$$\therefore \quad 0 = 50(1.8) + (6 \times 10^{24})v$$

$$\therefore \quad v = -1.5 \times 10^{-23} \text{ m/s}$$

Negative sign implies the opposite direction of the velocity of man.

6. $m_1v_1 = m_2v_2$ (in opposite direction)

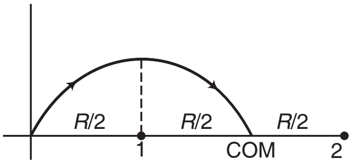
$$\therefore \quad (60)(3) = (20)\, v_2$$

$$\therefore \quad v_2 = 9 \text{ m/s} \qquad \textbf{Ans.}$$

$$\text{KE} = \frac{1}{2} \times 60 \times (3)^2 + \frac{1}{2} \times 20 \times (9)^2$$

$$= 1080 \text{J} = 1.08 \text{ kJ} \qquad \textbf{Ans.}$$

7. Path of COM will remain unchanged



$$x_2 = \frac{3R}{2} = \frac{3}{2}\left(\frac{u^2 \sin 2\theta}{g}\right)$$

$$= \frac{3}{2} \frac{(20)^2 \sin 90°}{10} = 60 \text{m} \qquad \textbf{Ans.}$$

INTRODUCTORY EXERCISE 11.4

1. Thrust force = mg

$$\therefore \quad v_r\left(-\frac{dm}{dt}\right) = mg$$

$$\therefore \quad \left(-\frac{dm}{dt}\right) = \frac{mg}{v_r}$$

$$= \frac{(200)(9.8)}{1.6 \times 10^3} = 1.225 \text{ kg/s}$$

(i) In this case, fuel will be finished in 90 s.

$$v = u - gt + v_r \ln\left(\frac{m_0}{m}\right)$$

$$= 0 - 9.8 \times 90 + (1.6 \times 10^3) \ln\left(\frac{200}{20}\right)$$

$$= 2.8 \text{ km/s} \qquad \textbf{Ans.}$$

(ii) In this case, fuel is finished in 9 s.

$$\therefore \quad v = 0 - 9.8 \times 10 + 1.6 \times 10^3 \ln\left(\frac{200}{20}\right)$$

$$= 3.6 \text{ km/s}$$ **Ans.**

2. After 1 min total 600 kg gases will be burnt.

$$v = u - gt + V_r \ln\left(\frac{m_0}{m}\right)$$

$$= 0 - 10 \times 60 + (2000)\ln\left(\frac{1000}{400}\right)$$

$$= 1232.6 \text{ m/s}$$

3. $\left(-\frac{dm}{dt}\right) = \mu$

$$F_{\text{net}} = \text{thrust force} - \text{weight}$$

$$\therefore \quad ma = v_r\left(-\frac{dm}{dt}\right) - mg$$

or $$(m_0 - \mu t)\frac{d^2x}{dt^2} = u(\mu) - (m_0 - \mu t)g$$

4. $\left(-\frac{dm}{dt}\right) = \frac{m_0}{3}$

At $t = 1$, mass will remain,

$$m = m_0 - \frac{m_0}{3} = \frac{2}{3}m_0$$

Now using the equation,

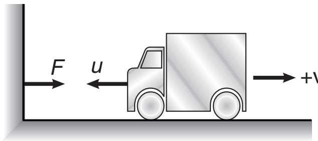
$$v = u - gt + v_r \ln\left(\frac{m_0}{m}\right)$$

$$= 0 - g(1) + u \ln\left(\frac{m_0}{2/3 m_0}\right)$$

$$= u \ln\left(\frac{3}{2}\right) - g$$ **Ans.**

INTRODUCTORY EXERCISE 11.5

1. Using impulse = change in linear momentum



We have, $F \cdot t = mv_f - mv_i = m(v_f - v_i)$

or $F(2) = 2 \times 10^3 [0 - (-4)]$

or $2F = 8 \times 10^3$ or $F = 4 \times 10^3$ N

2. Using $\mathbf{J} = m(\mathbf{v}_f - \mathbf{v}_i)$

$$-3m\,\hat{\mathbf{i}} = m[\mathbf{v}_f - (2\hat{\mathbf{i}} + 3\hat{\mathbf{j}})]$$

or $\mathbf{v}_f = -3\hat{\mathbf{i}} + (2\hat{\mathbf{i}} + 3\hat{\mathbf{j}})$

or $\mathbf{v}_f = -\hat{\mathbf{i}} + 3\hat{\mathbf{j}}$

Note *The velocity component in the direction of $\hat{\mathbf{j}}$ is unchanged. This is because there is no impulse component in this direction.*

3. Impulse = area under F - t graph

$$= \Delta p = m(v_f - v_i)$$

$$\therefore \quad v_f = \frac{\text{Area}}{m} \qquad (\text{as } v_i = 0)$$

$$= \frac{1}{2} \times \frac{(20 \times 10^3)(8 + 16)}{12000}$$

$$= 200 \text{ m/s}$$ **Ans.**

4. (a) $v^2 = u^2 - 2as$

$$\therefore \quad a = \frac{u^2}{2s} \qquad (v = 0)$$

$$= \frac{(100)^2}{2 \times 0.06} = 8.3 \times 10^4 \text{ m/s}^2$$

$$v = u - at$$

$$0 = u - at$$

or $$t = \frac{u}{a} = \frac{100}{8.3 \times 10^4}$$

$$= 1.2 \times 10^{-3} \text{ s}$$ **Ans.**

(b) Impulse $= |\Delta p| = m v_i$

$$= (5 \times 10^{-3})(100)$$

$$= 0.5 \text{ N-s}$$ **Ans.**

(c) Impulse $= (F_{\text{av}})\,t$

$$\therefore \quad F_{\text{av}} = \frac{\text{Impulse}}{t}$$

$$= \frac{0.5}{1.2 \times 10^{-3}}$$

$$= 417 \text{ N}$$ **Ans.**

INTRODUCTORY EXERCISE 11.6

1. At maximum extension their velocities are same. This common velocity is given by

$$v = \frac{\text{Total momentum}}{\text{Total mass}}$$

$$= \frac{2 \times 6 - 1 \times 3}{3 + 6} = 1 \text{ m/s}$$

Now, $E_i = E_f$

$$\therefore \quad \frac{1}{2} \times 6 \times (2)^2 + \frac{1}{2} \times 3 \times (1)^2 = \frac{1}{2} \times 9\,(1)^2 + \frac{1}{2} \times 200 \times x_m^2$$

Solving we get, $x_m = 0.3$ m

$$= 30 \text{ cm}$$ **Ans.**

2. Substituting the values in above result

$$\frac{K_i - K_f}{K_i} = \frac{4\,m_1 m_2}{(m_1 + m_2)^2}$$

$$= \frac{4 \times m \times 2m}{(m + 2m)^2}$$

$$= \frac{8}{9} \qquad \textbf{Ans.}$$

3. $$\frac{K_i - K_f}{K_i} = 1 - \frac{K_f}{K_i}$$

$$= \frac{1 - \frac{1}{2} m_1 v_1'^{\,2}}{\frac{1}{2} m_1 v_1^2} = 1 - \left(\frac{v_1'}{v_1}\right)^2$$

$$= 1 - \left[\frac{(m_1 - m_2)}{(m_1 + m_2)} v_1 / v_1\right]^2$$

$$= \frac{4\,m_1 m_2}{(m_1 + m_2)^2} \qquad \textbf{Ans.}$$

4. $$v_1' = \left(\frac{m_1 - m_2}{m_1 + m_2}\right) v_1 + \left(\frac{2m_2}{m_1 + m_2}\right) v_2$$

We can see that $v_1' = v_2$ only if $m_1 = m_2$

Similarly $v_2' = v_1$ if $m_1 = m_2$.

5. In elastic collision between two equal masses, velocities are interchanged.

6. $$v_1' = \left(\frac{m_1 - m_2}{m_1 + m_2}\right) v_1 + \left(\frac{2m_2}{m_1 + m_2}\right) v_2$$

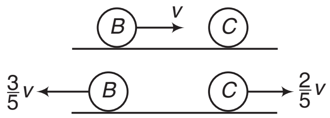
$$= \left(\frac{1-2}{1+2}\right)(+4) + \left(\frac{2 \times 2}{1+2}\right)(-6)$$

$$= -\frac{28}{3}\ \text{m/s} \qquad \textbf{Ans.}$$

$$v_2' = \left(\frac{2-1}{1+2}\right)(-6) + \left(\frac{2 \times 1}{1+2}\right)(+\,4)$$

$$= \frac{2}{3}\ \text{m/s} \qquad \textbf{Ans.}$$

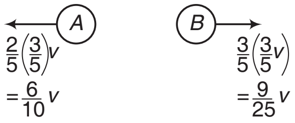
7. **After first collision with $B + C$**



$$v_B' = \left(\frac{m - 4m}{m + 4m}\right) v = -\frac{3}{5} v$$

$$v_C' = \left(\frac{2 \times m}{m + 4m}\right) v = \frac{2}{5} v$$

After second collision with $B + A$



Now since $\frac{9}{25} v < \frac{2}{5} v$ or v_C

So, B will not collide with C further.

Hence total collisions are only 2.

8. 
$$p_i = p_f$$

$$\therefore \quad mv = m\frac{v'}{2} + mv'$$

$$\therefore \quad v' = \frac{2}{3} v$$

Now, $$e = \frac{RVOS}{RVOA} = \frac{v' - v'/2}{v}$$

$$= \frac{v'/2}{v} = \frac{(1/3\,v)}{v} = \frac{1}{3} \qquad \textbf{Ans.}$$

9. (a) $p_i = p_f$

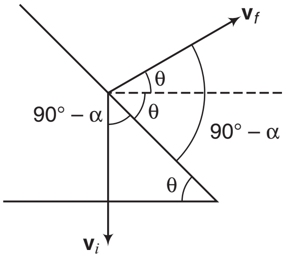
$$\therefore \quad mv = MV$$

$$\Rightarrow \quad M = \frac{mv}{V}$$

(b) $$e = \frac{RVOS}{RVOA} = \frac{V}{v}$$

10. Component parallel to wall will remain unchanged and component perpendicular to wall will become e times but in opposite direction.

11. Initial velocity vector is making an angle of 90° – α with plane. Therefore final velocity vector will also make an angle 90° – α with inclined plane.



$\therefore$ Angle of $\mathbf{v}_f$ with horizontal

$$\theta = (90° - \alpha) - \alpha$$

$$\theta = (90° - 2\alpha) \qquad \textbf{Ans.}$$

Exercises

LEVEL 1

Assertion and Reason

1. 
In the above case, centre of mass lies outside the body.

2. $a_{\text{CM}} = \dfrac{F}{3m} = \text{constant}$

$\therefore \quad v_{\text{CM}} = a_{\text{CM}}t = \dfrac{F}{3m}\,t$

or $\quad v_{\text{CM}} \propto t$

3. To conserve linear momentum, forces can act on a system but their vector sum should be zero.

4. Gases inside the rocket are pushed backwards.

5. Net vector sum of all internal forces = 0. So, they cannot change the linear momentum.

6. $p_1 = p_2$

$\therefore \quad \sqrt{2K_1 m_1} = \sqrt{2K_2 m_2}$

or $\quad \dfrac{K_1}{K_2} = \dfrac{m_2}{m_1}$

$\Rightarrow \quad K \propto \dfrac{1}{m}$

7. Of the two masses A and B, mass A is moving downwards. Therefore net force on the system is vertically downwards and momentum is not conserved in vertical direction.

8. $\Delta p_1 + \Delta p_2 = 0$

or $\quad \Delta p_1 = -\Delta p_2$

10. Energy can be given in the form of potential energy without giving the momentum.

11. Centre of mass remains stationary.

12. $e = \dfrac{RVOS}{RVOA}$

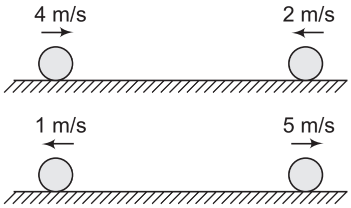
For elastic collision $e = 1$

$\therefore \quad RVOS = RVOA$

Before collision they approach towards each other and after collision they recede from each other.

13. Centre of mass remains stationary.

15. Relative velocity of separation is equal to the relative velocity of approach. One of the case is shown below.



Before collision, relative speed is 2 m/s and relative velocity of approach is 6 m/s.
After collision, relative speed is 4 m/s and relative velocity of separation is 6 m/s.

Single Correct Option

10. Impulse = $F_{\text{av}}\ (\Delta t) = |\Delta P|$

$$\therefore \quad F_{\text{av}} = \frac{|\Delta P|}{\Delta t} = \frac{m\,(v_i - v_f)}{\Delta t}$$

$$= \frac{(5)\,(65-15)}{2}$$

$$= 125 \text{ N}$$ **Ans.**

11. 
$$\frac{r_1}{r_2} = \frac{m_2}{m_1}$$

$$\therefore \quad r_1 = \left(\frac{m_2}{m_1 + m_2}\right) d$$

$$= \left(\frac{16}{12+16}\right)(1.2 \times 10^{-10})$$

$$= 0.68 \times 10^{-10}\text{m}$$ **Ans.**

12. 
$$3v_1 = 6v^2$$

$$v_2 = \frac{3v_1}{6}$$

$$= \frac{3 \times 16}{6} = 8 \text{ m/s}$$

$$(\text{KE})_{6\text{ kg}} = \frac{1}{2} \times 6 \times (8)^2$$

$$= 192 \text{ J}$$ **Ans.**

13. 
$$m_1 >> m_2$$

$$v_2' = \left(\frac{m_2 - m_1}{m_1 + m_2}\right) v_1 + \left(\frac{2m_1}{m_1 + m_2}\right) v_2$$

Substituting $m_2 \approx 0$ and $v_1 = 0$ we get,

$$v_2 \approx 2v$$

14. Velocity of dropped out mass is also 6 m/s. So its relative velocity is zero and no thrust force will act. Therefore final speed remains 6 m/s.

15. $F = \frac{\Delta p}{\Delta t} = n\,(mv)$

Here n = number of bullets fired per second

$$\Rightarrow \qquad n = \frac{F}{mv}$$

$$= \frac{144}{(40 \times 10^{-3})\,(1200)} = 3 \qquad \textbf{Ans.}$$

16. $|\Delta \mathbf{p}| = |\,\text{Impulse}\,| = |\mathbf{F} \cdot \Delta t|$

Here $\qquad \Delta t = T = \frac{2v \sin 45^\circ}{g} = \frac{\sqrt{2}\,v}{g}$

and $\qquad |\,\mathbf{F}\,| = mg$

$\therefore \qquad |\Delta \mathbf{p}| = (mg)\left(\frac{\sqrt{2}\,v}{g}\right)$

$$= \sqrt{2}\,mv \qquad \textbf{Ans.}$$

17. Velocity of ball just before collision with ground,

$$v = \sqrt{2gh} = \sqrt{2 \times 9.8 \times 4.9} = 9.8 \text{ m/s}$$

Velocity just after collision,

$$u = ev = \left(\frac{3}{4}\right)(9.8) \text{ m/s}$$

$$T = \frac{2u}{g} = \frac{2 \times (3/4) \times 9.8}{9.8} = \frac{3}{2} \text{ s}$$

18. 
dm = (Mass per unit length) (Length)

$$= \left(\frac{kx^2}{L}\right) dx \quad \Rightarrow \quad X_{\text{COM}} = \frac{\int_0^L x\,dm}{\int_0^L dm}$$

$$= \frac{\int_0^L (x)\left(\frac{kx^2}{L}\right) dx}{\int_0^L \left(\frac{kx^2}{L}\right) dx} = \frac{3}{4} L \qquad \textbf{Ans.}$$

19. 
$$450\,x = 50\,(10 - x)$$

$\therefore \qquad x = 1 \text{ m} \qquad$ **Ans.**

20. 
$$\frac{M}{3}\,x = M\,(L - x)$$

$$x = \frac{3}{4}\,L$$

$\therefore$ Displacement of man relative to ground

$$= L - x = \frac{L}{4} \qquad \textbf{Ans.}$$

21. 
Before collision   After collision

From conservation of momentum we can see that velocity of heavier mass after collision becomes $\frac{v}{3}$.

Now, coefficient of restitution,

$$e = \frac{RVOS}{RVOA} = \frac{v/3}{v} = \frac{1}{3} \qquad \textbf{Ans.}$$

22. In elastic collision between equal masses velocities are interchanged. Therefore change in momentum in any one particle is mu.

Now, $\qquad |\Delta \mathbf{p}| = |\,\text{Impulse}\,|$

$\qquad = \text{area under } F\text{-}t \text{ graph}$

$\therefore \qquad mu = \frac{1}{2} \times t_0 \times F_0$

$\therefore \qquad F_0 = \frac{2\,mu}{t_0} \qquad$ **Ans.**

23. Acceleration of centre of mass $= \frac{F}{2m}$

$$a_{\text{CM}} = \frac{m_1 a_1 + m_2 a_2}{m_1 + m_2}$$

$\therefore \qquad \frac{F}{2m} = \frac{(m)\,(a_0) + (m)\,a_2}{2m}$

$\therefore \qquad a_2 = \frac{F}{m} - a_0 \qquad$ **Ans.**

24. Impulse $= \Delta\,\mathbf{p} = m\,(\mathbf{v}_f - \mathbf{v}_i)$

$$= m\left[\left(-\frac{3}{4}\,v_0 \cos 53^\circ \hat{\mathbf{i}} + \frac{3}{4}\,v_0 \sin 53^\circ \hat{\mathbf{j}}\right) - (v_0 \cos 37^\circ \hat{\mathbf{i}} + v_0 \sin 37^\circ \hat{\mathbf{j}}\,)\right]$$

$$= -\frac{5}{4}\,mv_0 \hat{\mathbf{i}} \qquad \textbf{Ans.}$$

25. $h_n = (e^{2n})\, hi$ ...(i)

Given that

$$(64 \text{ cm}) = (e^2)\,(100 \text{ cm})$$

$$\therefore \qquad e = 0.8$$

Substituting in Eq. (i) we have

$$h_n = (0.8)^{2n}\,(1\text{m})$$

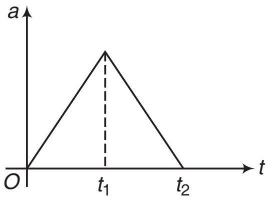
$$= (0.8)^{2n}$$ **Ans.**

26. $\mathbf{p}_i = \mathbf{p}_f$

$\therefore$ $(500)\,(\hat{\mathbf{i}}) = (25)\,(20\hat{\mathbf{j}}) + 475\mathbf{v}$

$$\therefore \qquad \mathbf{v} = \left[\left(\frac{20}{19}\,\hat{\mathbf{i}}\right) - \left(\frac{20}{19}\,\hat{\mathbf{k}}\right)\right] \text{m/s}$$ **Ans.**

27. $a = \dfrac{F}{m}$ or $a \propto F$



Hence, a-t graph is similar to F-t graph.

From *O* to t_1

$$a \propto t$$

or $\qquad a = kt \quad (k \rightarrow \text{a positive constant})$

Integrating we get,

$$v = \frac{kt^2}{2} \quad \text{or} \quad v \propto t^2$$

i.e. v-t graph is a parabola passing through origin.

From t_1 to t_2 again acceleration is positive (in the direction of velocity). So, velocity will further increase.

28. $$x_{\text{CM}} = \frac{A_1x_1 - A_2x_2}{A_1 - A_2}$$

$$= \frac{\pi\,(3R)^2\,(0) - (\pi R^2)\,(2R)}{\pi\,(3R)^2 - \pi R^2} = -\frac{R}{4}$$

$\therefore$ Distance of centre of mass from origin $= \dfrac{R}{4}$ **Ans.**

29. $$\mathbf{r}_{\text{CM}} = \frac{A_1\mathbf{r}_1 - A_2\mathbf{r}_2 - A_3\mathbf{r}_3}{A_1 - A_2 - A_3}$$

$$= \frac{\pi\,(4R)^2\,(0) - (\pi R^2)\,(3R\hat{\mathbf{i}}) - (\pi R^2)\,(3R\hat{\mathbf{j}})}{\pi\,(4R)^2 - \pi R^2 - \pi R^2}$$

$$= \left(-\frac{3R}{14}\,\hat{\mathbf{i}} - \frac{3R}{14}\,\hat{\mathbf{j}}\right)$$ **Ans.**

30. Net horizontal force on system is zero, Therefore, centre of mass does not move in horizontal. Further, all surfaces are smooth. Therefore mechanical energy of the system remains constant.

31. Ler v' is the velocity of $(M + m)$ after collision. Then from conservation of linear momentum we have,

$$mv = (M + m)\,v'$$

$$\therefore \qquad v' = \left(\frac{m}{M + m}\right) v$$

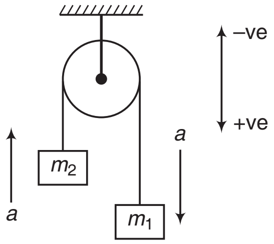
Now, $\qquad v' = \sqrt{2gh}$

$$\therefore \qquad \left(\frac{m}{M + m}\right) v = \sqrt{2gh}$$

or $\qquad v = \sqrt{2gh}\left(\dfrac{M + m}{m}\right)$

32. Net horizontal force on system is zero.

33.



$$a = \frac{\text{Net pulling force}}{\text{Total mass}}$$

$$= \frac{m_1g - m_2g}{m_1 + m_2}$$

$$= \left(\frac{m_1 - m_2}{m_1 + m_2}\right) g \qquad \text{...(i)}$$

Now, $\qquad a_{\text{CM}} = \dfrac{m_1\,a_1 + m_2\,a_2}{m_1 + m_2}$

$$a_{\text{CM}} = \frac{m_1\,(+a) + m_2\,(-a)}{m_1 + m_2}$$

$$= \left(\frac{m_1 - m_2}{m_1 + m_2}\right) a$$

Substituting the value of a from Eq. (i) we have,

$$a_{\text{CM}} = \left(\frac{m_1 - m_2}{m_1 + m_2}\right)^2 g$$ **Ans.**

34. Using the equation,

$$v = u - gt + v_r \ln\left(\frac{m_0}{m}\right)$$

Substituting the values we get,

$$v_r = 0 - 0 + v_r \ln\left(\frac{m_0}{m}\right)$$

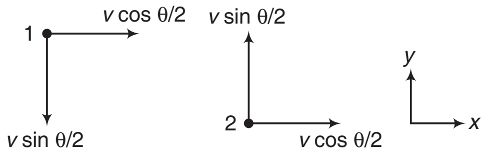
$$\therefore \qquad \frac{m_0}{m} = e = 2.178 \qquad \textbf{Ans.}$$

35. $v_i = 1\text{ m/s},\ v_f = 0$

$$|F| = \left|\frac{\Delta p}{\Delta t}\right| = \left(\frac{\Delta m}{\Delta t}\right)(v_i - v_f)$$

$$= 0.5 \times 1 = 0.5\text{ N}$$

36.



From the figure, we can see that velocity of approach is $2v \sin\frac{\theta}{2}$.

$$e = \frac{RVOS}{RVOA}$$

For completely inelastic collision, $e = 0$

$$\therefore \qquad RVOS = 0$$

$$\mathbf{p}_i = \mathbf{p}_f$$

$$\therefore \quad m\left[v\cos\frac{\theta}{2}\hat{\mathbf{i}} - v\sin\frac{\theta}{2}\hat{\mathbf{j}}\right] + m\left[v\cos\frac{\theta}{2}\hat{\mathbf{i}} + v\sin\frac{\theta}{2}\hat{\mathbf{j}}\right]$$

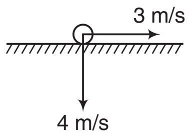
$$= 2m\mathbf{v}_c$$

$$\therefore \quad \text{Common velocity } \mathbf{v}_c = \left(v\cos\frac{\theta}{2}\right)\hat{\mathbf{i}}$$

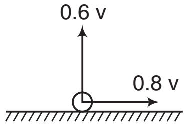
37. Component parallel to plane remains unchanged.

$$\therefore \qquad 0.8\,v = 3$$

$$\text{or} \qquad v = \frac{3}{0.8} = 3.75\text{ m/s}$$



Just before collision



Just after collision

$|\Delta v| = (4 + 0.6\,v) = 6.25\text{ m/s}$ (in vertical direction)

$\therefore$ Impulse $= |\Delta p| = m\,|\Delta v| = 6.25$ N-s **Ans.**

38. Horizontal side of wedge is $h\cot\theta$.

$$Mx = m(h\cot\theta - x)$$

$$\therefore \qquad x = \frac{mh\cot\theta}{M + m} \qquad \textbf{Ans.}$$

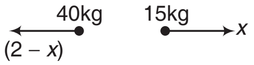
39. $$x_{CM} = \frac{A_1x_1 + A_2x_2 + A_3x_3 + A_4x_4}{A_1 + A_2 + A_3 + A_4}$$

$$= \frac{(4)(1) + (4)(1) + (4)(3) + (4)(3)}{16} = 2\text{cm}$$

$$y_{CM} = \frac{A_1y_1 + A_2y_2 + A_3y_3 + A_4y_4}{A_1 + A_2 + A_3 + A_4}$$

$$= \frac{(4)(1) + 4(3) + 4(3) + 4(3)}{16} = 2.5\text{cm}$$

40.



$$40(2 - x) = 15x$$

$$\therefore \qquad x = 1.46\text{ m} \qquad \textbf{Ans.}$$

41. $\mathbf{p}_i = \mathbf{p}_f$

$$\therefore \quad m(v_0\hat{\mathbf{i}}) + m(-3\,v_0\hat{\mathbf{j}}) + m(5\,v_0\hat{\mathbf{k}})$$

$$= 3m\mathbf{v}$$

$$\therefore \qquad \mathbf{v} = \frac{v_0}{3}(\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 5\hat{\mathbf{k}}) \qquad \textbf{Ans.}$$

42. $$x_{CM} = \frac{m_1x_1 + m_2x_2}{m_1 + m_2}$$

$$\therefore \qquad R = \frac{(M/5)(0) + (4M/5)D}{M}$$

$$\therefore \qquad D = \frac{5}{4}R \qquad \textbf{Ans.}$$

Subjective Questions

1. $$x_{CM} = \frac{A_1x_1 - A_2x_2}{A_1 - A_2}$$

$$= \frac{(ab)(0) - \left(\frac{ab}{4}\right)\left(\frac{a}{4}\right)}{ab - \frac{ab}{4}}$$

$$= -\frac{a}{12}$$

$$y_{CM} = \frac{A_1y_1 - A_2y_2}{A_1 - A_2}$$

$$= \frac{(ab)(0) - \left(\frac{ab}{4}\right)\left(\frac{b}{4}\right)}{ab - \frac{ab}{4}}$$

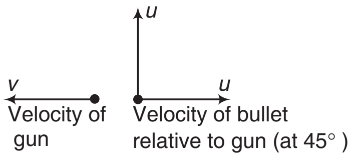
$$= -\frac{b}{12}$$

2. $$x_{CM} = \frac{V_1x_1 - V_2x_2}{V_1 - V_2} \qquad (V = \text{volume})$$

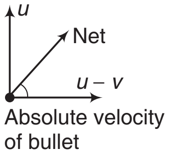
$$= \frac{\left(\frac{4}{3}\pi R^3\right)(0) - \left(\frac{4\pi a^3}{3}\right)(b)}{\left(\frac{4}{3}\pi R^3\right) - 4\left(\frac{\pi a^3}{3}\right)}$$

$$= \frac{-a^3 b}{R^3 - a^3}$$ **Ans.**

3.



At 45° means horizontal and vertical components are same (let u).



In absolute velocity, since horizontal component of velocity has been decreased ($= u - v$). Therefore, $\theta > 45°$

4. $p = \text{constant}$

$$\therefore \qquad \sqrt{2\,Km} = \text{constant}$$

$$\text{or} \qquad K \propto \frac{1}{m}$$

5. In head on elastic collision between two equal masses, velocities are interchanged.

6. At maximum elastic potential energy, velocity of both particles is same. This common velocity will be given by

$$v = \frac{\text{Total momentum}}{\text{Total mass}}$$

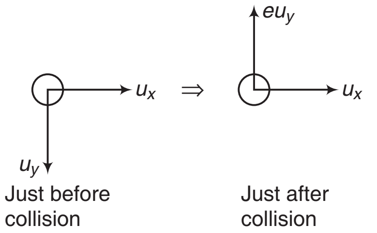
$$= \frac{\sqrt{2Km}}{2m} = \sqrt{\frac{K}{2m}}$$

$$E_i = E_f$$

$$K = \frac{1}{2} \times 2m\left(\sqrt{\frac{K}{2m}}\right)^2 + v_{\max}$$

$$\therefore \qquad v_{\max} = \frac{K}{2}$$ **Ans.**

7. Just after collision x-component of velocity remain unchanged but y-component of velocity becomes e times.



$$\text{Now,} \quad T = \frac{2u_y}{g},\ H = \frac{u_y^2}{2g} \quad \text{and} \quad R = \frac{2u_x\,u_y}{g}$$

$$\text{or} \qquad T \propto u_y\,,\ H \propto u_y^2 \text{ and } R \propto u_y$$

$$\therefore \qquad \frac{T_1}{T_2} = a = \frac{u_y}{eu_y} = \frac{1}{e}$$

$$\frac{R_1}{R_2} = b = \frac{u_y}{eu_y} = \frac{1}{e}$$

$$\text{and} \qquad \frac{H_1}{H_2} = c = \frac{(u_y)^2}{(eu_y)^2} = \frac{1}{e^2}$$

8. (a) $$\mathbf{a}_{COM} = \frac{m_1\mathbf{a}_1 + m_2\mathbf{a}_2}{m_1 + m_2}$$

$$= \frac{(1)(-10\hat{\mathbf{j}}) + (2)(-10\hat{\mathbf{j}})}{1+2}$$

$$= (-10\hat{\mathbf{j}})\ \text{m/s}^2$$ **Ans.**

(b) $$\mathbf{v}_{COM} = \frac{m_1\mathbf{v}_1 + m_2\mathbf{v}_2}{m_1 + m_2}$$

$$= \frac{m_1(\mathbf{u}_1 + \mathbf{a}_1t) + m_2(\mathbf{u}_2 + \mathbf{a}_2t)}{m_1 + m_2}$$

$$= \frac{(1)[0 + (-10\hat{\mathbf{j}})(1)] + 2[(10\hat{\mathbf{i}} + 10\hat{\mathbf{j}}) + (-10\hat{\mathbf{j}})(1)]}{1+2}$$

$$= \frac{10}{3}(2\hat{\mathbf{i}} - \hat{\mathbf{j}})\ \text{m/s}$$ **Ans.**

(c) $$\mathbf{r}_{CM} = \frac{m_1\mathbf{r}_1 + m_2\mathbf{r}_2}{m_1 + m_2}$$

$$= \frac{m_1\left[\mathbf{r}_i + \mathbf{u}t + \frac{1}{2}\mathbf{a}t^2\right]_1 + m_2\left[\mathbf{r}_i + \mathbf{u}t + \frac{1}{2}\mathbf{a}t^2\right]_2}{m_1 + m_2}$$

$$= \frac{1\left[(10\hat{\mathbf{i}} + 20\hat{\mathbf{j}}) + 0 + \frac{1}{2}(-10\hat{\mathbf{j}})(1)^2\right] + 2\left[(20\hat{\mathbf{i}} + 40\hat{\mathbf{j}}) + (10\hat{\mathbf{i}} + 10\hat{\mathbf{j}})(1) + \frac{1}{2}(-10\hat{\mathbf{j}})(1)^2\right]}{1+2}$$

$$= \left(\frac{70}{3}\hat{\mathbf{i}} + 35\hat{\mathbf{j}}\right)\ \text{m}$$ **Ans.**

9. (a) $$y_{CM} = \frac{m_1 y_1 + m_2 y_2}{m_1 + m_2}$$

$$\therefore \quad 24 = \frac{(0.6)\,(80) + (m_2)\,(0)}{\text{Total mass}}$$

∴ Total mass = 2 kg **Ans.**

(b) $$\mathbf{a}_{CM} = \frac{d}{dt}(\mathbf{v}_{CM}) = \frac{d}{dt}[6t^2]\,\hat{\mathbf{j}}$$

$$= (12t)\,\hat{\mathbf{j}}\ \text{m/s}^2$$ **Ans.**

(c) $$\mathbf{F}_{\text{ext}} = m_{CM}\,\mathbf{a}_{CM} = m_{CM}\frac{d}{dt}(\mathbf{v}_{CM})$$

$$= m_{CM}\,(12t)\,\hat{\mathbf{j}}$$

At $t = 3$ s , $\mathbf{F}_{\text{ext}} = (2\text{kg})\,(12)\,(3)\,\hat{\mathbf{j}}$ N

$$= (72\hat{\mathbf{j}})\ \text{N}$$ **Ans.**

10. (a) $$\mathbf{v}_c = \frac{m_1\mathbf{u}_1 + m_2\mathbf{u}_2}{m_1 + m_2} = \mathbf{0.8\,\hat{i}}\ \text{m/s}$$

(b) $\mathbf{v}_1 = -1.6\,\hat{\mathbf{i}}$ m/s

From COM, $m_1\mathbf{u}_1 + m_2\mathbf{u}_2 = m_1\mathbf{v}_1 + m_2\mathbf{v}_2$

⇒ $v_2 = 2.4\hat{\mathbf{i}}$ m/s

(c) $$e = \frac{v_2 - v_1}{u_1 - u_2} = \frac{4}{7}$$

11. Fuel is finished in 40 s

$$v = u - gt + v_r \ln\left(\frac{m_0}{m}\right)$$

$$= 0 - 10 \times 40 + (2 \times 10^3)\ln\left(\frac{200}{40}\right)$$

$$= 2818\ \text{m/s} = 2.82\ \text{km/s}$$ **Ans.**

12. Let v is the horizontal velocity of platform in opposite direction. Then from momentum conservation in opposite direction we have,

$$(60 + 40)\,v = (1)\,(10\cos 45°)$$

$$\therefore \quad v = \frac{10}{100}\cos 45°\ \text{m/s}$$

$$= \frac{10}{\sqrt{2}}\ \text{cm/s}$$

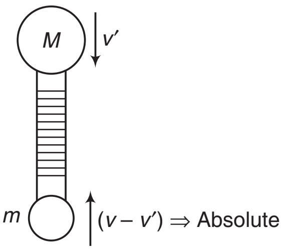
∴ Displacement of platform = vt

$$= \frac{(v)\,(2u\sin 45°)}{g}$$

$$= \left(\frac{10}{\sqrt{2}}\right) = \frac{2 \times 10 \times \frac{1}{\sqrt{2}}}{10}$$

$$= 10\ \text{cm}$$ **Ans.**

13. Since the system (or COM) was initially at rest. So it will always remain at rest. Because the net external forces are not changing.



(a) $Mv' = m\,(v - v')$

$$\therefore \quad v' = \frac{mv}{M + m}$$ **Ans.**

(b) If man stops climbing, then balloon will also stop to keep the system at rest.

14. $$\frac{F}{m} = \frac{v_r\left(-\frac{dm}{dt}\right)}{m} = a = \text{constant}$$

$$\therefore \quad \frac{u\left(-\frac{dm}{dt}\right)}{m} = a$$

$$\therefore \quad \int_{m_0}^{m} -\frac{dm}{m} = \int_0^t \frac{a}{u}\,dt$$

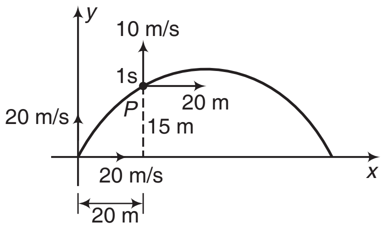
Solving this equation we get,

$$m = m_0\,e^{-at/u}$$ **Ans.**

15. At 1 seconds particle is at point P as shown in figure. Let velocity of second part is $\mathbf{v}$. Then applying momentum conservation, just before and just after explosion we have,

$$2m\,(20\hat{\mathbf{i}} + 10\hat{\mathbf{j}}) = m\,(0) + m\mathbf{v}$$

$$\therefore \quad \mathbf{v} = (40\hat{\mathbf{i}} + 20\hat{\mathbf{j}})$$



Its vertical component of velocity is still 20 m/s. So total height,

$$h = h_i + \frac{u^2}{2g}$$

$$= 15 + \frac{(20)^2}{2 \times 10}$$

$$= 35\,\text{m}$$ **Ans.**

16. $h = (1+1)\text{ m} = 2\text{m}$

$\therefore \quad v = \sqrt{2gh}$

$= \sqrt{2 \times 10 \times 2}$

$= 6.32\text{ m/s}$ (downwards)

Impulse $= \Delta p = m\,(v_f - v_i)$

$= (1)\,[0 - (-6.32)] = 6.32\text{ N-s}$ (upwards)

18. In elastic collision, velocities are interchanged. So, v is minimum

$\therefore \quad \frac{1}{2} \times 0.1 \times v^2 = 0.2$

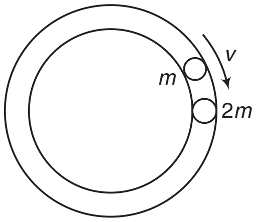
$\therefore \quad v = 2\text{ m/s} =$ minimum value **Ans.**

In perfectly inelastic collision, speed of combined mass will remain half.

$\therefore \quad \frac{1}{2} \times 0.1 \times \left(\frac{v}{2}\right)^2 = 0.2$

$\therefore \quad v = 2\sqrt{2}\text{ m/s} =$ maximum value **Ans.**

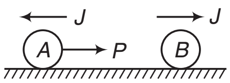
19. Since collision is elastic. It means relative velocity of separation will remain v and relative velocity means one mass is assumed at rest.



$\therefore \quad t = \frac{2\pi r}{v}$ **Ans.**

20. $J =$ impulse $=$ change in momentum

$$e = \frac{RVOS}{RVOA}$$



Initial momenta

Final momenta

$$= \frac{(J/m) + (J\text{-}P/m)}{(P/m)}$$

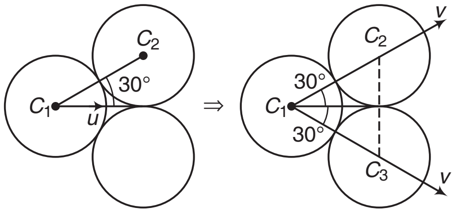
$$= \frac{2J}{P} - 1$$ **Ans.**

21. $p_i = p_f$

$\therefore \quad mu = 2\,mv\cos 30°$

or $\quad v = \frac{u}{\sqrt{3}}$

$e = \frac{RVOS}{RVOA}$ (along C_1C_2 or C_1C_3)



$$= \frac{v}{u\cos 30°} = \frac{(u/\sqrt{3})}{\sqrt{3}\,u/2} = \frac{2}{3}$$ **Ans.**

22. For the collision

$1 \times 10 = 10 \times v \quad \Rightarrow \quad v = 1\text{m/s}$

If x be the maximum compression

$$\frac{1}{2} \times 10 \times 1^2 = \mu\,(m+M)\,gx + \frac{1}{2}kx^2$$

$$5 = 10x + 120x^2$$

$\Rightarrow \quad x = \frac{1}{6}m$ **Ans.**

23.

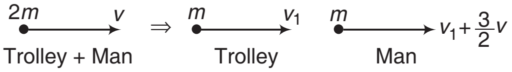
$$m_A\,x_A = m_B\,x_B$$

$\therefore \quad (5)\,(0.5 - x) = 30x$

$\therefore \quad x = 0.0714\text{ m}$

$= 71.4\text{ mm}$ **Ans.**

24. $t_1 = \frac{L}{(3/2)\,v} = \frac{2L}{3v}$



$$t_2 = \frac{L}{(3/2)\,v} = \frac{2L}{3v}$$

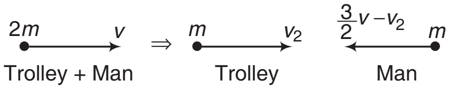
$$p_i = p_f$$

$\therefore \quad 2\,mv = mv_1 + m\left(v_1 + \frac{3}{2}v\right)$

$$v_1 = \frac{v}{4}$$

$\therefore \quad s_1 = v_1\,t_1 = \left(\frac{v}{4}\right)\left(\frac{2L}{3v}\right) = \frac{L}{6}$

In return journey



$$p_i = p_f$$

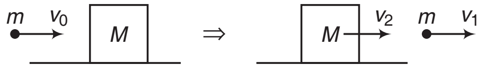
$$\therefore \quad 2\,mv = mv_2 - m\left(\frac{3}{2}v - v_2\right)$$

$$\therefore \quad v_2 = \frac{7}{4}\,v$$

or $$s_2 = v_2 t_2 = \left(\frac{7}{4}v\right)\left(\frac{2L}{3v}\right) = \frac{7L}{6v}$$

$$s_{\text{Total}} = s_1 + s_2 = \frac{4L}{3}$$ **Ans.**

25.



(a) $p_i = p_f$

$$\therefore \quad mv_0 = mv_1 + mv_2$$

$$\therefore \quad v_2 = \frac{mv_0 - mv_1}{M}$$

$$= \frac{(0.004)\,(500-100)}{1.0}$$

$$= 1.6 \text{ m/s}$$

Retardation due to friction,

$$a = \frac{\mu mg}{m} = \mu g = (10\,\mu)$$

$$s = \frac{v_2^2}{2a} = \frac{v_2^2}{20\,\mu}$$

$$\therefore \quad \mu = \frac{v_2^2}{20s}$$

$$= \frac{(1.6)^2}{20 \times 0.3} = 0.43$$ **Ans.**

(b) Decrease in kinetic energy of bullet

$$= \frac{1}{2}m\,(v_0^2 - v_1^2)$$

$$= \frac{1}{2} \times 0.004\,[\,(500)^2 - (100)^2\,]$$

$$= 480 \text{ J}$$ **Ans.**

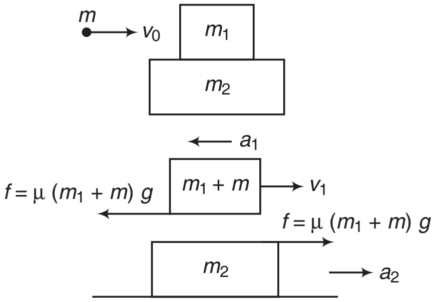
(c) Kinetic energy of block,

$$= \frac{1}{2}\,Mv_2^2$$

$$= \frac{1}{2} \times 1.0 \times (1.6)^2$$

$$= 1.28 \text{ J}$$ **Ans.**

26.



(i) Common velocity $= \dfrac{\text{Initial momentum}}{\text{Total mass}}$

$$v_c = \frac{0.25 \times 302}{0.25 + 37.5 + 1.25}$$

$$= 1.94 \text{ m/s}$$ **Ans.**

(ii) $$v_1 = \frac{\text{Initial momentum}}{m_1 + m}$$

$$= \frac{0.25 \times 302}{37.5 + 0.25} = 2 \text{ m/s}$$

$$a_1 = \frac{f}{m_1 + m} = \mu g = 5 \text{ m/s}^2$$

$$a_2 = \frac{f}{m_1 + m + m_2} = \left(\frac{m_1 + m}{m_1 + m + m_2}\right)\mu g$$

$$= \left(\frac{37.5 + 0.25}{37.5 + 0.25 + 1.25}\right)(0.5 \times 10)$$

$$= 4.84 \text{ m/s}^2$$

$$a_r = a_1 - a_r = 0.16 \text{ m/s}^2$$

Common velocity is achieved when, v_1 converts into v_c by a retardation a_1.

$$\therefore \quad v_c = v_1 - a_1 t$$

$$\therefore \quad t = \frac{v_1 - v_c}{a_1} = \frac{2 - 1.94}{5}$$

$$= 0.012 \text{ s}$$

Now, $$s_r = \frac{1}{2}\,a_r t^2$$

$$= \frac{1}{2} \times 0.16 \times (0.012)^2$$

$$= 0.011 \text{ mm}$$ **Ans.**

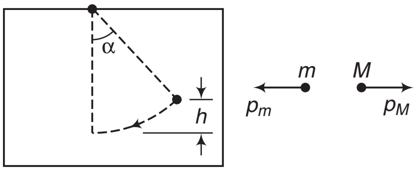
27. $h = l\,(1 - \cos\alpha)$ ...(i)

$$p_m = p_M \text{ (in opposite directions)}$$

$$\therefore \quad \sqrt{2K_m m} = \sqrt{2K_M M}$$

or $$\frac{K_m}{K_M} = \frac{M}{m}$$ ...(ii)

$$K_m + K_M = mgh = mgl\,(1 - \cos\alpha) \qquad \text{...(iii)}$$



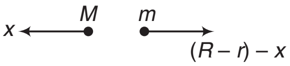
Solving these three equations we get,

$$K_M = \left(\frac{m}{m + M}\right) mgl\,(1 - \cos\alpha)$$

$$\therefore \quad \frac{1}{2} Mv_M^2 = \left(\frac{m}{M + m}\right) mgl\,(1 - \cos\alpha)$$

$$\therefore \quad v_m = 2m \sin\frac{\alpha}{2}\sqrt{\frac{gl}{M(M + m)}} \qquad \textbf{Ans.}$$

28. (i)



$$Mx = m\,(R - r - x)$$

$$\therefore \quad x = \frac{m\,(R - r)}{M + m} \qquad \textbf{Ans.}$$

(ii)

$$p_M = p_m$$

$$\therefore \quad \sqrt{2K_M M} = \sqrt{2K_m m}$$

$$\therefore \quad \frac{K_M}{K_m} = \frac{m}{M} \qquad \text{...(i)}$$

$K_m + K_m$ = decrease in potential energy of m

$$= mg\,(R - r) \qquad \text{...(ii)}$$

Solving these two equations we get,

$$K_M = \left(\frac{m}{M + m}\right) mg\,(R - r) = \frac{1}{2} Mv_M^2$$

$$\therefore \quad v_M = m\sqrt{\frac{2g\,(R - r)}{M\,(M + m)}} \qquad \textbf{Ans.}$$

29. (a) $|\Delta \mathbf{p}| = \sqrt{p_1^2 + p_2^2 - 2p_1 p_2 \cos 90°}$

$$= \sqrt{p_1^2 + p_2^2}$$

$$= \sqrt{(0.05 \times 2)^2 + (0.05 \times 2)^2}$$

$$= 0.14 \text{ kg-m/s} \qquad \textbf{Ans.}$$

(b) Initial and final velocity of wall is zero. Therefore change in momentum is zero.

30. $v = \sqrt{2gy}$

Thrust force downwards

$$F = \lambda v^2 \qquad (\lambda = \text{mass/length})$$

or $\quad F = m\,(2gy)$ or $F = 2\,mgy$

y length is lying on table. So its weight

$$W = (ym)\,g$$

Total force on table = $F + W = (3\,mgy)$

= weight of a length $3y$ of the rope

31. Relative velocity of sand is 2 m/s in backward direction. Since mass is increasing, therefore thrust force is in the direction of relative velocity (backwards).

$$\text{Thrust force} = v_r\left(+\frac{dm}{dt}\right)$$

$$= (5)\,(2) = 10 \text{ N} \qquad \text{(backwards)}$$

$\therefore$ Force needed (F_{ext}) to move the belt with constant velocity ($F_{\text{net}} = 0$) is

$$F_{\text{ext}} = F = 10 \text{ N} \qquad \text{(in forward direction)}$$

$$P = F_{\text{ext}}\, v = 20 \text{ W} \qquad \textbf{Ans.}$$

32. Impulse = $\Delta p = p_f - p_i$

$$= m\,(v_f - v_i)$$

$$= (3)\,[40 - (-50)]$$

$$= 270 \text{ N-s}$$

i.e. impulse is 270 N-s (towards right) **Ans.**

Impulse = $F_{\text{av}}\ \Delta t$

$$\therefore \quad F_{\text{av}} = \frac{\text{Impulse}}{\Delta t} = \frac{270}{0.02}$$

$$= 13500 \text{ N}$$

$$= 13.5 \text{ kN} \qquad \text{(towards right)} \qquad \textbf{Ans.}$$

33. $v_3' = \left(\frac{m_3 - m_2}{m_3 + m_2}\right) v_3 + \left(\frac{2m_2}{m_2 + m_3}\right) v_2$

$$= \left(\frac{3 - 2}{3 + 2}\right)(2) + 0 = 0.4 \text{ m/s}$$

$$v_2' = 0 + \left(\frac{2 \times 3}{2 + 3}\right)(2) = 2.4 \text{ m/s}$$

Retardation of each block,

$$a = \frac{\mu_K mg}{m} = \mu_K g = 3 \text{ m/s}^2$$

Before coming to rest

$$s_3 = \frac{v_3'^2}{2a} = \frac{(0.4)^2}{2 \times 3} = 0.03 \text{ m}$$

$$s_2 = \frac{v_2'2}{2a} = \frac{(2.4)^2}{2 \times 3} = 0.96 \text{ m}$$

$$\therefore \quad d = s_2 - s_3 = 0.93 \text{ m} \qquad \textbf{Ans.}$$

LEVEL 2

Single Correct Option

1. Let velocity of m just after collision is v. Then, from conservation of momentum we have,

$$m_1v_1 = mv + m_1\frac{v_1}{3} \quad \Rightarrow \quad \therefore \quad v = \frac{2}{3}\frac{m_1v_1}{m}$$

Now, for just completing the circle,

$$v = \sqrt{5gl}$$

$$\therefore \qquad \frac{2}{3}\frac{m_1v_1}{m} = \sqrt{5gl}$$

$$\therefore \qquad v_1 = \frac{3m}{2m_1}\sqrt{5gl} \qquad \textbf{Ans.}$$

2. $v_m = \sqrt{2gl}$

From conservation of linear momentum,

$$v_{2m} = \frac{v_m}{2} = \frac{\sqrt{2gl}}{2}$$

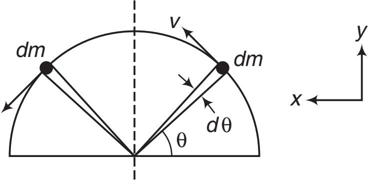
$$\text{Now,} \qquad h = \frac{v_{2m}^2}{2g} = \frac{l}{4}$$

$$\text{But} \qquad h = l(1 - \cos\theta)$$

$$\therefore \qquad \frac{l}{4} = l(1 - \cos\theta)$$

$$\therefore \qquad \theta = \cos^{-1}\left(\frac{3}{4}\right)$$

3. y-components of momenta are cancelled and x-components are added.



$$P = \int_0^\pi dP_x = \int_0^\pi (dm)(v\sin\theta)$$

$$= \int_0^\pi \left(\frac{M}{\pi}\,d\theta\right)(v\sin\theta) = \frac{2Mv}{\pi} \qquad \textbf{Ans.}$$

4. Let v is the velocity of mass $2m$ in natural length of spring, then from conservation of energy we have,

$$\frac{1}{2}kx_0^2 = \frac{1}{2}(2m)v^2$$

$$\therefore \qquad v = \sqrt{\frac{k}{2m}}\,x_0$$

Velocity of centre of mass at this instant,

$$v_{CM} = \frac{\text{Total momentum}}{\text{Total mass}}$$

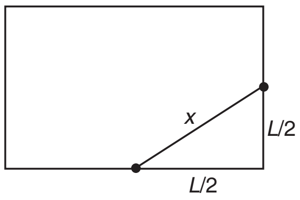
$$= \frac{2mv}{3m} = \frac{2}{3}v = \frac{1}{3}\sqrt{\frac{2k}{m}}\,x_0$$

Now, impulse on system = change in momentum of system

$$\therefore \qquad F_{av}\,\Delta t = (3m)\,v_{CM} = (\sqrt{2mk})\,x_0$$

$$\therefore \qquad F_{av} = \frac{(\sqrt{2mk})\,x_0}{\Delta t} \qquad \textbf{Ans.}$$

5. Retardation, $a = \frac{\mu\, mg}{m} = \mu g$



$$= 0.2 \times 10 = 2\ \text{m/s}^2$$

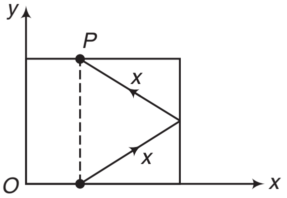
Total distance travelled before coming to rest,

$$d = \frac{u^2}{2a} = \frac{(2)^2}{2\times 2} = 1\text{m}$$

$$x = \sqrt{2}\frac{L}{2} = \frac{L}{\sqrt{2}} = \frac{1}{2}$$

$$= 0.5\ \text{m}$$

Therefore striker will stop after travelling a distance $2x$, as shown in figure.



Co-ordinates of point P are, $\left(\frac{L}{2}, L\right)$

$$\text{or} \qquad \left(\frac{1}{2\sqrt{2}}, \frac{1}{\sqrt{2}}\right).$$

6. Displacement of M relative to m on reaching the other end is $2L\sin 30°$ or 1m.

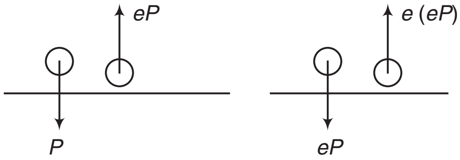
$$4x = 1\,(1 - x)$$

$$\therefore \qquad x = 0.2\ \text{m} \qquad \textbf{Ans.}$$

7. $\Delta P_1 = (1 + e)\,P$

$\Delta P_2 = (1 + e)\,eP$

and so on



$$\therefore \Delta P_{\text{Total}} = \Delta P_1 + \Delta P_2 + \ldots$$
$$= (1 + e)\, P\, (1 + e + e^2 + \ldots)$$
$$= \left(\frac{1+e}{1-e}\right) P$$

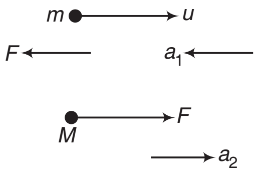
8. Assuming retardation force F to same in both cases, we have,

retardation $a = \dfrac{F}{m}$

Using, $v^2 = u^2 - 2as$, we have,

$$0 = u^2 - 2\left(\frac{F}{m}\right) h$$

$$\therefore \qquad F = \frac{mu^2}{2h} \qquad \text{...(i)}$$



In second case,

$$a_1 = \frac{F}{m},\ a_2 = \frac{F}{M}$$

Relative retardation of m,

$$a_r = a_1 + a_2 = F\left(\frac{M+m}{Mm}\right)$$

Now, $\qquad v_r^2 = u_r^2 - 2a_r s$

$$\therefore \qquad 0 = u^2 - 2F\left(\frac{M+m}{Mm}\right) s$$

or $\qquad s = \dfrac{u^2 Mm}{2F\,(M+m)}$

Substituting, $\dfrac{u^2}{F} = \dfrac{2h}{m}$ from Eq. (i) we have,

$$s = \frac{Mh}{M+m} \qquad \textbf{Ans.}$$

9. Velocity of B after collision will become,

$$\left(\frac{1+e}{2}\right) v = \left(\frac{1+e}{2}\right)(16)$$

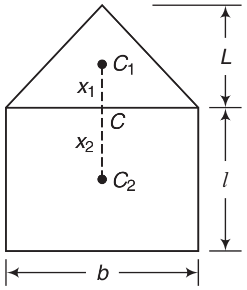
or $\qquad 8\,(1 + e)$ m/s

Now, $\quad 8\,(1 + e) = \sqrt{2gh}$

$$= \sqrt{2 \times 10 \times 5} = 10$$

$$\therefore \qquad e = 0.25 \qquad \textbf{Ans.}$$

10.

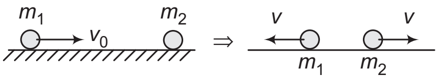


$$A_1 x_1 = A_2 x_2$$

$$\therefore \qquad \frac{1}{2}(bL)\left(\frac{L}{3}\right) = (bl)\left(\frac{l}{2}\right)$$

$$\therefore \qquad l = \frac{L}{\sqrt{3}} \qquad \textbf{Ans.}$$

11. $p_i = p_f$



$$\therefore \qquad m_1 v_0 = m_1 v + m_2 v \qquad \text{...(i)}$$

$$e = \frac{RVOS}{RVOA}$$

$e = 1$ for elastic collision

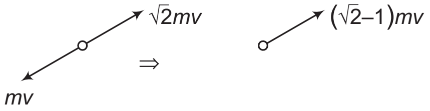
$$\therefore \qquad RVOS = RVOA$$

or $\qquad 2v = v_0 \qquad$ ...(ii)

From Eqs. (i) and (ii) we get,

$$\frac{m_1}{m_2} = \frac{1}{3}$$

12. Net momentum of three fragments



$$\mathbf{p}_i = \mathbf{p}_f = 0$$

$\therefore$ Momentum of fourth part is $(\sqrt{2} - 1)\, mv$ in opposite direction.

So, velocity of fourth part is $(\sqrt{2} - 1)\, v$

$$\therefore \qquad \text{KE} = 3\left(\frac{1}{2}mv^2\right) + \frac{1}{2}m\,[(\sqrt{2} - 1)\, v]^2$$

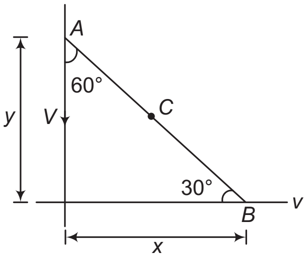
$$= (3 - \sqrt{2})\, mv^2 \qquad \textbf{Ans.}$$

13. $v_a = v_b = \dfrac{v}{2}$

$$v_c = \frac{v}{3}$$

$$\therefore \qquad v_a : v_b : v_c = 3 : 3 : 2$$

14. Distance AB = constant



$\therefore$ Component of V along AB

= component of v along AB

or $$\frac{V}{2} = \frac{\sqrt{3}\, v}{2}$$

or $$V = \sqrt{3}\, v$$

Now, $$\frac{dx}{dt} = v$$

$$\left(-\frac{dy}{dt}\right) = V = \sqrt{3}\, v$$

$$\mathbf{r}_c = \frac{x}{2}\,\hat{\mathbf{i}} + \frac{y}{2}\,\hat{\mathbf{j}}$$

$$\therefore \qquad \mathbf{v}_c = \frac{d\mathbf{r}_c}{dt} = \frac{1}{2}\left[\frac{dx}{dt}\hat{\mathbf{i}} + \frac{dy}{dt}\hat{\mathbf{j}}\right]$$

$$= \frac{1}{2}[v\hat{\mathbf{i}} - \sqrt{3}\, v\hat{\mathbf{j}}]$$

$$\therefore \qquad |\mathbf{v}_c| = \left[\sqrt{\left(\frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2}\,\right] v = v \qquad \textbf{Ans.}$$

15. At 5 s

$$\mathbf{r}_{\text{COM}} = \mathbf{r}_i + \mathbf{v}_{\text{CM}}\, t$$

$$= (\hat{\mathbf{i}}) + (0.2 \times 5)\,\hat{\mathbf{i}}$$

$$= 2\hat{\mathbf{i}} = \frac{m_1\mathbf{r}_i + m_2\mathbf{r}_2}{m_1 + m_2}$$

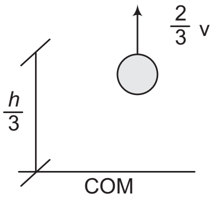
$$\therefore \quad 2\hat{\mathbf{i}} = \frac{(2/3)\,(3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - -4\hat{\mathbf{k}}) + (4/3)\mathbf{r}_2}{2}$$

$$\therefore \quad \mathbf{r}_2 = (4.5\hat{\mathbf{i}} - \hat{\mathbf{j}} - 2\hat{\mathbf{k}})$$

So, the co-ordinates are (4.5m, – 1m, – 2m) **Ans.**

16. m mass falls a distance $\dfrac{h}{2}$ in time, say t.

Then,



$$\frac{h}{2} = \frac{1}{2}gt^2 \quad \Rightarrow \quad \therefore \quad t = \sqrt{\frac{h}{g}}$$

For mass $2m$,

$$\frac{h}{2} = vt - \frac{1}{2}gt^2$$

$$= v\sqrt{\frac{h}{g}} - \frac{h}{2}$$

$$\therefore \qquad v = \sqrt{gh}$$

Now, let u is the velocity with which combined mass collides with ground, then

$$u = \sqrt{\left(\frac{2}{3}v\right)^2 + 2g\left(\frac{h}{3}\right)}$$

$$= \sqrt{\frac{4}{9}gh + \frac{2}{3}gh}$$

$$= \frac{\sqrt{10}}{3}\sqrt{gh} \qquad \textbf{Ans.}$$

17. $2mv = m\,(u - v)$

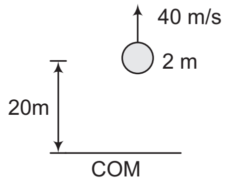
$$\therefore \qquad v = \frac{u}{3}$$

$$\therefore \qquad u - v = \frac{2u}{3}$$

$$\text{KE} = \frac{1}{2} \times m\left(\frac{2u}{3}\right)^2 + \frac{1}{2}(2m)\left(\frac{u}{3}\right)^2$$

$$= \frac{1}{3}mu^2 \qquad \textbf{Ans.}$$

18. $h_{\max} = 20 + \dfrac{(40)^2}{2g} = 100\,\text{m}$ **Ans.**



19. Let $|\mathbf{p}| = mv = p$

In elastic head on collision with equal masses, velocities are interchanged.

Gain in kinetic energy of first

$$= \frac{1}{2} m\,[(2v)^2 - v^2]$$

$$= \frac{3}{2} mv^2 = \left(\frac{3}{2} m\right)\left(\frac{p}{m}\right)^2 = \frac{3p^2}{2m}$$ **Ans.**

20. $$\frac{(4m)\,X_1 + (4m)\left(\frac{a}{2}\right)}{8m} = \frac{(4m)\,X_1 + (m)\,(a)}{5m}$$

Solving this equation, we get

$X_1 = X$-coordinate of COM of plate

$$= \frac{a}{6}$$ **Ans.**

21. $$X_{\text{CM}} = \frac{m_1X_1 + m_2X_2 + m_3X_3 + m_4X_4}{m_1 + m_2 + m_3 + m_4}$$

Similarly Y_{CM}.

22. $\mathbf{p}_i = \mathbf{p}_f$

$$\therefore\ (m_0v_0\hat{\mathbf{i}}) = m_0\frac{v_0}{\sqrt{2}}\left(\frac{1}{\sqrt{2}}\hat{\mathbf{i}} + \frac{1}{\sqrt{2}}\hat{\mathbf{j}}\right) + 2m_0\mathbf{v}$$

$$\therefore\quad \mathbf{v} = \frac{v_0}{4}\hat{\mathbf{i}} - \frac{v_0}{4}\hat{\mathbf{j}}$$

$$\therefore\quad |\mathbf{v}| = \sqrt{2}\,\frac{v_0}{4} = \frac{v_0}{2\sqrt{2}}$$ **Ans.**

23. $$\frac{1}{2}kx_0^2 = \frac{1}{2}m_2v_2^2$$

$$\therefore\quad v_2 = \sqrt{\frac{k}{m_2}}\,x_0$$

$$v_{\text{CM}} = \frac{m_1v_1 + m_2v_2}{m_1 + m_2}$$

$$= \left(\frac{\sqrt{k\,m_2}}{m_1 + m_2}\right)x_0 \qquad (\text{as } v_1 = 0)$$

24. Velocity of second ball

$$= \left(\frac{m/2 - m}{m/2 + m}\right)(0) + \left(\frac{2 \times m}{m + m/2}\right)v$$

$$= \frac{4}{3}v$$

Velocity of third ball will become,

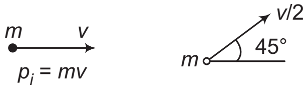
$$\frac{4}{3} \text{ times } \frac{4}{3}v \quad \text{or} \quad \left(\frac{4}{3}\right)^2 v$$

$$\therefore\quad v_n = \left(\frac{4}{3}\right)^{n-1} v = \sqrt{5gr}$$

$$\therefore\quad v = \left(\frac{3}{4}\right)^{n-1}\sqrt{5gr}$$ **Ans.**

More than One Correct Options

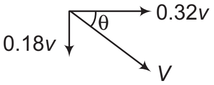
1. Momentum remains conserved in any type of equation



$$\mathbf{p}_i = \mathbf{p}_f$$

$$\therefore\quad (mv\hat{\mathbf{i}}) = \left(\frac{mv}{2\sqrt{2}}\hat{\mathbf{i}} + \frac{mv}{2\sqrt{2}}\hat{\mathbf{j}}\right) + (2m)\,\mathbf{v}$$

$\mathbf{v}$ = velocity of mass 2m



$$= 0.32\hat{\mathbf{i}} - 0.35\hat{\mathbf{j}}$$

$$= (0.32v)\,\hat{\mathbf{i}} - (0.18v)\,\hat{\mathbf{j}}$$

$$V = 0.37\,v$$

$$\tan\theta = \frac{0.18v}{0.32v} = 0.5625$$

$\therefore\ \theta = 29.35°$

Since $(\theta + 45°) < 90°$. Therefore, the angle of divergence between particles after collision is less than 90°.

Further, $K_i = \frac{1}{2}mv^2$ and

$$K_f = \frac{1}{2}m\left(\frac{v}{2}\right)^2 + \frac{1}{2}(2m)\,(0.37v)^2$$

$$K_f < K_i \quad .$$

Therefore, collision is inelastic.

2. Just after collision,

$$v_m = \left(\frac{m - 5m}{m + 5m}\right)\sqrt{2gl} = -\frac{2}{3}\sqrt{2gl}$$

$$v_{5\text{m}} = \left(\frac{2 \times m}{m + 5m}\right)\sqrt{2gl} = \frac{\sqrt{2gl}}{3}$$

$$T - mg = \frac{mv_m^2}{l} = \frac{m}{l}\left(\frac{8gl}{9}\right)$$

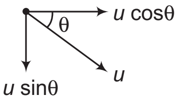
$$\therefore\quad T = \frac{17}{9}mg$$

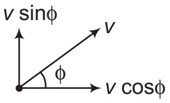
$$h_m = \frac{v_m^2}{2g} = \frac{4l}{9}$$

3. $$u\cos\theta = v\cos\phi \qquad \text{...(i)}$$

$$v\sin\phi = eu\sin\theta$$

or $$eu\sin\theta = v\sin\phi \qquad \text{...(ii)}$$





From Eqs. (i) and (ii), we can see that,

$$\tan\phi = e\tan\theta$$

Momentum or velocity changes only in vertical direction.

$$\therefore \quad |\text{Impulse}| = |\Delta p|$$

$$= m(u\sin\theta + eu\sin\theta)$$

$$= m(1+e)\,u\sin\theta$$

$$v = \sqrt{(v\cos\phi)^2 + (v\sin\phi)^2}$$

$$= \sqrt{(u\cos\theta)^2 + (eu\sin\theta)^2}$$

$$= \sqrt{u^2(\cos^2\theta + e^2\sin^2\theta)}$$

$$= u\sqrt{1-(1-e^2)\sin^2\theta}$$

$$\frac{K_f}{K_i} = \frac{\frac{1}{2}mv^2}{\frac{1}{2}mu^2} = \frac{v^2}{u^2}$$

$$= \cos^2\theta + e^2\sin^2\theta$$

4. Impulse $= \Delta\mathbf{p} = m(\mathbf{v}_f - \mathbf{v}_i)$

$\therefore$ Impulse received by m

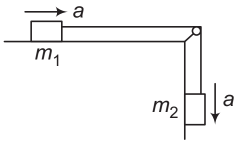
$$= m[(-2\hat{\mathbf{i}} + \hat{\mathbf{j}}) - (3\hat{\mathbf{i}} + 2\hat{\mathbf{j}})]$$

$$= m(-5\hat{\mathbf{i}} - \hat{\mathbf{j}})$$

Impulse received by $M = -$ (impulse received by m)

$$= m(5\hat{\mathbf{i}} + \hat{\mathbf{j}})$$

5. $a = \dfrac{\text{Net pulling force}}{\text{Total mass}} = \dfrac{m_2 g}{m_1 + m_2}$



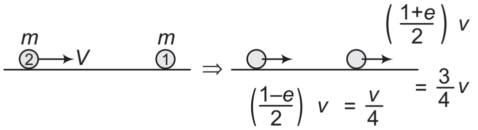
Now,

$$(a_{\text{cm}})_x = \frac{m_1 a}{m_1 + m_2} = \frac{m_1 m_2 g}{(m_1 + m_2)^2}$$

$$(a_{\text{cm}})_y = \frac{m_2 a}{m_1 + m_2} = \left(\frac{m_2}{m_1 + m_2}\right)^2 g$$

6. Out of two blocks, one block of mass m is moving in vertical direction also (downwards). Therefore COM is moving vertically downwards and momentum of the system is not conserved in vertical direction.

7. $|\text{Impulse}| = |\Delta p_1 \text{ or } \Delta p_2|$



$$= m\left(\frac{3}{4}v\right) = \frac{3mv}{4}$$

Loss of kinetic energy $= K_i - K_f$

$$= \frac{1}{2}mv^2 - \left[\frac{1}{2}m\left(\frac{3v}{4}\right)^2 + \frac{1}{2}m\left(\frac{v}{4}\right)^2\right]$$

$$= \frac{3}{16}mv^2$$

8. External force gravity acts on system. Therefore momentum of system is not conserved.

Mass keep on decreasing. Therefore acceleration will keep on increasing.

Comprehension Based Questions

1. Impulse $= mu$

$$\therefore \quad u = \frac{\text{Impulse}}{m} = \frac{4}{2} = 2 \text{ m/s}$$

Now, $\quad E_i = E_f$

$$\therefore \quad \frac{1}{2}\times 2\times(2)^2 + \frac{1}{2}\times 4000\times(0.05)^2 = \frac{1}{2}\times 2\times v^2$$

Solving we get,

$v = 3$ m/s **Ans.**

2. Again using,

$$E_i = E_f$$

$$\therefore \quad \frac{1}{2}\times 2\times(2)^2 + \frac{1}{2}\times 4000\times(0.05)^2 = \frac{1}{2}\times 4000\times x^2$$

$\therefore \quad x = 0.067$ m $= 6.7$ m $=$ compression

$\therefore \quad d = 5$ cm $+ 6.7$ cm $+ 6.7$ cm $+ 6.7$ cm

≈ 25 cm **Ans.**

3. $p_i = p_f$

$$\therefore \quad 0 = (8m)(2v) - (16m)(v) + (48m)v'$$

Here v' = absolute speed of rod

$= 0$

$\therefore$ Displacement of rod $= 0$ **Ans.**

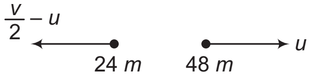
4. $x_A + x_B = 12\,L$

$$\therefore \quad 2vt + vt = 12L$$

$$\therefore \quad vt = 4L$$

$$\Rightarrow \quad X_B = vt = 4L$$

5. $(24\,m)\left(\dfrac{v}{2} - u\right) = (48\,m)\,u$



$$\therefore \quad u = \frac{v}{6} \qquad \textbf{Ans.}$$

6. $t = t_1 + t_2 = \left(\dfrac{4L}{v}\right) + \left(\dfrac{12L - 4L}{v/2}\right) = \dfrac{20L}{v}$

$$\text{But} \quad \frac{L}{v} = T = 4 \text{ s}$$

$$\therefore \quad t = 80 \text{ s} \qquad \textbf{Ans.}$$

7. Till t_1, rod is stationary. For time t_2 rod is moving with absolute speed $u\ (= v/6)$

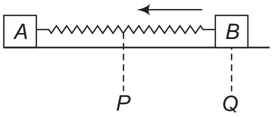
$$\therefore \quad \text{Displacement of rod} = \left(\frac{v}{6}\right) t_2$$

$$= \left(\frac{v}{6}\right)\left(\frac{16L}{v}\right) = \frac{8L}{3} \qquad \textbf{Ans.}$$

Match the Columns

1. $P \rightarrow$ compressed state of spring

$Q \rightarrow$ natural length of spring



From P to Q

$$a_B = \frac{Kx}{m_B}$$

$$a_{CM} = \frac{m_B a_B}{m_A + m_B} = \frac{(m_B)\,(Kx)}{m_A + m_B}$$

From P to Q, compression x decreases. Therefore, a_{CM} decreases. After Q, A leaves contact with wall, spring comes in its natural length. Net force on system becomes zero.

Therefore, a_{CM} becomes zero.

From P to Q velocity of B, therefore velocity of COM will increase. After that a_{CM} becomes zero. Therefore, v_{CM} becomes constant.

2. $t_1 = \dfrac{2u}{g} = \dfrac{2 \times 20}{10} = 4\,\text{s}$

$$t_2 = \sqrt{\frac{2h}{g}} = \frac{\sqrt{2 \times 180}}{10} = 6 \text{ s}$$

At $t = 0$

$$a_{CM} = \frac{m_1 a_1 + m_2 a_2}{m_1 + m_2} = \frac{(m)\,(10) + (m)\,(10)}{2m}$$

$$= 10 \text{ m/s}^2$$

$$v_{CM} = \frac{m_1 v_1 + m_2 v_2}{m_1 + m_2} = \frac{(m)\,(-20) + (m)\,(0)}{2m}$$

$$= -10 \text{ m/s}$$

At $t = 5$ s

$$a_{CM} = \frac{(m)\,(0) + (m)\,(10)}{2m} = 5 \text{ m/s}^2$$

$$v_{CM} = \frac{(m)\,(0) + (m)\,(50)}{2m} = 25 \text{ m/s}$$

3. (a) $p = \sqrt{2Km} = \sqrt{2 \times 0.5 \times 4} = 2$ kg-m/s

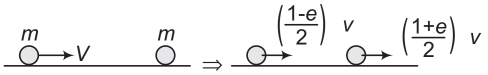
(b) $p_{CM} = p_A + p_B = 0 + 2 = 2$ kg - m/s

(c) At maximum compression, their velocities or, their momenta are same (half of p_{CM}).

$$\therefore \quad p_A = p_B = \frac{p_{CM}}{2} = 1 \text{ kg - m / s}$$

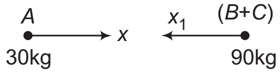
(d) In elastic collision between two equal masses, velocities are interchanged. So, B comes to rest and A starts moving.

4.



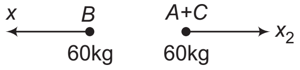
m
V
m
$\Rightarrow$
$\left(\frac{1-e}{2}\right) v$
$\left(\frac{1+e}{2}\right) v$

5. (a) If A moves towards right then B and C will move towards left.



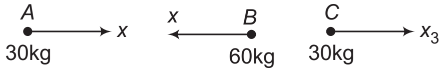
$$30x = 90x_1 \quad \Rightarrow \quad x_1 = \frac{x}{3}$$

(b) $60x = 60x_2 \quad \Rightarrow \quad x_2 = x$

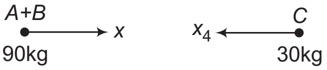


(c) $30x + 30x_3 = 60x$

$$\therefore \quad x_3 = x$$



(d) $90x = 30x_4 \quad \Rightarrow \quad x_4 = 3x$



6. (a) If T = tension on string connecting m_1 and m_2, then, $2T$ = tension in other string.

Equilibrium of m_2 gives,

$$T = m_2\, g = 200 \text{ N}$$

Equilibrium of $(M + m_1)$ gives,

$$3T = W_{\text{man}} + m_1 g$$

$$\text{or} \quad 600 = W_{\text{man}} + 100 \quad \Rightarrow \quad W_{\text{man}} = 500 \text{ N}$$

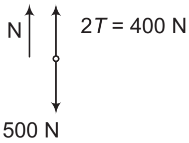
(b) Total upward force on system is $4T$ and total downward force is weight of all. To accelerate COM upwards,

$$4T > 200 + 100 + 500 \quad \text{or} \quad T > 200 \text{ N}$$

(c) To accelerate downwards,

$$T < 200 \text{ N}$$

(d) In equilibrium, forces on man



$$N + 400 = 500$$

$$\therefore \quad N = 100 \text{ N}$$

7. $$v_{\text{CM}} = \frac{\text{Total momentum}}{\text{Total mass}}$$

$$= \frac{2 \times 3}{3 + 6} = \frac{2}{3} \text{ m/s} = \text{constant}$$

At maximum deformation,

$$v_{3\text{kg}} = v_{6\text{kg}} = v_{\text{CM}} = \frac{2}{3} \text{ m/s}$$

Upto maximum elongation spring force on 6kg is towards left. So 6 kg block will accelerate and its velocity will be maximum.

8. $$V_{\text{CM}} = \frac{\text{Total momentum}}{\text{Total mass}}$$

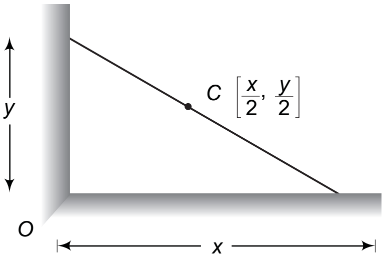
$$= \frac{(10 \times 1) - (5 \times 2)}{3} = 0 = \text{constant}$$

$$P_{\text{CM}} = (m_{\text{CM}})\,(v_{\text{CM}}) = 0 = \text{constant}$$

Finally both blocks will stop.

Subjective Questions

1. $$y = \sqrt{L^2 - x^2} \quad \Rightarrow \quad \frac{dy}{dt} = -\frac{x}{\sqrt{L^2 - x^2}}\,\frac{dx}{dt}$$

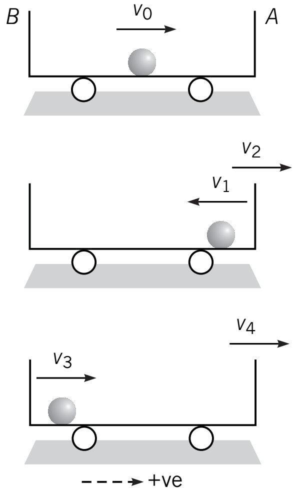


$$= -\frac{3 \times 2}{4} = -\frac{3}{2} \text{ m/s}$$

$$V_{CM} = \sqrt{\left(\frac{1}{2}\frac{dx}{dt}\right)^2 + \left(\frac{1}{2}\frac{dy}{dt}\right)^2}$$

$$= \sqrt{(1)^2 + \left(\frac{3}{4}\right)^2} = 1.25 \text{ m/s} \qquad \textbf{Ans.}$$

2. Applying conservation of linear momentum and



$$e = \frac{\text{Relative speed of separation}}{\text{Relative speed of approach}}, \quad \text{we get}$$

$$mv_0 = Mv_2 - mv_1 \qquad \ldots\text{(i)}$$

$$v_1 + v_2 = ev_0 \qquad \ldots\text{(ii)}$$

Solving these two equations, we get,

$$v_1 = \left(\frac{eM - m}{M + m}\right) v_0, \quad v_2 = m\left(\frac{e + 1}{M + m}\right) v_0 \qquad \textbf{Ans.}$$

The desired time is

$$t = \frac{d}{v_0} + \frac{2d}{ev_0} + \frac{d}{e^2 v_0}$$

$$\text{or} \qquad t = \frac{d}{v_0}\left(1 + \frac{2}{e} + \frac{1}{e^2}\right) \qquad \textbf{Ans.}$$

3. (i) $x_1 = v_0 t - A(1 - \cos \omega t)$

$$t\, x_{\text{cm}} = \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2} = v_0 t$$

$$\therefore \quad x_2 = v_0 t + \frac{m_1}{m_2} A(1 - \cos \omega t)$$

(ii) $$a_1 = \frac{d^2 x_1}{dt^2} = -\omega^2 A \cos \omega t$$

The separation $x_2 - x_1$ between the two blocks will be equal to l_0 when $a_1 = 0$ or $\cos \omega t = 0$

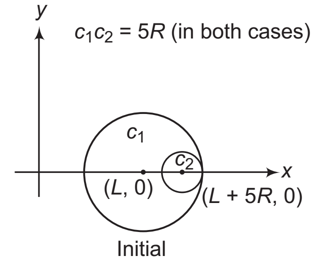
$$x_2 - x_1 = \frac{m_1}{m_2} A(1 - \cos \omega t) + A(1 - \cos \omega t)$$

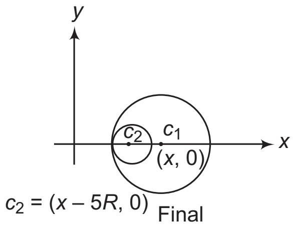
or $$l_0 = \left(\frac{m_1}{m_2} + 1\right) A \qquad (\cos \omega t = 0)$$

Thus, the relation between l_0 and A is,

$$l_0 = \left(\frac{m_1}{m_2} + 1\right) A$$ **Ans.**

4. Since, all the surfaces are smooth, no external force is acting on the system in horizontal direction. Therefore, the centre of mass of the system in horizontal direction remains stationary.





x-coordinate of COM initially will given by

$$x_i = \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2}$$

$$x_i = \frac{(4M)(L) + M(L + 5R)}{4M + M} = (L + R) \qquad \ldots\text{(i)}$$

Let $(x, 0)$ be the coordinates of the centre of large sphere in final position. Then, x-coordinate of COM finally will be

$$x_f = \frac{(4M)(x) + M(x - 5R)}{4M + M} = (x - R) \qquad \ldots\text{(ii)}$$

Equating Eqs. (i) and (ii), we have

$$x = L + 2R$$

Therefore, coordinates of large sphere, when the smaller sphere reaches the other extreme position are $(L + 2R, 0)$. **Ans.**

5. (a) Chain has a constant speed. Therefore, net force on it should be zero. Thus,

P = Weight of length y of chain + thrust force

$$= \frac{m}{l} yg + \rho v_0^2 \qquad \left(\text{here } \rho = \frac{m}{l}\right)$$

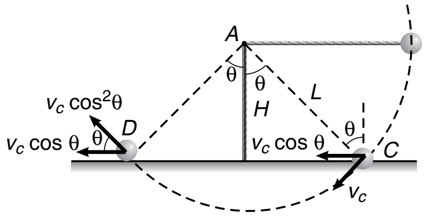
$$= \frac{m}{l}(gy + v_0^2)$$ **Ans.**

(b) Energy lost during the lifting = work done by applied force – increase in mechanical energy of chain

$$= \int_0^y P \cdot dy - \left(\frac{m}{l} y\right) g \left(\frac{y}{2}\right) - \frac{1}{2}\left(\frac{m}{l} \cdot y\right) v_0^2$$

$$= \frac{myv_0^2}{2l}$$ **Ans.**

6. In perfectly inelastic collision with the horizontal surface the component parallel to the surface will remain unchanged. Similarly when the string becomes taut again, the component perpendicular to its length will remain unchanged.



$$\cos\theta = \frac{H}{L} \quad \Rightarrow \quad v_c = \sqrt{2gH}$$

$$v_c \cos^2\theta = (\sqrt{2gH})\frac{H^2}{L^2} = v \ \text{(say)}$$

$$\therefore \qquad h = \frac{v^2}{2g} = \frac{(2gH)\frac{H^4}{L^4}}{2g} = \frac{H^5}{L^4}$$ **Ans.**

7. Applying conservation of linear momentum at the time of collision or at $t = 1$ s,

$$m\mathbf{v} + m(0) = 2m(20\hat{\mathbf{i}} + 10\hat{\mathbf{j}})$$

$$\therefore \qquad \mathbf{v} = 40\hat{\mathbf{i}} + 20\hat{\mathbf{j}}$$

At 1 s, masses will be at height

$$h_1 = u_y t + \frac{1}{2} v_y t^2 = (20)(1) + \frac{1}{2}(-10)(1)^2 = 15 \text{ m}$$

After explosion other mass will further rise to a height :

$$h_2 = \frac{u_y^2}{2g} = \frac{(20)^2}{2 \times 10}$$

$$= 20 \text{ m}$$

$$\Rightarrow \qquad u_y = 20 \text{ m/s just after collision.}$$

$\therefore$ Total height $h = h_1 + h_2 = 35$ m **Ans.**

8. Let CT stands for common tangent direction and CN for common normal directions.

	Mass $m = eM$		Mass M	
	CT	**CN**	**CT**	**CN**
Befor collision	v_1 (let)	v_2 (let)	Zero (given)	Zero (given)
After collision	v_1	v_3 (suppose)	Zero	v_4 (suppose)

In the common tangent directions velocity components remain unchanged.

In common normal direction applying conservation of linear momentum and definition of *e*.

$$eMv_2 = eMv_3 + Mv_4 \qquad \text{...(i)}$$

From the definition of coefficient of restitution

$$e = \frac{v_4 - v_3}{v_2} \qquad \text{...(ii)}$$

Solving these two equations we get,

$$v_3 = 0 \text{ but } v_4 \neq 0$$

So, after collision velocity of *m* is along CT while that of *M* along CN or they are moving at right angles.

9. Muzzle velocity v_r is given to be constant.

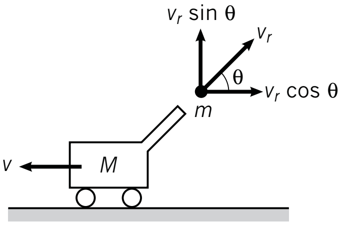
From conservation of linear momentum in horizontal direction we have,

$$Mv = m(v_r \cos\theta - v)$$

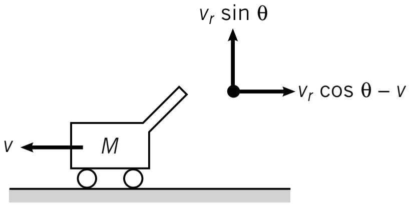
or
$$v = \frac{mv_r \cos\theta}{M + m} \qquad \text{...(i)}$$

Further, range of bullet on horizontal ground

$$R = \frac{2v_r \sin\theta}{g}(v_r \cos\theta - v)$$



Components of velocity of bullet with respect to gun



Components of velocity of bullet with respect to ground

$$= \frac{2v_r \sin\theta}{g}\left(v_r \cos\theta - \frac{mv_r \cos\theta}{M + m}\right)$$

$$= \frac{2Mv_r^2 \sin\theta \cos\theta}{(M + m)g}$$

or
$$R = \left(\frac{M}{M + m}\right)\frac{v_r^2 \sin 2\theta}{g} \qquad \text{...(ii)}$$

(a) From Eq. (ii) we see that maximum range is at

$$\theta = 45° \qquad \textbf{Ans.}$$

(b) At $\theta = 45°$,

$$R_{\max} = \left(\frac{M}{M + m}\right)\frac{v_r^2}{g} \qquad \textbf{Ans.}$$

10. (a) $u_r = 0, \quad a_r = g$

$$\therefore \quad v_r = \sqrt{2gh_1}$$

After collision relative velocity

$$v_r' = e\sqrt{2gh_1}$$

and relative retardation is still *g* (downwards). Hence,

$$h_2 = \frac{(v_r')^2}{2g} = e^2 h_1 \qquad \textbf{Ans.}$$

(b) $u_r = 0, \quad a_r = g + \dfrac{g}{4} = \dfrac{5g}{4}$

$\therefore$ Just before collision $v_r = \sqrt{2\left(\dfrac{5g}{4}\right)h_1}$

Just after collision $v_r' = ev_r$.

Relative retardation is still $\dfrac{5g}{4}$.

Hence,
$$h_2 = \frac{(v_r')^2}{2\left(\dfrac{5g}{4}\right)} = e^2 h_1 \qquad \textbf{Ans.}$$

11. Let the velocity of the block and the plank, when the block leaves the spring be *u* and *v* respectively.

By conservation of energy $\dfrac{1}{2}kx^2 = \dfrac{1}{2}mu^2 + \dfrac{1}{2}Mv^2$

[*M* = mass of the plank, *m* = mass of the block]

$$\therefore \quad 100 = u^2 + 5v^2 \qquad \text{...(i)}$$

By conservation of momentum

$$mu + Mv = 0$$

$$\Rightarrow \quad u = -5v \qquad \text{...(ii)}$$

Solving Eqs. (i) and (ii)

$$30v^2 = 100 \Rightarrow \therefore v = \sqrt{\frac{10}{3}} \text{ m/s}$$

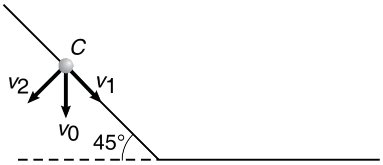
From this moment until block falls, both plank and block keep their velocity constant.

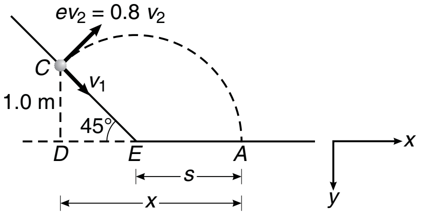
Thus, when block falls velocity of plank

$$= \sqrt{\frac{10}{3}} \text{ m/s.} \qquad \textbf{Ans.}$$

12. $v_0 = \sqrt{2gh} = \sqrt{2 \times 9.8 \times 1.5} = 5.42 \text{ m/s}$

Component of velocity parallel and perpendicular to plane at the time of collision.





$$v_1 = v_2 = \frac{v_0}{\sqrt{2}} = 3.83 \text{ m/s}$$

Component parallel to plane (v_1) remains unchanged, while component perpendicular to plane becomes ev_2, where

$$ev_2 = 0.8 \times 3.83 = 3.0 \text{ m/s}$$

$\therefore$ Component of velocity in horizontal direction after collision

$$v_x = \frac{(v_1 + ev_2)}{\sqrt{2}} = \frac{(3.83 + 3.0)}{\sqrt{2}} = 4.83 \text{ m/s}$$

While component of velocity in vertical direction after collision.

$$v_y = \frac{v_1 - ev_2}{\sqrt{2}} = \frac{3.83 - 3.0}{\sqrt{2}} = 0.59 \text{ m/s}$$

Let t be the time, the particle takes from point C to A, then

$$1.0 = 0.59t + \frac{1}{2} \times 9.8 \times t^2$$

Solving this we get,

$$t = 0.4 \text{ s} \qquad \text{(Positive value)}$$

$\therefore$ $DA = v_x t = (4.83)(0.4) = 1.93 \text{ m}$

$\therefore$ $s = DA - DE$

$= 1.93 - 1.0$

$s = 0.93 \text{m}$ **Ans.**

$v_{yA} = v_{yc} + gt$

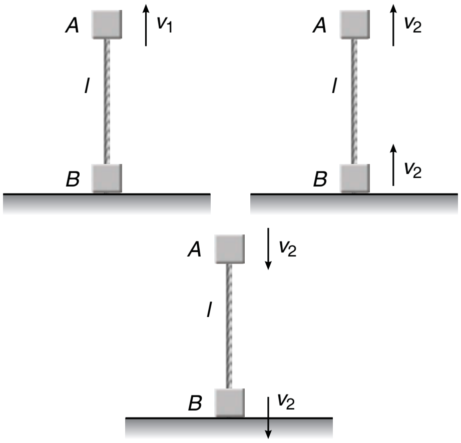
$= (0.59) + (9.8)(0.4) = 4.51 \text{ m/s}$

$v_{xA} = v_{xC} = 4.83 \text{ m/s}$

$\therefore$ $v_A = \sqrt{(v_{xA})^2 + (v_{yA})^2}$

$= 6.6 \text{ m/s}$ **Ans.**

13. String becomes tight when A moves upwards by a distance l. Let v_1 be the velocity of A at this moment, then



$$v_1^2 = (\sqrt{10gl})^2 - 2gl = 8gl \text{ or } v_1 = \sqrt{8gl}$$

Let v_2 be the common velocities of both A and B just after string becomes tight. Then from conservation of linear momentum.

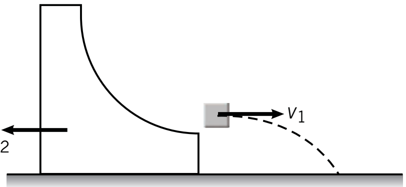
$$v_2 = \frac{v_1}{2} = \frac{\sqrt{8gl}}{2}$$

Both particles return to their original height with same speed v_2. String becomes loose after B strikes the ground and the speed v with which A strikes the ground is,

$$v^2 = v_2^2 + 2gl = \frac{8gl}{4} + 2gl$$

or $v^2 = 4gl$ or $v = 2\sqrt{gl}$ **Ans.**

14.



$$mv_1 = Mv_2 \quad \text{...(i)}$$

$$mgR = \frac{1}{2}mv_1^2 + \frac{1}{2}Mv_2^2 \quad \text{...(ii)}$$

$$t = \sqrt{\frac{2(R/2)}{g}} = \sqrt{\frac{R}{g}} \quad \text{...(iii)}$$

The desired distance is

$$S = (v_1 + v_2)t \quad \text{...(iv)}$$

Solving Eqs. (i) and (ii) for v_1 and v_2 and substituting in Eq. (iv), we get

$$S = R\sqrt{\frac{2(M+m)}{M}}$$ **Ans.**

15. Let v_r be the velocity of washer relative to centre of hoop and v the velocity of centre of hoop. Applying conservation of linear momentum and mechanical energy we have,

$$m(v_r \cos\phi - v) = Mv \qquad \text{...(i)}$$

$$mgr(1+\cos\phi) = \frac{1}{2}Mv^2 + \frac{1}{2}m(v_r^2 + v^2 - 2vv_r\cos\phi) \qquad \text{...(ii)}$$

Solving Eqs. (i) and (ii), we have,

$$v = m\cos\phi\sqrt{\frac{2gr(1+\cos\phi)}{(M+m)(M+m\sin^2\phi)}} \qquad \textbf{Ans.}$$

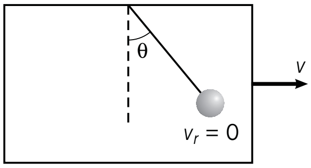
16. $$H = \frac{u^2\sin^2\theta}{2g} = \frac{(20)^2 \times \frac{3}{4}}{2\times 10} = 15\text{ m}$$

i.e. the shell strikes the ball at highest point of its trajectory. Velocity of (ball + shell) just after collision,

$$v = \frac{u\cos 60°}{2}$$

(from conservation of linear momentum)

$$= \frac{20}{2\times 2} = 5\text{ m/s}$$



At highest point combined mass is at rest relative to the trolley. Let v be the velocity of trolley at this instant. From conservation of linear momentum we have,

$$2\times 5 = \left(2+\frac{4}{3}\right)v \quad \text{or} \quad v = 3\text{ m/s}$$

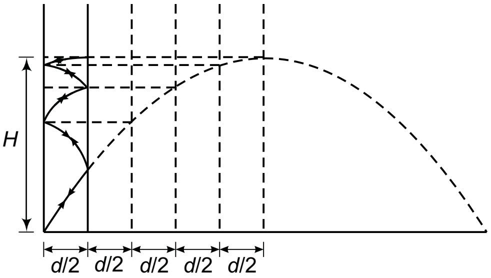
From conservation of energy, we have

$$\frac{1}{2}\times 2\times(5)^2 - \frac{1}{2}\left(2+\frac{4}{3}\right)(3)^2 = 2\times 10(1-\cos\theta)$$

Solving we get, $\cos\theta = \dfrac{1}{2}$

$$\therefore \qquad \theta = 60° \qquad \textbf{Ans.}$$

17. While colliding with the wall its vertical component (v_y) of velocity will remain unchanged (component along common tangent direction remains unchanged) while horizontal component (v_x) is reversed remaining same in magnitude. Thus, path of the particle will be as shown in figure.



(a) $H = \dfrac{u^2\sin^2\alpha}{2g}$

(b) Total number of collisions with the walls before the ball comes back to the ground are nine.

(c) Ball will return to point O (the starting point)

18. As the collisions are perfectly elastic, collision of the ball will not affect the vertical component of its velocity while the horizontal component will be simply reversed.

Hence, $$H_{\max} = \frac{v_y^2}{2g} = \frac{[20\times\sin 45°]^2}{2\times 10} = 10\text{ m}$$

Total time of flight

$$T = \frac{2v_y}{g} = \frac{2\times 20\times\left(\frac{1}{\sqrt{2}}\right)}{10} = 2\sqrt{2}\text{ s}$$

Total horizontal distance travelled before striking the ground $x = v_xT = 40$ m

$$PB + BA + AB + BA + AB = 45\text{ m}$$

Hence, total number of collision suffered by the particle with the walls before it hits ground = 4.

Ans.

19. Let v_1 = velocity of block 2 kg just before collision

v_2 = velocity of block 2 kg just after collision

and v_3 = velocity of block M just after collision.

Applying work energy theorem

(change in kinetic energy = work done by all the forces) at different stages as shown in figure.

Figure 1.

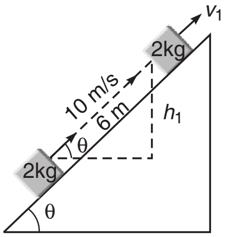


Fig. 1

$$\Delta\text{KE} = W_{\text{friction}} + W_{\text{gravity}}$$

$$\left[\frac{1}{2} m\{v_1^2 - (10)^2\}\right] = -6\mu mg\cos\theta - mgh_1$$

$(m = 2\text{ kg})$

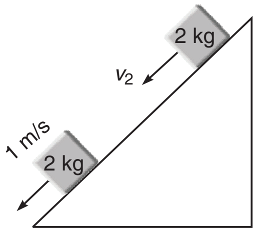
or $$v_1^2 - 100 = 2[6\mu g\cos\theta + gh_1]$$

$$\cos\theta = \sqrt{1-\sin^2\theta} = \sqrt{1-(0.05)^2} \approx 0.99$$

$\therefore$ $$v_1^2 = 100 - 2[(6)(0.25)(10)(0.99) + (10)(0.3)]$$

$\Rightarrow$ $$v_1 \approx 8\text{ m/s}$$

Figure 2.



$$\Delta\text{KE} = W_{\text{friction}} + W_{\text{gravity}}$$

$$\frac{1}{2} m[(1)^2 - (v_2^2)] = -6\mu mg\cos\theta + mgh_1$$

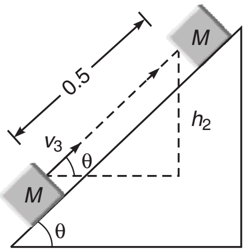
or $$1 - v_1^2 = 2[-6\mu g\cos\theta + gh_1]$$

$$= 2[(-6)(0.25)(10)(0.99) + (10)(0.3)]$$

$$= -23.7$$

$\therefore$ $$v_2^2 = 24.7 \quad\text{or}\quad v_2 \approx 5\text{ m/s}$$

Figure 3.



$$\Delta\text{KE} = W_{\text{friction}} + W_{\text{gravity}}$$

$$\frac{1}{2} M[0 - v_3^2] = -(0.5)(\mu)(M)g\cos\theta - Mgh_2$$

or $$-v_3^2 = -\mu g\cos\theta - 2gh_2$$

or $$v_3^2 = (0.25)(10)(0.99) + 2(10)(0.025)$$

or $$v_3^2 = 2.975$$

$\therefore$ $$v_3 \approx 1.72\text{ m/s}$$

Now

(i) Coefficient of restitution

$$= \frac{\text{Relative velocity of separation}}{\text{Relative velocity of approach}}$$

$$= \frac{v_2 + v_3}{v_1} = \frac{5 + 1.72}{8} = \frac{6.72}{8}$$

or $$e \approx 0.84$$

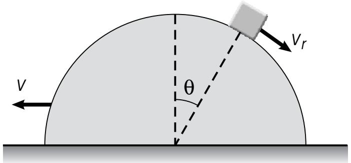
(ii) Applying conservation of linear momentum before and after collision

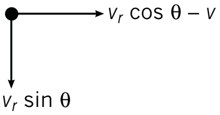
$$2v_1 = Mv_3 - 2v_2$$

$\therefore$ $$M = \frac{2(v_1 + v_2)}{v_3} = \frac{2(8+5)}{1.72} = \frac{26}{1.72}$$

$$M \approx 15.12\text{ kg}$$ **Ans.**

20. Let v_r be the relative velocity of block as it leaves contact with the sphere ($N = 0$) and v the horizontal velocity of sphere at this instant.





Absolute components of velocity of block

Applying conservation of linear momentum in horizontal direction, we get

$$mv = m(v_r\cos\theta - v)$$

or $$2v = v_r\cos\theta \qquad \ldots\text{(i)}$$

Conservation of mechanical energy gives,

$$mgr(1-\cos\theta) = \frac{1}{2}mv^2 + \frac{1}{2}m(v_r^2 + v^2 - 2vv_r\cos\theta)$$

or $$gr(1-\cos\theta) = v^2 + \frac{v_r^2}{2} - vv_r\cos\theta \qquad \ldots\text{(ii)}$$

Equation of laws of motion gives,

$$mg\cos\theta = \frac{mv_r^2}{r} \quad\text{or}\quad gr = \frac{v_r^2}{\cos\theta} \qquad \ldots\text{(iii)}$$

Solving Eqs. (i), (ii) and (iii), we get

$$\cos^3\theta - 6\cos\theta + 4 = 0$$ **Ans.**

Note *We have not considered pseudo force while writing the equation of motion. Think why?*

21. $$\frac{x}{u\cos\alpha} + \frac{x}{eu\cos\alpha} = T = \frac{2u\sin\alpha}{g}$$

or $$x = \frac{eu^2\sin 2\alpha}{(1+e)g} \Rightarrow x_{\max} = \frac{eu^2}{(1+e)g}$$

at $$2\alpha = 90°$$ **Ans.**

12. Rotational Mechanics

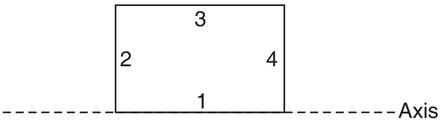
INTRODUCTORY EXERCISE 12.1

1. $K = \sqrt{\dfrac{I}{m}} = \sqrt{\dfrac{m\,(2l)^2/3}{m}} = \dfrac{2}{\sqrt{3}}\, l$ **Ans.**

2. $I = (1)\left[\sqrt{(1)^2 + (2)^2}\right]^2 + 2[\sqrt{(3^2) + (4)^2}\,]^2$

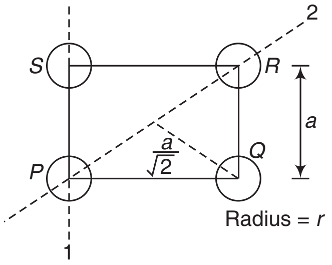
$= 55 \text{ kg-m}^2$ **Ans.**

3. $I = I_1 + I_2 + I_3 + I_4$



$= 0 + \dfrac{ml^2}{3} + ml^2 + \dfrac{ml^2}{3} = \dfrac{5}{3}\, ml^2$ **Ans.**

5. $I_1 = I_P + I_Q + I_R + I_S$



$= \left(\dfrac{2}{5}\, mr^2\right) + \left(\dfrac{2}{5}\, mr^2 + ma^2\right) + \left(\dfrac{2}{5}\, mr^2 + ma^2\right) + \dfrac{2}{5}\, mr^2$

$= \dfrac{8}{5}\, mr^2 + 2ma^2$

$I_2 = I_P + I_Q + I_R + I_S$

$= \dfrac{2}{5}\, mr^2 + \left(\dfrac{2}{5}\, mr^2 + \dfrac{ma^2}{2}\right) + \dfrac{2}{5}\, mr^2 + \left(\dfrac{2}{5}\, mr^2 + \dfrac{ma^2}{2}\right)$

$= \dfrac{8}{5}\, mr^2 + ma^2$

6. $M = \int_0^{2l} dM = \int_0^{2l} (mx) \cdot dx$

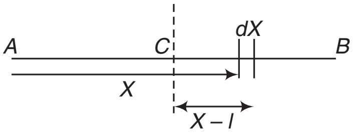
$= 2ml^2$

$\therefore \quad m = \dfrac{M}{2l^2}$

(a) $I_A = \int_0^{2l} (dM)\, X^2 = \int_0^{2l} (mXdX)\, X^2$

$= \int_0^{2l} \left(\dfrac{M}{2l^2}\, X^3\, dX\right) = 2\, Ml^2$ **Ans.**

(b) $I_C = \int_0^{2l} (dM)\,(X - l)^2$



$= \int_0^{2l} (mXdX)\,(X - l)^2$

$= \int_0^{2l} \left(\dfrac{M}{2l^2}\right)(X)\,(X - l)^2\, dX$

$= \dfrac{1}{3}\, Ml^2$ **Ans.**

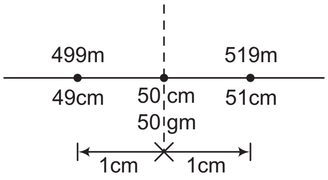
7. $I = \dfrac{5}{6}\, I_{\text{Total}} = \dfrac{5}{6}\, (0.6) \text{ kg-m}^2 = 0.5 \text{ kg-m}^2$

8. $I = \dfrac{1}{2}\, mR^2$ or $I \propto R^2$

m and thickness are same.

Therefore, radius *R* of the material having smaller density should be more, so the moment of inertia.

9. $I = 50\,(0)^2 + (49 + 51)\,(1)^2 + (48 + 52)\,(2)^2 + \ldots\ldots\ldots + (1 + 99)\,(49)^2$



$= 100\,[(1)^2 + (2)^2 + \ldots\ldots + (49)^2\,]$

$= 4.3 \times 10^6 \text{ gm-cm}^2 = 0.43 \text{ kg-m}^2$ **Ans.**

10. $l = 2\pi R \quad \Rightarrow \quad R = \dfrac{l}{2\pi}$

$\dfrac{I_1}{I_2} = \dfrac{ml^2/12}{mR^2} = \dfrac{l^2}{12R^2}$

$= \dfrac{l^2}{12\,(l/2\pi)^2}$

$= \dfrac{\pi^2}{3}$ **Ans.**

INTRODUCTORY EXERCISE 12.2

1. $\omega = \dfrac{2\pi}{T}$

$$= \frac{2\pi}{60} = \frac{\pi}{30} \text{ rad/s} \qquad \textbf{Ans.}$$

2. $\omega = \dfrac{v_r}{PQ} = \dfrac{2v - v}{2R} = \dfrac{v}{2R}$

Rotation is clockwise. So, ω is perpendicular to paper inwards.

3. $\omega = \dfrac{\text{component of velocity perpendicular to } \mathbf{r}}{r}$

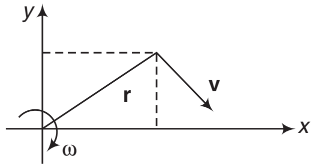
$$\mathbf{r} = 3\hat{\mathbf{i}} + 4\hat{\mathbf{j}}$$

$$\mathbf{v} = 4\hat{\mathbf{i}} - 3\hat{\mathbf{j}}$$

Since, $\mathbf{r} \cdot \mathbf{v} = 0$

$\therefore$ $\mathbf{v} \perp \mathbf{r}$

$\therefore$ $\omega = \dfrac{v}{r} = 1 \text{ rad/s}$

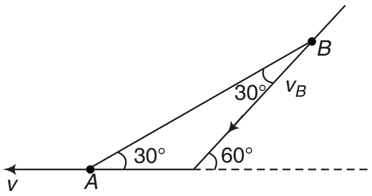


$$v = |\mathbf{v}| = 5 \text{ m/s}$$

$$r = |\mathbf{r}| = 5 \text{ m}$$

From the figure, we can see that ω is along negative *z*-axis. **Ans.**

4. Component of velocities of *A* and *B* along *AB* should be same



$\therefore$ $v_A \cos 30° = v_B \cos 30°$

$\therefore$ $v_B = v_A = v$

$$\omega = \frac{\text{Relative velocity} \perp \text{to } AB}{AB}$$

$$= \frac{v_A \sin 30° + v_B \sin 30°}{l}$$

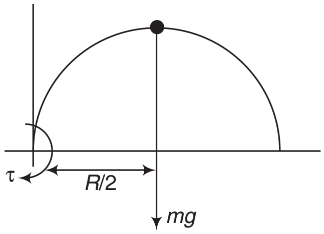
$$= \frac{v}{l} \qquad (\text{as } v_A = v_B = v)$$

INTRODUCTORY EXERCISE 12.3

1. $\mathbf{r} = (2\hat{\mathbf{i}} + 4\hat{\mathbf{j}} - 2\hat{\mathbf{k}})$

$$\tau = \mathbf{r} \times \mathbf{F} \qquad \textbf{Ans.}$$

2. $\tau = \dfrac{mgR}{2} = \dfrac{(mg)\, u^2 \sin 2\theta}{2g}$



$$= \frac{mu^2}{2} \qquad (\text{as } \theta = 45°)$$

$$= \frac{(1)\,(20\sqrt{2})^2}{2}$$

$$= 400 \text{ N-m} \qquad \textbf{Ans.}$$

3. $\tau_{10N} = 0$

$$\tau_{20N} = (20 \cos 45° \times 0.1) \qquad \text{(clockwise)}$$

$$= 1.414 \text{ N-m}$$

$$\tau_{30N} = (30 \sin 60° \times 0.05) \qquad \text{(clockwise)}$$

$$= 1.299 \text{ N-m}$$

$\therefore$ $\tau_{\text{Total}} = 2.71 \text{ N-m}$

4. $\tau_{10N} = 10 \times 0.25$

$$= 2.5 \text{ N-m} \qquad \text{(clockwise)}$$

$$\tau_{9N} = 9 \times 0.25$$

$$= 2.25 \text{ N-m} \qquad \text{(clockwise)}$$

$$\tau_{12N} = 12 \cos 60° \times 0.1$$

$$= 0.6 \text{ N} \qquad \text{(anticlockwise)}$$

$\therefore$ $\tau_{\text{net}} = 4.15 \text{ N-m}$

INTRODUCTORY EXERCISE 12.4

1. $\theta = \dfrac{1}{2} \alpha t^2$

$\therefore$ $\alpha = \dfrac{2\theta}{t^2} = \dfrac{2\,(50)\,(2\pi)}{(5)^2}$

$$= (8\pi) \text{ rad/s}^2$$

$$= 25.14 \text{ rad/s}^2 \qquad \textbf{Ans.}$$

$$\omega = (\alpha t)$$

$$= (8\pi)\,(5)$$

$$= (40\pi) \text{ rad/s} \qquad \textbf{Ans.}$$

2. $\omega^2 = \omega_0^2 + 2\alpha\theta$

$$\therefore \qquad \theta = \frac{\omega^2 - \omega_0^2}{2\alpha} = \frac{225 - 25}{2\times 1}$$

$$= 100 \text{ rad} \qquad \textbf{Ans.}$$

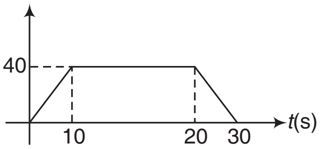
3. $0 = \omega_0 - \alpha t$

$$\Rightarrow \qquad \alpha = \frac{\omega_0}{t} = \frac{10}{10}$$

$$= 1 \text{ rad/s}^2$$

$$\tau = I\alpha = 5 \text{ N-m} \qquad \textbf{Ans.}$$

4. θ = Area under ω-t graph



$$= \frac{1}{2}(30 + 10)(40) = 800 \text{ rad} \qquad \textbf{Ans.}$$

5. $\omega^2 = \omega_0^2 - 2\alpha\theta$

$$0 = \left(\frac{100}{60}\times 2\pi\right)^2 - 2\alpha\,(10\times 2\pi)$$

$$\alpha = 0.87 N = \frac{\tau}{I}$$

$$= \frac{F\cdot R}{\frac{1}{2}mR^2}$$

$$\therefore \qquad F = (0.87)(0.5\,mR)$$

$$= (0.87)(0.5)(10)(0.2)$$

$$= 0.87 \text{ N} \qquad \textbf{Ans.}$$

6. $\omega = \dfrac{d\theta}{dt} = 6 - 6t^2$

$$\alpha = \frac{d\omega}{dt} = -12t$$

$$\omega = 0$$

at $\qquad t = 1$ s

$$\text{(a)}\ \langle\omega\rangle_{0-1} = \frac{\int_0^1 \omega dt}{1} = \int_0^1 (6 - 6t^2)\,dt$$

$$= 4 \text{ rad/s} \qquad \textbf{Ans.}$$

$$\langle\alpha\rangle_{0-1} = \frac{\int_0^1 (-12t)\,dt}{1}$$

$$= -6 \text{ rad/s}^2 \qquad \textbf{Ans.}$$

(b) At $t = 1$ s

$$\alpha = -12 \text{ rad/s}^2 \qquad \textbf{Ans.}$$

7. $\omega = \omega_0 - \alpha t$

$$-20 = 20 - 2t$$

$$\therefore \qquad t = 20 \text{ s} \qquad \textbf{Ans.}$$

8. (a) Angular impulse

= change in angular momentum

$$\therefore \qquad \tau_f t = I\omega$$

$$\text{or} \qquad \tau_f = \frac{I\omega}{t} = \frac{0.03\times 20}{60} = 0.01 \text{ N-m} \qquad \textbf{Ans.}$$

(b) During acceleration

$$(\tau_e - \tau_f)\,t = I\omega$$

$$\therefore \qquad \tau_e = \frac{I\omega}{t} + \tau_f = \frac{0.03\times 20}{5} + 0.01$$

$$= 0.13 \text{ N-m} \qquad \textbf{Ans.}$$

9. (a) Angular impulse

= change in angular momentum

$$\therefore \qquad \tau\, t_0 = I\omega$$

$$\therefore \qquad t_0 = \frac{I\omega}{\tau} = \frac{16\times 9}{4} = 36 \text{ s}$$

$$\text{(b)}\ \int_0^{t_0} \tau\, dt = I\omega$$

$$\therefore \qquad \int_0^{t_0} kt\,dt = I\omega$$

$$\therefore \qquad \frac{kt_0^2}{2} = I\omega$$

$$\therefore \qquad t_0 = \sqrt{I\omega}\sqrt{\frac{2}{k}}$$

$$= \sqrt{16\times 9}\sqrt{\frac{2}{k}} = 12\sqrt{\frac{2}{k}} \qquad \textbf{Ans.}$$

10. (a) $\int d\omega = \int \alpha\, dt$

$$\therefore \qquad \int_{65}^{\omega} d\omega = \int_0^3 (-10 - 5t)\,dt$$

$$\therefore \qquad \omega = 65 - [10\,t + 2.5\,t^2]_0^3$$

$$= 12.5 \text{ rad/s} \qquad \textbf{Ans.}$$

$$\text{(b)}\ \int_{65}^{\omega} d\omega = \int_0^t (-10 - 5t)\,dt$$

$$\therefore \qquad \omega = 64 - 10t - 2.5t^2$$

$$\int_0^{\theta} d\theta = \int_0^3 \omega dt = \int_0^3 (65 - 10t - 2.5t^2)\,dt$$

$$\therefore \qquad \theta = 195 - 45 - 22.5$$

$$= 127.5 \text{ rad} \qquad \textbf{Ans.}$$

11. $\theta = \displaystyle\int_0^3 \omega\, dt = \int_0^3 (12 - 3t^2)\,dt$

$$= 36 - 27 = 9 \text{ rad} \qquad \textbf{Ans.}$$

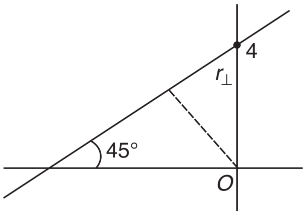
$$N = \frac{\theta}{2\pi} = \frac{9}{2\times 3.14} = 1.43 \qquad \textbf{Ans.}$$

INTRODUCTORY EXERCISE 12.5

1. $I = \dfrac{m\,(3l)^2}{12} + m\left(\dfrac{l}{2}\right)^2 = ml^2$

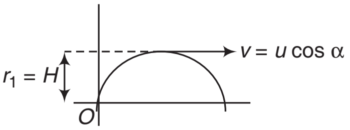
$$L = I\omega = ml^2\omega$$

2. $r_\perp = 4\cos 45^\circ = 2\sqrt{2}$ m



$$\begin{aligned} L_0 &= mvr_\perp \\ &= (1)\,(2)\,(2\sqrt{2}) \\ &= 4\sqrt{2}\ \text{kg-m}^2/\text{s} \end{aligned}$$

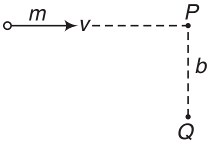
3. $L_0 = mvr_\perp$



$$= m\,(u\cos\alpha)\left(\frac{u^2\sin^2\alpha}{2g}\right)$$

$$= \frac{mu^3\cos\alpha\,\sin^2\alpha}{2g} \qquad \textbf{Ans.}$$

4.



$$L_P = 0 \qquad (\text{as } r_\perp = 0)$$

$$L_Q = mvb \qquad (\text{as } r_\perp = b)$$

5. $L = mvr_\perp + I_c\omega$

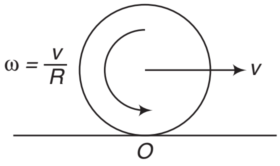
$$= mvR + \left(\frac{2}{5}mR^2\right)\left(\frac{v}{R}\right)$$

$$= \frac{7}{5}mvR$$

This is clockwise, or along negative z-axis.

$$\therefore \qquad \mathbf{L} = \left(-\frac{7}{5}mvR\right)\hat{\mathbf{k}} \qquad \textbf{Ans.}$$

6. $L_0 = mvR - I_c\omega$



$$= mvR - \left(\frac{1}{2}mR^2\right)(vR)$$

$$= \frac{1}{2}mvR \qquad (\text{clockwise}) \qquad \textbf{Ans.}$$

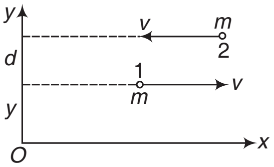
7. $L_0 = L_1 + L_2$

= (mvy in clockwise or along negative z-axis)

+ [$mv\,(y + d)$ in anticlockwise or along positive z-axis]

= mvd in anticlockwise direction or along positive z-axis.

= constant



INTRODUCTORY EXERCISE 12.6

1. $I_1\,\omega_1 = I_2\,\omega_2$

$$\therefore \qquad \omega_2 = \frac{I_1}{I_2}\,\omega_1$$

$$= \left(\frac{MR^2}{MR^2 + 2\,mR^2}\right)\omega_0$$

$$= \left(\frac{M}{M + 2m}\right)\omega_0 \qquad \textbf{Ans.}$$

2. Mass will move towards equator (away from axis). So, I will increase. Therefore ω will decrease (as $I\omega$ = constant). Hence, time period will increase $\left(\text{as } T = \dfrac{2\pi}{\omega}\right)$.

3. Moment of inertia I increase. Therefore, ω decreases (as $I\omega$ = constant). Hence time period increases $\left(\text{as } T = \dfrac{2\pi}{\omega}\right)$

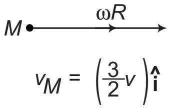
4. I will increase $\left(\text{as } I = \frac{2}{5}mR^2\right)$

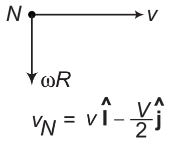
$\therefore$ ω will decrease (as $I\omega$ = constant)

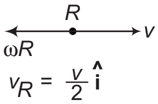
$\therefore T$ will increase (as $T = 2\pi/\omega$)

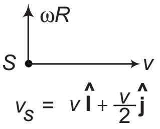
INTRODUCTORY EXERCISE 12.7

1. $\omega R = \frac{v}{2}$









2. There is only one acceleration,

$$a_r = R\omega^2 \qquad \text{(towards centre)}$$

INTRODUCTORY EXERCISE 12.8

1. $\frac{K_R}{K_T} = \frac{2}{5} \Rightarrow K_T = \frac{5}{2}K_R = \frac{5}{2} \times 10 = 25\text{ J}$

$\therefore$Total kinetic energy $= K_R + K_T = 35\text{ J}$

2. Under forward slip condition $v > R\omega$

$$K_T = \frac{1}{2}mv^2$$

$$K_R = \frac{1}{2}I\omega^2 = \frac{1}{2}(mR^2)\omega^2$$

$$\therefore \qquad K_T > K_R$$

3. $K_T = \frac{1}{2}mv^2,\ K_R = \frac{1}{2}I\omega^2 = \frac{1}{2}\left(\frac{1}{2}mR^2\right)\omega^2$

Since, in backward slip condition, $v < R\omega$

$\therefore$ K_R may be equal to K_T.

INTRODUCTORY EXERCISE 12.9

1. $v = r\omega$, where r is the distance from A (position of instantaneous axis of rotation)

For A, $r = 0 \Rightarrow v_A = 0$

For B and D, $r = \sqrt{2}R$

$\Rightarrow \qquad v_B = v_D = \sqrt{2}R\omega = \sqrt{2}v$

For C, $r = 2R \Rightarrow v_C = 2R\omega = 2v$

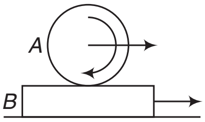
Direction of velocity of a general point P is perpendicular to AP in the sense of rotation.

2. $I_C = \frac{2}{5}mR^2,\ I_0 = \frac{7}{5}mR^2$ and $\omega = \frac{v}{R}$

Substituting these values in the given equation, we get the result.

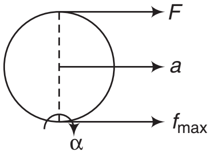
INTRODUCTORY EXERCISE 12.10

1. Net work done by friction in pure rolling is always zero.



For example, if A pure rolls over B, then work done by friction on both A and B are non-zero (one is positive and other is negative). But net work done by friction = 0.

2. Till pure rolling continues we can find α about bottommost point. About bottommost point torque of friction is zero.



$$\alpha = \frac{F\ (2R)}{(3/2)\ mR^2} = \frac{4F}{3mR}$$

$$a = R\alpha = \frac{4F}{3m}$$

$$F + f_{\text{max}} = ma = \frac{4F}{3}$$

$$F = 3\ f_{\text{max}} = 3\ \mu mg$$

$$= 3 \times 0.6 \times 4 \times 10 = 72\text{ N} \qquad \textbf{Ans.}$$

This is the maximum value of applied force, as we have taken the maximum friction.

3. (a) $\mu_{\text{min}} = \frac{\tan\theta}{1 + (mR^2/I)}$

$$= \frac{\tan 30^\circ}{1 + 5/2} = \frac{2}{7\sqrt{3}} \qquad \textbf{Ans.}$$

(b) $a = \frac{g\sin\theta}{1 + I/mR^2}$

$$= \frac{(10)\sin 30^\circ}{1 + 2/5}$$

$$= \frac{25}{7}\text{ m/s}^2 \qquad \textbf{Ans.}$$

(c) $a = g\sin\theta - \mu g\cos\theta$

$$= (10)\sin 30^\circ - \left(\frac{1}{7\sqrt{3}}\right)(10)(\cos 30^\circ)$$

$$= 5 - \frac{5}{7} = \frac{30}{7}\ \text{m/s}^2$$ **Ans.**

4. (a) Maximum friction will act

$$\therefore \quad a = \frac{mg\sin\theta - \mu\, mg\cos\theta}{m}$$

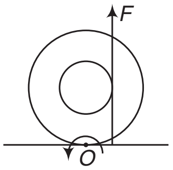
$$= g\sin\theta - \mu\, g\cos\theta$$

(b) Only friction will provide the torque.

$$\therefore \quad \alpha = \frac{\tau}{I} = \frac{(\mu\, mg\cos\theta)\,R}{\frac{2}{5}\,mR^2}$$

$$= \frac{5\mu\, g\cos\theta}{2R}$$ **Ans.**

5. τ_F about O is anticlockwise.



So, it will roll leftwards F is vertical. So, horizontal force is vertical. So, horizontal force is provided by friction (to give it linear acceleration a). So, friction acts leftwards.

INTRODUCTORY EXERCISE 12.11

1. Torque of $mg\sin\theta$ is non-zero. So, angular momentum is not constant.

2. (a) $v = \frac{J}{m}$, J and m are same for both.

(b) $\omega = \frac{Jh}{I}$

or $\qquad \omega \propto \frac{1}{I}$

J and h are same but, $I_{\text{solid}} < I_{\text{hollow}}$

$$\therefore \quad \omega_{\text{solid}} < \omega_{\text{hollow}}$$

(c) $K_R = \frac{1}{2} I\omega^2$

$$\omega \propto \frac{1}{I}$$

$$\therefore \quad K_R \propto \frac{1}{I}$$

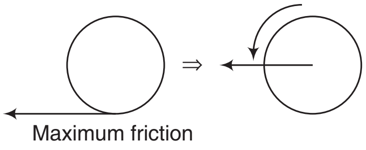
Exercise

LEVEL 1

Assertion and Reason

1. If we compare between many parallel axes, then moment of inertial is least about that axis which passes through COM.

2. Slips is towards right. So maximum friction will act towards left which will convert this slip into pure rolling.



3. Solid sphere, $\quad \frac{K_R}{K_T} = \frac{2}{5}$

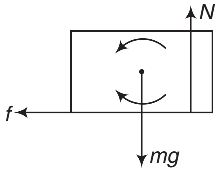
$$\therefore \quad K_R = \frac{2}{7} K_{\text{Total}} \quad \text{and} \quad K_T = \frac{5}{7} K_{\text{Total}}$$

Hollow sphere, $\quad \frac{K_R}{K_T} = \frac{2}{3}$

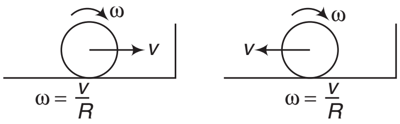
$$\therefore \quad K_R = \frac{2}{5} K_{\text{Total}} \quad \text{and} \quad K_T = \frac{3}{5} K_{\text{Total}}$$

4. In case of smooth surface whole of its potential energy (at A) will convert into its translational kinetic energy (at B).

5. f = friction force



6. In second figure, net angular momentum about bottommost axis,

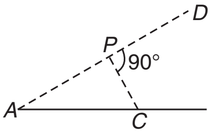


$$L = mvR - I_c\omega$$

$$= mvR - (mR^2)\left(\frac{v}{R}\right)$$

$$= 0$$

7. At P distance from C is minimum.



$$I = I_C + mr^2$$

From A to P, moment of inertia will first decrease. At P it is minimum. Then it will increase.

8. Constant linear momentum means moving with constant speed in a straight line. Therefore, in $L = mv\, r_\perp$ all three m, v and $r_\perp$ are constant.

9. At C, two terms v and $R\omega$ are at 0°. At A they are at 180° and at B they are at 90°

$$\therefore \qquad v_C = v + R\omega$$

$$v_A = v \sim R\omega$$

$$\text{and} \qquad v_B = \sqrt{v^2 + (R\omega)^2}$$

11. In first case,

$$a = R\alpha$$

$$\therefore \qquad \frac{F - \mu_1\, mg}{m} = R\left(\frac{\mu_1\, mgR}{2/5\; mR^2}\right)$$

$$= \frac{5}{2}\mu_1 g \quad \text{or} \quad \mu_1 = \frac{2}{7}\frac{F}{mg}$$

In second case,

$$a - R\alpha = a_{\text{Plank}}$$

$$\therefore \qquad \left(\frac{F - \mu_2\, mg}{m}\right) - R\left(\frac{\mu_2\, mg}{2/5\; mR^2}\right) = \frac{\mu_2\, mg}{M}$$

$$\therefore \qquad \frac{F}{m} = \mu_2\, g + \frac{5}{2}\mu_2 g + \frac{m}{M}\mu_2 g$$

$$\therefore \qquad \mu_2 = \frac{F}{\left(7/2 + \dfrac{m}{M}\right) mg}$$

$$\text{or} \qquad \mu_2 < \mu_1$$

Net work done by friction in pure rolling is zero.

Single Correct Option

2. $K = \sqrt{\dfrac{I}{M}}$

$$= \sqrt{\frac{\frac{1}{2}mR^2}{m}} = \frac{R}{\sqrt{2}}$$

$$= \frac{25}{\sqrt{2}} \approx 18 \text{ cm}$$

3. $0 = \omega_0 - \alpha t$

$$\therefore \qquad \alpha = \frac{\omega_0}{t} = \frac{(2\pi)\,(1725/60)}{20}$$

$$= 9 \text{ rad/s}^2$$

$$\theta = \frac{1}{2}\alpha t^2 = \frac{1}{2} \times 9 \times (20)^2 = 1800 \text{ rad}$$

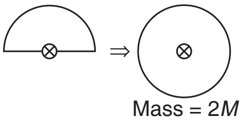
$$N = \frac{\theta}{2\pi} = 287$$ **Ans.**

4. I will decrease

$\therefore$ ω will increase (as $L = I\omega$ = constant)

KE $= \dfrac{L^2}{2I}$ will increase as I is decreasing.

5. $I_{\text{Whole disc}} = \dfrac{1}{2}(2M)\, r^2 = Mr^2$



$$\therefore \qquad I_{\text{Half disc}} = \frac{1}{2} Mr^2$$

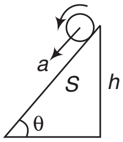
7. In case of pure rolling on ground, net work done by friction = 0

8. After melting, ice will distribute in whole pan. So, moment of inertia I will increase. Hence, angular speed ω will decrease (as $I\omega$ = constant).

9. $\dfrac{K_R}{K_T} = \dfrac{\frac{1}{2}I\omega^2}{\frac{1}{2}mv^2} = \dfrac{I\omega^2}{mv^2}$

$$= \frac{(mR^2)\,(v/r)^2}{mv^2} = \frac{R^2}{r^2}$$ **Ans.**

10. $a = \dfrac{g \sin\theta}{1 + I/mR^2} = \dfrac{g\sin\theta}{1 + 2/5} = \dfrac{5}{7} g \sin\theta$



$$t = \sqrt{\frac{2S}{a}} = \sqrt{\frac{2\left(\dfrac{h}{\sin\theta}\right)}{(5/7)\, g\sin\theta}}$$

$$\text{or} \qquad t \propto \frac{1}{\sin\theta}$$

So, time will be different.

$$v = \sqrt{2aS} = \sqrt{2\left(\frac{5}{7} g \sin\theta\right)\left(\frac{h}{\sin\theta}\right)}$$

or v is independent of θ. So, v will be same.

11. Mass is distributed at maximum distance (from the axis) in case of four rods.

12. $f = \dfrac{mg \sin\theta}{1 + mR^2/I}$

$$f_{\text{disc}} = \frac{mg \sin\theta}{1+2} = \frac{1}{3}\, mg \sin\theta$$

$$f_{\text{sphere}} = \frac{mg \sin\theta}{1+5/2} = \frac{2}{7}\, mg \sin\theta$$

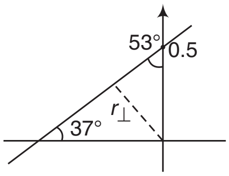
$\therefore$ The ratio is $\dfrac{7}{6}$.

13. $I_1\,\omega_1 = I_2\,\omega_2$

$$\therefore\ \omega_2 = \left(\frac{I_1}{I_2}\right)\omega_1 = \frac{\left(\frac{1}{2}mR^2\right)}{\left(\frac{1}{2}mR^2 + mR^2\right)}\,\omega = \frac{\omega}{3}$$

14. Friction will act (due to sliding). But torque of friction about the mentioned point in the question will be zero. Hence, angular momentum will remain constant.

15. $y = \dfrac{3}{4}x + 0.5$



$$\text{Slope } = \tan\theta = \frac{3}{4}$$

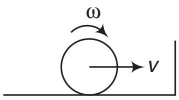
$$\therefore \qquad \theta = 37°$$

$$r_\perp = 0.5 \sin 53° = 0.4 \text{ m}$$

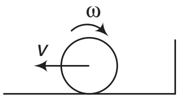
$$L = mvr_\perp = (3)\,(5)\,(0.4)$$

$$= 6 \text{ kg-m}^2/\text{s}$$

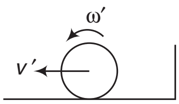
16. $v = R\omega$ and $v' = R\omega'$



(a)



(b)



(c)

From (b) to (c), forward slip will take place and backward maximum friction will convert it into pure rolling.

17. $I_\theta = \dfrac{ma^2}{12}$ (in case of square plate)

or it is independent of θ.

18. Net torque about bottommost point is clockwise. Hence, the spool will move towards right.

19. $K = \dfrac{L^2}{2I}$ or $K \propto \dfrac{1}{I}$ (as L = constant)

As I has doubled, so K will become half.

20. $\rho = \dfrac{M}{\left\{\frac{4}{3}\pi\,(2R)^3\right\} - \left\{\frac{4}{3}\pi R^3\right\}}$

$$= \frac{3M}{28\,\pi R^3}$$

$$M_{2R} = \rho\left(\frac{4}{3}\right)(\pi)\,(2R)^3$$

$$= \left(\frac{3}{28}\right)\left(\frac{4}{3}\right)(8)\,M = \frac{8}{7}M$$

$$M_R = \rho\left(\frac{4}{3}\pi R^3\right)$$

$$= \left(\frac{3}{28}\right)\left(\frac{4}{3}\right)M = \frac{1}{7}M$$

Now, $I = I_{2R} - I_R$

$$= \frac{1}{2}M_{2R}\,(2R)^2 - \frac{1}{2}M_R R^2$$

$$= \frac{1}{2}\left(\frac{8}{7}M\right)(4R^2) - \frac{1}{2}\left(\frac{M}{7}\right)R^2$$

$$= \frac{31}{14}MR^2$$ **Ans.**

21. S = area of cross-section

$$\rho_x = \rho_0 + \left(\frac{2\rho_0 - \rho_0}{L}\right)x = \rho_0 + \frac{\rho_0}{L}x$$

Now, $M = \int_0^L dM = \int_0^L (Sdx)\left(\rho_0 + \dfrac{\rho_0}{L}x\right)$

$$= \rho_0 S\left(\frac{3L}{2}\right)$$

$$\therefore \qquad \rho_0 S = \frac{2M}{3L} \qquad \text{...(i)}$$

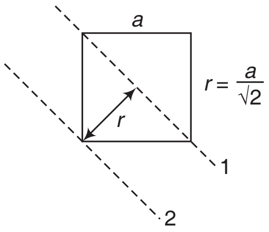
Now, $I = \int_0^L dI = \int_0^L (dM)\,x^2$

$$= \int_0^L (Sdx)\left(\rho_0 + \frac{\rho_0}{L}x\right)(x^2)$$

After substituting value of $\rho_0 S$ from Eq. (i), then we find

$$I = \frac{7}{18} ML^2$$ **Ans.**

22. $I_1 = \dfrac{ma^2}{12}$



$$I_2 = I_1 + mr^2$$

$$= \frac{ma^2}{12} + \frac{ma^2}{2}$$

$$= \frac{7}{12} ma^2$$

$$\therefore \qquad I_1 : I_2 = 1 : 7$$ **Ans.**

23. $I = \dfrac{ML^2}{12} + M\left(\dfrac{L}{4}\right)^2 = \dfrac{7}{48} ML^2$

24. Decrease in gravitational kinetic energy
= increase in rotational kinetic energy

$$\therefore mg\left(\frac{l}{2} - \frac{l}{2}\cos\theta\right) = \frac{1}{2} I\omega^2$$

$$= \frac{1}{2}\left(\frac{ml^2}{3}\right)\omega^2$$

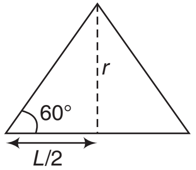
$$\therefore \qquad \omega = \sqrt{\frac{6g}{L}} \sin\frac{\theta}{2}$$ **Ans.**

25. $I = 1\,(2)^2 + 2\,(1)^2$

$$= 6 \text{ kg-m}^2$$ **Ans.**

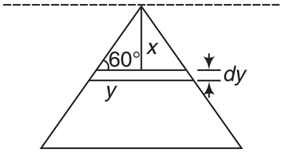
26. $r = \dfrac{L}{2} \tan 60°$

$$= \frac{\sqrt{3}}{2} L$$



$$\text{Area } = \frac{1}{2} \times \text{base} \times \text{height}$$

$$= \frac{1}{2} \times L \times \frac{\sqrt{3}\,L}{2} = \frac{\sqrt{3}}{4} L^2$$



$$\therefore \text{ Mass per unit area} = \frac{M}{\sqrt{3}L^2/4} = \frac{4M}{\sqrt{3}L^2}$$

or $$y = \frac{x}{\sqrt{3}}$$

$$\Rightarrow \qquad dy = \frac{dX}{\sqrt{3}}$$

$$\text{Area of strip} = (2y)\, dy = \left(\frac{2x}{\sqrt{3}}\right)\left(\frac{dx}{\sqrt{3}}\right)$$

$$= \left(\frac{2x}{3}\right) dX$$

$$\therefore \qquad \text{Mass of strip} = \left(\frac{4M}{\sqrt{3}L^2}\right)\left(\frac{2x}{3}\, dX\right) = dM$$

$$I = \int dI$$

$$= \int_0^{\frac{\sqrt{3}}{2}L} (dM)\, X^2$$

$$= \frac{3}{8\sqrt{3}} L^2$$ **Ans.**

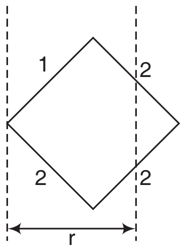
27. $r = \dfrac{l}{\sqrt{2}} + \dfrac{l}{2\sqrt{2}} = \dfrac{3l}{2\sqrt{2}}$

$$I = 2I_1 + 2I_2$$

$$= 2\,(I_1 + I_2)$$

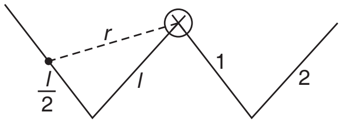
$$= 2\left[\frac{ML^2}{3}\sin^2 45° + \left(\frac{ML^2}{12}\sin^2 45° + Mr^2\right)\right]$$

$$= \frac{8}{3} ML^2$$



28. $r = \sqrt{l^2 + \frac{l^2}{4}} = \frac{\sqrt{5}}{2}\, l$

$$I = 2[I_1 + I_2] = 2\left[\frac{ml^2}{3} + \left(\frac{ml^2}{12} + mr^2\right)\right]$$



$$= \frac{10}{3}\, ml^2 \qquad \textbf{Ans.}$$

29. $\frac{x}{r} = \frac{h}{R} \quad \Rightarrow \quad r = \frac{x}{h} R$

Volume of disc = $(\pi r^2)\, dX$

Mass of disc = $(\pi r^2)(dX)\,\rho = dm$

$$dI = \frac{1}{2}(dm)\, r^2 = \frac{1}{2}(\pi r^2 dx)\,\rho r^2$$

$$= \frac{\pi\rho}{2} r^4\, dx = \left(\frac{\pi\rho}{2}\right)\left(\frac{R^4}{h^4}\right) x^4\, dx$$

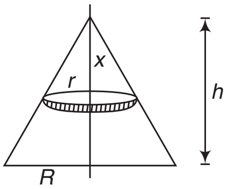
$$I = \int_0^h dI = \left(\frac{\pi\rho}{2}\right)\left(\frac{R^4}{h^4}\right)\left(\frac{h^5}{5}\right)$$

$$= \left(\frac{\pi\rho}{10}\right)(hR^4)$$

$$\rho = \frac{m}{\left(\frac{1}{3}\pi R^2 h\right)}$$

$$\therefore \qquad I = \left(\frac{\pi}{10}\right)\left(\frac{m}{\frac{1}{3}\pi R^2 h}\right)(hR^4)$$

So, $\qquad I \propto mR^2$



Since m and R are same. Therefore I is same.

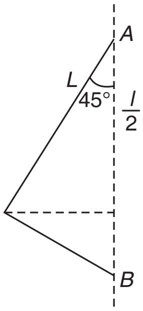
30. $L = \frac{l}{2}\sec 45° = \frac{l}{\sqrt{2}}$

$$m = Lx = \frac{lx}{\sqrt{2}}$$

$$I = 2\left[\frac{mL^2}{3}\sin^2 45°\right]$$

$$= 2\left[\left(\frac{lx}{3\sqrt{2}}\right)\left(\frac{l}{\sqrt{2}}\right)^2\left(\frac{1}{2}\right)\right]$$

$$= \frac{xl^3}{6\sqrt{2}} \qquad \textbf{Ans.}$$



Subjective Questions

1. Present angular momentum of earth

$$L_1 = I\omega = \frac{2}{5} MR^2\omega$$

New angular momentum because of change in radius

$$L_2 = \frac{2}{5} M\left(\frac{R}{2}\right)^2 \omega'$$

If external torque is zero then angular momentum must be conserved

$$L_1 = L_2$$

$$\frac{2}{5} MR^2\omega = \frac{1}{4} \times \frac{2}{5} MR^2\omega'$$

i.e. $\qquad \omega' = 4\omega$

$$T' = \frac{1}{4} T = \frac{1}{4} \times 24 = 6 \text{ h} \qquad \textbf{Ans.}$$

2. $R = \sqrt{\frac{I}{m}} = \sqrt{\frac{\frac{1}{2} mR^2 + md^2}{m}}$

$$\therefore \qquad d = \frac{R}{\sqrt{2}} \qquad \textbf{Ans.}$$

3. $I_1 = I_2 \quad \Rightarrow \quad I_1 + I_2 = I_3 = \frac{Ma^2}{6}$

$$\therefore \qquad 2I_1 \quad \text{or} \quad 2I_2 = \frac{Ma^2}{6}$$

$$\therefore \qquad I_1 = I_2 = \frac{Ma^2}{12} \qquad \textbf{Ans.}$$

4. $\frac{7}{12}ml^2 = \frac{ml^2}{12} + mr^2$

$\therefore \quad r = \frac{l}{\sqrt{2}}$ **Ans.**

5.

$$r_1 = \left(\frac{m_2}{m_1 + m_2}\right) r$$

$$r_2 = \left(\frac{m_1}{m_1 + m_2}\right) r$$

$$I_c = m_1 r_1^2 + m_2 r_2^2$$ **Ans.**

6. $I_r = I_c + mr^2$

$$mK_r^2 = mK_c^2 + mr^2$$

$\therefore \quad K_c = \sqrt{K_r^2 - r^2}$

$$= \sqrt{(10)^2 - (6)^2}$$

$= 8$ cm **Ans.**

7. Instantaneous angular velocity at time t is

$$\omega = \frac{d\theta}{dt} = \frac{d}{dt}(at^2)$$

or $\quad \omega = 2at = 0.4\,t \quad$ (as $a = 0.2$ rad/s^2)

Further, instantaneous angular acceleration is,

$$\alpha = \frac{d\omega}{dt} = \frac{d}{dt}(0.4\,t)$$

or $\quad \alpha = 0.4$ rad/s^2

Angular velocity at $t = 2.5$ s is

$\omega = 0.4 \times 2.5 = 1.0$ rad/s

Further, radius of the wheel

$$R = \frac{v}{\omega}$$

or $\quad R = \frac{0.65}{1.0} = 0.65$ m

Now, magnitude of total acceleration is,

$$a = \sqrt{a_n^2 + a_t^2}$$

Here, $\quad a_n = R\omega^2 = (0.65)(1.0)^2 = 0.65$ m/s^2

and $\quad a_t = R\alpha = (0.65)(0.4) = 0.26$ m/s^2

$\therefore \quad a = \sqrt{(0.65)^2 + (0.26)^2}$

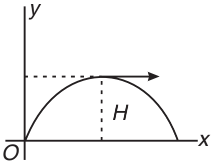
or $\quad a = 0.7$ m/s^2 **Ans.**

8. $\omega_c = \frac{v}{R} = \frac{2}{0.1} = 20$ rad/s

ω about any point on circumference.

$= \frac{\omega_c}{2} = 10$ rad/s **Ans.**

9. At the highest point it has only horizontal velocity $v_x = v\cos\theta$



Length of the perpendicular to the horizontal velocity from 'O' is the maximum height, where

$$H_{\max} = \frac{v^2 \sin^2\theta}{2g}$$

$\Rightarrow$ Angular momentum

$$L = \frac{mv^3 \sin^2\theta \cos\theta}{2g}$$

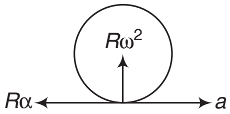
10. $I = \int_0^l dI = \int_0^l (dm)\, x^2$

$$= \int_0^l (\lambda_X\, dx)\, x^2$$

$$= \int_0^l (\alpha x + \beta)\, x^2\, dx$$

$= \frac{\alpha l^4}{4} + \frac{\beta l^3}{3}$ **Ans.**

11. $a = R\alpha$



So, net acceleration is $R\omega^2$ towards centre.

12. In case of pure rolling

$\frac{K_R}{K_T} = \frac{2}{5} \quad$ (for a solid sphere)

$\therefore \quad K_R = \frac{2}{7} \quad$ (total kinetic energy)

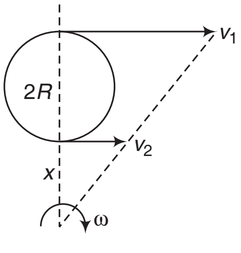
$= \frac{2}{7}(mgh)$ **Ans.**

13. $x\omega = v_2 \quad$ ...(i)

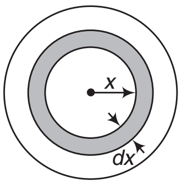
$(x + 2R)\,\omega = v_1 \quad$ ...(ii)

Solving Eqs. (i) and (ii) we get,

$\omega = \left(\frac{v_1 - v_2}{2R}\right)$ **Ans.**



14. $M = \int_0^a (dM)$



$$= \int_0^a (2\pi x)\,dX\,(kx^2) = \frac{\pi k a^4}{2}$$

$$\therefore \quad \pi k = \frac{2M}{a^4}$$

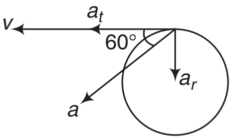
Now, $I = \int_0^a dI = \int_0^a (dM)\,X^2$

$$= \int_0^a (2\pi k x^3 dx)\,x^2 = \frac{(\pi k)\,a^6}{3}$$

Substituting the value of πk, we get

$$I = \frac{2}{3}Ma^2$$ **Ans.**

15. $\tan 60° = \frac{a_r}{a_t} = \frac{r\omega^2}{r\alpha}$



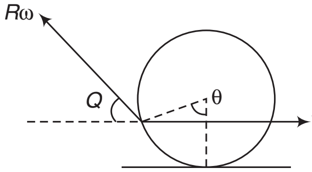
$$= \frac{\left[\int_0^t \alpha dt\right]^2}{\alpha} = \frac{(0.01\,t^2)^2}{0.02\,t}$$

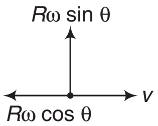
Solving we get,

$$t^3 = 346$$

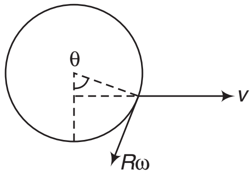
$$\therefore \quad t \approx 7 \text{ s}$$ **Ans.**

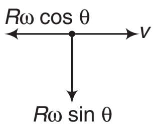
16. If $R\omega \cos\theta = v$ then velocity of point P is vertically upwards.





$$\therefore \quad \theta = \pm \cos^{-1}\left(\frac{v}{R\omega}\right)$$ **Ans.**





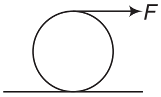
17. $a = R\alpha$ by applied forces

$$\therefore \quad \frac{F_1 + F_2}{M} = 2r\left[\frac{F_1\,(2r) - F_2\,(r)}{I}\right]$$

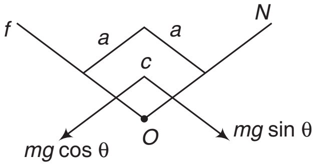
Solving these two equations we get,

$$\frac{F_1}{F_2} = \frac{I + 2\,Mr^2}{4\,Mr^2 - I}$$

18. Even a small force will produce torque about bottommost point. So, the disc starts toppling about bottommost point and here toppling means motion.



19. **For sliding** $mg\sin\theta > \mu\, mg\cos\theta$



or $\tan\theta > \mu$ ...(i)

For toppling

$$\tau_{mg\sin\theta} > \tau_{mg\cos\theta} \quad \text{(about } O\text{)}$$

$$\therefore \quad (mg\sin\theta)\left(\frac{a}{2}\right) > (mg\cos\theta)\left(\frac{a}{2}\right)$$

or $\tan\theta > 1$ ...(ii)

If $\mu > 1$, then condition (ii) is satisfied earlier. So, the cube topples before sliding.

If $\mu < 1$, then condition (i) is satisfied earlier. So, the cube slides before toppling.

20. Angular impulse = change in angular momentum

$$\therefore \quad \tau t = I\omega = \frac{1}{2}mR^2\,\omega \quad \text{...(i)}$$

$$\therefore \quad \tau = \frac{mR^2\omega}{2t}$$

$$= \frac{(20)\,(0.5)^2\left(2\pi \times \frac{240}{\pi \times 60}\right)}{2 \times 3}$$

$$= \frac{20}{3}\text{ N-m}$$ **Ans.**

During retardation using Eq. (i)

$$t = \frac{mR^2\omega}{2\tau} = \frac{mR^2\omega}{2\,(FR)}$$

$$= \frac{mR\omega}{2F}$$

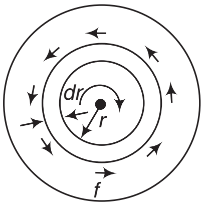
$$= \frac{(20)\,(0.5)\left(2\pi \times \frac{240}{\pi \times 60}\right)}{2 \times 10}$$

$$= 4 \text{ s}$$ **Ans.**

21. $d\tau = \mu\,(dm)\,g\cdot r$

$$= \mu\left(\frac{M}{\pi R^2}\right)(2\pi r dr)\,gr$$

$$\therefore \qquad \tau = \int_0^R d\tau = \frac{2\mu MgR}{3}$$



Angular retardation, $\alpha = \dfrac{\tau}{I}$

$$= \frac{(2\mu MgR/3)}{(1/2MR^2)} = \frac{4\mu g}{3R}$$

(a) $0 = \omega_0 - \alpha t$

$$\therefore \qquad t = \frac{\omega_0}{\alpha} = \frac{3\omega_0 R}{4\mu g} \qquad \textbf{Ans.}$$

(b) $0 = \omega_0^2 - 2\alpha\theta$

$$\therefore \qquad \theta = \frac{\omega_0^2}{2\alpha} = \frac{3\,\omega_0^2 R}{8\,\mu g} \qquad \textbf{Ans.}$$

22. $\theta = 6t - 2t^3$

$$\omega = \frac{d\theta}{dt}$$

$$= 6 - 6t^2$$

$$\alpha = \frac{d\omega}{dt} = -12t$$

$$\omega = 0$$

at $\qquad t = 1$ sec

$$\langle\omega\rangle_{0-1} = \frac{\int_0^1 \omega dt}{1} = \int_0^1 (6 - 6t^2)\,dt$$

$$= 4 \text{ rad/s} \qquad \textbf{Ans.}$$

$$\langle\alpha\rangle_{0-1} = \frac{\int_0^1 \alpha dt}{1} = \int_0^1 (-12t)$$

$$= -6 \text{ rad/s}^2 \qquad \textbf{Ans.}$$

23. Centre of mass of both lies at the centre of ring.

$$I_c = mR^2 + \frac{m\,(2R)^2}{12}$$

$$= \frac{4}{3}\,mR^2$$

$$L = (2mvr_\perp) + I_c\omega$$

$$= (2mvR) + \frac{4}{3}\,mR^2\left(\frac{v}{R}\right)$$

$$= \frac{10}{3}\,mvR$$

This is clockwise, or along negative z-axis

$$\therefore \qquad \mathbf{L} = \left(-\frac{10}{3}\,mvR\right)\hat{\mathbf{k}} \qquad \textbf{Ans.}$$

24. $I_1\,\omega_1 = I_2\,\omega_2$

$$\therefore \qquad \omega_2 = \left(\frac{I_1}{I_2}\right)\omega_1$$

$$= \frac{\left(\frac{1}{2}MR^2\right)}{\left[\frac{1}{2}MR^2 + m\left(\frac{R}{\sqrt{2}}\right)^2\right]}\,\omega_1$$

$$= \left(\frac{M}{M+m}\right)\omega_1 = \left(\frac{1}{1+0.2}\right)5$$

$$= \frac{25}{6} \text{ rad/s}$$

25. $I_1\omega_1 = I_2\,\omega_2$

$$\therefore \qquad I_1\,(100) = (I_1 + (10)\,(9)^2\,]\,(90)$$

or $\qquad I_1 + 810 = 1.11\,I_1$

$$\therefore \qquad I_1 = 7290 \text{ g-cm}^2$$

$$= 7.29 \times 10^{-4} \text{ kg-m}^2 \qquad \textbf{Ans.}$$

26. (a) $I_1\,\omega_1 = I_2\,\omega_2$

$$\therefore \qquad \omega_2 = \frac{I_1}{I_2}\cdot\omega_1$$

$$= \frac{[1.6 + (2)\,(4)\,(0.9)^2\,]}{[1.6 + (2)\,(4)\,(0.15)^2\,]} \times 0.5$$

$$= \left(\frac{8.08}{1.78}\right)(0.5)$$

$$= 2.27 \text{ rev/s}$$

$$= 14.3 \text{ rad/s}$$

(b) $\qquad K_i = \dfrac{1}{2}\,I_1\,\omega_1^2$

$$= \frac{1}{2}\,[1.6 + (2)\,(4)\,(0.9)^2\,]\,(0.5 \times 2\pi)^2$$

$$= 39.9 \text{ J} \qquad \textbf{Ans.}$$

$$K_f = \frac{1}{2}\,[1.6 + (2)\,(4)\,(0.15)^2\,]\,(14.3)^2$$

$$= 181 \text{ J}$$

(c) $W = K_f - K_i = 141.1$ J

27. (a) $I_1\,\omega_1 = I_2\,\omega_2$

$$\therefore \quad \omega_2 = \left(\frac{I_1}{I_2}\right)\omega_1 = \frac{\left(\frac{1}{2}MR^2 + mR^2\right)}{\left(\frac{1}{2}mR^2\right)}\cdot\omega_0$$

$$= \left(1 + \frac{2m}{M}\right)\omega_0$$

(b) $W = K_f - K_i$

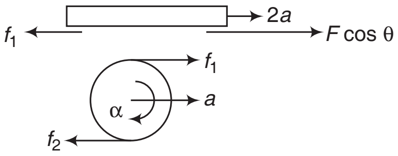
$$= \frac{1}{2}I_2\,\omega_2^2 - \frac{1}{2}I_1\,\omega_1^2$$

$$= \frac{1}{2}\left[\frac{1}{2}MR^2\right]\left[1 + \frac{2m}{M}\right]^2\omega_0^2 - \frac{1}{2}\left[\frac{1}{2}MR^2 + mR^2\right]\omega_0^2$$

$$= \frac{1}{4}MR^2\left(1 + \frac{2m}{M}\right)\omega_0^2\left[1 + \frac{2m}{M} - 1\right]$$

$$= \frac{1}{2}m\omega_0^2R^2\left(1 + \frac{2m}{M}\right) \qquad \textbf{Ans.}$$

28. Since, there is no slip at any contact. Therefore, net work done by friction = 0.



In time *t*

Work done by the applied force

= kinetic energy of plank and cylinder ($F\cos\theta$) (displacement of plank)

$$= \frac{1}{2}m\,(\text{velocity of plank})^2 + \frac{1}{2}\left(1 + \frac{1}{2}\right)M\,(\text{velocity of cylinder})^2$$

$$\therefore \quad (F\cos\theta)\left(\frac{1}{2}\times 2a\times t^2\right) = \frac{1}{2}\times m\,(2at)^2 + \frac{3}{4}\times M\times(at)^2$$

Solving, we get

$$a = \frac{4F\cos\theta}{3M + 8m} \qquad \textbf{Ans.}$$

Equation of plank gives,

$$F\cos\theta - f_1 = m\,(2a)$$

$$\therefore \quad f_1 = F\cos\theta - 2ma$$

$$= F - \frac{8mF\cos\theta}{3M + 8m}$$

$$= \frac{3MF\cos\theta}{3M + 8m} \qquad \textbf{Ans.}$$

Equation of cylinder gives

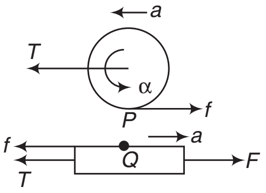
$$f_1 - f_2 = M\cdot a$$

$$\therefore \quad f_2 = f_1 - Ma$$

$$= \frac{3MF\cos\theta}{3M + 8m} - \frac{4\,MF\cos\theta}{3M + 8m}$$

or $$|f_2| = \frac{MF\cos\theta}{3M + 8m} \qquad \textbf{Ans.}$$

29. For Cylinder



$$T - f = ma \qquad \text{...(i)}$$

$$a_P = a_Q$$

$$\therefore \quad R\alpha - a = a \qquad \text{...(ii)}$$

$$\alpha = \frac{\tau}{I} = \frac{f\cdot R}{\frac{1}{1}mR^2} = \frac{2f}{mR} \qquad \text{...(iii)}$$

For Plank

$$F - T - f = Ma \qquad \text{...(iv)}$$

We have four knows f, T, a and α.

Solving the equations we get,

$$a = \frac{F}{M + 3m} \qquad \textbf{Ans.}$$

30. Angular impulse = change in angular momentum

$$\therefore \quad (J\times r_\perp) = I\omega$$

where, J = linear impulse $= \dfrac{I\omega}{r_t}$

$$= \frac{(m)\left(\frac{2l}{3}\right)^2\cdot\omega}{l}$$

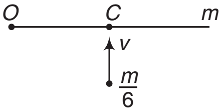
$$= \frac{4}{3}ml\omega \qquad \textbf{Ans.}$$

31. (a) Angular momentum about O remains constant just before and just after collision.

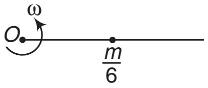
$$\therefore \quad L_i = L_f$$

or $$\left(\frac{m}{6}v\,\frac{L}{2}\right) = I\omega$$

$$= \left[\frac{mL^2}{3} + \frac{m}{6}\frac{L^2}{4}\right]\omega$$



⇒



Solving, we get

$$\omega = \frac{2v}{9L} \qquad \textbf{Ans.}$$

(b) $$\frac{K_f}{K_i} = \frac{\frac{1}{2}I\omega^2}{\frac{1}{2}\left(\frac{m}{6}\right)v^2}$$

$$= \frac{6\,I\omega^2}{v^2}$$

$$= \frac{6\left[\frac{mL^2}{3} + \frac{mL^2}{24}\right]\left(\frac{2v}{9L}\right)^2}{v^2}$$

$$= 6 \times \frac{9}{24} \times \frac{4}{81}$$

$$= \frac{1}{9} \qquad \textbf{Ans.}$$

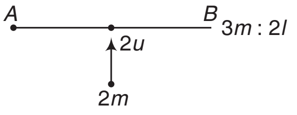
32. (a) Angular momentum of system is conserved just before and just after the impact.

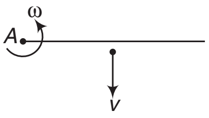
$\therefore \qquad L_i = L_f$

$\therefore \quad (2m)\,(2u)\,(l) = \dfrac{(3m)\,(2l)^2}{3}\cdot\omega - (2m)\,vl \qquad$ ...(i)

At the point of impact,

$$e = 1$$





$\therefore \qquad \dfrac{RVOS}{RVOA} = 1$

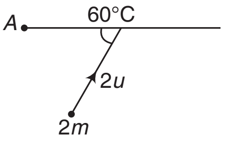
$\therefore \qquad RVOS = RVOA$

or $\qquad \omega l + v = 2u \qquad$ ...(ii)

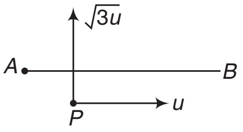
Solving Eqs. (i) and (ii) we get,

$$v = \frac{2u}{3} \qquad \textbf{Ans.}$$

(b) Component of velocity of particle $P\,(= u)$ parallel to AB remains the same. Component perpendicular to AB produces the same impact as was done in part (a).



⇒

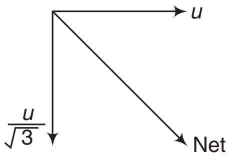


In part *(a)*, $2u$ velocity becomes

$$\frac{2u}{3}\left(\text{i.e., } \frac{1}{3}\text{ rd}\right).$$

Therefore, in this part $\sqrt{3}\,u$ will become

$$\frac{\sqrt{3}\,u}{3} \text{ or } \frac{u}{\sqrt{3}}.$$



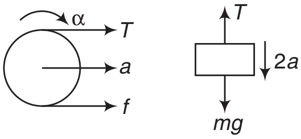
$\therefore \quad$ Net velocity $= \sqrt{u^2 + \dfrac{u^2}{3}}$

$$= \frac{2u}{\sqrt{3}} \qquad \textbf{Ans.}$$

LEVEL 2

Single Correct Option

1. **For Block**



$$mg - T = m\,(2a) \qquad \text{...(i)}$$

For Ring

$$T + f = ma \qquad \text{...(ii)}$$

$$\frac{(T - f)\,R}{mR^2} = \alpha \qquad \text{...(iii)}$$

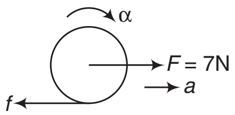
$$a = R\alpha \qquad \text{...(iv)}$$

Solving these equations we get

$$a = \frac{g}{3},\ 2a = \frac{2g}{3},\ T = \frac{mg}{3} \text{ and } f = 0$$

2. $f_{\max} = \mu mg = 0.1 \times 10 \times 10 = 10\ \text{N}$

Requirement of friction



$$a = R\alpha$$

$$\therefore \quad \left(\frac{7-f}{10}\right) = \frac{(R)\,(f\cdot R)}{2/5\ mR^2}$$

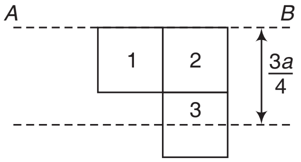
$$= \frac{2.5f}{m} = \frac{2.5f}{10}$$

Solving this equation, we get

$$f = 2$$

Since, $f < f_{\max}$, therefore $2N$ frictional force will act.

3. $I_{AB} = I_1 + I_2 + I_3$



$$= \frac{(m/4)\,(a/2)^2}{3} + \frac{(m/4)\,(a/2)^2}{3}$$

$$+ \left[\frac{(m/4)\,(a/2)^2}{12} + (m/4)\left(\frac{3a}{4}\right)^2\right]$$

$$= \frac{3}{16}ma^2$$

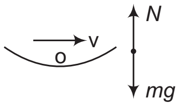
4. At bottom total kinetic energy

=decrease in potential energy

$= mgR$

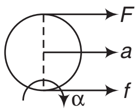
The ratio, $\dfrac{K_R}{K_T} = \dfrac{2}{5}$

$$\therefore \quad K_T = \frac{1}{2}mv^2 = \frac{5}{7}mgR$$



$$\therefore \quad \frac{mv^2}{R} = \frac{10}{7}mg = N - mg$$

$$\therefore \quad N = \frac{17}{7}mg \qquad \textbf{Ans.}$$



5. In case of pure rolling α can be obtained about bottommost point, about which torque of friction is zero.

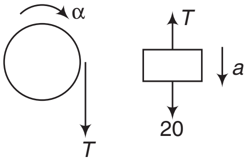
$$\alpha = \frac{F\ (2R)}{3/2\ mR^2} = \frac{4}{3}\frac{F}{mR}$$

$$\therefore \quad a = R\alpha = \frac{4F}{3m} \qquad \textbf{Ans.}$$

6. $F + f = ma = \dfrac{4F}{3}$

$$\therefore \quad f = \frac{F}{3} \quad \text{(towards right)} \qquad \textbf{Ans.}$$

7. **For Block**



$$20 - T = 2a \qquad \text{...(i)}$$

For Pulley

$$TR = I\alpha$$

$$\therefore \quad T\ (0.2) = (0.32)\,\alpha$$

$$T = 1.6\,\alpha \qquad \text{...(ii)}$$

$$a = R\alpha = 0.2\,\alpha \qquad \text{...(iii)}$$

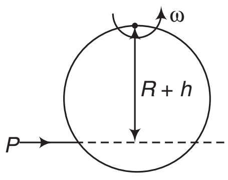
Solving these equations, we get

$$a = 2\ \text{m/s}^2 \qquad \textbf{Ans.}$$

8. $\omega = \dfrac{\text{Angular impulse}}{I}$ (about O)

$$= \frac{P\ (R+h)}{\frac{3}{2}mR^2}$$

Now, $v_{\text{COM}} = R\omega = \dfrac{PR\ (R+h)}{\frac{3}{2}mR^2}$



$$P + P_{\text{Hinge}} = mv_{\text{COM}} = \frac{mpR\ (R+h)}{\frac{3}{2}mR^2}$$

Solving this equation, we get $h = \dfrac{R}{2}$

9. $T_i = \dfrac{mg}{2}$ and $T_f = \dfrac{mg}{4}$

10. In first case $T < Mg$

In second case $T = Mg$

Torques are different, so angular accelerations are different.

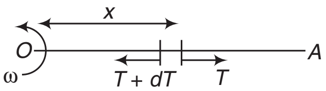
11. From energy conservation principle, maximum spring potential energy

= maximum decrease in gravitational potential energy

$$\therefore \quad \frac{1}{2}kx_m^2 = Mgh = Mg\,(x_m \sin\theta)$$

$$\therefore \quad x_m = \frac{2\,Mg\sin\theta}{k}$$

12. $-\,dT = (dm)\times\omega^2 = \left(\dfrac{m}{l}\,dx\right)x\omega^2$



$$\therefore \quad -\int_0^T dT = \int_l^x \left(\frac{m}{l}\,\omega^2\right)x\,dx$$

$$\therefore \quad T = \frac{1}{2}\,m\omega^2\,l\left(1-\frac{x^2}{l^2}\right) \qquad \textbf{Ans.}$$

13. $\omega = 10 + 5t$

$$\alpha = \frac{d\omega}{dt} = 5$$

At $\quad t = 0, \omega = 10$ rad/s

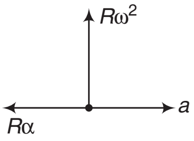
and $\quad \alpha = 5$ rad/s^2 $\Rightarrow r = OA = 1$ m

$$\mathbf{v} = (r\omega)\,\hat{\mathbf{j}} = (10\hat{\mathbf{j}}) \text{ m/s}$$

$$\mathbf{a} = (r\alpha)\,\hat{\mathbf{j}} - (r\omega^2)\,\hat{\mathbf{i}}$$

$$= (-100\,\hat{\mathbf{i}} + 5\hat{\mathbf{j}}) \text{ m/s}^2 \qquad \textbf{Ans.}$$

14. $a = R\alpha$

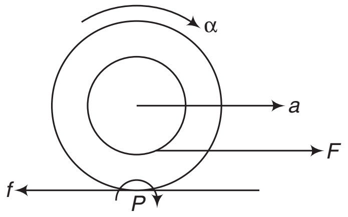


$$\therefore \quad a_{\text{net}} = R\omega^2 \quad \text{(towards centre)}$$

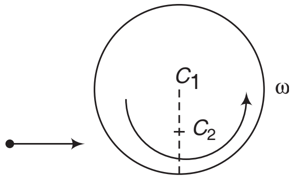
15. I_C is least and C lies between O and B as density is increasing from A to B.

$I_A > I_B$ as more mass is concentrated towards B.

16. Torque of F about P is clockwise. So, spool will move towards right. Torque of friction will provide the clockwise torque about centre. So, f is leftwards. Further, a is towards right, so, $F > f$.



17. $C_1 C_2 = \dfrac{R}{2}$



where, C_2 = combined centre of mass of ring and particle.

From conservation of angular momentum about C_2.

$$L_i = L_f$$

$$\therefore \quad \frac{mv\cdot R}{2} = I\omega$$

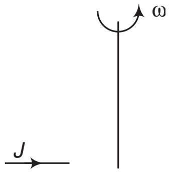
$$= \left[mR^2 + \frac{mR^2}{4} + \frac{mR^2}{4}\right]\omega$$

Solving this equation we get,

$$\omega = \frac{v}{3R} \qquad \textbf{Ans.}$$

18. Mg can't provide rotational motion. This is only N which actually provides the rotational motion.

19. Angular momentum = Angular impulse



$$\therefore \quad I\omega = Jl$$

or $\quad \omega = \dfrac{\text{Angular impulse}}{I}$

$$= \frac{Jl}{ml^2/3} = \frac{3J}{ml}$$

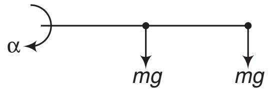
$$\text{KE} = \frac{1}{2}\,I\omega^2 = \frac{1}{2}\left(\frac{ml}{3}\right)^2\left(\frac{3J}{ml}\right)^2$$

$$= \frac{3J^2}{2m}$$

20. No rotational motion.

21. $\alpha = \dfrac{\tau_{\text{net}}}{I}$

$$= \frac{mg\left(\frac{l}{2}\right) + mgl}{(ml^2/3)}$$

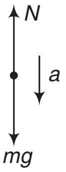


$$= \frac{4.5\,g}{l}$$

$$a_{\text{coin}} = l\alpha = 4.5\,g$$

$$mg - N = ma_{\text{coin}}$$

$\therefore \quad N = mg - ma_{\text{coin}} = -3.5\,g$



Since, N can't be negative.

So, $N = 0$ and coin can not remain in contact with rod.

22. Let F = the applied force and f = force of friction (leftwards)

Net horizontal force = 0

$\therefore \quad F\cos\theta = f$ ...(i)

Net torque about centre = 0

$\therefore \quad F\cdot r = fR$

Substituting $\dfrac{f}{R} = \dfrac{r}{R}$ in Eq. (i) we have,

$$\cos\theta = \frac{r}{R}$$

or $\quad \sin\theta = \sqrt{1 - \dfrac{r^2}{R^2}}$

$\therefore \quad \theta = \sin^{-1}\left(\sqrt{1 - \dfrac{r^2}{R^2}}\right)$

23. $a = \dfrac{mg - T}{m}$ ...(i)

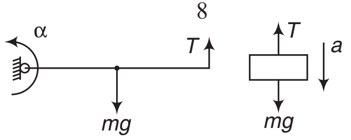
$$\alpha = \frac{\tau}{I} = \frac{T\cdot l - mg\cdot\frac{l}{2}}{(ml^2/3)}$$

or $\quad \alpha = \dfrac{1}{ml}\left[3T - \dfrac{3mg}{2}\right]$ ...(ii)

$a = l\alpha$ ...(iii)

Solving these three equations we get,

$a = \dfrac{3g}{8}$ **Ans.**

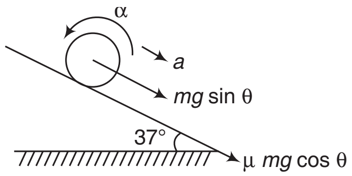


24. $a = (\mu g\cos\theta) + (g\sin\theta)$

$$= 0.5\times 10\times 0.8 + 10\times 0.6 = 10\text{ m/s}^2$$

$$\alpha = \frac{(\mu\, mg\cos\theta)\,R}{\frac{1}{2}mR^2} = \frac{2\,\mu g\cos\theta}{R}$$

$$= \frac{2\times 0.5\times 10\times 0.8}{0.4} = 20\text{ rad/s}^2$$



Pure rolling will start when,

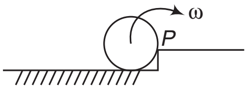
$v = R\omega$ or $at = R(\omega_0 - \alpha t)$

$\therefore \quad 10\,t = 0.4\,(54 - 20t)$

Solving this equation, we get

$t = 1.2\text{ s}$ **Ans.**

25. Angular momentum will remain conserved at the point of impact P. and just after impact it starts rotating about point P.



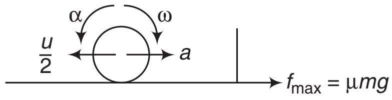
$$L_i = L_f$$

$$\therefore\ Mv_0\left(R - \frac{R}{4}\right) + \frac{1}{2}MR^2\left(\frac{v_0}{R}\right) = \frac{3}{2}MR^2\cdot\omega$$

$\therefore \quad \omega = \dfrac{5v_0}{6R}$

$\therefore \quad v_{\text{COM}} = \omega R = \dfrac{5v_0}{6}$ **Ans.**

26. $a = \dfrac{\mu mg}{m} = \mu g$



$\omega = \dfrac{u}{R} \Rightarrow \alpha = \dfrac{(\mu mg)\,R}{2/5\;mR^2} = \dfrac{5\,\mu g}{2R}$

Pure rolling will start when

$$v = R\omega$$

$$\left(\frac{u}{2} - at\right) = R\,(\alpha t - \omega)$$

or $\quad \left(\dfrac{u}{2} - \mu\,gt\right) = R\left(\dfrac{5\,\mu g}{2R}\,t - \dfrac{u}{R}\right)$

Solving we get, $\quad t = \dfrac{3u}{7\,\mu g}$ **Ans.**

27. Viscous liquid has only translational kinetic energy

$\therefore$ KE = translational + rotational kinetic energy of hollow sphere + translational kinetic energy of liquid.

$$= \frac{1}{2}mv^2 + \frac{1}{2} \times \frac{2}{3}mR^2\left(\frac{v}{R}\right)^2 + \frac{1}{2}mv^2$$

$$= \frac{4}{3}mv^2$$ **Ans.**

28. $$a = \frac{g\sin\theta}{1 + I/mR^2} = \frac{g\sin\theta}{1 + (1/2)}$$

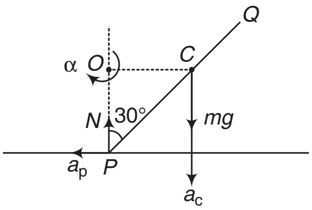
$$= \frac{2g\sin\theta}{3}$$

$$\therefore \quad g\sin\theta = \frac{3}{2}a$$

Now, $$f = \frac{mg\sin\theta}{1 + mR^2/I} = \frac{m\,(3/2\,a)}{1 + 2}$$

$$= \frac{1}{2}ma$$ **Ans.**

29. Only two forces are acting on rod, normal reaction (vertically upwards) and weight (vertically downwards). Since, both forces are vertical centre of mass falls in vertical direction (downwards).



$$OC = \frac{l}{2}\sin 30° = \frac{l}{4}$$

$$\alpha = \frac{\tau}{I} \qquad \text{(about } O\text{)}$$

$$= \frac{(mg)\left(\frac{l}{2}\sin 30°\right)}{\left(\frac{ml^2}{12} + \frac{ml^2}{16}\right)}$$

$$= \frac{12}{7}\frac{g}{l}$$

$$a_C = (OC)\,\alpha$$

$$= \left(\frac{l}{4}\right)\left(\frac{12}{7}\frac{g}{l}\right) = \frac{3}{7}g$$

Now, $$mg - N = ma_C = \frac{3\,mg}{7}$$

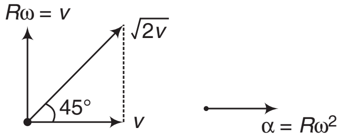
$$\therefore \quad N = \frac{4\,mg}{7}$$ **Ans.**

30. $$a_P = (OP)\,\alpha$$

$$= \left(\frac{l}{2}\cos 30°\right)\left(\frac{12}{7}\frac{g}{l}\right)$$

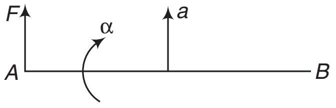
$$= \frac{3\sqrt{3}g}{7}$$ **Ans.**

31. Angle between acceleration and velocity is 45°.



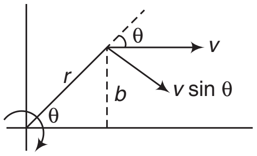
32. $$a = \frac{F}{M}$$

$$\alpha = \frac{FL/2}{ML^2/12} = \frac{6F}{ML}$$



$$a_B = \frac{L}{2}\alpha - a = \frac{2F}{M} \qquad \text{(downwards)}$$

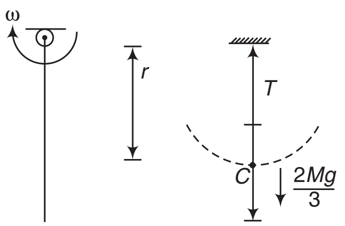
33. $$\omega = \frac{v\sin\theta}{r} = \frac{v\sin\theta}{b/\sin\theta}$$



$$= \frac{v\sin^2\theta}{b} \propto \sin^2\theta \qquad \text{(as } v \text{ and } b \text{ are constants)}$$

θ is decreasing. Therefore, ω will decrease.

34. Decrease in gravitational potential energy = increase in rotational kinetic energy



$$\therefore \quad Mg\frac{L}{2} = \frac{1}{2}\left(\frac{ML^2}{3}\right)\cdot\omega^2 \quad \therefore \quad \omega^2 = \frac{3g}{L}$$

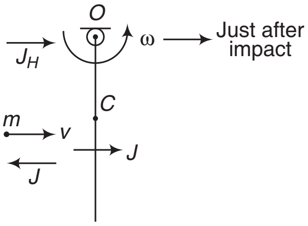
$$r = \frac{L}{3} + \frac{2L/3}{2} = \frac{2L}{3}$$

$$\frac{T-2Mg}{3}=\left(\frac{2M}{3}\right)a_C=\left(\frac{2M}{3}\right)(r\omega^2)$$

$$\therefore \qquad T=\frac{2Mg}{3}+\left(\frac{2Mg}{3}\right)\left(\frac{2L}{3}\right)\left(\frac{3g}{L}\right)$$

$$=2\,Mg$$ **Ans.**

35. From conservation of angular momentum, just before and just after impact about point O we have,



$$L_i=L_f$$

$$\therefore \qquad mv\frac{L}{2}=\left(\frac{mL^2}{3}\right)\cdot\omega$$

$$\therefore \qquad \omega=\frac{3v}{2L}$$

$$v_C=\frac{1}{2}\cdot\omega=\frac{3}{4}v$$

Impulse J has changed the momentum of particle from mv to O. Hence,

$$J=mv$$

For rod

$$J_H+J=mv_C=\frac{3}{4}mv$$

$$\therefore \qquad J_H=\frac{3}{4}mv-J=\frac{3}{4}mv-mv$$

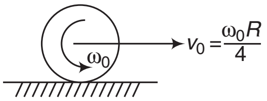
$$=-\frac{mv}{4}\text{ or }|J_H|=\frac{mv}{4}$$ **Ans.**

36. $L_i=L_f$

$$(I+mR^2)\,\omega=(mvR)+I\omega'$$

$$\therefore \qquad \omega'=\frac{(I+mR^2)\,\omega-mvR}{I}$$ **Ans.**

37. About bottommost point,



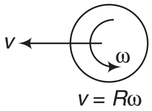
Angular momentum,

$$L=I_C\,\omega_0-mv_0R \qquad \text{(anticlockwise)}$$

$$=\frac{1}{2}mR^2\omega_0-m\left(\omega_0\frac{R}{4}\right)R$$

$$=\frac{1}{4}mR^2\omega_0$$

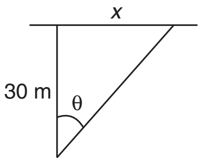
$$=+\text{ ve or anticlockwise}$$



During slip, friction acts about bottommost point. So, its torque is zero or angular momentum about bottommost point should also remain anticlockwise when pure rolling starts. So, figure should be as shown below.

So, the disc will return to its initial position for all values of μ.

38. $x=30\tan\theta$



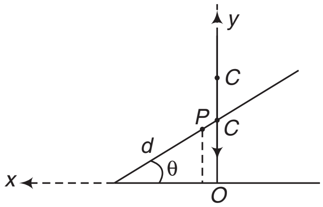
$$\therefore \qquad \left(\frac{dX}{dt}\right)=(30\sec^2\theta)\cdot\frac{d\theta}{dt}$$

or $$v_{\text{car}}=(30\sec^2\theta)\,\omega$$

$$\therefore \qquad \omega=\frac{v_{\text{car}}}{30\sec^2\theta}$$

$$=\frac{40}{(30)\sec^2 30^\circ}=1\text{ rad/s}$$

39. Two forces normal reaction and weight are the only forces acting on the rod during motion. Both forces are vertical. So centre of mass will fall downwards in a vertical line.



$$X_P=x\text{ (say)}=\frac{l}{2}\cos\theta-d\cos\theta$$

or $$\cos\theta=\frac{x}{\left(\frac{l}{2}-d\right)} \qquad \text{...(i)}$$

Similarly,

$$y_P=y=d\sin\theta$$

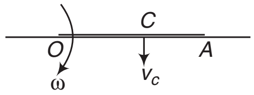
$$\therefore \qquad \sin\theta=\frac{y}{d} \qquad \text{...(ii)}$$

Squaring and adding Eqs. (i) and (ii), we get

$$\frac{X^2}{\left(\frac{l}{2}-d\right)^2}+\frac{y^2}{d^2}=1$$

This is an equation of a circle for $d=\frac{l}{4}$. For any other value of 'd' it is equation of ellipse.

40. Instantaneous axis of rotation will pass through O.



$$\therefore \qquad v_0 = 0$$

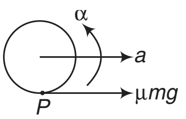
41. Decrease in gravitational potential energy
= increase in rotational kinetic energy about O

$$\therefore \qquad mg\frac{l}{2} = \frac{1}{2}\left(\frac{ml^2}{3}\right)\omega^2$$

$$\text{or} \qquad \omega = \sqrt{\frac{3g}{l}}$$

$$v_A = r\omega = l\omega = \sqrt{3gl} \qquad \textbf{Ans.}$$

42. $a = \dfrac{\mu\, mg}{m} = \mu g = \dfrac{2}{7}g$



$$\alpha = \frac{\mu\, mgR}{\frac{2}{5}mR^2} = \frac{5\mu g}{2R} = \frac{5}{7}\frac{g}{R}$$

Pure rolling will start when,

$$v_P = v + R\omega = v_0$$

$$\text{or} \qquad at + R(\alpha t) = v_0$$

$$\therefore \qquad \left(\frac{2}{7}gt\right) + \frac{5}{7}gt = v_0$$

$$\therefore \qquad t = \frac{v_0}{g}$$

$$S = \frac{1}{2}at^2$$

$$= \frac{1}{2}\left(\frac{2}{7}g\right)\left(\frac{v_0}{g}\right)^2 = \frac{v_0^2}{7g} \qquad \textbf{Ans.}$$

More than One Correct Options

1. $\dfrac{K_R}{K_T} = \dfrac{I}{mr^2}$

$$\therefore \qquad K_T = \left(\frac{mr^2}{I + mr^2}\right)K_{\text{Total}}$$

$$\text{or} \qquad K_{\text{Total}} = \left(\frac{I + mr^2}{mr^2}\right)\left(\frac{1}{2}mv^2\right)$$

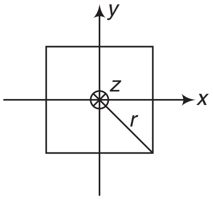
$$= mgh = mg\left(\frac{3}{4}\frac{v^2}{g}\right)$$

Solving we get $I = \dfrac{1}{2}mr^2$

So it is either solid cylinder or disc.

2. (a) $I_x = I_y = 2\left[\dfrac{ml^2}{12} + m\left(\dfrac{l}{2}\right)^2\right]$

$$= \frac{2}{3}ml^2$$



(b) $I_z = I_x + I_y = \dfrac{4}{3}ml^2$

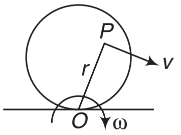
(c) $I = I_z + (4m)\,r^2$

$$= \frac{4}{3}ml^2 + (4m)\left(\frac{l}{\sqrt{2}}\right)^2$$

$$= \frac{10}{3}ml^2$$

(d) $I = 2\dfrac{ml^2}{3} + ml^2 = \dfrac{5}{3}ml^2$

3. $O \rightarrow$ instantaneous axis of rotation

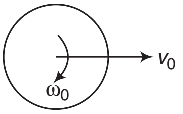


$$v = r\omega \;\text{ or }\; v \propto r$$

More the value of r from O more is the speed of point P.

4. $v_0 + R\omega_0 = v \qquad$ ...(i)

$v_0 - R\omega_0 = 3v \qquad$ ...(ii)



Solving these two equations,

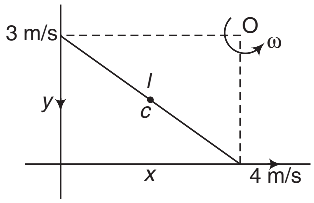
we get $\qquad v_0 = 2v$

and $\qquad \omega_0 = -\dfrac{v}{R}$

5. $x^2 + y^2 = l^2 = (0.25)\ m^2$

$$y\omega = 4 \quad \text{...(i)}$$

$$x\omega = 3 \quad \text{...(ii)}$$



Squaring and adding, we get

$$(x^2 + y^2)\,\omega^2 = 25$$

or $$(0.25)\,\omega^2 = 25$$

$$\therefore \quad \omega = 10 \text{ rad/s}$$

$$OC = \frac{l}{2} = 0.25\text{m}$$

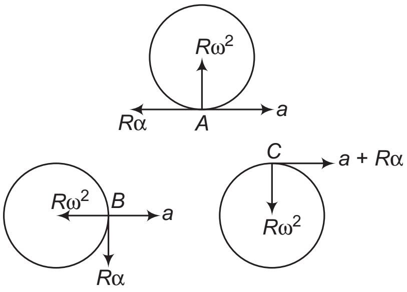
$$v_{\text{CM}} = (OC)\,\omega = 2.5 \text{ m/s}$$

$$K_{\text{Total}} = \frac{1}{2}mv_{\text{cm}}^2 + \frac{1}{2}I_{\text{cm}}\,\omega^2$$

$$= \frac{1}{2}\times 2\times(2.5)^2 + \frac{1}{2}\left(\frac{2\times 0.25}{12}\right)(10)^2$$

$$= \frac{25}{3}\text{ J}$$

6. Net acceleration of any point on the rim is vector sum of a, $R\omega^2$ and $R\alpha$ with $a = R\alpha$

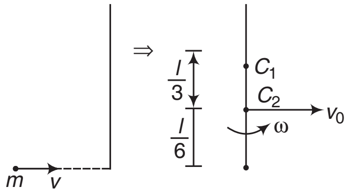


$a_A = R\omega^2 \rightarrow$ vertically upwards

If $a = R\omega^2$, a_B is vertically downwards and so on.

7. C_1 is centre of mass of rod

C_2 is centre of mass of both



$$P_i = P_f$$

$$\therefore \quad mv = 3mv_0 \Rightarrow v_0 = \frac{v}{3} \quad \text{...(i)}$$

$L_i = L_f$ about C_2 we have,

$$mv\,\frac{l}{6} = I_{C_2}\,\omega$$

$$= \left[\left(\frac{2ml^2}{12}\right) + 2m\left(\frac{l}{3}\right)^2 + m\left(\frac{l}{6}\right)^2\right]$$

$$\therefore \quad \omega = \frac{2}{5}\frac{v}{l} \Rightarrow K_i = \frac{1}{2}mv^2$$

$$K_f = \frac{1}{2}(3m)\left(\frac{v}{3}\right)^2 + \frac{1}{2}I_{C_2}\,\omega^2$$

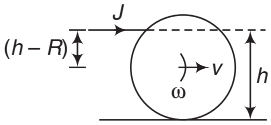
$$= \frac{1}{6}mv^2 + \frac{1}{2}\left(\frac{5}{12}ml^2\right)\left(\frac{2}{5}\frac{v}{l}\right)^2$$

$$= \frac{1}{5}mv^2$$

$\therefore$ Loss of kinetic energy $= K_i - K_f = \dfrac{3}{10}mv^2$

8. $I = mK^2$ $\left(\text{where, } K = \dfrac{R}{2} = \text{radius of gyration}\right)$

$$= m\left(\frac{R}{2}\right)^2 = \frac{1}{4}mR^2$$



Ball will roll purely if

$$v = R\omega$$

$$\therefore \quad \left(\frac{J}{m}\right) = R\left[\frac{J\,(h-R)}{(1/4)\,mR^2}\right]$$

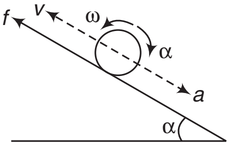
Solving this equation, we get

$$h = \frac{5R}{4}$$

Further, if ball is struck at centre of mass, there will be no rotation only translation.

9. Friction always acts upwards. If the ball moves upwards, it becomes a case of retardation with pure rolling.

$$\mu_{\min} = \frac{\tan\alpha}{1 + \dfrac{mR^2}{I}} = \frac{\tan\alpha}{1 + \dfrac{3}{2}} = \frac{2}{5}\tan\alpha$$



10. $I_1\omega_1 = I_2\omega_2$

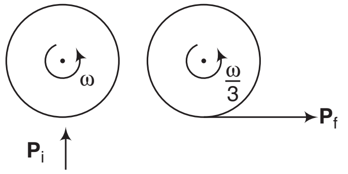
$$\therefore \quad \omega_2 = \frac{I_1}{I_2}\cdot\omega_1$$

$$= \frac{(1/2\ mR^2)}{(1/2\ mR^2 + mR^2)}\cdot\omega$$

$$= \frac{\omega}{3}$$

$$P_i = mv_i = m\,(2\omega R) = 2m\omega R$$

$$P_f = mv_f = m\left(\frac{\omega}{3}R\right) = \frac{1}{3}m\omega R$$

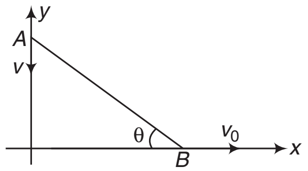


Impulse $J = |\mathbf{P}_f - \mathbf{P}_i|$

$$= \sqrt{P_i^2 + P_f^2} \qquad (\text{as}\ \theta = 90°)$$

$$= \frac{\sqrt{37}}{3}\,m\omega R$$

11. Velocity component along $AB = 0$



$$\therefore \quad v_0\cos\theta = v\sin\theta$$

or $\quad v = v_0\cot\theta = f_1(\theta)$

at $\quad \theta = 37°,\ v = \frac{4}{3}v_0$

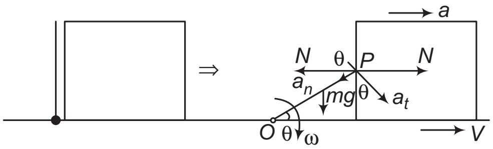
$$\omega = \frac{\text{Relative velocity} \perp \text{to } AB}{l}$$

$$= \frac{v_0\sin\theta + v\cos\theta}{l} = f_2(\theta)$$

$$= \frac{(v_0)(3/5) + (4/3\ v_0)(4/5)}{l} = \frac{5v_0}{3l}$$

Comprehension Based Questions

1. At angle θ shown in figure :



decrease in potential energy of rod
= increase in rotational kinetic energy of rod
+ translational kinetic energy of block.

But $\quad v = v_P\sin\theta = (l\omega)\sin\theta$

$$\therefore \quad mg\left(\frac{l}{2} - \frac{l}{2}\sin\theta\right) = \frac{1}{2}\left(\frac{ml^2}{3}\omega^2\right) + \frac{1}{2}M\,(\omega l\sin\theta)^2$$

From here we get,

$$l\omega^2 = a_n = \frac{mg\,(1-\sin\theta)}{m/3 + M\sin^2\theta} \qquad \text{...(i)}$$

$$a_t = l\alpha = l\left(\frac{\tau}{I}\right)_0 = l\left[\frac{mg\,\frac{l}{2}\cos\theta - Nl\sin\theta}{ml^2/3}\right]$$

$$= \frac{3}{2}g\cos\theta - \frac{3N\sin\theta}{m} \qquad \text{...(ii)}$$

For block

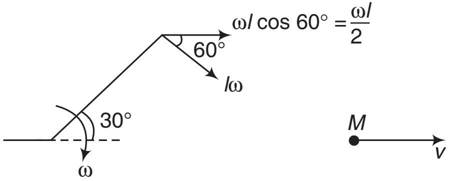
$$N = Ma = M\,[a_t\sin\theta - a_n\cos\theta] \qquad \text{...(iii)}$$

Now putting values of a_t and a_n from Eqs. (i) and (ii) in Eqs. (iii) and then putting $N = 0$ and $\theta = 30°$ in the equation we get,

$$\frac{M}{m} = \frac{4}{3} \qquad \textbf{Ans.}$$

2. $\frac{M}{m} = \frac{4}{3}$

$$M = \frac{4}{3}m$$



$$\frac{\omega l}{2} = v \quad \therefore \quad \omega = \frac{2v}{l}$$

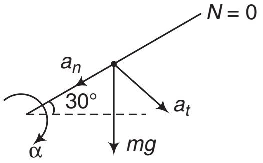
Decrease in potential energy of rod
= increase in rotational kinetic energy of rod
+ translational kinetic energy of block

$$\therefore \quad mg\left(\frac{l}{2} - \frac{l}{2}\sin 30°\right) = \frac{1}{2}\left(\frac{ml}{3}\right)^2\left(\frac{2v}{l}\right)^2 + \frac{1}{2}\left(\frac{4m}{3}\right)(v^2)$$

Solving this equation, we get

$$v = \frac{\sqrt{3gl}}{4} \qquad \textbf{Ans.}$$

3. $a_n = \frac{l}{2}\omega^2 = \frac{l}{2}\left(\frac{4v^2}{l^2}\right)$



$$= \left(\frac{2}{l}\right)\left(\frac{3gl}{16}\right) = \frac{3}{8}g$$

$$a_t = \frac{l}{2}\alpha = \frac{l}{2}\left(\frac{\tau}{I}\right) = \frac{l}{2}\left[\frac{mg\left(\frac{l}{2}\cos 30°\right)}{ml^2/3}\right]$$

$$= \frac{3\sqrt{3}\,g}{8}$$

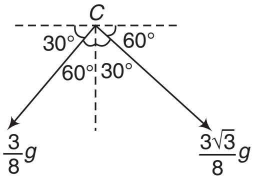
$$\therefore \qquad a = \sqrt{a_n^2 + a_t^2}$$

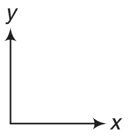
$$= \frac{3g}{4}$$

4. $\mathbf{a}_C = \left(\frac{3\sqrt{3}\,g}{8}\cos 60° - \frac{3}{8}g\cos 30°\right)\hat{\mathbf{i}}$

$$+ \left(\frac{3\sqrt{3}\,g}{8}g\cos 30° + \frac{3}{8}g\cos 60°\right)(-\hat{\mathbf{j}})$$

$$= -\left(\frac{3g}{4}\right)\hat{\mathbf{j}}$$





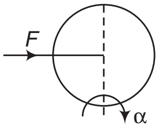
Now, $\quad mg(-\hat{\mathbf{j}}) + \mathbf{F}_{\text{Hinge}} = m\mathbf{a}_C$

Substituting the values we get

$$\mathbf{F}_{\text{Hinge}} = \left(\frac{mg}{4}\right)\hat{\mathbf{j}}$$ **Ans.**

5. Bottommost point where friction actually acts is at rest.

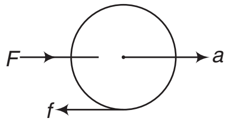
6. $\alpha = \frac{F \cdot R}{\frac{3}{2}mR^2} = \frac{2F}{3mR}$



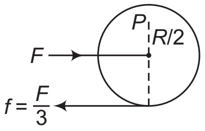
$$a = R\alpha = \frac{2F}{3m}$$

$$F - f = ma = \frac{2F}{3}$$

$$\therefore \qquad f = \frac{F}{3} = \frac{1}{2}ma$$



7. About point P net torque of F and f is zero. So, angular momentum is conserved.



8. K_{Total} after falling a height h is mgh

$$\frac{K_R}{K_T} = \frac{2}{3}$$

$$\therefore \qquad K_T = \frac{1}{2}mv^2 = \left(\frac{3}{5}\right)(mgh)$$

$$\therefore \qquad v = \sqrt{\frac{6gh}{5}}$$ **Ans.**

9. $H = \frac{v^2 \sin^2 \sin 37°}{2g}$

$$= \frac{(6gh/5)\,(3/5)^2}{2g} = \frac{27h}{125}$$ **Ans.**

10. $R = x = \frac{2u^2 \sin 37° \cos 37°}{g}$

$$= \frac{(2)\,(6gh/5)\,(3/5)\,(4/5)}{g}$$

$$= \frac{144}{125}h$$ **Ans.**

Match the Columns

1. (a) $t = \sqrt{\frac{2S}{a}}$ and $a = \frac{g\sin\theta}{1 + I/mR^2}$

I of hollow sphere is maximum.

So, a is minimum and t is maximum.

(b) $K_{\text{Total}} = mgh$ for all

(c) $\frac{K_R}{K_T} = \frac{2}{5}$ for solid sphere

$= \frac{2}{3}$ for hollow sphere

$= \frac{1}{2}$ for disc

It is maximum for hollow sphere.

But $\frac{K_T}{K_R}$ is maximum for solid sphere.

2. In all cases,

$$v = \frac{J}{m} \qquad (J = \text{linear impulse})$$

$$\omega = \frac{J \times r_\perp}{I_E}$$

Here, $r_\perp$ is from centre E. v is rightwards. So, for pure rolling ω should be clockwise. Hence, J should be applied at A.

If it is below A, angular velocity is anticlockwise and it will cause forward slip.

3. In case of pure roll (upwards or downwards) required value of friction acts in upward direction.

In case of slip (forward or backward) maximum friction will act in backward or forward direction.

4. (a) $K = \sqrt{I/m}$

$$= \sqrt{\frac{m\,(2a)^2}{3}} = \frac{2}{\sqrt{3}}\,a$$

(b) $K = \sqrt{\frac{m\,(2a)^2}{12}} = \frac{a}{\sqrt{3}}$

(c) $K = \sqrt{\frac{ma^2}{3}} = \frac{a}{\sqrt{3}}$

(d) $K = \sqrt{\frac{ma^2}{12}} = \frac{a}{\sqrt{12}}$

5. (a) $K_{\text{Total}} = mgh\,K \text{ (say)}$

$$\frac{K_R}{K_T} = \frac{2}{5}$$

$$\therefore \quad K_R = \frac{2}{7}K = \frac{2}{7}mgh$$

(b) $K_{\text{Total}} = mg\frac{h}{2}$

$$\frac{K_R}{K_T} = \frac{2}{5}$$

$$\therefore\ K_T = \frac{5}{7}\left(mg\frac{h}{2}\right) = \frac{5}{14}mgh$$

(c) At 3

$$K_R = \frac{2}{7}\left(mg\frac{h}{2}\right) = \frac{1}{7}mgh$$

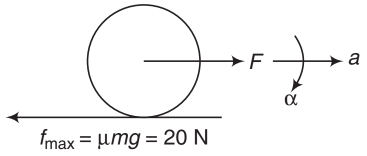
From 3 to 4, K_R will become constant.

(d) $K_T = K_{\text{Total}} - K_R$

$$= mgh - \frac{1}{7}mgh = \frac{6}{7}mgh$$

6. $a = R\alpha = R\left(\frac{\tau}{I}\right)$

$$\therefore \quad \frac{F-20}{10} = (1)\left(\frac{20 \times 1}{\frac{1}{2} \times 10 \times 1^2}\right)$$



Solving this equation, we get

$$F = 60 \text{ N}$$

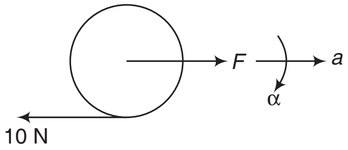
So, when $F = 60$ N, friction reaches its maximum value or slipping will start. F becomes 60 N at 6 s.

(d) $a = R\alpha = R\left(\frac{\tau}{I}\right)$

$$\text{or} \quad \frac{F-10}{10} = (1)\left[\frac{10 \times 1}{\frac{1}{2} \times 10 \times 1^2}\right]$$

$$F = 30 \text{ N}$$

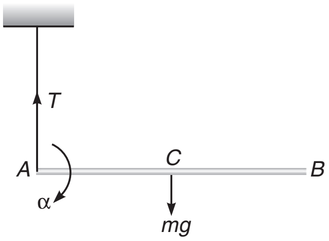
and F becomes 30 N at 3 s.



Subjective Questions

1. Torque about bottommost point in each case is clockwise.

2. $\alpha = \frac{\tau}{I} = \frac{mg\left(\frac{l}{2}\right)}{\frac{ml^2}{3}} = \frac{3}{2}\frac{g}{l}$



(a) $a_B = l\alpha = \frac{3g}{2}$ **Ans.**

(b) $a_C = \frac{l}{2}\alpha = \frac{3g}{4}$ **Ans.**

(c) $a_C = \frac{mg - T}{m}$ or $\frac{3g}{4} = \frac{mg - T}{m}$

∴ $T = \frac{mg}{4}$ **Ans.**

3. $mgh = K_R + K_T = \frac{3}{4}mv^2$

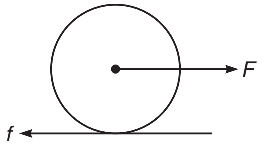
Here $h = s\sin\theta$

∴ $gs\sin\theta = \frac{3}{4}v^2$ or $s = \frac{3v^2}{4g\sin\theta}$

$$= \frac{3\times(2.0)^2}{4\times 9.8\times\frac{1}{2}} = 0.612 \text{ m}$$ **Ans.**

4. $I = MR^2$

For pure rolling to take place. $a = R\alpha$



or $\frac{F - f}{M} = R\left(\frac{f.R}{MR^2}\right) = \frac{f}{M}$

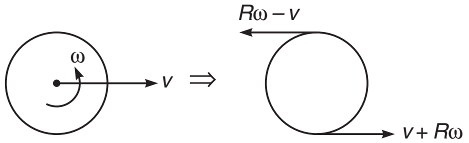
∴ $f = \frac{F}{2}$ **Ans.**

and $a = \frac{F - f}{M} = \frac{F}{2M}$ **Ans.**

5. $v + R\omega = 1.5$ ...(i)

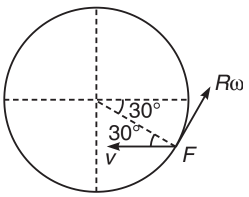
and $R\omega - v = 3.0$ ...(ii)

From Eq. (i) and (ii), we have



$R\omega = 2.25$ m/s and $v = -0.75$ m/s

Thus, velocity of point C is 0.75 m/s (towards left).



$$v_F = \sqrt{v^2 + (R\omega)^2 + 2v(R\omega)\cos(90 + 30)}$$

$$= \sqrt{0.5625 + 5.0625 + 2\times 0.75\times 2.25\times\left(-\frac{1}{2}\right)}$$

$= 1.98$ m/s **Ans.**

6. $a = \frac{Mg - T}{M}$ ...(i)

$$\alpha = \frac{TR}{\frac{1}{2}MR^2} = \frac{2T}{MR}$$ ...(ii)

$$a = R\alpha$$ ...(iii)

Solving these three equations, we get

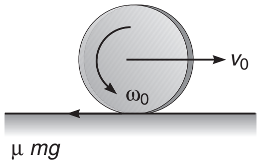
$a = \frac{2g}{3}$ and $T = \frac{Mg}{3}$ **Ans.**

7. From conservation of mechanical energy, decrease in gravitational PE = increase in rotational KE

or $mg(R) = \left[\frac{1}{2}MR^2 + mR^2\right]\left(\frac{1}{2}\omega^2\right)$

or $\omega = \sqrt{\frac{4mg}{(2m + M)R}}$ **Ans.**

8. Initially there is forward slipping. Therefore, friction is backwards and maximum.



Let velocity becomes zero in time t_1 and angular velocity becomes zero in time t_2.

Then, $0 = v_0 - at_1$

or $t_1 = \frac{v_0}{a} = \frac{v_0}{\mu g}$ ...(i)

and $0 = \omega_0 - \alpha t_2$

or $t_2 = \frac{\omega_0}{\alpha}$

Here, $\alpha = \frac{\mu mgR}{\frac{1}{2}mR^2} = \frac{2\mu g}{R}$

∴ $t_2 = \frac{\omega_0 R}{2\mu g}$ ...(ii)

Disk will return back when

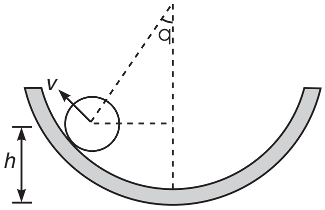
$t_2 > t_1$ or $\frac{\omega_0 R}{2\mu g} > \frac{v_0}{\mu g}$

or $\omega_0 > \frac{2v_0}{R}$ **Ans.**

9. $h = (R - r)(1 - \cos\theta)$ …(i)

Kinetic energy at angle θ is,

$$K = \frac{7}{5}\left(\frac{1}{2}mv_0^2\right) - mgh$$



∵ In case of pure rolling

$$K_T = \frac{5}{7}K$$

$$\therefore \quad \frac{1}{2}mv^2 = \frac{1}{2}mv_0^2 - \frac{5}{7}mgh$$

$$\therefore \quad v^2 = v_0^2 - \frac{10}{7}gh \qquad \text{…(ii)}$$

Equation of motion at angle θ is,

$$N - mg\cos\theta = \frac{mv^2}{(R - r)}$$

$$\therefore \quad N = mg\cos\theta + \frac{m}{(R - r)}\left(v_0^2 - \frac{10}{7}gh\right)$$

Substituting value of h from Eq. (i)

$$N = mg\cos\theta + \left(\frac{m}{R - r}\right)\left\{v_0^2 - \frac{10}{7}g(R - r)(1 - \cos\theta)\right\}$$

$$= \frac{mg}{7}(17\cos\theta - 10) + \frac{mv_0^2}{(R - r)} \qquad \textbf{Ans.}$$

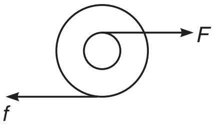
Force of friction,

$$f = \frac{mg\sin\theta}{1 + \frac{mr^2}{I}} \quad \text{(for pure rolling to take place)}$$

$$= \frac{mg\sin\theta}{1 + \frac{5}{2}} \qquad \left(I = \frac{2}{5}mr^2\right)$$

$$= \frac{2}{7}mg\sin\theta \qquad \textbf{Ans.}$$

10. (a) For pure rolling to take place,



$$a = R\alpha \quad \text{or} \quad \frac{F - f}{m} = R\left[\frac{Fr + fR}{\frac{1}{2}mR^2}\right]$$

Solving this equation, we get

$$f = \frac{2}{3}\left(\frac{1}{2} - \frac{r}{R}\right)F \qquad \textbf{Ans.}$$

(b) Acceleration $a = \dfrac{F - f}{m}$

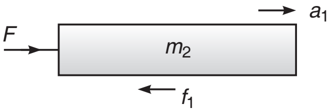
Substituting value of f from part (a), we get

$$a = \frac{2F}{3mR}(R + r) \qquad \textbf{Ans.}$$

(c) $a > \dfrac{F}{m}$ if $\dfrac{2}{3R}(R + r) > 1$ or $r > \dfrac{R}{2}$ **Ans.**

(d) In this case force of friction is in forward direction. **Ans.**

11. We can choose any arbitrary directions of frictional forces at different contacts.



In the final answer, the negative value will show the opposite directions.

Let f_1 = friction between plank and cylinder

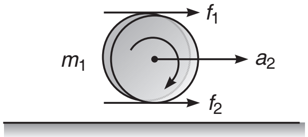
f_2 = friction between cylinder and ground

a_1 = acceleration of plank

a_2 = acceleration of centre of mass of cylinder

and α = angular acceleration of cylinder about is COM.

Directions of f_1 and f_2 are as shown here



Since, there is no slipping anywhere

$$\therefore \quad a_1 = 2a_2 \qquad \text{…(i)}$$

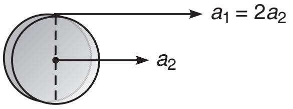
(Acceleration of plank = acceleration of top point of cylinder)

$$a_1 = \frac{F - f_1}{m_2} \qquad \text{…(ii)}$$

$$a_2 = \frac{f_1 + f_2}{m_1} \qquad \text{…(iii)}$$

$$\alpha = \frac{(f_1 - f_2)R}{I}$$

(I = moment of inertia of cylinder about COM)

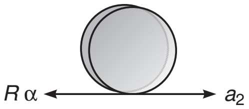


$$\therefore \qquad \alpha = \frac{(f_1 - f_2)R}{\frac{1}{2}m_1 R^2}$$

$$\alpha = \frac{2(f_1 - f_2)}{m_1 R} \qquad \ldots\text{(iv)}$$

$$a_2 = R\alpha = \frac{2(f_1 - f_2)}{m_1} \qquad \ldots\text{(v)}$$

(Acceleration of bottommost point of cylinder = 0)



(a) Solving Eqs. (i), (ii), (iii) and (v), we get

$$a_1 = \frac{8F}{3m_1 + 8m_2}$$

and
$$a_2 = \frac{4F}{3m_1 + 8m_2}$$

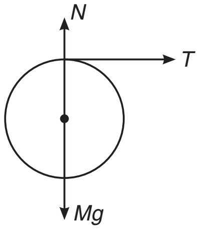
(b) $f_1 = \dfrac{3m_1 F}{3m_1 + 8m_2}$

$$f_2 = \frac{m_1 F}{3m_1 + 8m_2}$$

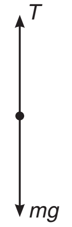
Since, all quantities are positive, they are correctly shown in figures.

Note *Above calculations have been done at $t = 0$ when $\omega = 0$.*

12. If α be the angular acceleration of the hoop and a be the acceleration of its centre, acceleration of m would be $\alpha r + a$.



FBD of hoop



FBD of block of mass m

Here, $Tr = I\alpha$ [where I = moment of inertia of the hoop about the horizontal axis passing through its centre]

Also, $\quad T = Ma \quad$ and $\quad mg - T = m[a + \alpha r]$

Solving, we get

$$a = \frac{mg}{[M + 2m]} = \frac{2}{1.4} = 1.43 \text{ m/s}^2$$

Hence, $\quad T = 1.43$ N

and $\quad \alpha = \dfrac{Tr}{I} = \dfrac{T}{Mr} = 7.15 \text{ rad/s}^2$

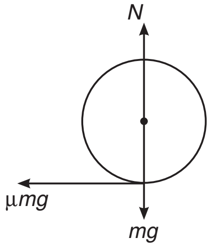
13. Initially the cylinder will slip on the plank, therefore kinetic friction will act between the cylinder and the plank.

$$a_c = -\frac{\mu mg}{m} = -\mu g$$

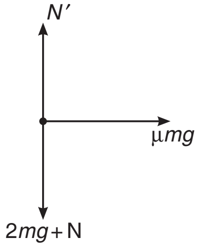
$$a_p = +\frac{\mu mg}{2m} = +\frac{\mu g}{2}$$

$$\alpha_c = +\frac{(\mu mg)(R)}{(mR^2/2)} = +\frac{2\mu g}{R}$$

For pure rolling,



FBD of cylinder



FBD of plank

$$v_p = v_c - R\omega_c$$

$$\therefore \qquad \frac{\mu g}{2}t = v_0 - \mu g t - (R)\left(\frac{2\mu g}{R}\right)(t)$$

$$\therefore \qquad t = \frac{v_0}{3.5\mu g} = \frac{7}{3.5 \times 0.1 \times 10} = 2 \text{ s}$$

$$\therefore \qquad s_c - s_p = v_0 t - \frac{1}{2} \times (\mu g)(t^2) - \frac{1}{2}\left(\frac{\mu g}{2}\right)(t^2)$$

$$= (7 \times 2) - \frac{1}{2}(0.1)(10)(4) - \frac{1}{2}\left(\frac{0.1 \times 10}{2}\right)(4) = 11 \text{ m}$$

Also, $\quad v_c - v_P = (v_0 - \mu g t) - \left(\dfrac{\mu g}{2}\right)(t)$

$$= 7 - 0.1 \times 10 \times 2 - \frac{0.1 \times 10 \times 2}{2} = 4 \text{ m/s}$$

Hence, the remaining distance $(12 - 11 = 1 \text{ m})$ is travelled in a time,

$$t' = \frac{1.0}{4} = 0.25 \text{ s}$$

$\therefore \quad$ Total time $= 2 + 0.25 = 2.25$ s

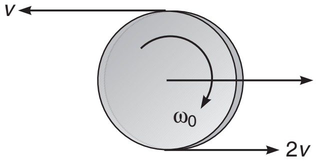
14. In rolling without sliding on a stationary ground, work done by friction is zero. Hence work done by the applied force = change in kinetic energy

$$\therefore\quad (30)(0.25)=\frac{1}{2}\times 9\times v^2 + 2\left[\frac{1}{2}\times 6\times v^2+\frac{1}{2}\times\frac{1}{2}\times 6\times r^2\times\frac{v^2}{r^2}\right]$$

or $$7.5 = 13.5v^2$$

$\therefore$ $$v = 0.745\ \text{m/s}$$ **Ans.**

15. Let v_0 be the linear velocity and ω_0 the angular velocity of the disc as shown in figure then,



$$v_0 - r\omega_0 = 2v \qquad \text{...(i)}$$

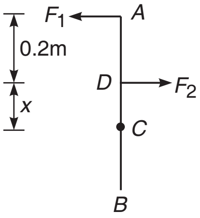
and $$v_0 + r\omega_0 = -v \qquad \text{...(ii)}$$

Solving Eqs. (i) and (ii), we have

$$\omega_0 = -\frac{3}{2}\frac{v}{r}$$

Hence, the angular velocity of disc is $\frac{3}{2}\frac{v}{r}$ anticlockwise. **Ans.**

16. Let x be the distance of centre point C of rod from D. Then,



$$F_2 - F_1 = ma$$

or $$F_1 = 3\ \text{N}$$

Further, $$\tau_c = 0$$

$\therefore$ $$F_2x = F_1\ (0.2 + x)$$

$$5x = F_1\ (0.2 + x)$$

$\therefore$ $$5x = 3\ (0.2 + x)$$

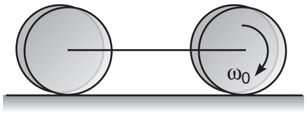
or $$x = 0.3\ \text{m}$$

$\therefore$ Length of rod = 2 (x + 0.2) = 1.0 m **Ans.**

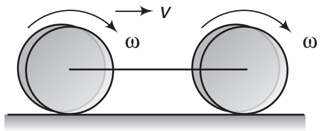
17. $L_i = L_f$ (about bottommost point)

$\therefore$ $$I\omega_0 = 2[I\omega + mRv]$$

or $$\left(\frac{1}{2}mR^2\right)\omega_0 = 2\left[\frac{1}{2}mR^2\omega + mR\ (\omega R)\right]$$



$\Rightarrow$



$\therefore$ $$\omega = \frac{\omega_0}{6}$$ **Ans.**

and $$v = \omega R = \frac{\omega_0 R}{6}$$ **Ans.**

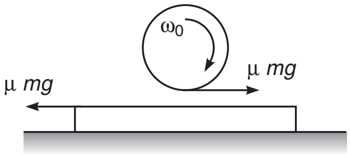
18. Let,

a_1 = linear acceleration of sphere (towards right),

a_2 = linear acceleration of plank (towards left)

and α = angular retardation of sphere

$$a_1 = a_2 = \frac{\mu mg}{m} = \mu g \quad\Rightarrow\quad \alpha = \frac{\mu mgr}{\frac{2}{5}mr^2} = \frac{5}{2}\frac{\mu g}{r}$$



Let pure rolling starts after time 't'. Then

$$\omega r - v = v$$

$\therefore$ $$\omega r = 2v$$

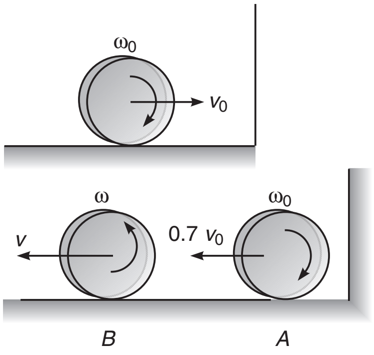
$$(\omega_0 - \alpha t)r = 2(a_1 t)$$

Substituting the values,

$$t = \frac{2}{9}\frac{\omega_0 r}{\mu g}$$

$\therefore$ $$s = \frac{1}{2}(a_2)t^2 = \frac{2\omega_0^2 r^2}{81\mu g}$$ **Ans.**

19. Between A and B, there is forward slipping. Therefore, friction will be maximum and backwards (rightwards). At point B where $v = R\omega$, ball starts rolling without slipping and force of friction becomes zero.



From conservation of angular momentum between points A and B about bottommost point (because torque of friction about this point is zero)

$$L_A = L_B$$

$\therefore \quad m(0.7v_0)R - I\omega_0 = mvR + I\omega$

Substituting $\omega_0 = \dfrac{v_0}{R}, \omega = \dfrac{v}{R}$

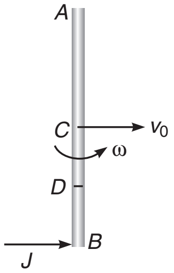
and $\quad I = \dfrac{2}{5}mR^2$, we get

$$v = \frac{3}{14}v_0 = \left(\frac{3}{14}\right)(7)\text{ m/s} = 1.5 \text{ m/s} \qquad \textbf{Ans.}$$

20. Let J be the linear impulse applied at B and ω the angular speed of rod.

$$J = mv_0 \qquad \text{...(i)}$$

$$J\left(\frac{l}{2}\right) = \frac{ml^2}{12}.\omega \qquad \text{...(ii)}$$



Solving these two equations,

$$\omega = \frac{6v_0}{l}$$

Linear speed of D (mid-point of CB) relative to C,

$$v = \omega\left(\frac{l}{4}\right) = \frac{3}{2}v_0$$

$\therefore$ Force exerted by upper half on the lower half,

$$F = \frac{\left(\frac{m}{2}\right)v^2}{\left(\frac{l}{4}\right)}$$

Substituting $\quad v = \dfrac{3}{2}v_0$, we get

$$F = \frac{9}{2}\frac{mv_0^2}{l} \qquad \textbf{Ans.}$$

21. $\dfrac{I}{mR^2} = \dfrac{2}{5} = 0.4$ for sphere

$= \dfrac{1}{2} = 0.5$ for disc $\quad$ and $\quad = 1$ for hoop

$$s = \frac{2}{\sin 30°} = 4 \text{ m}$$

For sphere

$$a = \frac{g\sin\theta}{1 + \dfrac{I}{mR^2}} = \frac{9.8 \times \dfrac{1}{2}}{1 + 0.4} = 3.5 \text{ m/s}$$

$\therefore \quad v = \sqrt{2as} = \sqrt{2 \times 3.5 \times 4} = 5.29 \text{ m/s}$

$$f = \frac{mg\sin\theta}{1 + mR^2/I} = \frac{3 \times 9.8 \times \dfrac{1}{2}}{1 + \left(\dfrac{1}{0.4}\right)} = 4.2 \text{ N}$$

$$t = \sqrt{\frac{2s}{a}} = \sqrt{\frac{2 \times 4}{3.5}} = 1.51\text{s}$$

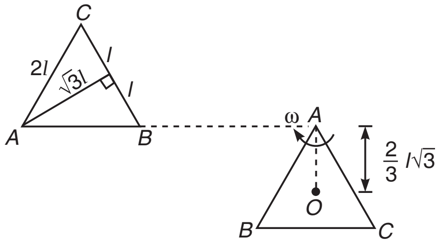
Similarly, the values for disk and hoop can be obtained.

22. $I_A = I_{AB} + I_{AC} + I_{BC}$

$$= \frac{4}{3}ml^2 + \frac{4}{3}ml^2 + \left\{\frac{1}{3}ml^2 + m\,(l\sqrt{3})^2\right\}$$

$$= 6\,ml^2$$

If ω is the angular velocity in the second position, then using conservation of mechanical energy, we have



For COM $\qquad h_i = +\dfrac{\sqrt{3}l}{3}$

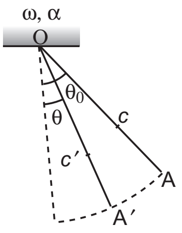
and $\qquad h_f = -\dfrac{2\sqrt{3}}{3}\,l$

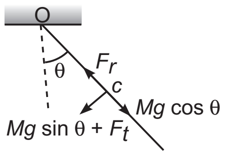
$$3mg\left(\frac{l\sqrt{3}}{3}\right) = \frac{1}{2}(6ml^2)\omega^2 + 3mg\left(\frac{-2l\sqrt{3}}{3}\right)$$

or $\qquad \omega = \sqrt{\dfrac{g\sqrt{3}}{l}}$

Now, velocity of C at this instant is $2l\omega$ or $2\sqrt{gl\sqrt{3}}$ and maximum. **Ans.**

23. (*i*) C is the centre of mass of the rod. Let ω be the angular speed of rod about point O at angle θ. From conservation of mechanical energy,





$$Mg\,\frac{L}{2}(\cos\theta - \cos\theta_0) = \frac{1}{2}\left(\frac{ML^2}{3}\right)\omega^2$$

$$\therefore \qquad \omega^2 = \frac{3g}{L}(\cos\theta - \cos\theta_0) \qquad \ldots\text{(i)}$$

Now, $F_r - Mg\cos\theta = M\left(\dfrac{L}{2}\right)\omega^2$ ...(ii)

From Eqs. (i) and (ii), we get

$$F_r = \frac{1}{2}Mg\,(5\cos\theta - 3\cos\theta_0)$$ **Hence proved.**

(*ii*) Angular acceleration of rod at this instant,

$$\alpha = \frac{\tau}{I} = \frac{Mg\,\frac{L}{2}\sin\theta}{\frac{ML^2}{3}} = \frac{3}{2}\,\frac{g\sin\theta}{L}$$

Tangential acceleration of COM,

$$a_t = (\alpha)\left(\frac{L}{2}\right) = \frac{3}{4}g\sin\theta \qquad \ldots\text{(iii)}$$

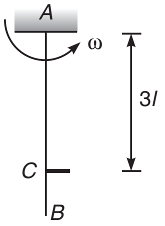
Now, $F_t + Mg\sin\theta = Ma_t$ ...(iv)

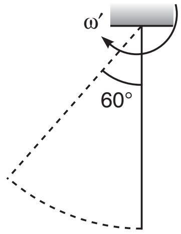
From Eqs. (iii) and (iv), we get

$$F_t = -\frac{1}{4}Mg\sin\theta$$ **Hence proved.**

Here negative sign implies that direction of F_t is opposite to the component $Mg\sin\theta$.

24. (a) From conservation of mechanical energy.





$$(3m)(g)(2l) = \frac{1}{2}I\omega^2 = \frac{1}{2}\left[\frac{(3m)(4l)^2}{3}\right]\omega^2 = 8ml^2\omega^2$$

$$\therefore \qquad \omega = \frac{1}{2}\sqrt{\frac{3g}{l}}$$

Applying,

angular impulse = change in angular momentum

$$J(3l) = I\omega$$

or $$3Jl = (16ml^2)\left(\frac{1}{2}\sqrt{\frac{3g}{l}}\right)$$

$$\therefore \qquad J = \frac{8}{3}ml\sqrt{\frac{3g}{l}}$$

or $$J = \frac{8}{3}m\sqrt{3gl}$$ **Ans.**

(b) Let ω' be the angular speed in opposite direction. Again applying conservation of mechanical energy,

$$(3m)(g)(l) = \frac{1}{2}I(\omega')^2 = 8ml^2(\omega')^2$$

$$\therefore \qquad \omega' = \frac{1}{2\sqrt{2}}\sqrt{\frac{3g}{l}}$$

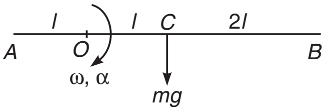
Now, applying, angular impulse = change in angular momentum

$$\therefore\ J(3l) = I(\omega + \omega') = (16ml^2)\frac{1}{2}\sqrt{\frac{3g}{l}}\left(1 + \frac{1}{\sqrt{2}}\right)$$

$$\therefore \qquad J = \frac{4}{3}m\sqrt{6gl}\,(\sqrt{2} + 1)$$ **Ans.**

25. $$\alpha = \frac{mgl}{\frac{m(4l)^2}{12} + ml^2} = \frac{3}{7}\cdot\frac{g}{l}$$

$$\therefore \qquad (a_C)_V = l\alpha = \frac{3}{7}g \qquad \text{(downwards)}$$



Let V be the vertical reaction (upwards) at axis, then

$$mg - V = ma_C = \frac{3mg}{7}$$

$$\therefore \qquad V = \frac{4}{7}mg \qquad \ldots\text{(i)}$$

If H be the horizontal reaction (towards CO) at axis, then

$$H = ml\omega^2 \qquad \ldots\text{(ii)}$$

$\therefore$ Total reaction at axis,

$$N = \sqrt{H^2 + V^2} = \frac{4}{7}mg\sqrt{1 + \left(\frac{7l\omega^2}{4g}\right)^2}$$ **Ans.**

(b) $$a_C = \sqrt{(a_C)_V^2 + (l\omega^2)^2} = \sqrt{\left(\frac{3g}{7}\right)^2 + (l\omega^2)^2}$$ **Ans.**

(c) Let ω' be the angular speed of the rod when it becomes vertical for the first time. Then from conservation of mechanical energy,

$$\frac{1}{2}I({\omega'}^2 - \omega^2) = mgl$$

$$\therefore \qquad \omega'^2 = \omega^2 + \frac{2mgl}{I}$$

$$= \omega^2 + \frac{2mgl}{\frac{7}{3}ml^2}$$

$$= \omega^2 + \frac{6}{7}\frac{g}{l}$$

Acceleration of centre of mass at this instance will be,

$$a_C = l\omega'^2 = l\omega^2 + \frac{6g}{7} \qquad \textbf{Ans.}$$

Let V be the reaction (upwards) at axis at this instant, then,

$$V - mg = ma_C = ml\omega^2 + \frac{6mg}{7}$$

$$\therefore \qquad V = \frac{13}{7}mg + ml\omega^2 \qquad \textbf{Ans.}$$

(d) From conservation of mechanical energy,

$$mgl = \frac{1}{2}I\omega_{\min}^2$$

$$\therefore \qquad \omega_{\min} = \sqrt{\frac{2mgl}{I}} = \sqrt{\frac{2mgl}{\frac{7}{3}ml^2}}$$

$$= \sqrt{\frac{6}{7}\frac{g}{l}} \qquad \textbf{Ans.}$$

26. Linear momentum, angular momentum and kinetic energy are conserved in the process.
From conservation of linear momentum,

$$Mv' = mv$$

$$\text{or} \qquad v' = \frac{m}{M}v \qquad \text{...(i)}$$

Conservation of angular momentum gives,

$$mvd = \left(\frac{Ml^2}{12}\right)\omega$$

$$\text{or} \qquad \omega = \left(\frac{12mvd}{Ml^2}\right) \qquad \text{...(ii)}$$

Collision is elastic. Hence,

$$e = 1$$

or relative speed of approach

= relative speed of separation

$$\therefore \qquad v = v' + d\omega$$

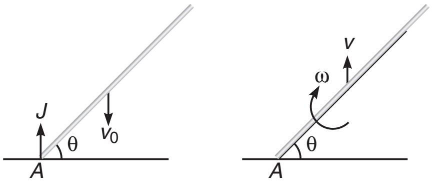
Substituting the values, we have

$$v = \frac{m}{M}v + \frac{12mvd^2}{Ml^2}$$

Solving it, we get

$$m = \frac{Ml^2}{12d^2 + l^2} \qquad \textbf{Ans.}$$

27. Let v = linear velocity of rod after impact (upwards),



At the time of impact After impact

ω = angular velocity of rod

and J = linear impulse at A during impact

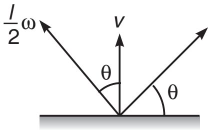
$$\text{Then,} \qquad J = \Delta P = P_f - P_i$$

$$J = mv - (-mv_0)$$

$$\therefore \qquad J = m(v + v_0) \qquad \text{...(i)}$$

Angular impulse = ΔL

$$\therefore \qquad J\left(\frac{l}{2}\cos\theta\right) = I\omega = \frac{ml^2}{12}\omega \qquad \text{...(ii)}$$



Collision is elastic ($e = 1$)

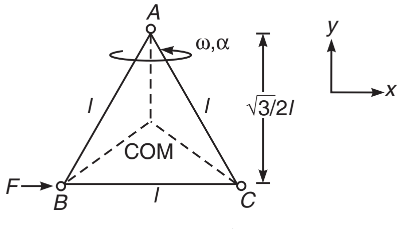
∴ Relative speed of approach = Relative speed of separation at point of impact

$$v_0 = v + \frac{l}{2}\omega\cos\theta \qquad \text{...(iii)}$$

Solving above equations, we get

$$\omega = \frac{6v_0\cos\theta}{l(1 + 3\cos^2\theta)} \qquad \textbf{Ans.}$$

28. (a) The distance of centre of mass (COM) of the system about point A will be



$$r = \frac{l}{\sqrt{3}}$$

Therefore, the magnitude of horizontal force exerted by the hinge on the body is

$$F = \text{centripetal force}$$

$$\text{or} \qquad F = (3m)r\omega^2$$

or $$F = (3m)\left(\frac{l}{\sqrt{3}}\right)\omega^2$$

or $$F = \sqrt{3}\, ml\omega^2$$

(b) Angular acceleration of system about point A is

$$\alpha = \frac{\tau_A}{I_A} = \frac{(F)\left(\frac{\sqrt{3}}{2}l\right)}{2ml^2} = \frac{\sqrt{3}\,F}{4ml}$$

Now, acceleration of COM along x-axis is

$$a_x = r\alpha = \left(\frac{l}{\sqrt{3}}\right)\left(\frac{\sqrt{3}\,F}{4ml}\right) \text{ or } a_x = \frac{F}{4m}$$

Now, let F_x be the force applied by the hinge along x-axis.

Then, $$F_x + F = (3m)a_x$$

or $$F_x + F = (3m)\left(\frac{F}{4m}\right)$$

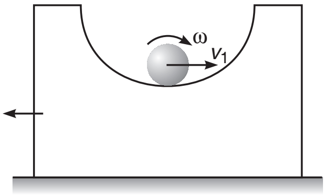
or $$F_x + F = \frac{3}{4}F \text{ or } F_x = -\frac{F}{4}$$

Further if F_y be the force applied by the hinge along y-axis. Then,

$$F_y = \text{centripetal force}$$

or $$F_y = \sqrt{3}\, ml\omega^2$$

29. From conservation of linear momentum



$$mv_1 = Mv_2 \qquad \ldots\text{(i)}$$

∴ Velocity of cylinder axis relative to block

$$v_r = v_1 + v_2 \qquad \ldots\text{(ii)}$$

Applying conservation of mechanical energy,

$$mg(R - r) = \frac{1}{2}mv_1^2 + \frac{1}{2}I\omega^2 + \frac{1}{2}Mv_2^2 \qquad \ldots\text{(iii)}$$

Here, $I = \frac{1}{2}mr^2$ and $\omega = \frac{v_r}{r}$

Solving the above equations with given data, we get

$$v_1 = 2.0 \text{ m/s}$$

and $$v_2 = 1.5 \text{ m/s}$$ **Ans.**

Further, $$N - mg = \frac{mv_r^2}{R - r}$$

$$\therefore N = mg + \frac{mv_r^2}{R - r} = (0.5)(10) + \frac{(0.5)(3.5)^2}{0.525} = 16.67 \text{ N}$$ **Ans.**

30. Given $\mu > \tan\alpha \Rightarrow \mu mg\cos\alpha > mg\sin\alpha$

$$a = (\mu g\cos\alpha - g\sin\alpha)$$

$$\alpha = \frac{(\mu mg\cos\alpha)\,r}{\frac{1}{2}mr^2} = \frac{2\mu g\cos\alpha}{r}$$

Slipping will stop when,

$$v = r\omega$$

or $$at = r(\omega_0 - \alpha t)$$

$$\therefore \quad t = \frac{r\omega_0}{a + r\alpha} = \left(\frac{r\omega_0}{3\mu g\cos\alpha - g\sin\alpha}\right)$$

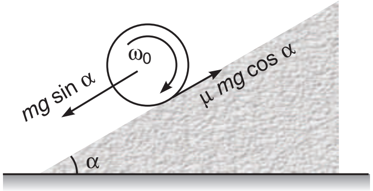
$$d_1 = \frac{1}{2}at^2$$

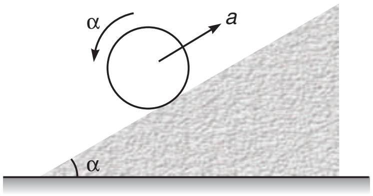
$$= \frac{1}{2}(\mu g\cos\alpha - g\sin\alpha)\left(\frac{r\omega_0}{3\mu g\cos\alpha - g\sin\alpha}\right)^2$$

$$= \frac{r^2\omega_0^2(\mu\cos\alpha - \sin\alpha)}{2g(3\mu\cos\alpha - \sin\alpha)^2}$$ **Ans.**

$$v = at = (\mu g\cos\alpha - g\sin\alpha)\left(\frac{r\omega_0}{3\mu g\cos\alpha - g\sin\alpha}\right)$$

$$= \frac{r\omega_0(\mu\cos\alpha - \sin\alpha)}{(3\mu\cos\alpha - \sin\alpha)}$$





Once slipping is stopped, retardation in cylinder,

$$a' = \frac{g\sin\alpha}{1 + \frac{I}{mr^2}} = \frac{g\sin\alpha}{1 + \frac{1}{2}} = \frac{2}{3}g\sin\alpha$$

$$d_2 = \frac{v^2}{2a'} = \frac{3r^2\omega_0^2\,(\mu\cos\alpha - \sin\alpha)^2}{(3\mu\cos\alpha - \sin\alpha)^2\,(4g\sin\alpha)}$$

$$\therefore \qquad d_{\max} = d_1 + d_2$$

$$= \frac{r^2\omega_0^2\,(\mu\cos\alpha - \sin\alpha)}{2g\,(3\mu\cos\alpha - \sin\alpha)^2}\left[1 + \frac{3\,(\mu\cos\alpha - \sin\alpha)}{2\sin\alpha}\right]$$

$$= \frac{r^2\omega_0^2\,(\mu\cos\alpha - \sin\alpha)}{4g\sin\alpha\,(3\mu\cos\alpha - \sin\alpha)}$$ **Ans.**

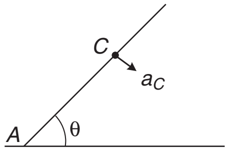
Note *Once slipping was stopped, pure rolling continues if*

$$\mu > \frac{\tan\alpha}{1 + \dfrac{mr^2}{I}}$$

or $\mu > \dfrac{\tan\alpha}{1+2}$ or $\mu > \dfrac{\tan\alpha}{3}$

and already in the question it is given that $\mu > \tan\alpha$. That's why we have taken $a' = \frac{2}{3}g\sin\alpha$.

31. Point A is momentarily at rest.



$$\alpha = \frac{mg\dfrac{l}{2}\cos\theta}{\dfrac{ml^2}{3}} = \frac{3}{2}\frac{g\cos\theta}{l}$$

$$\therefore \qquad a_C = \frac{l}{2}\alpha = \frac{3}{4}g\cos\theta$$

Now $\mu N = ma_x$

or $\mu N = ma_C\sin\theta$

or $\mu N = \dfrac{3}{4}mg\sin\theta\cos\theta$ …(i)

Further, $mg - N = ma_y$

or $N = mg - ma_C\cos\theta$

or $N = mg - \dfrac{3}{4}mg\cos^2\theta$ …(ii)

Dividing Eq. (i) by Eqs. (ii), we have

$$\mu = \frac{\dfrac{3}{4}\sin\theta\cos\theta}{1 - \dfrac{3}{4}\cos^2\theta} = \frac{3\sin\theta\cos\theta}{4 - 3\cos^2\theta}$$

$$= \frac{3\sin\theta\cos\theta}{1 + 3\sin^2\theta}$$ **Hence proved.**

32. Figure (a) and (b)

ω : Decrease in gravitational potential energy = increase in rotational kinetic energy

$$\therefore \quad mg\frac{l}{4}\sin\theta = \frac{1}{2}I_0\omega^2$$

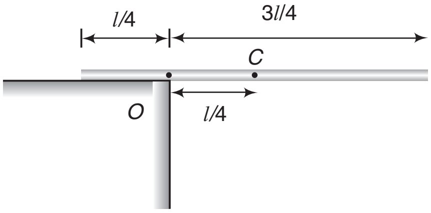
$$= \frac{1}{2}\left[\frac{ml^2}{12} + m\left(\frac{l}{4}\right)^2\right]\omega^2$$

$$\therefore \qquad \omega = \sqrt{\left[\frac{24g\sin\theta}{7l}\right]} \qquad \text{…(i)}$$

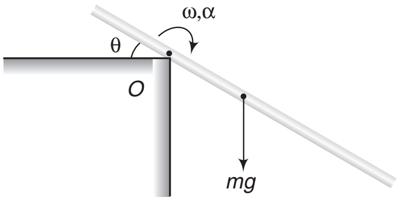
$$\alpha: \qquad \alpha = \frac{\tau}{I} = \frac{mg\dfrac{l}{4}\cos\theta}{\left[\dfrac{ml^2}{12} + m\left(\dfrac{l}{4}\right)^2\right]}$$

$$= \frac{12\,g\cos\theta}{7l} \qquad \text{…(ii)}$$

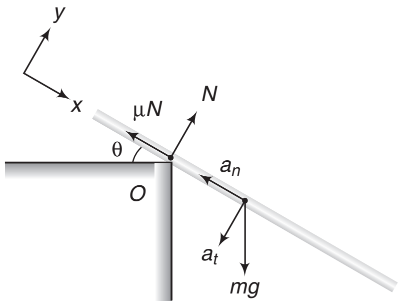
$\Sigma F_y = ma_y$ or $mg\cos\theta - N = ma_t$



(a)



(b)



(c)

or $$N = mg\cos\theta - ma_t$$

$$= mg\cos\theta - m\frac{l}{4}\alpha$$

Substituting value of α from Eq. (ii), we get

$$N = \frac{4}{7}mg\cos\theta \qquad \text{...(iii)}$$

Rod begins to slip when

$$\mu N - mg\sin\theta = ma_n$$

or $$\frac{4}{7}\mu mg\cos\theta - mg\sin\theta = m\frac{l}{4}\omega^2$$

Substitution value of ω from Eq. (i), we get

$$\tan\theta = \frac{4\mu}{13}$$

$\therefore$ $$\theta = \tan^{-1}\left(\frac{4\mu}{13}\right)$$ **Ans.**

33. Writing equations of motion, we get

$$5g - T_2 = 5a_2 \qquad \text{...(i)}$$

$$\frac{(T_2 - T_1)R_2}{\frac{1}{2}M_2R_2^2} = \alpha_2 \qquad \text{...(ii)}$$

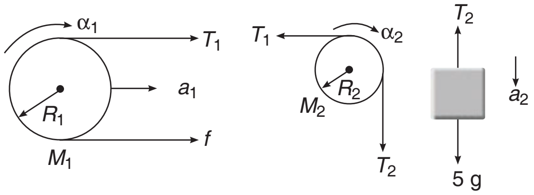
$$T_1 + f = M_1a_1 \qquad \text{...(iii)}$$

$$\frac{(T_1 - f)R_1}{\frac{1}{2}M_1R_1^2} = \alpha_1 \qquad \text{...(iv)}$$

$$a_1 = R_1\alpha_1 \qquad \text{...(v)}$$

$$a_1 + R_1\alpha_1 = R_2\alpha_2 \qquad \text{...(vi)}$$

$$R_2\alpha_2 = a_2 \qquad \text{...(vii)}$$



We have seven unknowns, $T_1, T_2, a_1, a_2, \alpha_1, \alpha_2$ and f solving above equations, we get

$$a_2 = \frac{4}{11}g = 3.6 \text{ m/s}^2$$ **Ans.**

$$v = a_2t = \frac{4gt}{11}$$ **Ans.**

34. Equations of motion are,

$$F + f_1 = Ma_1 \qquad \text{...(i)}$$

$$f_1 + f_2 = Ma_2 \qquad \text{...(ii)}$$

$$2F - f_2 = 2Ma_3 \qquad \text{...(iii)}$$

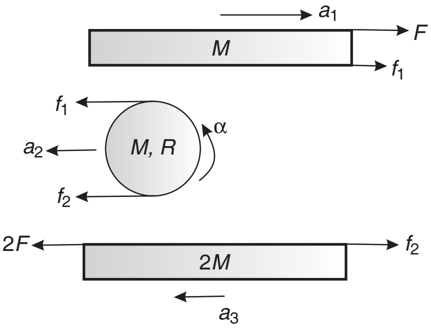
$$\alpha = \frac{(f_1 - f_2)R}{\frac{1}{2}MR^2}$$

or $$\alpha = \frac{2(f_1 - f_2)}{MR} \qquad \text{...(iv)}$$

For no slipping condition,

$$a_2 + R\alpha = -a_1 \qquad \text{...(v)}$$

and $$a_2 - R\alpha = a_3 \qquad \text{...(vi)}$$



We have six unknowns, f_1, f_2, a_1, a_2, a_3 and α. Solving the above six equations, we get

$$a_1 = \frac{21F}{26M} \quad \text{and} \quad a_2 = \frac{F}{26M}$$ **Ans.**

35. **Angular velocity** From conservation of mechanical energy,

decrease in gravitational PE

= increase in rotational KE

or $mgr\sin 60° + mg\,(2r\sin 60°)$

$$= \frac{1}{2}\left[\frac{3mr^2}{2} + m\,(2r)^2\right]\omega^2$$

$\therefore$ $$\frac{3\sqrt{3}mgr}{2} = \frac{11}{4}mr^2\omega^2$$

$\therefore$ $$\omega = \sqrt{\frac{6g\sqrt{3}}{11r}}$$ **Ans.**

Angular acceleration

$$\alpha = \frac{\tau}{I} = \frac{mgr\cos 60° + mg\,(2r\cos 60°)}{\left[\frac{3mr^2}{2} + m\,(2r)^2\right]}$$

$$= \frac{\frac{3mgr}{2}}{\frac{11}{2}mr^2} = \frac{3g}{11r}$$ **Ans.**

36. $\mathbf{a}_B = \mathbf{a}_0 + \mathbf{a}_{B/0}$

Here, $\mathbf{a}_{B/0}$ has two components a_t (tangential acceleration) and a_n (normal acceleration)

$$a_t = r\alpha = (0.3)(5) = 1.5 \text{ m/s}^2$$

$$a_n = r\omega^2 = (0.3)(4)^2 = 4.8 \text{ m/s}^2$$

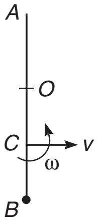
and $$a_0 = 2 \text{ m/s}^2$$

$$\therefore \quad a_B = \sqrt{(\Sigma a_x)^2 + (\Sigma a_y)^2}$$

$$= \sqrt{(2 + 4.8 \cos 45° - 1.5 \cos 45°)^2 + (4.8 \sin 45° + 1.5 \sin 45°)^2}$$

$$= 6.21 \text{ m/s}^2$$

37. C is the COM of $(M + m)$



$$BC = \left(\frac{M}{M+m}\right)\left(\frac{l}{2}\right)$$

and $$OC = \left(\frac{m}{M+m}\right)\left(\frac{l}{2}\right)$$

From conservation of linear momentum,

$$(M + m)\, v = m v_0$$

or $$v = \left(\frac{m}{M+m}\right) v_0 \qquad \ldots\text{(i)}$$

From conservation of angular momentum about point C we have,

$$m v_0 (BC) = I\omega$$

or $$\frac{m M v_0 l}{2\,(M+m)} = \left[m \left(\frac{M}{M+m}\right)^2 \left(\frac{l}{4}\right)^2 + \frac{Ml^2}{12} + M \left(\frac{m}{M+m}\right)^2 \left(\frac{l^2}{4}\right) \right] \omega$$

Putting $\dfrac{m v_0}{M+m} = v$

from Eq. (i), we have

$$\frac{v}{\omega} = \frac{l}{6}\left[\frac{4m + M}{M+m}\right]$$

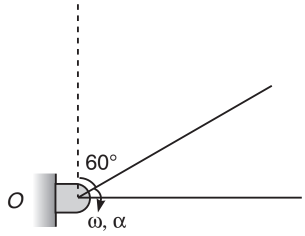
Now, a point (say P) at a distance $x = \dfrac{v}{\omega}$, from C (towards O) will be at rest. Hence, distance of point P from boy at B will be

$$BP = BC + x$$

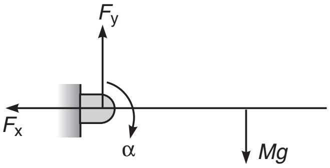
$$= \left(\frac{M}{M+m}\right)\left(\frac{l}{2}\right) + \frac{l}{6}\left[\frac{4m+M}{M+m}\right]$$

$$= \frac{2l}{3}$$ **Ans.**

38. Let ω be the angular velocity and α the angular acceleration of rod in horizontal position. Then



$$\alpha = \frac{(Mg)\dfrac{l}{2}}{\dfrac{Ml^2}{3}} = \frac{3}{2}\frac{g}{l} \qquad \ldots\text{(i)}$$



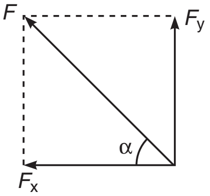
$$\frac{1}{2}\left(\frac{Ml^2}{3}\right)\omega^2 = Mg\,\frac{l}{4}$$

$$\therefore \quad \omega = \frac{3}{2} \cdot \frac{g}{l} \qquad \ldots\text{(ii)}$$

$$F_x = M\left(\frac{l}{2}\right)\omega^2 = M\left(\frac{l}{2}\right)\left(\frac{3g}{2l}\right) = \frac{3}{4}Mg$$

$$Mg - F_y = M(\alpha)\left(\frac{l}{2}\right)$$

$$F_y = Mg - \frac{3}{4}Mg = \frac{Mg}{4}$$



$$\therefore \quad F = \sqrt{F_x^2 + F_y^2}$$

$$= \frac{\sqrt{10}}{4} Mg$$ **Ans.**

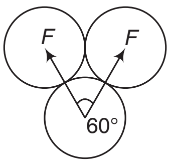
$$\tan \alpha = \frac{F_y}{F_x} = \frac{(Mg/4)}{(3Mg/4)} = \frac{1}{3}$$

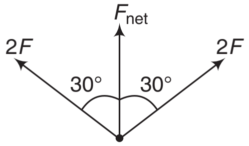
$$\therefore \quad \alpha = \tan^{-1}\left(\frac{1}{3}\right)$$ **Ans.**

13. Gravitation

INTRODUCTORY EXERCISE 13.1

1. $F_{\text{net}} = \sqrt{F^2 + F^2 + 2FF\cos 60°}$

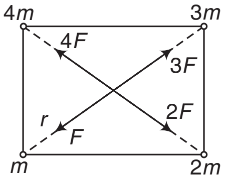


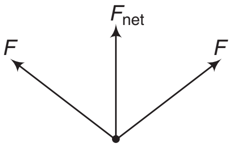


$$= \sqrt{3}\,F$$

$$= \sqrt{3}\,\frac{GMM}{(2a)^2} = \frac{\sqrt{3}\,GM^2}{4a^2}$$

2. $F_{\text{net}} = \sqrt{2}\,(2F)$





$$= 2\sqrt{2}\,\frac{G.m.m}{r^2}$$

$$= \frac{2\sqrt{2}\,Gm^2}{(a/\sqrt{2})^2} = \frac{4\sqrt{2}\,Gm^2}{a^2}$$

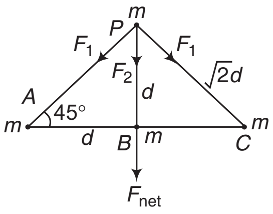
3. $a_1 = \frac{F}{m_1} = \frac{Gm_1m_2}{r^2} = \frac{Gm_2}{r^2}$

$$= \frac{(6.67\times10^{-11})\,(2)}{(0.5)^2}$$

$$= 5.3\times10^{-10}\ \text{m/s}^2$$

Similarly, $a_2 = \frac{Gm_1}{r^2}$

4. $F_{\text{net}} = 2(F_1\cos 45°) + F_2$



$$= \sqrt{2}\,F_1 + F_2 = \frac{(\sqrt{2})\,Gmm}{(\sqrt{2}d)^2} + \frac{Gmm}{d^2}$$

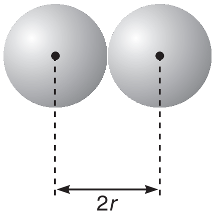
$$= \left(\frac{\sqrt{2}+1}{\sqrt{2}}\right)\frac{Gm^2}{d^2} \qquad \text{(Along } PB\text{)}$$

5. $m_1 = m_2 = (\text{volume})(\text{density})$

$$= \left(\frac{4}{3}\pi r^3\right)\rho$$

$$\therefore \quad F = \frac{Gm_1m_2}{r^2}$$

$$= \frac{G\left(\frac{4}{3}\pi r^3\right)\left(\frac{4}{3}\pi r^3\right)\rho^2}{r^2}$$



or $\quad F \propto r^4 \qquad$ **Hence proved.**

INTRODUCTORY EXERCISE 13.2

1. $g = \frac{GM}{R^2}$ or $g \propto \frac{M}{R^2}$

Mass and radius both are two times. Therefore, value of g is half.

2. (a) $g' = \frac{g}{\left(1+\frac{h}{R}\right)^2}$

At $h = R,\ g' = \frac{g}{4}$

(d) $g' = g\left(1 - \frac{d}{R}\right)$

At $d = \frac{R}{2},\ g' = \frac{g}{2}$

3. $\frac{g}{\left(1+\frac{h}{R}\right)^2} = g\left(1-\frac{h}{R}\right)$

Solving this equation, we get

$$h = \left(\frac{\sqrt{5}-1}{2}\right)R$$

4. $\Delta g = g' - g$

$$= -R\omega^2\cos^2\theta$$

$$= -(6.37\times10^6)\left(\frac{2\pi}{24\times3600}\right)^2\cos^2 45°$$

$$= -0.0168\ \text{m/s}^2$$

5. $g' = 0.64\,g = \frac{g}{\left(1+\frac{h}{R}\right)^2}$

$$\therefore \quad 1 + \frac{h}{R} = \frac{5}{4}$$

$$h = \frac{R}{4} = 1600\ \text{km}$$

6. $g' = \frac{3}{5}g = g - R\omega^2 \cos^2 0°$

$\therefore \qquad R\omega^2 = \frac{2}{5}g$

or $\qquad \omega = \sqrt{\frac{2g}{5R}} = \sqrt{\frac{2 \times 9.8}{5 \times 6400 \times 10^3}}$

$= 7.8 \times 10^{-4}$ rad/s

7. At equator, $g' = g - R\omega^2$

$$= (9.8)^2 - (6400 \times 10^3)\left(\frac{2\pi}{24 \times 3600}\right)^2$$

$$= 9.766 \text{ m/s}^2$$

Now, $mg = 1000$

$\therefore \qquad m = \frac{1000}{g}$

$w' = mg' = (1000)\left(\frac{g'}{g}\right)$

$= \frac{(1000)\,(9.766)}{(9.8)} = 997$ N

8. $g' = g - R\omega^2$

$\therefore \qquad 0 = g - R\omega^2$

$\therefore \qquad \omega = \sqrt{\frac{g}{R}} = \sqrt{\frac{9.8}{6400 \times 1000}}$

$= 1.237 \times 10^{-3}$ rad/s and $T = \frac{2\pi}{\omega}$

By putting the value of ω, we get

$T \approx 84.6$ min

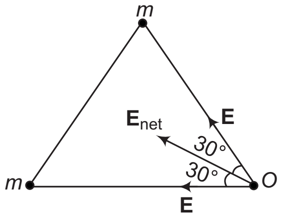
9. $\frac{g}{\left(1 + \frac{h}{R}\right)} = g - R\omega^2$

By putting the values of g, h, R and ω, we get

$h \approx 10$ km

INTRODUCTORY EXERCISE 13.3

1. $V = -\frac{Gm}{a} - \frac{Gm}{a} = -\frac{2Gm}{a}$



$E = \frac{Gm}{a^2}$

$E_{\text{net}} = \sqrt{E^2 + E^2 + 2(E)(E)\cos 60°} = \sqrt{3}E$

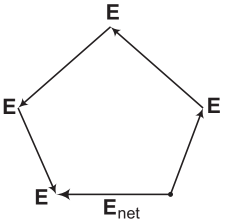
$= \frac{\sqrt{3}Gm}{a^2}$

2. $V = 5\left(\frac{-Gm}{a}\right) = -\frac{5Gm}{a}$

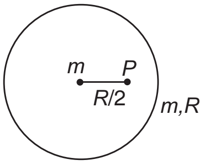
For E Five vectors of equal magnitudes, when added as per polygon law of vector addition make a closed regular pentagon. Hence, net **E** is zero.

3. $V = 4\left(-\frac{Gm}{a}\right) = -4\frac{Gm}{a}$

For **E**



$\mathbf{E}_{\text{net}} = \mathbf{E} = \frac{Gm}{a^2}$



4. V_p = due to particle + due to shell

$= -\frac{Gm}{R/2} - \frac{Gm}{R}$

$= -\frac{3Gm}{R}$

5. $\mathbf{E} = \frac{\mathbf{F}}{m} = \frac{4\hat{\mathbf{i}}}{20 \times 10^{-3}} = (200\,\hat{\mathbf{i}})$ N/kg

INTRODUCTORY EXERCISE 13.4

1. $\mathbf{E} = -\left[\frac{\partial V}{\partial X}\hat{\mathbf{i}} + \frac{\partial V}{\partial y}\hat{\mathbf{j}} + \frac{\partial V}{\partial z}\hat{\mathbf{k}}\right]$

2. $|\mathbf{E}| = \sqrt{\left(-\frac{\partial V}{\partial x}\right)^2 + \left(-\frac{\partial V}{\partial y}\right)^2 + \left(\frac{-\partial V}{\partial z}\right)^2}$

$-\frac{\partial V}{\partial x} = 10$ J/kg-m is given

No information is given about

$-\frac{\partial V}{\partial y}$ and $-\frac{\partial V}{\partial z}$

So, $\qquad |\mathbf{E}| \geq 10$ N/kg

3. $\mathbf{F} = m\mathbf{E} = m\left[\left(-\frac{\partial V}{\partial x}\right)\hat{\mathbf{i}} + \left(-\frac{\partial V}{\partial y}\right)\hat{\mathbf{j}}\right]$

$= -(10\,\hat{\mathbf{i}} + 10\,\hat{\mathbf{j}})$ N or $|\mathbf{F}| = 10\sqrt{2}$ N

4. $\mathbf{F} = m\mathbf{E} = (2\hat{\mathbf{i}} + 3\hat{\mathbf{j}})$ N/kg

We can check that path given (therefore displacement) is perpendicular to force.

$\therefore \qquad W = 0$

INTRODUCTORY EXERCISE 13.5

1. $K_i + U_i = K_f + U_f$

$$\therefore\ 0 - \frac{Gm_1m_2}{r_i} = \frac{1}{2} \times 10 \times (2v)^2 + \frac{1}{2} \times 20\, v^2 - \frac{Gm_1m_2}{r_f}$$

$$\therefore \qquad v = \sqrt{\frac{Gm_1m_2}{30}\left(\frac{1}{r_f} - \frac{1}{r_i}\right)}$$

$$= \sqrt{\frac{6.67 \times 10^{-11} \times 10 \times 20}{30}\left(\frac{1}{0.5} - \frac{1}{1}\right)}$$

$$= 2.1 \times 10^{-5} \text{ m/s}$$

and $\qquad 2v = 4.2 \times 10^{-5}$ m/s

2. Total pairs $= \dfrac{4(4-1)}{2} = 6$. Four pairs are at a distance of a and two pairs at distance of $\sqrt{2}a$.

3. $\Delta U = \dfrac{mgh}{1 + \dfrac{h}{R}}$

Put $\qquad h = R$

4. *(i)* $\Delta U = \dfrac{mgh}{1 + \dfrac{h}{R}}$

Putting $h = nR$, we get

$$\Delta U = \left(\frac{n}{n+1}\right) mgR$$

(ii) $\Delta U = \left(\dfrac{n}{n+1}\right) mgR$

$$= \frac{1}{2} mv^2$$

$$\therefore \qquad v = \sqrt{\frac{2ngR}{n+1}}$$

5. $h = \dfrac{v^2}{2g - (v^2/R)}$

$$= \frac{(10^4)^2}{2 \times 9.8 - \dfrac{(10^4)^2}{6.4 \times 10^6}}$$

$$= 2.51 \times 10^7 \text{ m}$$

$$= 2.51 \times 10^4 \text{ km}$$

6. Apply $\dfrac{1}{2} mv^2 = \dfrac{mgh}{1 + \dfrac{h}{R}}$

INTRODUCTORY EXERCISE 13.6

1. $\text{KE} = \dfrac{1}{2} mv_e^2$

$$= \frac{1}{2} m \left(\frac{2GM}{R}\right)$$

$$= \frac{m}{R}(gR^2) \qquad \text{(as } GM = gR^2\text{)}$$

$$= mgR$$

2. $v_e = \sqrt{\dfrac{2GM}{R}}$

or $\qquad v_e \propto \sqrt{\dfrac{M}{R}}$

3. (a) Total mechanical energy $= E_0 - 2E_0 = -E_0$.

Since, it is negative, it will not escape to infinity.

(b) $E_i = E_f \Rightarrow E_0 - 2E_0 = 0 + U \Rightarrow U = -E_0$

INTRODUCTORY EXERCISE 13.7

1. Delhi does not lie on equator.

2. $T \propto r^{3/2}$

$$\therefore \qquad \left(\frac{T_2}{\pi}\right) = \left(\frac{r_2}{r_1}\right)^{3/2}$$

or $\qquad T_2 = \left(\dfrac{r_2}{r_1}\right)^{3/2} T_1$

$$= \left(\frac{2 \times 10^4}{10^4}\right)^{3/2} (28) = 56\sqrt{2} \text{ h}$$

3. $r_1 = R + h_1 = R + R = 2R$

$r_2 = R + h_2 = R + 3R = 4R$

KE and PE $\propto \dfrac{1}{r}$

$$\therefore \qquad \frac{K_1}{K_2} = \frac{U_1}{U_2} = \frac{r_2}{r_1} = \frac{2}{1}$$

4. (a) $v = \sqrt{\dfrac{GM}{r}} = \sqrt{\dfrac{GM}{R+h}}$

(b) $\text{KE} = \dfrac{GMm}{2r} = \dfrac{GMm}{2(R+h)}$

(c) $\text{PE} = -\dfrac{GMm}{r} = -\dfrac{GMm}{(R+h)}$

(d) $T = \dfrac{2\pi}{\sqrt{GM}} r^{3/2} = \dfrac{2\pi}{\sqrt{GM}} (R+h)^{3/2}$

5. (a) W = Energy of satellite in first orbit – energy of satellite on the surface of earth

$$= -\frac{GMm}{2\,(2R)} - \left(-\frac{GMm}{R}\right)$$

$$= \frac{3}{4}\frac{GMm}{R}$$

$$= \frac{3}{4}mgR = \frac{3}{4} \times 2 \times 10^3 \times 10 \times 6.4 \times 10^6$$

$$= 9.6 \times 10^{10}\ \text{J}$$

(b) W = energy of satellite in second orbit – energy in first orbit

$$= -\frac{GMm}{2\,(3R)} - \left[\frac{-GMm}{2\,(2R)}\right]$$

$$= \frac{1}{12}\frac{GMm}{R} = \frac{1}{12}mgR$$

$$= \frac{1}{12} \times 2 \times 10^3 \times 10 \times 6.4 \times 10^6$$

$$= 1.07 \times 10^{10}\ \text{J}$$

Exercises

LEVEL 1

Assertion and Reason

1. $U = -\dfrac{G\,m_1m_2}{r}$

If r decreases, U also decreases.

2.

$$V_C = -1.5\frac{GM}{R}$$

$$V_S = -\frac{GM}{R}$$

$$E_C = 0 \quad \text{and} \quad E_S = \frac{GM}{R^2}$$

$C \to$ centre, $S \to$ surface.

3. If a mass m is displaced from centre along the line AB, force on it is away from the centre. So, it is in unstable equilibrium position at centre. So, potential energy and hence the potential at centre is maximum.

4. $\mathbf{E} = -\left[\dfrac{\partial V}{\partial x}\hat{\mathbf{i}} + \dfrac{\partial V}{\partial y}\hat{\mathbf{j}} + \dfrac{\partial V}{\partial z}\hat{\mathbf{k}}\right]$

$\dfrac{\partial V}{\partial X} = 0$ does not mean field strength is zero. Because it also depends on $\dfrac{\partial V}{\partial y}$ and $\dfrac{\partial V}{\partial z}$.

5. $h = \dfrac{u^2}{2g}$ or $h \propto u^2$ cannot be applied in this case. Because, for higher values of v, acceleration due to gravity g does not remain constant.

6. Force on planet is towards centre of sum. Hence, torque is zero only about centre of sun.

7. Polar satellites don't have equatorial plane.

8. Earth's gravity is utilised in providing the necessary centripetal force. But weight is felt due to moon's weight is felt due to moon's gravity.

9. Geostationary satellites lies about equator and Moscow does not lies over equator.

10. $V = -\dfrac{GMm}{r}$, $K = \dfrac{GMm}{2r}$, $E = -\dfrac{GMm}{2r}$

and $V = \sqrt{\dfrac{GM}{r}}$

11. By changing the radius, moment of inertia will change. Hence, angular speed ω will change. But ω has no effect on the value of g on pole.

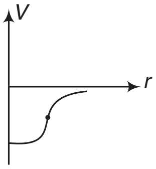
Single Correct Option

2. Angular momentum is conserved only about centre of sun.

3. $g' = g - R\omega^2\cos^2\phi$

At $\phi = 90°$, $g' = g$, independent of ω.

5. V is negative.



6. Comparing with

$$\oint \mathbf{E}\cdot d\mathbf{S} = \left(\frac{q}{\varepsilon_0}\right)$$

We have, $\dfrac{1}{4\pi\,\varepsilon_0} \equiv G$

$\Rightarrow \quad \dfrac{1}{\varepsilon_0} \equiv 4\pi G$

$\Rightarrow \quad q \equiv m$

8. $E = 0$ inside a sheet. Therefore, gravitational force on m is zero.

9. $T \propto r^{3/2}$

10. Area velocity remains constant. If area is half time taken is half.

11. $T \propto \frac{1}{\sqrt{g}}$

$$\frac{T_2}{T_1} = \sqrt{\frac{g_1}{g_2}} \quad \text{or} \quad \frac{1.05\,T}{T} = \sqrt{\frac{g}{g\left(1 - \frac{h}{R}\right)}}$$

Solving this equation we get, $h = 64$ km

12. $g = \frac{GM}{R^2} \;\Rightarrow\; \therefore\; \frac{g}{G} = \frac{M}{R^2}$

13. $E \propto \frac{1}{r^2}$

$$\frac{E_2}{E_1} = \left(\frac{r_1}{r_2}\right)^2$$

or $$\frac{1}{100} = \left(\frac{R_e}{R_e + h}\right)^2$$

or $$h = 9\,R_e$$

14. $T \propto r^{3/2}$

$$\frac{T_2}{T_1} = \left(\frac{r_2}{r_1}\right)^{3/2} = \left(\frac{3R + R}{R}\right)^{3/2} = 8$$

∴ $$T_2 = 8T_1$$

15. $g_{\text{equator}} = g - R\omega^2$ and $g_{\text{pole}} - R\omega^2$

∴ $$\frac{g_{\text{pole}}}{2} \quad \text{or} \quad \frac{g}{2} = g - R\omega^2$$

or $$\omega \sqrt{\frac{g}{2R}}$$

$$= \sqrt{\frac{9.8}{2 \times 6.4 \times 10^6}}$$

$$= 8.75 \times 10^{-4} \text{ rad/s}$$

16. $U = mV$

or $$U \propto V$$

U is half, it means gravitational potential is half.

$$-\frac{GM}{(R + h)} = \frac{1}{2}\left[-\frac{3}{2}\frac{GM}{R}\right]$$

Solving we get, $h = \frac{R}{3}$ **Ans.**

17. $\Delta U = \dfrac{mgh}{1 + \frac{h}{R}}$

18. $T = \sqrt{\dfrac{GM}{r}}$

T is independent of R, the radius of earth.

19. $g = \dfrac{GM}{R^2} = \dfrac{G\left(\frac{4}{3}\pi R^3 \rho\right)}{R^2}$

or $$g \propto \rho R$$

or $$g_1 = g_2$$

∴ $$\rho_1 R_1 = \rho_2 R_2$$

or $$R_2 = \frac{\rho_1}{\rho_2} \cdot R_1 = \left(\frac{1}{2}\right) R = \frac{R}{2}$$ **Ans**

20. At 84.6 min, g at equator becomes zero.

$$\frac{\omega_2}{\omega_1} = \frac{2\pi/T_2}{2\pi/T_1} = \frac{T_1}{T_2}$$

$$= \frac{24 \times 60}{84.6} = 17$$ **Ans.**

21. $\omega_1\, t + \omega_2 t = 2\pi$

$$(\omega_1)\, 6 + \left(\frac{2\pi}{23}\right)^6 = 2\pi$$

or $$6\omega_1 = \frac{3\pi}{2} \quad \text{or} \quad \omega_1 = \left(\frac{\pi}{4}\right) \text{rad/h}$$

23. Only due to M_1.

24. Time taken in one complete oscillations is 84.6 min.

25. $W = \Delta U = U_f - V_i$

$$= 3\left(-\frac{GMM}{2l}\right) - 3\left(-\frac{GMM}{l}\right)$$

$$= \frac{3}{2}\frac{GM^2}{l}$$

26. Change in kinetic energy = change in potential energy

∴ $$\frac{1}{2} mv^2 = -\frac{GMm}{R + R} - \left(-\frac{GMm}{R}\right)$$

$$v = \sqrt{\frac{GM}{R}} = \frac{\sqrt{2GM/R}}{\sqrt{2}}$$

$$= \frac{v_e}{\sqrt{2}}$$

where, v_e = escape velocity

27. $U = \dfrac{-GMm}{r}$

∴ $$(-GM) = \frac{Ur}{m}$$

$$E = -\frac{GM}{(2r)^2} = \frac{(Ur/m)}{4r^2} = \frac{U}{4mr}$$

$$F = mE = \frac{U}{4r}$$

Subjective Questions

1. Potential at the surface of sphere,

$$V = -\frac{GM}{R}$$

$$= -\frac{(6.67\times10^{-11})(20)}{1}\ \text{J/kg}$$

$$= -1.334\times10^{-9}\ \text{J/kg}$$

i.e. 1.334×10^{-9} J work is obtained to bring a mass of 1 kg from infinity to the surface of sphere. Hence, the same amount of work will have to be done to take the particle away from the surface of sphere. Thus,

$$W = 1.334\times10^{-9}\ \text{J}$$

2. $g = \dfrac{GM}{R^2}$

$$\Rightarrow \quad \frac{dg}{dR} = \frac{-2GM}{R^3}$$

$$\Rightarrow \quad \frac{dg}{h} = \frac{-2GM}{R^2}\cdot\frac{1}{R}$$

$$\Rightarrow \quad \frac{dg}{g} = -2\left(\frac{h}{R}\right)$$

3. Let v_r be their velocity of approach. From conservation of energy,

Increase in kinetic energy

= decrease in gravitational potential energy

$$\text{or} \quad \frac{1}{2}\mu v_r^2 = \frac{Gm_1m_2}{r} \qquad \text{...(i)}$$

Here, μ = reduced mass

$$= \frac{m_1m_2}{m_1+m_2}$$

Substituting in Eq. (i), we get

$$v_r = \sqrt{\frac{2G(m_1+m_2)}{r}}$$

4. Close to earth,

$$T = 2\pi\sqrt{\frac{R}{g}} = 2\pi\sqrt{\frac{R}{GM/R^2}}$$

$$\text{or} \quad T^2 = \frac{4\pi^2R^3}{GM}$$

$$= \frac{4\pi^2R^3}{G\left(\frac{4}{3}\pi R^3\rho\right)}$$

$$\text{or} \quad \rho T^2 = \frac{3\pi}{G} = a \text{ universal constant}$$

5. (a) $v_e = \sqrt{2}\,v_o$. Given $v = \sqrt{1.5}\,v_o$

If $v_o < v < v_e$, satellite will move in elliptical orbit with initial position as the perigee position.

(b) $v = 2v_o > \sqrt{2}\,v_o$ or v_e

Hence, the satellite will escape to infinity.

6. Present angular momentum of earth

$$L_1 = I\omega = \frac{2}{5}MR^2\omega$$

New angular momentum because of change in radius

$$L_2 = \frac{2}{5}M\left(\frac{R}{2}\right)^2\omega'$$

If external torque is zero then angular momentum must be conserved

$$L_1 = L_2$$

$$\frac{2}{5}MR^2\omega = \frac{1}{4}\times\frac{2}{5}MR^2\omega'$$

$$\text{i.e.} \quad \omega' = 4\omega$$

$$T' = \frac{1}{4}T = \frac{1}{4}\times24 = 6\ \text{h}$$

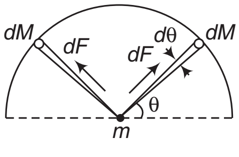
7. Particle lies between two shells. Therefore, net force in exerted only by the inner shell.

$$\therefore \quad F = \frac{Gm_1m}{\left(\frac{R_1+R_2}{2}\right)^2} = \frac{4\,Gm_1m}{(R_1+R_2)^2}$$

8. $L = \pi R$

$$\therefore \quad R = \frac{L}{\pi} \quad \Rightarrow F = \int_0^{\pi} dF\sin\theta$$

$$= \int_0^{\pi}\frac{GdM.m}{R^2}\sin\theta$$



$$= \int_0^{\pi}\frac{G\left(\frac{M}{\pi}d\theta\right)m}{L^2}(\pi^2)\sin\theta$$

$$= \frac{2\pi G\,mM}{L^2}$$

9. $K_i + U_i = K_f + U_f$

$$\therefore \quad \frac{1}{2}m\,(2\sqrt{gR})^2 - \frac{GMm}{R} = \frac{1}{2}mv^2 + 0$$

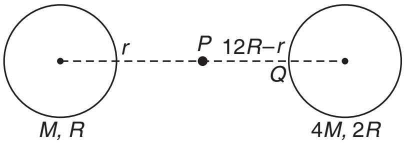
$$\therefore \qquad v^2 = 4gR - \frac{2GM}{R}$$

Putting $GM = gR^2$, we get

$$v^2 = 4gR - 2gR$$

$$\therefore \qquad v = \sqrt{2gR}$$

10. (a) $\dfrac{GM}{r^2} = \dfrac{G\,(4M)}{(12\,R - r)^2}$



Solving this equations, we get $r = 4R$

$$v_P = \frac{v_Q}{2}$$

$$\therefore \qquad \left(-\frac{GM}{r}\right) = \left[\frac{-G\,(4m)}{12\,R - r}\right]$$

$$= \frac{-G\,(4m)}{2R} - \frac{GM}{10\,R}$$

Solving this equation, we get

$$r = 7.65\,R \quad \text{and} \quad 1.49\,R$$

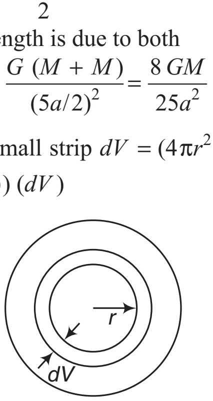
11. (a) At distance $\dfrac{3a}{2}$ which lies between solid sphere and shell field is only due to solid sphere.

$$E = \frac{GM}{(3a/2)^2} = \frac{4GM}{9a^2} \quad \text{(towards centre)}$$

(b) At distance $\dfrac{5a}{2}$ which lies outside the shell. So, field strength is due to both

$$\therefore \quad E = \frac{G\,(M + M)}{(5a/2)^2} = \frac{8\,GM}{25a^2} \quad \text{(towards centre)}$$

12. Volume of small strip $dV = (4\pi r^2)\,dr$ mass of this strip $dm = (\rho)\,(dV)$



$$= \left(\frac{\rho_0 a}{r}\right)(4\pi r^2) dr = (4\pi\; a\rho_0)\,(rdr)$$

$$\therefore \text{ Mass of whole sphere } = \int_0^a (4\pi a \rho_0)\, rdr$$

$$m = (2\pi\; a^3 \rho_0)$$

$$E = \frac{Gm}{(2a)^2} = \frac{G\,(2\pi a^3 \rho_0)}{4a^2}$$

$$= \frac{\pi G \rho_0 a}{2}$$

13. By conservation of momentum, their speeds are same. Using the energy equations we have

$$K_i + U_i = K_f + U_f$$

$$0 - \frac{Gmm}{r_i} = 2\left(\frac{1}{2}\,mv^2\right) - \frac{Gmm}{r_f}$$

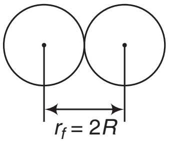
$$\therefore \qquad v = \sqrt{Gm\left(\frac{1}{r_f} - \frac{1}{r_i}\right)} \qquad \ldots\text{(i)}$$

$$= \sqrt{\frac{Gm}{r_i}}$$

$$= \sqrt{\frac{6.67 \times 10^{-11} \times 10^{30}}{10^{10}}}$$

$$= 8.16 \times 10^4 \text{ m/s}$$

$$= 81.6 \text{ km/s}$$ **Ans.**



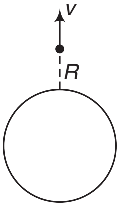
Using Eq. (i), we have

$$v = \sqrt{Gm\left(\frac{1}{r_f} - \frac{1}{r_i}\right)}$$

$$= \sqrt{6.67 \times 10^{-11} \times 10^{30}\left(\frac{1}{2 \times 10^5} - \frac{1}{10^{10}}\right)}$$

$$= 1.8 \times 10^7 \text{ m/s} = 1.8 \times 10^4 \text{ km/s}$$ **Ans.**

14. Using the equation



$$K_i + U_i = K_f + U_f$$

$$\therefore \quad \frac{1}{2}\,mv^2 - \frac{GmM}{2R} = 0 + 0$$

$$\therefore \qquad v = \sqrt{\frac{GM}{R}}$$

15. (a) $W = U_f - U_i = U_B - U_A$

$$= mV_B - mV_A \qquad (V = \text{gravitational potential})$$

$$= m\,(V_B - V_A)$$

$$= (1)\left[-\frac{100}{2} - \frac{400}{8} + \frac{100}{8} + \frac{400}{2}\right](6.67 \times 10^{-11})$$

$$= 7.5 \times 10^{-9} \text{ J}$$

(b) First let us find the point (say) c between A and B where field strength due to 400 kg and 100 kg masses is zero. Let its distance from 400 kg is r.

Then, $$\frac{G(400)}{r^2} = \frac{G\,(100)}{(10-r)^2}$$

$$r = \frac{20}{3}\text{ m} \quad\text{and}\quad (10-r) = \frac{10}{3}\text{ m}$$

So, we have to move the body only from A to C. After that 100 kg mass will pull 1 kg mass by its own.

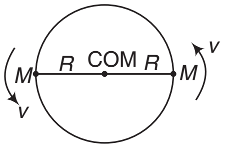
$\therefore$ Minimum kinetic energy $= \Delta U = U_C - U_A$

$$= m\,(V_C - V_A)$$

$$= (1)\left[-\frac{400}{20/3} - \frac{100}{10/3} + \frac{100}{8} + \frac{400}{2}\right](6.67\times10^{-11})$$

$$= 8.17\times10^{-9}\text{ J}$$

16. (a) $$F = \frac{GM.M}{(2R)^2} = \frac{GM^2}{4R^2}$$



(b) $$\frac{GM^2}{4R^2} = \frac{MV^2}{R}$$

$$\therefore\quad v = \sqrt{\frac{GM}{4R}}$$

$$T = \frac{2\pi(R)}{v} = \frac{2\pi R}{\sqrt{GM/4R}} = \frac{4\pi R^{3/2}}{\sqrt{GM}}$$

(c) $W = E_f - E_i = [U_f - U_i] + [K_f - K_i]$

$$= \left[0 - \left(\frac{-GMM}{2R}\right)\right] + \left[0 - 2\times\frac{1}{2}\times M\left(\sqrt{\frac{GM}{4R}}\right)^2\right]$$

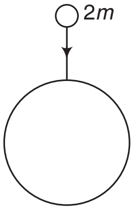
$$= \frac{GM^2}{4R}$$

17. (a) $E = 2$ (energy of one satellite)

$$= 2\left(-\frac{GMm}{2r}\right) = \frac{-GMm}{r}$$

(b) Immediately after collision velocity of combined mass = 0

Path is straight line as shown only potential energy is there.



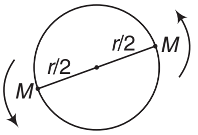
$$v = -\frac{G\,(2m)\,M}{r}$$

$$= -\frac{2GMm}{r}$$

18. $$\frac{2\pi}{\sqrt{GM}}r^{3/2} = 1\text{yr} \qquad \text{...(i)}$$

$$\frac{G\,(M)\,(M)}{r^2} = \frac{Mv^2}{(r/2)}$$

$$\therefore\quad v = \sqrt{\frac{GM}{2r}}$$



$$T = \frac{2\pi\,(r/2)}{v} = \frac{\pi r}{\sqrt{\dfrac{GM}{2r}}}$$

$$= \sqrt{2}\left(\frac{\pi}{\sqrt{GM}}\right)r^{3/2}$$

$$= \sqrt{2}\left(\frac{1}{2}\right)\text{yr} = 0.71\text{ yr} \qquad \left[\text{as } \frac{\pi r^{3/2}}{\sqrt{GM}} = \frac{1}{2}\text{ yr}\right]$$

19. $$W_1 = \Delta U = -\frac{GMm}{(R+h)} + \frac{GMm}{R} = \frac{GMmh}{R\,(R+h)}$$

$$W_2 = \frac{1}{2}mv^2 = \frac{1}{2}m\left(\sqrt{\frac{GM}{r}}\right)^2$$

$$= \frac{1}{2}m\left(\frac{GM}{R+h}\right) = \frac{GMm}{2\,(R+h)}$$

$$W_1 > W_2$$

If $\quad \dfrac{h}{R} > \dfrac{1}{2} \quad$ or $\quad h > \dfrac{R}{2}$

or $\quad h > \dfrac{6370}{2}$ km

or $\quad h > 3185$ km

LEVEL 2

Single Correction Option

1. Just before collision,

$$v_0 = \sqrt{\frac{GM}{r}} = \sqrt{\frac{GM}{R+R}} = \sqrt{\frac{GM}{2R}}$$

From conservation of linear momentum,

$$mv_0 = \frac{m}{2}\times0 + \frac{m}{2}v$$

$$\therefore\quad v = 2v_0 = \sqrt{\frac{2GM}{R}}$$

Increase in mechanical energy

$$= K_f - K_i$$

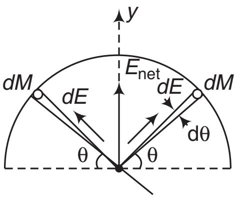
$$= \frac{1}{2}\frac{m}{2}v^2 - \frac{1}{2}mv_0^2$$

$$= \frac{1}{4}m\,(2v_0)^2 - \frac{1}{2}mv_0^2$$

$$= \frac{1}{2} m v_0^2 = \frac{1}{2} m \left(\frac{GM}{2R}\right) = \frac{1}{4} \frac{GMm}{R}$$

$$= \frac{1}{4} mgR \qquad \left(\text{as } g = \frac{GM}{R^2}\right)$$

2. $E_{\text{net}} = \int_0^{\pi} dE \sin\theta$



$$= \int_0^{\pi} \frac{G \cdot dM}{R^2} \sin\theta$$

$$= \int_0^{\pi} \frac{G\left(\frac{M}{\pi} d\theta\right)}{R^2} \sin\theta$$

$$= \frac{2GM}{\pi R^2} = \frac{2\,G\pi M}{l^2}$$

$$l = \pi R$$

$$\therefore \qquad R = \frac{l}{\pi}$$

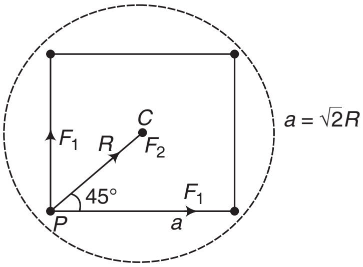
3. Net force on P towards centre

$$F = \sqrt{2}\, F_1 + F_2$$

$$\therefore \qquad \frac{Mv^2}{R} = \sqrt{2}\left[\frac{G.MM}{a^2}\right] + \frac{GMM}{(2R)^2}$$

$$\text{or} \qquad \frac{v^2}{R} = \frac{\sqrt{2}\, GM}{(\sqrt{2}R)^2} + \frac{GM}{4R^2}$$

$$\therefore \qquad v = \sqrt{\frac{GM}{R}\,\frac{2\sqrt{2}+1}{4}}$$



4. $K_i + U_i = K_f + U_f$

$$\frac{1}{2} m\,(kv_e)^2 - \frac{GMm}{R} = 0 - \frac{GMm}{r}$$

$$\therefore \qquad \frac{1}{2} k^2\,(2gR) - \frac{GM}{R} = -\frac{GM}{r}$$

$$\text{or} \qquad \frac{GM}{r}\,(1-k^2) = \frac{GM}{r} \qquad \left(\text{as } gR = \frac{GM}{R}\right)$$

$$\text{So,} \qquad r = \frac{R}{1-k^2}$$

5. $a = E = \left(\dfrac{GM}{R^3}\right) y \qquad \left(\text{as } a = E = \dfrac{F}{m}\right)$

$$= \frac{G\left(\frac{4}{3}\pi R^3 \rho\right)}{R^3}\, y = \frac{4}{3}\,\pi G \rho y$$

6. Earth rotates from west to east. Net velocity of train

$$= (\omega\, R - \theta)^2$$

$$\text{Now, } mg - N = \frac{m\,(\omega R - \theta)^2}{R}$$

$$\therefore \qquad N = mg - \frac{m\,(\omega R - v)^2}{R}$$

$$= mg\left[1 - \frac{\omega^2 R^2 + v^2 - 2\,vR\omega}{gR}\right]$$

$$= mg\left[1 - \frac{\omega\,(\omega R - 2v)}{g} - \frac{v^2}{Rg}\right] \quad \textbf{Ans.}$$

7. Gravitational field at any point inside the cavity is uniform (both in magnitude as well as direction). So, let us find its value at centre of cavity.

$E_R = E_T - E_C$ (at centre of cavity)

$R \to$ Remaining, $T \to$ total, $C \to$ cavity

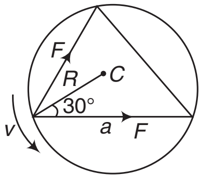
So, $E_R = E_T$ (as $E_C = 0$)

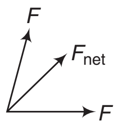
$$= \left(\frac{GM}{R^3}\right) a \quad \text{or} \quad E_R \propto a$$

8. Potential (and hence potential energy) at centre is $\frac{3}{2}$ times the value on surface. So, required kinetic energy is $\frac{3}{2}$ times or required speed is $\sqrt{\frac{3}{2}}$ times.

9. $\int dV = -\int E dr$

10. $a = 2R \cos 30° = \sqrt{3}\, R$





$F_{\text{net}} = \sqrt{3}\, F$ is towards centre C

$$\therefore \qquad \sqrt{3}\, F = \frac{MV^2}{R}$$

or $$\sqrt{3}\,\frac{GMM}{a^2} = \frac{MV^2}{R}$$

or $$\frac{\sqrt{3}GM^2}{(\sqrt{3}R)^2} = \frac{MV^2}{R}$$

or $$v = \sqrt{\frac{GM}{\sqrt{3}R}}$$

11. $T^2 \propto R^3 \;\Rightarrow\; \therefore\; T^{2/3} \propto R$ or $T^2 \propto \dfrac{1}{(1/R^3)}$

12. $W = \Delta E = E_A - E_\alpha$

$$= (K_A + U_A) - (K_\alpha + U_\alpha)$$
$$= (K_A + mV_A) - (0 + 0)$$

$\therefore\; -5.5 = \frac{1}{2} \times 1 \times (3)^2 + (1)\,V_A$

or $V_A = -10$ J/kg

13. $K_i + U_i = K_f + U_f$

$\therefore\; \frac{1}{2} mv^2 - 2\frac{GMm}{\sqrt{2}R} = 0 + 0$

$\therefore\; v = \sqrt{\frac{2\sqrt{2}GM}{R}}$

14. $W = -\Delta U = U_i - U_f$

$$= -\frac{Gmm}{a}\left[\left\{\frac{(1)\,(2)}{1} + \frac{(1)\,(3)}{1} + \frac{(2)\,(3)}{\sqrt{2}}\right\} - \left\{\frac{(1\times 2)}{1} + \frac{(1\times 3)}{1} + \frac{(2\times 3)}{1}\right\}\right]$$

$$= \frac{6\,Gm^2}{a}\left(1 - \frac{1}{\sqrt{2}}\right)$$

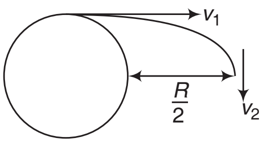
15. $K_i + U_i = K_f + U_f$

$\therefore\; \frac{1}{2} mv^2 - \frac{3}{2}\frac{GMm}{R} = 0 - \frac{GMm}{R}$

Solving, we get

$$v = \sqrt{\frac{GM}{R}}$$

16. $v_1 = nv_e = n\sqrt{2gR} = n\sqrt{\frac{2GM}{R}}$



From mechanical energy conservative, we have

$$\frac{1}{2}m\left[n\sqrt{\frac{2GM}{R}}\right]^2 - \frac{GMm}{R} = \frac{1}{2}mv_2^2 - \frac{GMm}{R + \frac{R}{2}} \quad \text{...(i)}$$

From conservation of angular momentum about centre of earth

$$m\left[n\sqrt{\frac{2GM}{R}}\right]R = mv_2\left(R + \frac{R}{2}\right) \quad \text{...(ii)}$$

Solving these two equations we get,

$$n = \sqrt{0.6}$$

17. Let v is the velocity at centre then.

$$K_i + U_i = K_f + U_f$$

or $$0 - \frac{GMm}{R} = \frac{1}{2}mv^2 - \frac{3}{2}\frac{GMm}{R}$$

$\therefore$ $$v = \sqrt{\frac{GM}{R}}$$

From conservation of linear momentum.

$$2mv - mv = (2m + m)\,v$$

$\therefore$ $$v' = \frac{v}{3} = \frac{1}{3}\sqrt{\frac{GM}{R}}$$

Again applying energy conservation,

$$K_i + U_i = K_f + U_f$$

$\therefore$ $$\frac{1}{2}(3m)\left[\frac{1}{3}\sqrt{\frac{GM}{R}}\right]^2 - \frac{3}{2}\frac{GM\,(3m)}{R}$$
$$= 0 - 3m\left[\frac{GM}{R^3}(1.5\,R^2 - 0.5\,r^2)\right]$$

Solving this equations, we get

$$r = \frac{R}{3}$$

So, $\frac{R}{3}$ is the amplitude of oscillations.

18. $v_e = \sqrt{2gR}$

or $v_e \propto \sqrt{gR}$

19. $F = -\frac{dU}{dr} = -6r^2$

Now $\frac{mv^2}{r} = 6r^2$

$\therefore\; \frac{1}{2}mv^2 = 3r^3$

$$E = K + U = 3r^3 + 2r^3 = 5r^3$$

At $r = 5\,\text{m},\; E = 625$ J **Ans.**

20. E on the surface of earth,

$$E_1 = \frac{F}{m} = \frac{10}{1}$$
$$= 10\ \text{N/kg}$$
$$E \propto \frac{1}{r^2}$$

$$\therefore \qquad \frac{E_2}{E_1} = \left(\frac{r_1}{r_2}\right)^2 = \left(\frac{R}{3R/2}\right)^2 = \frac{4}{9}$$

$$\therefore \qquad E_2 = \frac{4}{9} E_f = \frac{40}{9} \text{ N/kg}$$

$$F_2 = m\,E_2 = (200)\left(\frac{40}{9}\right) = 889 \text{ N}$$

21. $g = \dfrac{GM}{R^2} \quad \Rightarrow \quad \therefore \quad GM = gR^2$

$$v = \sqrt{\frac{GM}{r}} = \sqrt{\frac{GM}{R+x}} = \sqrt{\frac{gR^2}{R+x}}$$

22. $C \to$ cavity, $T \to$ Total, $R \to$ remaining

$$F_1 = \frac{GMm}{(2R)^2} \qquad \ldots\text{(i)}$$

$$F_R = F_2 = F_T - F_C = F_1 - F_C$$

or
$$F_2 = \frac{GMm}{(2R)^2} - \frac{G\left(\dfrac{M}{8}\right)m}{(3R/2)^2}$$

or
$$F_2 = \frac{14\,GMm}{72R^2} \qquad \ldots\text{(ii)}$$

From Eqs. (i) and (ii) we get,

$$\frac{F_2}{F_1} = \frac{7}{9}$$

More than One Correct Options

1. $g = \dfrac{GM}{R^2} = \dfrac{G\left(\dfrac{4}{3}\pi R^3\rho\right)}{R^2}$

or
$$g \propto R \qquad \text{(as } \rho \text{ is same)}$$

$$v_e = \sqrt{2gR} = \sqrt{\frac{2GM}{R}}$$

$$= \sqrt{\frac{2G\left(\dfrac{4}{3}\pi R^3\rho\right)}{R}}$$

So, v_e or $v \propto R$ (as ρ is same).

3. $K_i + U_i = K_f + U_f$

$$\therefore \qquad 0 - \frac{GMm}{2R} = \frac{1}{2}mv^2 - \frac{3}{2}\frac{GMm}{R}$$

or
$$v = \sqrt{\frac{2GM}{R}}$$

4. E due to point mass is $E = \dfrac{Gm}{r^2}$

As $r \to 0, E \to \propto$

So, just over the point masses, $E = \infty$. Hence, in moving from one point mass to other point mass, E first decreases and then increases.

V due to a point mass is

$$V = -\frac{Gm}{r}$$

As $\qquad r \to 0, V \to -\infty$

So, just over the point mass, V is $-\infty$. Hence, in moving from one point mass to other point mass, V first increases and then decreases.

5. Inside a shell, $V =$ constant and $E = 0$.

Between A and B, $E_{\text{net}} = 0$, $V_{\text{net}} =$ constant because these points μ inside both shells.

Between *B* and *C*

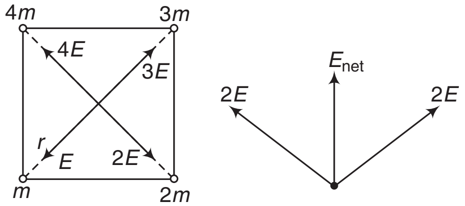
E of $m \neq 0$, E of $2m = 0$

V of $m \neq$ constant, V of $2m =$ constant.

Beyond *C*

E and V due to both shells are neither zero nor constant.

6. $E = \dfrac{Gm}{r^2}$

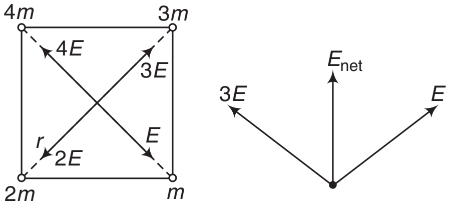


$$E'_{\text{net}} = 2\sqrt{2}\,E = \frac{2\sqrt{2}\,Gm}{r^2}$$

$$E'_{\text{net}} = \sqrt{(9E)^2 + E^2} = \sqrt{10}\,E$$

$$= \frac{\sqrt{10}\,Gm}{r^2}$$

$$E'_{\text{net}} > E_{\text{net}}$$



Potential in both cases is

$$V_{\text{net}} = -\frac{G}{r}(m + 2m + 3m + 4m)$$

$$= -\frac{10\,Gm}{r}$$

7. At highest point velocity of particle-1will becomes zero. But velocity of particle-2 is non zero.

8. At maximum distance (at A) kinetic energy is minimum. But angular momentum about centre of sun always remains constant.

9. $E_1 = -\dfrac{GMm}{R}$

$$U_2 = -\frac{GMm}{2R} \qquad (r = R + R = 2R)$$

$$K_2 = \frac{GMm}{4R}$$

and $$E_2 = -\frac{GMm}{4R}$$

10. $v = \sqrt{\dfrac{GM}{r}}$

or $$v \propto \sqrt{GM}$$

$$T = \frac{2\pi}{\sqrt{GM}} r^{3/2}$$

or $$T \propto \frac{1}{\sqrt{GM}}$$

Match the Columns

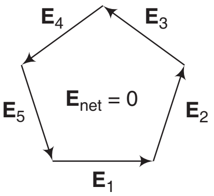
1. Inside the shell, V, U, K, and v remains constant. F, E and a are zero.

From A to B, kinetic energy increase and potential energy decreases.

2. Resultant of five field strength vectors of equal magnitude acting at same angles is zero.

(b) $V = -\dfrac{5\,GMm}{r}$

(c) If $\mathbf{E}_5$ is removed then resultant of rest four vectors is equal and opposite of $\mathbf{E}_5$.



$\therefore$ $$|\mathbf{E}_{\text{net}}| = |\mathbf{E}_5| = \frac{Gm}{r^2}$$

(d) $V = -\dfrac{4Gm}{r}$

3. $\dfrac{GM}{y} = x$ or $GM = xy$

(a) $E = \dfrac{GM}{(2y)^2} = \dfrac{xy}{4y^2} = \dfrac{x}{4y}$

(b) $|V| = \dfrac{GM}{y^3}\left(1.5\, y^2 - 0.5\,\dfrac{y^3}{4}\right)$

$$= \left(\frac{xy}{y^3}\right)\left(\frac{11}{8}\, y^2\right) = \frac{11}{8}\, x$$

(c) $E = \dfrac{GM}{y^3}\left(\dfrac{y}{2}\right) = \dfrac{xy}{y^3}\,\dfrac{y}{2} = \dfrac{x}{2y}$

(d) $|V| = \dfrac{GM}{2y} = \dfrac{xy}{2y} = \dfrac{x}{2}$

4. (a) $W = \Delta U = \dfrac{mgh}{1 + \dfrac{h}{R}}$

Put $h = R$, $W = \dfrac{1}{2}\, mgR$

(b) $\text{KE} = \dfrac{GMm}{2r} = \dfrac{GMm}{4R} = \dfrac{1}{4}\, mgR \quad (\text{as}\, GM = gR^2)$

(c) $E = -\dfrac{GMm}{2r}$

$$E_1 = -\frac{GMm}{2\,(2R)} = -\frac{GMm}{4R} = -\frac{1}{4}\, mgR$$

$$E_2 = -\frac{GMm}{2\,(3R)} = -\frac{1}{6}\, mgR$$

$$E_1 \sim E = \frac{1}{12}\, mgR$$

(d) $\text{KE} = \Delta U = \dfrac{mgh}{1 + \dfrac{h}{R}}$

Putting $h = R$, $\text{KE} = \dfrac{1}{2}\, mgR$

Subjective Questions

1. $W = \Delta U = U_f - U_i$

$$= 3\left[\frac{-Gmm}{2a}\right] - 3\left[-\frac{Gmm}{a}\right]$$

$$= \frac{3\,Gmm}{2a} = \frac{3Gm^2}{2a} \qquad \textbf{Ans.}$$

2. $h = \dfrac{u^2}{2g_e}$

$\therefore$ $$u = \sqrt{2g_e h} \qquad \ldots\text{(i)}$$

For the asked planet this u should be equal to the escape velocity from its surface.

$\therefore$ $$\sqrt{2g_e h} = \sqrt{2g_p R_p}$$

or $$g_e h = g_p R_p$$

$$\frac{GM_e}{R_e^2}.h = \frac{GM_p}{R_p^2}.\, R_p$$

or $$\frac{\left(\frac{4}{3}\pi R_e^3\right)\rho h}{R_e^2} = \frac{\left(\frac{4}{3}\pi R_p^3\right)\rho R_p}{R_p^2}$$

or $$R_P = \sqrt{R_e h}$$

$$= \sqrt{(6.41 \times 10^6)(1.5)}$$

$$= 3.1 \times 10^3 \text{ m}$$ **Ans.**

3. (a) $v_o = \frac{v_e}{2}$

$$\therefore \quad \sqrt{\frac{GM}{r}} = \frac{\sqrt{\frac{2GM}{R}}}{2}$$

$$\therefore \quad r = 2R$$

or $h = r - R = R$ or height = radius of earth.

(b) Increase in kinetic energy = decrease in potential energy

$$\therefore \quad \frac{1}{2}mv^2 = \frac{mgh}{1 + \frac{h}{R}}$$

$$\therefore \quad v = \sqrt{\frac{2hg}{1 + \frac{h}{R}}}$$

Substituting the values we have,

$$v = \sqrt{\frac{2 \times 9.81 \times 6400 \times 10^3}{1 + \frac{R}{R}}}$$

$$= 7924 \text{ m/s} \approx 7.92 \text{ km/s}$$ **Ans.**

4. (i) At point A, field strength due to shell will be zero.

Net field is only due to metal sphere. Distance between centre of metal sphere and point A is $4R$.

$$\therefore \quad E_A = \frac{G(m)}{(4R)^2} = \frac{Gm}{16R^2}$$

(ii) At point B, net field is due to both, due to shell and due to metal sphere.

$$\therefore \quad E_B = \frac{Gm}{(5R)^2} + \frac{Gm}{(6R)^2}$$

$$= \frac{61\,Gm}{900\,R^2}$$ **Ans.**

5. Radius of hollow sphere is $\frac{R}{2}$, so mass in this hollow portion would had been, $\frac{M}{8}$.

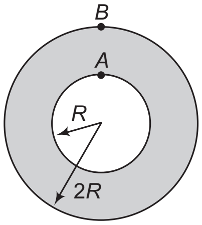
Now, net force on m due to whole sphere = force due to remaining mass + force due to cavity mass.

$\therefore$ Force due to remaining mass = force due to whole sphere − force due to cavity mass

$$= \frac{G\,Mm}{d^2} - \frac{G\,Mm}{8(d - R/2)^2}$$

$$= \frac{G\,Mm}{d^2}\left[1 - \frac{1}{8\left(1 - \frac{R}{2d}\right)^2}\right]$$

6. Let m_1 be the mass of the core and m_2 the mass of outer shell.



$$g_A = g_B \qquad \text{(given)}$$

Then $$\frac{Gm_1}{R^2} = \frac{G(m_1 + m_2)}{(2R)^2}$$

$$\therefore \quad 4m_1 = (m_1 + m_2)$$

or $$4\left\{\frac{4}{3}\pi R^3 \rho_1\right\} = \frac{4}{3}\pi R^3 \cdot \rho_1 + \left\{\frac{4}{3}\pi(2R)^3 - \frac{4}{3}\pi R^3\right\}\rho_2$$

$$\therefore \quad 4\rho_1 = \rho_1 + 7\rho_2$$

$$\therefore \quad \frac{\rho_1}{\rho_2} = \frac{7}{3}$$ **Ans.**

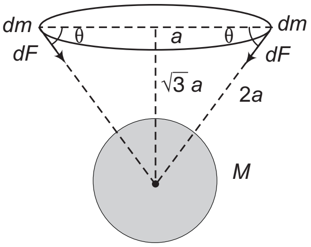
7. Total mechanical energy of a satellite in an elliptical orbit of semi major axis 'a' is $-\frac{GMm}{2a}$.

$$E = K + U$$

$$\therefore \quad -\frac{GMm}{2a} = \frac{1}{2}mv^2 - \frac{GMm}{r}$$

or $$v^2 = GM\left[\frac{2}{r} - \frac{1}{a}\right]$$ **Hence Proved.**

8. dF = force on a small mass 'dm' of the ring by the sphere.



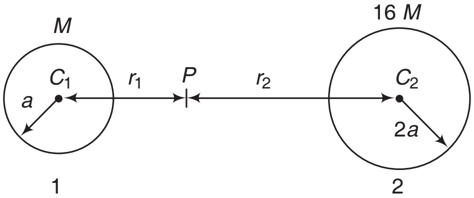
Net force on ring $= \Sigma(dF \sin\theta)$ or $\int dF \sin\theta$

$$= \Sigma \frac{GM(dm)}{(2a)^2} \times \frac{\sqrt{3}}{2} = \frac{\sqrt{3}GM}{8a^2}\Sigma(dm)$$

But $\Sigma(dm) = m$, the mass of whole ring.

$$\therefore \qquad \text{Net force} = \frac{\sqrt{3}GMm}{8a^2} \qquad \textbf{Ans.}$$

9. Let there are two stars 1 and 2 as shown below.



Let P is a point between C_1 and C_2, where gravitational field strength is zero. Or at P field strength due to star 1 is equal and opposite to the field strength due to star 2. Hence,

$$\frac{GM}{r_1^2} = \frac{G(16M)}{r_2^2} \quad \text{or} \quad \frac{r_2}{r_1} = 4$$

also $\qquad r_1 + r_2 = 10a$

$$\therefore \qquad r_2 = \left(\frac{4}{4+1}\right)(10a) = 8a$$

and $\qquad r_1 = 2a$

Now, the body of mass m is projected from the surface of larger star towards the smaller one. Between C_2 and P it is attracted towards 2 and between C_1 and P it will be attracted towards 1. Therefore, the body should be projected to just cross point P because beyond that the particle is attracted towards the smaller star itself.

From conservation of mechanical energy $\frac{1}{2}mv_{\min}^2$

= Potential energy of the body at P

– Potential energy at the surface of the larger star.

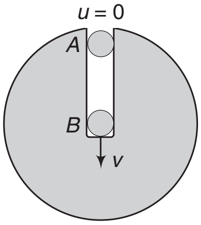
$$\therefore \quad \frac{1}{2}mv_{\min}^2 = \left[-\frac{GMm}{r_1} - \frac{16GMm}{r_2}\right] - \left[-\frac{GMm}{10a-2a} - \frac{16GMm}{2a}\right]$$

$$= \left[-\frac{GMm}{2a} - \frac{16GMm}{8a}\right] - \left[-\frac{GMm}{8a} - \frac{8GMm}{a}\right]$$

$$\text{or} \qquad \frac{1}{2}mv_{\min}^2 = \left(\frac{45}{8}\right)\frac{GMm}{a}$$

$$\therefore \qquad v_{\min} = \frac{3\sqrt{5}}{2}\left(\sqrt{\frac{GM}{a}}\right) \qquad \textbf{Ans.}$$

10. Let mass of the ball be m.



$$\frac{1}{2}mv^2 = m(V_A - V_B)$$

$$= m\left[-\frac{GM}{R} - \left(-1.5\frac{GM}{R}\right)\right]$$

$$= \frac{GMm}{2R}$$

$$\therefore \qquad v = \sqrt{\frac{GM}{R}}$$

Velocity of ball just after collision,

$$v' = ev = \frac{1}{2}\sqrt{\frac{GM}{R}}$$

Let r be the distance from the centre upto where the ball reaches after collision. Then,

$$\frac{1}{2}mv'^2 = m[V(r) - V(\text{centre})]$$

$$\text{or} \quad \frac{1}{8}\frac{GMm}{R} = m\left[\frac{3GM}{2R} - \frac{GM}{R^3}\left(\frac{3R^2}{2} - \frac{r^2}{2}\right)\right]$$

$$\text{or} \qquad \frac{1}{8} = \frac{3}{2} - \frac{3}{2} + \frac{r^2}{2R^2}$$

$$\therefore \qquad \frac{r^2}{R^2} = \frac{1}{4} \quad \text{or} \quad r = \frac{R}{2}$$

∴ The desired distance,

$$s = R + \frac{R}{2} + \frac{R}{2} = 2R \qquad \textbf{Ans.}$$

11. Applying conservation of mechanical energy,

Increase in kinetic energy

= decrease in gravitational potential energy

$$\text{or} \qquad \frac{1}{2}m_0v^2 = U_B - U_A = m_0(V_B - V_A)$$

$$\therefore \qquad v = \sqrt{2(V_B - V_A)} \qquad \ldots\text{(i)}$$

Potential at A

V_A = potential due to complete sphere

– potential due to cavity

$$= -\frac{1.5\,GM}{R} - \left[-\frac{Gm}{R/2}\right]$$

$$= \frac{2Gm}{R} - \frac{1.5\,GM}{R}$$

Here, $m = \frac{4}{3}\pi\left(\frac{R}{2}\right)^3 \rho = \frac{\pi\rho R^3}{6}$

and $M = \frac{4}{3}\pi R^3 \rho$

Substituting the values, we get

$$V_A = \frac{G}{R}\left[\frac{\pi\rho R^3}{3} - 2\pi\rho R^3\right] = -\frac{5}{3}\pi G\rho R^2$$

Potential at *B*

$$V_B = -\frac{GM}{R^3}\left[1.5R^2 - 0.5\left(\frac{R}{2}\right)^2\right] + \frac{1.5Gm}{R/2}$$

$$= -\frac{11}{8}\frac{GM}{R} + \frac{3Gm}{R}$$

$$= \frac{G}{R}\left[\frac{\pi\rho R^3}{2} - \frac{11}{6}\cdot\pi\rho R^3\right] = -\frac{4}{3}\pi G\rho R^2$$

$$\therefore \quad V_B - V_A = \frac{1}{3}\pi G\rho R^2$$

So, from Eq. (i)

$$v = \sqrt{\frac{2}{3}\pi G\rho R^2} \qquad \textbf{Ans.}$$

12. (a) Let x be the displacement of ring. Then displacement of the particle is $x_0 - x$, or $(3.0 - x)$ m. Centre of mass will not move. Hence,

$$(5.4 \times 10^9)x = (6 \times 10^8)(3 - x)$$

Solving, we get

$$x = 0.3 \text{ m} \qquad \textbf{Ans.}$$

(b) Apply conservation of linear momentum and conservation of mechanical energy.

13. (a) Mean radius of planet,

$$m_2 = \frac{r_1 + r_2}{2} = 1.4 \times 10^8 \text{ km}$$

Now, $T \propto r^{3/2}$

$\therefore$ Time period of m_2 :

$$T_2 = T_1\left(\frac{1.4 \times 10^8}{10^8}\right)^{3/2}$$

or $T_2 = 2\,(1.4)^{3/2}$

$$= 3.31 \text{ yr} \qquad \textbf{Ans.}$$

(b) For m_2, point P is perigee position. So, speed at this point is greater than orbital speed for circular orbit.

$$\therefore \quad U_{m_2} = U_{m_1}$$

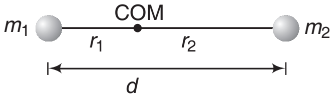
$$\therefore \quad E_{m_2} > E_{m_1}$$

$$K_{m_2} > K_{m_1}$$

(c) vr = constant

14. (a) $r_1 + r_2 = d$ ...(i)

$m_1 r_1 = m_2 r_2$ ...(ii)



Solving these two equations we get,

$$r_1 = \left(\frac{m_2}{m_1 + m_2}\right)d \quad \text{or} \quad r_2 = \left(\frac{m_1}{m_1 + m_2}\right)d$$

The centripetal force is provided by gravitational force,

$$m_1 r_1 \omega^2 = m_2 r_2 \omega^2 = \frac{Gm_1 m_2}{d^2}$$

Solving these equations, we get

$$\omega = \sqrt{\frac{G(m_1 + m_2)}{d^3}}$$

$$\therefore \quad T = \frac{2\pi}{\omega} = 2\pi\sqrt{\frac{d^3}{G(m_1 + m_2)}} \qquad \textbf{Ans.}$$

(b) $$\frac{K_1}{K_2} = \frac{\frac{1}{2}I_1\omega^2}{\frac{1}{2}I_2\omega^2} = \frac{I_1}{I_2} = \frac{m_1 r_1^2}{m_2 r_2^2}$$

$$= \left(\frac{m_1}{m_2}\right)\left(\frac{r_1}{r_2}\right)^2 = \left(\frac{m_1}{m_2}\right)\left(\frac{m_2}{m_1}\right)^2 = \frac{m_2}{m_1} \qquad \textbf{Ans.}$$

(c) $$\frac{L_1}{L_2} = \frac{I_1\omega}{I_2\omega} = \frac{I_1}{I_2} = \frac{m_2}{m_1} \qquad \textbf{Ans.}$$

(d) $$L = L_1 + L_2 = (I_1 + I_2)\,\omega$$

$$= (m_1 r_1^2 + m_2 r_2^2)\,\omega$$

$$= \left[\frac{m_1 m_2^2 d^2}{(m_1 + m_2)^2} + \frac{m_2 m_1^2 d^2}{(m_1 + m_2)^2}\right]\omega$$

$$= \mu\omega d^2 \qquad \textbf{Ans.}$$

where, $\mu = \frac{m_1 m_2}{m_1 + m_2}$ = reduced mass

(e) $$K = \frac{1}{2}(I_1 + I_2)\,\omega^2 = \frac{1}{2}\mu\omega^2 d^2 \qquad \textbf{Ans.}$$

14. Simple Harmonic Motion

INTRODUCTORY EXERCISE 14.1

1. $a = -4x$

Comparing with $a = -\omega^2 x$, we get

$$\omega = 2 \text{ rad/s}$$

Now, $\quad T = \frac{2\pi}{\omega} = (\pi)\text{sec}$

2. $E = \frac{1}{2}kA^2$

$$U = \frac{1}{2}kx^2 = \frac{1}{2}k\left(\frac{A}{4}\right)^2$$

$$= \frac{1}{16}\left(\frac{1}{2}kA^2\right)$$

$$= \frac{1}{16}E$$

Hence, $\frac{1}{16}$ fraction is potential energy and $\frac{15}{16}$ fraction is kinetic energy.

3. (a) $A =$ initial displacement from mean position

$= 15$ cm

(b) $T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{2.0}{150}} = 0.726$ s

(c) $F = \frac{1}{T} = 1.38$ Hz **Ans.**

(d) $E = \frac{1}{2}kA^2$

$= \frac{1}{2} \times 150 \times (0.15)^2 = 1.69$ J **Ans.**

(e) $v_{\max} = \omega A$

$= \left(\frac{2\pi}{T}\right)A = \left(\frac{2\pi}{0.726}\right)(0.15)$

$= 1.30$ m/s **Ans.**

4. $v_{\max} = \omega A = 2\pi fA$

$= (2\pi)(2)(8 \times 10^{-3})$

$= 0.101$ m/s **Ans.**

$a_{\max} = \omega^2 A = (2\pi f)^2 A$

$= 4 \times \pi^2 \times 4 \times 8 \times 10^{-3}$

$= 1.264 \text{ m/s}^2$ **Ans.**

$F_{\max} = ma_{\max}$

$= (0.5)(1.264)$

$= 0.632$ N **Ans.**

5. No, as acceleration in SHM $a = -\omega^2 x$ is variable.

INTRODUCTORY EXERCISE 14.2

1. (a) $E = \frac{1}{2}mv_{\max}^2 = \frac{1}{2}(m)\omega^2 A^2$

$= \frac{1}{2} \times 2.0 \times \left(\frac{\pi}{4}\right)^2 \times (1.5)^2$

$= 1.39$ J **Ans.**

(b) $0.5 = 1.5 \sin\left(\frac{\pi t_1}{4} + \frac{\pi}{6}\right)$

From here find t.

Then, $\quad -0.75 = 1.5 \sin\left(\frac{\pi t_2}{4} + \frac{\pi}{6}\right)$

From here find t_2.

Now, $t_1 \sim t_2$ is the required time.

2. $\omega = 3$ rad/s

$$A = 0.2 \text{ m}$$

At $x = 5$ cm

$v = \pm\,\omega\sqrt{A^2 - x^2}$

$= \pm\, 3.0\sqrt{(0.2)^2 - (0.05)^2}$

$= \pm\, 0.58$ m/s **Ans.**

$a = -\omega^2 x = -(3)^2(0.05)$

$= -0.45 \text{ m/s}^2$ **Ans.**

At $x = 0$

$v = \pm\,\omega A$

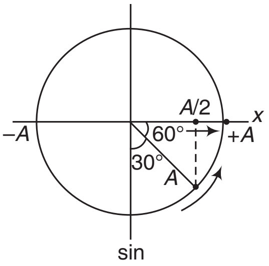
$= \pm\,(3.0)(0.2)$

$= \pm\, 0.6$ m/s **Ans.**

$a = -\omega^2 x = -(3)^2(0)$

$= 0$ **Ans.**

3.



$$x = A\sin(\omega t + 30°)$$

$\therefore \quad \delta = 30°$ **Ans.**

4. (b) $\omega = \frac{2\pi}{T} = \frac{2\pi}{4} = 1.57$ rad/s **Ans.**

(c) $\omega = \sqrt{\dfrac{k}{m}}$

$\therefore\ k = m\omega^2 = (0.8)(1.57)^2 = 1.97\ \text{N/m}$ **Ans.**

(d) At $t = 1$ s,

$v = \text{slope of } x\text{-}t \text{ graph} = 0$

(e) At $t = 1$ s, x is maximum $(= +A)$. Therefore. magnitude of acceleration is also maximum.

$a = \text{maximum} = \omega^2 A = (1.57)^2\,(0.08)$

$= 0.197\ \text{m/s}^2$ **Ans.**

5. $X = 5\sin\left(20t + \dfrac{\pi}{3}\right)$

$$v = \frac{dx}{dt} = 100\cos\left(20\,t + \frac{\pi}{3}\right)$$

$$a = \frac{dv}{dt} = -\,2000\sin\left(20t + \frac{\pi}{3}\right)$$

(a) $v = 0$ for the first time when,

$$20t + \frac{\pi}{3} = \frac{\pi}{2}$$

$\therefore$ $t = \dfrac{\pi}{120}$ s **Ans.**

(b) $a = 0$ for the first time, when

$$20t + \frac{\pi}{3} = \pi$$

$\therefore$ $t = \dfrac{\pi}{30}$ s **Ans.**

(c) When $a = 0$ for the first time, its speed will be maximum.

$t = \dfrac{\pi}{30}$ s **Ans.**

6. Simple harmonic with mean at $x = 10$, amplitude 4 and extreme positions at $x = 6$ and $x = 14$. At $t = 0$, it starts from $x = 6$. Here, x is coordinate, not displacement from mean position.

INTRODUCTORY EXERCISE 14.3

1. $a = -16x$

Comparing with $a = -\omega^2 x \Rightarrow \omega = 4$ rad/s

Now, $T = \dfrac{2\pi}{\omega} = \left(\dfrac{\pi}{2}\right)$ sec

2. $2 = 2\pi\sqrt{\dfrac{M}{k}}$ …(i)

$3 = 2\pi\sqrt{\dfrac{M+4}{k}}$ …(ii)

Solving two equations, we get

$M = 3.2$ kg

3. $2 = 2\pi\sqrt{\dfrac{(0.3 + 0.1)}{k}}$ …(i)

$T = 2\pi\sqrt{\dfrac{0.1}{k}}$ …(ii)

Solving these two equations we get,

$T = 1$ s

4. Comparing with $a = -\,\omega^2 x$

$$\omega^2 = p$$

$\therefore$ $\omega = \sqrt{p}$

5. $T = 2\pi\sqrt{\dfrac{M}{k}}$

$\dfrac{5T}{3} = 2\pi\sqrt{\dfrac{M+m}{k}}$

Solving these two equations, we get

$$\frac{m}{M} = \frac{16}{9}$$

6. $T \propto \sqrt{l}$

$$\frac{T'}{T} = \sqrt{\frac{l'}{l}} = \sqrt{\frac{1.21\,l}{l}} = 1.1$$

$\therefore$ $T' = 1.1\,T$

Hence, percentage increase in T is 11%.

7. $\omega^2 x = \omega\sqrt{A^2 - x^2} = \dfrac{\sqrt{A^2 - x^2}}{x} = 2\pi f$

$\therefore$ $f = \dfrac{\sqrt{A^2 - x^2}}{2\pi x}$

Substitute, $A = 2$ cm and $x = 1$ cm

INTRODUCTORY EXERCISE 14.4

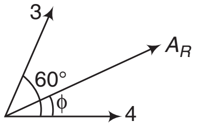
1. In such situation, amplitudes are added by vector method.

$$A_R = \sqrt{(4)^2 + (3)^2 + 2\,(4)\,(3)\cos\phi}$$

$= \sqrt{25 + 24\cos\phi}$ …(i)

Now, we can substitute different values of ϕ given in different parts in the question and can find the value of A_R.

2. $A_R = \sqrt{(4)^2 + (3)^2 + 2\,(4)\,(3)\cos 60^\circ}$



$= 6.1$ units

$$\tan\phi = \frac{3\sin 60^\circ}{4 + 3\cos 60^\circ} = 0.472$$

$\therefore \quad \phi = 25.3°$

$\therefore \quad x = 6.1 \sin (100\pi t + 25.3°)$

(a) At $t = 0$, $x = 6.1 \sin 25.3°$

$= 2.6$ unit

(b) $v_{\max} = \omega A$

$= (100\pi)(6.1)$

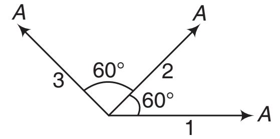
$= 1917$ unit

(c) $a_{\max} = \omega^2 A$

$= (100\pi)^2 (6.1)$

$= 6.0 \times 10^5$ units

3. Resultant of 1 and 3 is also A in the direction of 2.



$\therefore \quad A_R = 2A$

4. $A = \sqrt{A^2 + A^2 + 2A.A \cos\phi}$

Solving we get,

$$\cos\phi = -\frac{1}{2} \quad \text{or} \quad \phi = 120° \quad \text{or} \quad \frac{2\pi}{3}$$

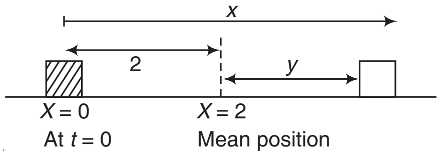
Exercises

LEVEL 1

Assertion and Reason

1. x is measured from the mean position.

2. $y = (-A \cos\omega t)$ at the particle starts from $-A$. So, displacement from the mean position will be $-A \cos\omega t$.

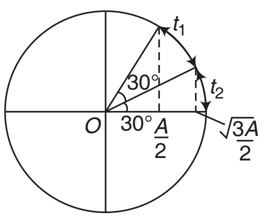


$\therefore \quad x = y + 2$

$= -2\cos\omega t + 2$

3. By applying a constant force on spring-block system mean position is changed but time period remains unchanged.

4. $t_1 = t_2 = \dfrac{\theta}{\omega} = \dfrac{\pi/6}{2\pi/T} = \dfrac{T}{12}$



5. In angular SHM, path is not straight line.

6. $k \propto \dfrac{1}{l} \quad \Rightarrow \quad \omega = \sqrt{\dfrac{k}{m}}$

$\therefore \quad \omega \propto \dfrac{1}{\sqrt{ml}}$

It m and l both are halved then ω will become 2 times.

7. $F = -kx$. For all displacements. From the mean position, whether they are small or large.

8. $\dfrac{\pi}{2\omega} = \dfrac{\pi}{2(2\pi/T)} = \dfrac{T}{4}$. In the given time particle moves from $x = A$ to $x = 0$.

9. $\left|\dfrac{x}{a}\right| = \left(\dfrac{T}{2\pi}\right)^2 = \dfrac{1}{\omega^2} =$ constant for a given SHM.

10. If a particle P rotates in a circle with constant angle speed ω and we draw a perpendicular on and diameter. This perpendicular cuts the diameter at point Q then motion of Q is simple harmonic. But motion of P is circular.

Single Correct Option

1. In equation $x = A\cos\omega t$, putting $x = \dfrac{A}{2}$ we get

$$\omega t = \frac{\pi}{3}$$

$\therefore \quad \left(\dfrac{2\pi}{T}\right) t = \dfrac{\pi}{3}$

or $\quad t = \dfrac{T}{6}$

2. Kinetic energy and potential energy in SHM oscillate with double frequency.

3. $v = \omega\sqrt{A^2 - x^2}$

$\therefore \quad \dfrac{v^2}{\omega^2} + \dfrac{x^2}{(1)^2} = A^2$

Hence, $v - x$ graph is an ellipse.

4. l in the equation $T = 2\pi\sqrt{\dfrac{l}{g}}$ is measured from centre of mass and centre of mass in both cases remains at same location.

5. **At $t = 1$ s**

$$\phi_1 = \frac{\pi}{2} + \phi$$

and $$\phi_2 = \frac{2\pi}{3} + \phi$$

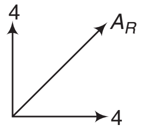
∴ $$\Delta\phi = \phi_2 - \phi_1 = \frac{\pi}{6}$$

6. $v = \omega\sqrt{A^2 - x^2}$

∴ $\dfrac{\omega A}{2} = \omega A\sqrt{A^2 - x^2}$ or $x = \dfrac{\sqrt{3}}{2}A$

7. All other equation can be converted into the from $y = a\sin(\omega t \pm \phi)$ or $a\cos(\omega t \pm \theta)$.

8. Phase difference between cos πt and sin πt is 90°.



$$A_R = 4\sqrt{2} \text{ units}$$

9. $\omega_1 t = \omega_2 t + 2\pi \qquad (\theta_1 = \theta_2 + 2\pi)$

∴ $$t = \frac{2\pi}{\omega_1 - \omega_2}$$

$$= \frac{2\pi}{(2\pi/T_1) - (2\pi/T_2)}$$

$$= \frac{T_1 T_2}{T_2 - T_1}$$

$$= \frac{4 \times 4.2}{4.2 - 4} = 84$$

Number of vibration of X in this time are,

$$N_1 = \frac{t}{T_1} = \frac{84}{4} = 21$$

10. $mg = kx \quad \Rightarrow \quad \therefore \quad k = \dfrac{mg}{x}$

$$T = 2\pi\sqrt{\frac{M+m}{R}} = 2\pi\sqrt{\frac{(M+m)\,x}{mg}}$$

11. $\omega_1 A_1 = \omega_2 A_2$

∴ $$\frac{A_1}{A_2} = \frac{\omega_2}{\omega_1} = \frac{\sqrt{k_2/m}}{\sqrt{k_1/m}} = \sqrt{\frac{k_2}{k_1}}$$

12. $I = \dfrac{1}{2}mR^2 + mR^2 = \dfrac{3}{2}mR^2$

$$T = 2\pi\sqrt{\frac{I}{mgl}}$$

Here $\quad l = R$

13. $U = \dfrac{1}{2}kx^2$

i.e. U *versus* x^2 graph is a straight line passing through origin.

14. $T = 2\pi\sqrt{\dfrac{1}{g\left(\dfrac{1}{l} + \dfrac{1}{R}\right)}}$

Put $\quad l = R$

15. $x = A\cos\omega t$

$$F \propto -x$$

Hence, F is $-\cos\omega t$ graph.

16. In equilibrium, let x_0 is extension in spring then

$$kx_0 = mg\sin\theta$$

∴ $$x_0 = \frac{mg\sin\theta}{k}$$

= amplitude of oscillations

17. $\dfrac{d^2x}{dt^2} = -\pi^2 x$

Comparing with $\dfrac{d^2x}{dt^2} = -\omega^2 x$

We have, $\quad \omega = \pi$

∴ $\quad 2\pi f = \pi$

$$f = \frac{1}{2}\text{ Hz}$$

18. $f = \dfrac{1}{2\pi}\sqrt{\dfrac{k}{\mu}}$

where, $\quad \mu$ = reduced mass

$$= \frac{M\,m}{M+m}$$

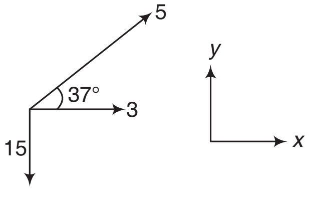
19. $T \propto \dfrac{1}{\sqrt{g}} \propto \dfrac{1}{\sqrt{M/R^2}}$

or $\quad T \propto \dfrac{R}{\sqrt{M}}$

R and M both are doubled. So, T will become $\sqrt{2}$ times.

∴ $\quad T^{-1} = \sqrt{2}\,T = 2\sqrt{2}$ s $\qquad$ (as $T = 2$ s)

20. x_3 can be written as



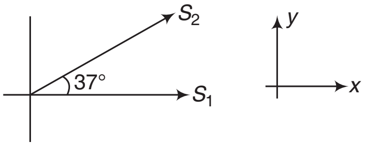
$$x_3 = 15\sin(\omega t - \pi/2)$$

$$\mathbf{A} = 3\,\hat{\mathbf{i}} + 5\cos 37°\,\hat{\mathbf{j}} + 5\sin 37°\,\hat{\mathbf{i}} - 15\,\hat{\mathbf{j}}$$

$$= 7\hat{\mathbf{i}} + 12\hat{\mathbf{j}}$$

$$\therefore \quad |\mathbf{A}| = \sqrt{(7)^2 + (12)^2} = 13.89$$

21. $X = S_1 + S_2 \cos 37°$



$$= (a \sin \omega t + 0.8\, b \sin \omega t) \qquad \ldots\text{(i)}$$

$$y = S_2 \sin 37°$$

$$= 0.6\, b \sin \omega t$$

$$\sin \omega t = \frac{y}{0.6\, b}$$

Substituting this value in Eq. (i), we have

$$x = \left(\frac{a + 0.8\, b}{0.6\, b}\right) y$$

This is equation of a straight line passing through origin.

22. (a) Kinetic energy is 0.64 times, it means speed is 0.8 times

$$0.8\,\omega A = \omega\sqrt{A^2 - x^2}$$

$$\therefore \quad x = 0.6\, A = 6\,\text{cm}$$

(b) $$\frac{\omega A}{2} = \omega\sqrt{A^2 - x^2}$$

$$\therefore \quad x = \frac{\sqrt{3}}{2} A$$

23. $$T = 2\pi \sqrt{\left|\frac{x}{a}\right|}$$

$$\therefore \quad \omega = \frac{2\pi}{T} = \sqrt{\left|\frac{x}{a}\right|} = \sqrt{\frac{0.5}{4 \times 10^{-2}}}$$

$$= 3.53\ \text{rad/s}$$

24. Let x_0 is the compression in equilibrium. Then,

$$kx_0 = ma$$

$$x_0 = \frac{ma}{k} = \frac{1 \times 2}{100}$$

$$= 0.02\ \text{m}$$

Amplitude $= x_0 = 0.02$ m **Ans.**

Subjective Question

1. Resultant of k and k is $2k$. Then, resultant of $2k$ and $2k$ is k.

Now $$T = 2\pi \sqrt{\frac{m}{k}}$$

2. $$T = 2\pi \sqrt{\frac{m}{k}} = 2\pi \sqrt{\frac{0.2}{80}} = \frac{\pi}{10}\ \text{s}$$

$$= 0.314\ \text{s}$$ **Ans.**

3. $F = kx$

$$\therefore \quad k = \frac{F}{x} = \frac{9}{0.05} = 180\ \text{N/m}$$

$$m = \frac{W}{g} = \frac{27}{10} = 2.7\ \text{kg}$$

$$T = 2\pi \sqrt{\frac{m}{k}} = 2\pi \sqrt{\frac{2.7}{180}}$$

$$= 0.78\ \text{s}$$ **Ans.**

4. $\Delta T = \frac{1}{2} T\alpha\, \Delta\theta$

$$\Rightarrow \quad \Delta t = \frac{\Delta T}{T^1} t$$

But $T' \approx T$

$$\therefore \quad \Delta t = \frac{1}{2} \alpha\, \Delta\theta\, (t)$$

$$= \frac{1}{2} \times 0.000012 \times 20 \times 24 \times 3600$$

$$= 10.37\ \text{s}$$ **Ans.**

At higher temperature, length of pendulum clock will be more. So, time period will be more and it will lose the time.

5. (a) $kx = mg$

$$\therefore \quad k = \frac{mg}{x} = \frac{(20 \times 10^{-3})(10)}{7 \times 10^{-2}}$$

$$= \frac{20}{7}\ \text{N/m}$$ **Ans.**

(b) $$T = 2\pi \sqrt{\frac{m}{k}}$$

$$= 2\pi \sqrt{\frac{50 \times 10^{-3}}{(20/7)}}$$

$$= 0.84\ \text{s}$$ **Ans.**

6. $k \propto \frac{1}{l}$

Length is halved, so value of force constant of each part will become $2k$. Now net force constant of $2k$ and $2k$ as shown in figure will becomes $4k$.

$$T = 2\pi \sqrt{\frac{m}{k}}$$

or $$T \propto \frac{1}{\sqrt{k}}$$

k has becomes 4 times. Therefore, T will remain half.

8. $$g_e = g - \frac{\text{Upthrust}}{\text{mass}}$$

$$= g - \frac{V\,(\delta/10)\,g}{V\delta} = \frac{9}{10}g$$

$$T' = 2\pi\sqrt{\frac{l}{g_e}} = 2\pi\sqrt{\frac{10}{9}\left(\frac{l}{g}\right)}$$

$$= \left(\sqrt{\frac{10}{9}}\right)T$$

9. For small values of x, the term x^2 can be neglected.

$\therefore$ $$F = -6\,x$$

Comparing with $F = -kx$, we get

$$k = 6\text{ N/m}$$ **Ans.**

10. $$\omega = \frac{2\pi}{T} = \frac{2\pi}{0.25} = (8\pi)\text{ rad/s}$$

$$x = A\sin(\omega t + \phi)$$

$$U = \frac{dx}{dt} = \omega A\cos(\omega t + \phi)$$

At $t = 0$

$$x = A\sin\phi$$

$\therefore$ $$5 = A\sin\phi \qquad \ldots\text{(i)}$$

$$U = \omega A\cos\phi = (8\pi)\,A\cos\phi$$

$\therefore$ $$218 = (8\pi\,A)\cos\phi \qquad \ldots\text{(ii)}$$

Solving Eqs. (i) and (ii) we get,

$$A = 10\text{ cm} \quad \text{and} \quad \phi = \frac{\pi}{6}\text{ or }30°$$

11. KE at mean position

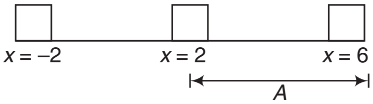
$$K = \frac{1}{2}m\,v_{\max}^2 = \frac{1}{2}m\,\omega^2A^2$$

$\therefore$ $$\omega = \left(\sqrt{\frac{2K}{m}}\right)\frac{1}{A}$$

$$= \left(\sqrt{\frac{2\times10^{-3}\times8}{0.1}}\right)\frac{1}{0.1} = 4\text{ rad/s}$$

Now, $y = A\sin(\omega t + \pi/4)$ is the required equation.

12. U_0 = minimum potential energy at mean position



$$= 10\text{ J}$$

At extreme position

U = Total mechanical energy

$$= 26\text{ J} = 10 + (x-2)^2$$

$\therefore$ $$(x-2) = \pm 4$$

Hence, $x = 6$ m and $x = -2$ m are the extreme positions.

(a) $$K_{\max} = E - U_0 = 16\text{J}$$

$\therefore$ $$\frac{1}{2}m\omega^2A^2 = 16$$

or $$\frac{1}{2}\times2\times\omega^2\times(4)^2 = 16$$

or $$\omega = 1\text{ rad/s}$$

(b) At mean position

$$E = 26\text{J}$$

$$U = U_0 = 10\text{J}$$

$\therefore$ $$K = 16\text{J}$$

At extreme position

$$K = 0$$

$\therefore$ $$U = E = 26\text{ J}$$

13. $$g' = \frac{g}{\left(1+\frac{h}{R}\right)^2}$$

Putting $h = R$

$$g' = \frac{g}{4}$$

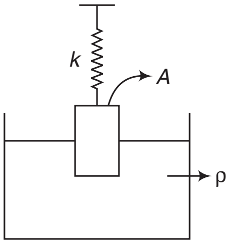
$$T = 2\pi\sqrt{\frac{l}{(g/4)}}$$

$$= 4\pi\sqrt{\frac{l}{g}}$$

$$= 4\sqrt{l} = 4\sqrt{1.0} \qquad (\text{as } g = \pi^2)$$

$$= 4\text{ s}$$ **Ans.**

14. In such situation, upthrust also behaves like a spring force of force constant $= \rho Ag$



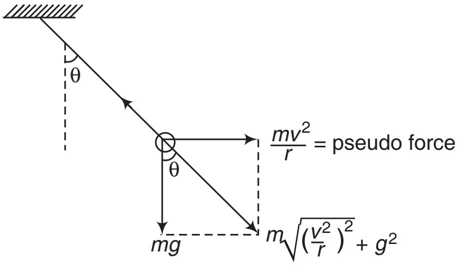
k_{net} in the given situation is $(k + \rho Ag)$

$\therefore$ $$T = 2\pi\sqrt{\frac{m}{k+\rho Ag}}$$

$$= 2\pi\sqrt{\frac{10}{100 + 1000\times20\times10^{-4}\times10}}$$

$$= 1.8\text{ s}$$ **Ans.**

15. $g_e = \sqrt{\left(\frac{v^2}{r}\right)^2 + g^2}$



θ
θ
$\frac{mv^2}{r}$ = pseudo force
mg
$m\sqrt{\left(\frac{v^2}{r}\right)^2 + g^2}$

$$T = 2\pi\sqrt{\frac{g}{g_e}} \quad \Rightarrow \quad \theta = \tan^{-1}\left(\frac{v^2}{rg}\right)$$

16. $\omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{4\times10^3}{0.1}} = 200$ rad/s

$$X = 10 \sin (200\, t)$$

$$6 = 10 \sin 200\, t_1$$

$$\therefore \quad 200\, t_1 = \sin^{-1}\left(\frac{3}{5}\right) = 0.646 \text{ rad}$$

$$\therefore \quad t_1 = 3.23 \text{ ms}$$

$$8 = 10 \sin 200\, t_2$$

$$\text{or} \quad 200\, t_2 = \sin^{-1}\left(\frac{4}{5}\right) = 0.925 \text{ rad}$$

$$\therefore \quad t_2 = 4.62 \text{ ms}$$

$$\therefore \quad \Delta t = 1.4 \text{ ms} = 1.4\times10^{-3}\text{s}$$ **Ans.**

17. (a) For small displacement x, the term x^2 can be neglected.

$$\therefore \quad F = -100x$$

Comparing with $F = -kx$ we have,

$$k = 100 \text{ N/m}$$

$$T = 2\pi\sqrt{\frac{m}{k}}$$

$$= 2\pi\sqrt{\frac{0.2}{100}} = 0.28 \text{ s}$$ **Ans.**

(b) $|\Delta F| = 10x^2 = 10\,(0.04)^2 = 0.016$ N

$$|F| = 100\,x = 100\,(0.04) = 4\text{N}$$

$$\therefore \quad \%\text{ error} = \frac{|\Delta F|}{|F|}\times100 = 0.4\%$$

18. It is a physical pendulum, the time period of which is,

$$T = 2\pi\sqrt{\frac{I}{mgl}}$$

Here, I = moment of inertia of the ring about point of suspension

$$= mr^2 + mr^2 = 2mr^2$$

and l = distance of point of suspension from centre of gravity $= r$

$$\therefore \quad T = 2\pi\sqrt{\frac{2mr^2}{mgr}}$$

$$= 2\pi\sqrt{\frac{2r}{g}}$$

∴ Angular frequency

$$\omega = \frac{2\pi}{T}$$

$$\text{or} \quad \omega = \sqrt{\frac{g}{2r}}$$ **Ans.**

19. (a) Frequency $= \frac{1}{2\pi}\sqrt{\frac{k}{m}}$

(Frequency is independent of g in spring)

(b) Extension in spring in equilibrium

$$\text{initial} = \frac{mg}{k}$$

Extension in spring in equilibrium in accelerating lift $= \frac{m\,(g+a)}{k}$

$$\therefore \quad \text{Amplitude} = \frac{m\,(g+a)}{k} - \frac{mg}{k} = \frac{ma}{k}$$ **Ans.**

20. $\omega = \frac{2\pi}{T} = \frac{2\pi}{0.05} = (40\pi)$ rad/s

Since, the body starts from the extreme position, we can write

$$\theta = \theta_0 \cos\omega t$$

$$\text{or} \quad \theta = \left(\frac{\pi}{10}\right)\cos 40\pi t$$ **Ans.**

21. $\omega = \frac{2\pi}{T} = \frac{2\pi}{16} = \frac{\pi}{8}$ rad/s

If at $t = 0$, particle passes through its mean position ($x = A \sin \omega t$) with maximum speed its v - t equation can be written as

$$v = \omega A \cos \omega t$$

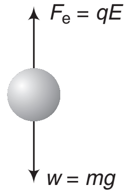
Substituting the given values, we have

$$2 = \left(\frac{\pi}{8}\right) A \cos\left(\frac{\pi}{8}\right)(2)$$

$$\therefore \quad A = \frac{16\sqrt{2}}{\pi}\text{ m}$$

$$= 7.2 \text{ m}$$ **Ans.**

22. The two forces acting on the bob are shown in figure



g_{eff} in this case will be $\dfrac{w - F_e}{m}$

or $$g_{\text{eff}} = \frac{mg - qE}{m}$$

$$= g - \frac{qE}{m}$$

$$\therefore \quad T = 2\pi\sqrt{\frac{l}{g_{\text{eff}}}}$$

$$= 2\pi\sqrt{\frac{l}{g - \dfrac{qE}{m}}} \qquad \textbf{Ans.}$$

23. (a) $g_e = g + a$

(b) $g_e = g - a$

(c) $g_e = 0$

(d) $g_e = \sqrt{g^2 + a^2}$

24. (a) Before the lump of putty is dropped the total mechanical energy of the block and spring is

$$E_1 = \frac{1}{2}kA_1^2.$$

Since, the block is at the equilibrium position, $U = 0$, and the energy is purely kinetic. Let v_1 be the speed of the block at the equilibrium position, we have

$$E_1 = \frac{1}{2}Mv_1^2 = \frac{1}{2}kA_1^2$$

$$\therefore \quad v_1 = \sqrt{\frac{k}{M}}\,A_1$$

During the process momentum of the system in horizontal direction is conserved. Let v_2 be the speed of the combined mass, then

$$(M + m)v_2 = Mv_1$$

$$\therefore \quad v_2 = \frac{M}{M + m}v_1$$

Now, let A_2 be the amplitude afterwards. Then,

$$E_2 = \frac{1}{2}kA_2^2 = \frac{1}{2}(M + m)v_2^2$$

Substituting the proper values, we have

$$A_2 = A_1\sqrt{\frac{M}{M + m}} \qquad \textbf{Ans.}$$

Note *$E_2 < E_1$, as some energy is lost into heating up the block and putty.*

Further, $$T_2 = 2\pi\sqrt{\frac{M + m}{k}} \qquad \textbf{Ans.}$$

(b) When the putty drops on the block, the block is instantaneously at rest. All the mechanical energy is stored in the spring as potential energy. Again the momentum in horizontal direction is conserved during the process. But now it is zero just before and after putty is dropped. So, in this case, adding the extra mass of the putty has no effect on the mechanical energy, i.e.

$$E_2 = E_1 = \frac{1}{2}kA_1^2$$

and the amplitude is still A_1. Thus,

$$A_2 = A_1$$

and $$T_2 = 2\pi\sqrt{\frac{M + m}{k}} \qquad \textbf{Ans.}$$

25. Let v is speed of combined mass just after collision. Then, from conservation of linear momentum, we have

$$(M + m)v = mv_0$$

$$\therefore \quad v = \frac{mv_0}{M + m}$$

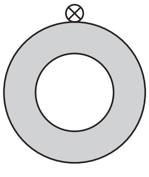
This is maximum speed of combined mass at mean position

$$\therefore \quad v = \omega A$$

or $$\left(\frac{m\,v_0}{M + m}\right) = \sqrt{\left(\frac{k}{M + m}\right)}\,A$$

$$\therefore \quad A = \frac{mv_0}{\sqrt{k\,(M + m)}}$$

26. Mass per unit area $= \dfrac{m}{\pi\,(R^2 - r^2)} = \sigma$ (say)



Whole mass $m_1 = (\pi R^2)\sigma$

$$= \left(\frac{R^2}{R^2 - r^2}\right)m$$

Mass of cavity $m_2 = (\pi r^2)\,\sigma$

$$= \left(\frac{r^2}{R^2 - r^2}\right) m$$

$$I = \frac{3}{2}\, m_1 R^2 - \left[\frac{1}{2}\, m_2 r^2 + m_2 R^2\right]$$

$$= \frac{3}{2}\left[\frac{R^2}{R^2 - r^2}\right] mR^2 - \left[\frac{1}{2}\left(\frac{r^2}{R^2 - r^2}\right) mr^2 + \left(\frac{r^2}{R^2 - r^2}\right) mR^2\right]$$

$$= \frac{m}{2\,(R^2 - r^2)}\,[3R^4 - r^4 - 2r^2R^2]$$

$$= \frac{m\,(3R^2 + r^2)}{2}$$

Now, $\quad T = 2\pi \sqrt{\dfrac{I}{mgl}} \quad$ …(i)

Here, $\quad l = R$

$\therefore \quad \dfrac{I}{mR} = \dfrac{3R}{2} + \dfrac{r^2}{2R}$

Substituting in Eq. (i) we have,

$$T = 2\pi \sqrt{\frac{\dfrac{3R}{2} + \dfrac{r^2}{2R}}{g}}$$

Comparing with

$$T = 2\pi \sqrt{\frac{l}{g}}$$

l of pendulum $= \dfrac{3R}{2} + \dfrac{r^2}{2R}$

$l = \dfrac{3R}{2} \quad$ as $r \to 0$

and $\quad l = 2R \quad$ as $r \to R$

27. $2\pi \sqrt{\dfrac{l}{g}} = 2\pi \sqrt{\dfrac{I}{mgl'}}$

$\therefore \quad l = \dfrac{I}{ml'}$

or $\quad I = (m)\,(l)\,(l')$

$= (200)\,(20)\,(35)$

$= 1.4 \times 10^5$ g-cm^2

28. At earth's surface, the value of time period is given by

$$T = 2\pi \sqrt{\frac{L}{g}} \quad \text{or} \quad T \propto \frac{1}{\sqrt{g}}$$

At a depth h below the surface,

$$g' = g\left(1 - \frac{h}{R}\right)$$

$\therefore \quad \dfrac{T'}{T} = \sqrt{\dfrac{g}{g'}}$

$$= \sqrt{\frac{1}{\left(1 - \dfrac{h}{R}\right)}} = \sqrt{\frac{R}{R - h}}$$

$\therefore \quad T' = T\sqrt{\dfrac{R}{R - h}}$

or $\quad T' \propto \dfrac{1}{\sqrt{R - h}} \quad$ **Hence proved.**

Further, $\quad T_{R/2} = 2\sqrt{\dfrac{R}{R - R/2}}$

$= 2\sqrt{2}$ s $\quad$ **Ans.**

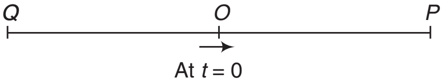
29. (a) Distance travelled in first 4 s

$= OP + PO = A + A = 2A$

Distance travelled in next 4 s

$= OQ + QO = A + A = 2A$

Two distances are equal.



(b) Distance travelled in first 2 s $= OP = A$ and distance travelled in next 2 s $= PO = A$

Again the two distances are same.

30. (a) $u = \omega\sqrt{A^2 - x_1^2} \quad$ … (i)

$v = \omega\sqrt{A^2 - x_2^2} \quad$ …(ii)

Solving Eqs. (i) and (ii), we get the result,

$$A \text{ or } a = \sqrt{\frac{v^2x_1^2 - u^2x_2^2}{v^2 - u^2}}$$

(b) $u_1 = \omega\sqrt{A^2 - x_1^2} \quad$ …(iii)

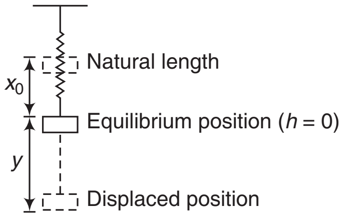
$u_2 = \omega\sqrt{A^2 - x_2^2} \quad$ …(iv)

Solving Eqs. (iii) and (iv), we find

$$\omega = \sqrt{\frac{u_1^2 - u_2^3}{x_2^2 - x_1^2}} = \frac{2\pi}{T}$$

$\therefore \quad T = 2\pi\sqrt{\dfrac{x_2^2 - x_1^2}{u_1^2 - u_2^2}}$

31. At equilibrium position, $kx_0 = mg$



In displaced position,

$$U = \frac{1}{2}k(x_0 + y)^2 - mg\ y$$

$$= \frac{1}{2}kx_0{}^2 + \frac{1}{2}ky^2 + kx_0y - mgy$$

Substituting $kx_0 = mg$ we get,

$$U = \frac{1}{2}kx_0^2 + \frac{1}{2}ky^2$$

$$= \frac{1}{2}kx_0^2 + \frac{1}{2}ky^2 + kx_0y - mgy$$

But $\quad \frac{1}{2}kx_0^2 =$ constant say U_0

$$\therefore \quad U = U_0 + \frac{1}{2}ky^2$$

32. While returning to equilibrium position,

$$\frac{1}{2}kd^2 = \frac{1}{2}(m_1 + m_2)v^2$$

$$\therefore \quad v = \left(\sqrt{\frac{k_1}{m_1 + m_2}}\right)d$$

Now, after mean position m_2 is detached from m_1 and keeps on moving with this constant velocity v towards right. Block $m_1$starts SHM with spring and this v becomes its maximum velocity at mean position.

$$\therefore \quad v = \omega A$$

$$\therefore \quad \left(\sqrt{\frac{k}{m_1 + m_2}}\right)d = \left(\sqrt{\frac{k}{m_1}}\right)A$$

$$\therefore \quad A = \left(\sqrt{\frac{m_1}{m_1 + m_2}}\right)d$$ **Ans.**

33. (a) In equilibrium, let x_0 is the elongation then,

$$F = kx_0$$

$$\therefore \quad x_0 = \frac{F}{k}$$

This x_0 is the amplitude

$$\therefore \quad A = x_0 = \frac{F}{k}$$

$$T = 2\pi\sqrt{\frac{M}{k}}$$

(b) $E = \frac{1}{2}kx_0^2 = \frac{1}{2}k\left(\frac{F}{k}\right)^2 = \frac{F^2}{2k}$

(c) Kinetic energy at mean position

$$= E = \frac{F^2}{2k}$$

34. (a) $F = kx_0$

$$\therefore \quad x_0 = \frac{F}{k} = \frac{10}{100} = 0.1 \text{ m}$$ **Ans.**

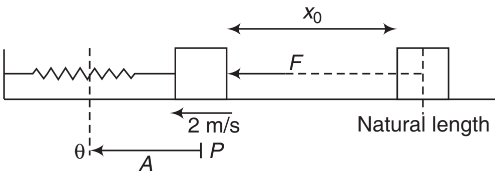
(b) $E = \frac{1}{2}mv^2 + \frac{1}{2}kx_0^2$

$$= \frac{1}{2} \times 1 \times (2)^2 + \frac{1}{2} \times 100 \times (0.1)^2 = 2.5 \text{ J}$$ **Ans.**

(c) $T = 2\pi\sqrt{\frac{M}{k}}$

$$= 2\pi\sqrt{\frac{1}{100}} = \frac{\pi}{5} \text{ sec}$$ **Ans.**

(d) From P to Q



Work done by applied force = change in mechanical energy.

$$\therefore \quad FA = E_Q - E_P$$

$$\therefore \quad (10)\ A = \frac{1}{2}k(A + x_0)^2 - 2.5$$

$$= \frac{1}{2} \times 100\,(A + 0.1)^2 - 2.5$$

Solving this equation, we get

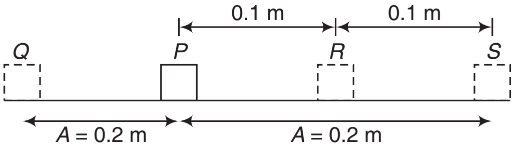
$$A = 0.2 \text{ m}$$ **Ans.**

(e) $U_Q = \frac{1}{2}k(A + x_0)^2$

$$= \frac{1}{2} \times 100\,(0.2 + 0.1)^2$$

$$= 4.5 \text{ J}$$ **Ans.**

(f) P = mean position



$Q, S =$ extreme position

$R =$ natural length

$$U_S = \frac{1}{2}k\,(0.1)^2$$

$$= \frac{1}{2} \times 100 \times (0.1)^2 = 0.5\ \text{J}$$

Due to work done by the applied fore, F, answer are different.

35. $$T_A = 2\pi\sqrt{\frac{I}{mgl}}$$

$$= 2\pi\sqrt{\frac{(md^2/3)}{mg\,(d/2)}} = \left(\frac{\sqrt{2}}{3}\right) 2\pi\sqrt{\frac{d}{g}}$$

and $$T_B = 2\pi\sqrt{\frac{d}{g}}$$

$\therefore$ $$\frac{T_A}{T_B} = \sqrt{\frac{2}{3}} = 0.816$$ **Ans.**

36. In displaced position,

$$E = \frac{1}{2}kx^2 + \frac{1}{2}mv^2 + \frac{1}{2}I\,\omega^2$$

Putting $$I = \frac{1}{2}mR^2$$

and $$\omega = \frac{v}{R}$$

we get $$E = \frac{1}{2}kx^2 + \frac{3}{4}mv^2$$

Since, $E =$ constant

$\therefore$ $$\frac{dE}{dt} = 0$$

or $$0 = \frac{1}{2}k\left(\frac{dx}{dt}\right)(2x) + \frac{3}{4}m\,(2v)\frac{dv}{dt}$$

Putting, $$\frac{dx}{dt} = v \text{ and } \frac{dv}{dt} = a$$

we get, $$F = (ma) = -\left(\frac{2k}{3}\right)x$$

Since, $F \propto -x$ motion is simple harmonic

$$k_e = -\frac{2k}{3}$$

$$T = 2\pi\sqrt{\frac{m}{k_e}} = 2\pi\sqrt{\frac{3m}{2k}}$$ **Hence Proved.**

37. In equilibrium

$$k\,x_0 = mg$$

$\therefore$ $$x_0 = \frac{mg}{k} = \frac{0.5 \times 10}{20}$$

$$= 0.25\ \text{m}$$

When displaced downwards by x from the mean position, total mechanical energy,

$$E = -\,mgx + \frac{1}{2}mv^2 + \frac{1}{2}I\omega^2 + \frac{1}{2}(x + x_0)^2$$

Substituting $I = 0.6\,MR^2$ and $\omega = \dfrac{v}{R}$

We have,

$$E = -\,mgx + \frac{1}{2}mv^2 + \frac{1}{2}(0.6\,MR^2)\left(\frac{v}{R}\right)^2$$

$$+\frac{1}{2}k\,(x + x_0)^2$$

Since $E =$ constant

$\therefore$ $$\frac{dE}{dt} = 0$$

or $$0 = -\,mg\left(\frac{dx}{dt}\right) + \frac{1}{2}m\left(2v\cdot\frac{dv}{dt}\right)$$

$$+ (0.6\,M) + (v)\frac{dv}{dt} + \frac{1}{2}k\,[2\,(x + x_0)]\frac{dx}{dt}$$

Putting $\dfrac{dx}{dt} = v$, $kx_0 = mg$ and $\dfrac{dv}{dt} = a$

We have

$$0 = (ma + 0.6\,Ma) + kx$$

or $$a = -\left(\frac{k}{m + 0.6\,M}\right)x$$

Since, $a \propto -x$ motion is SHM.

$$f = \frac{1}{2\pi}\sqrt{\left|\frac{a}{x}\right|}$$

$$= \frac{1}{2\pi}\sqrt{\frac{k}{m + 0.6\,M}}$$

$$= \frac{1}{2\pi}\sqrt{\frac{20}{0.5 \times 0.6 \times 5}}$$

$$= 0.38\ \text{Hz}$$ **Ans.**

38. $x = A\sin\omega t$ ...(i)

$$y = A\sin(2\omega t + \pi/2)$$

$$= A\cos 2\omega t$$

$$= A\,(1 - 2\sin^2\omega t)$$

From Eq. (i),

$$\sin\omega t = \frac{x}{A}$$

$\therefore$ $$y = A\left(1 - \frac{2x^2}{A}\right)$$

39. (a) $x = x_1 + x_2$

At $t = 0.0125$ s

$$x_1 = -\sqrt{2}\text{ cm}$$

and $$x_2 = -1\text{ cm}$$

$\therefore$ $$x = x_1 + x_2 = -2.41\text{ cm}$$

(b) At $t = 0.025$ s.

$$x_1 = 2\text{cm}$$

and $$x_2 = -1.73\text{cm}$$

$\therefore$ $$x = x_1 + x_2$$
$$= 0.27\text{cm}$$

LEVEL 2

Single Correct Option

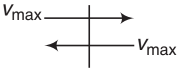
1. $\frac{1}{2}kA^2 = 1.0$

$$\frac{1}{2}k\,(0.4)^2 = 1.0$$

or $$k = 12.5 \quad \text{or} \quad \frac{25}{2}\text{ N/m}$$

$$T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{2}{\frac{25}{2}}} = \frac{4\pi}{5}\text{ s}$$

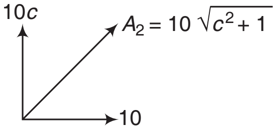
2. $v_{\max} = \omega A = \left(\sqrt{\frac{K}{m}}\right)a$



$$\Delta P = 2m\,v_{\max} = 2m\left(\sqrt{\frac{K}{m}}\right)a$$

$$F = \frac{\Delta P}{\Delta t} = \frac{\Delta P}{T/2} = \frac{2ma\sqrt{k/m}}{\pi\sqrt{m/k}} = \frac{2aK}{\pi}$$

3. $A_1 = 40$ units



Putting $A_1 = A_2$ we get,

$$c = \sqrt{15}$$

4. $T = \frac{1}{F} = \frac{1}{2.5} = 0.4$ s

$$t = 0.3\text{ s} = \frac{3T}{4}$$

At the given time, particle will be in its extreme position if at $t = 0$ it crosses the mean position.

5. $\omega = \frac{2\pi}{T} = \frac{2\pi}{16} = \frac{\pi}{8}$ rad/s

At $t = 0$, particle crosses the means position. Hence its velocity is maximum. So, velocity as a function of time can be written as

$$v = v_{\max}\cos\omega t$$

or $$v = \omega A\cos\omega t$$

$\therefore$ $$1 = \left(\frac{\pi}{8}\right)A\cos\left(\frac{\pi}{8}\right)(2)$$
$$= \left(\frac{\pi}{8\sqrt{2}}\right)A$$

$\therefore$ $$A = \frac{8\sqrt{2}}{\pi}\text{m}$$

6. $g_e = \sqrt{g^2 + a^2} = \sqrt{(10)^2 + (4)^2}$

$$= 10.77\text{ m/s}^2$$

$$T = 2\pi\sqrt{\frac{l}{g_e}} = 2\pi\sqrt{\frac{1}{10.77}}$$
$$= 1.90\text{ s}$$

7. If $v = v_0\sin\omega t$, then

$$a = \frac{dv}{dt} = v_0\omega\cos\omega t$$

$$\sin\omega t = \frac{v}{v_0} \quad \ldots\text{(i)}$$

$$\cos\omega t = \frac{a}{v_0\omega} \quad \ldots\text{(ii)}$$

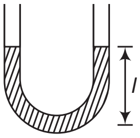
Squaring and adding these equations, we get

$$1 = \frac{v_2}{v_0^2} + \frac{a^2}{v_0\omega}$$

$\therefore$ $$v^2 = \left(-\frac{v_0}{\omega}\right)a^2 + v_0^2$$

Hence, v^2 *versus* a^2 equation is a straight line with positive intercept and negative slope.

8. $T = 2\pi\sqrt{\frac{l}{g}}$



$$2l = \frac{1000}{20}\text{ g}$$
$$= 50\text{ cm} = 0.5\text{ cm}$$

$\Rightarrow$ $$l = 0.25\text{ m}$$

Now $$T = 2\pi\sqrt{\frac{0.25}{9.8}} = 1\text{ s}$$

9. $T = 2\pi\sqrt{\dfrac{m}{k}}$

Here $\qquad m = (\rho_0)(a^3)$

and $\qquad K = \rho_l\, A\, g = \rho a^2 g$

$\therefore \qquad T = 2\pi\sqrt{\dfrac{\rho_0 a}{\rho g}}$

10. $T = 2\pi\sqrt{\dfrac{I}{mgd}}$

$$= 2\pi\sqrt{\frac{\dfrac{ml^2}{12} + md^2}{mgd}}$$

$$= 2\pi\sqrt{\frac{l^2 + 12d^2}{12\,d}}$$

$$= 2\pi\sqrt{\left(\frac{l^2}{12d} + d\right)}$$

T is minimum when first derivation of the quantity inside the root with respect to d is zero.

$$-\frac{l^2}{12d^2} + 1 = 0$$

or $\qquad \dfrac{d}{l} = \dfrac{1}{\sqrt{12}}$

11. In solved example, we have shown that

$$T_1 = 2\pi\sqrt{\frac{m}{k}}$$

$$T_2 = 2\pi\sqrt{\frac{4m}{k}}$$

and $\qquad T_3 = 2\pi\sqrt{\dfrac{m}{4k}}$

12. $T = 2\pi\sqrt{\dfrac{m + m_s/3}{k}}$ (in general)

Here $\qquad m_s =$ mass of spring

and $\qquad m =$ mass of block

13. Half the oscillation is completed with one spring and the other half with other spring. Hence,

$$T = \frac{T_1}{2} + \frac{T_2}{2} = \frac{2\pi\sqrt{\dfrac{M}{k}}}{2} + \frac{2\pi\sqrt{\dfrac{M}{4k}}}{2}$$

$$= \pi\sqrt{\frac{M}{k}}\left[1 + \frac{1}{2}\right] = \frac{3\pi}{2}\sqrt{\frac{M}{k}}$$

14. $F = -\dfrac{dU}{dx} = 20 - 10x$

$$F = 0$$

at $\qquad x = 0$

So, from $x = -3$ to $x = 2$, amplitude in 5.

Hence, other extreme position will be

$$x = 2 + 5 = 7$$

15. $k \propto \dfrac{1}{\text{Length of spring}}$

Length	Force constant
L	k
nL	k/n
$(1-n)L$	$k/(1-n)$

$$m_1 = nm$$

and $\qquad m_2 = (1-n)\,m$

$$\frac{f_1}{f_2} = \frac{\dfrac{1}{2\pi}\sqrt{\dfrac{k/n}{(1-n)\,m}}}{\dfrac{1}{2\pi}\sqrt{\dfrac{k/(1-n)}{nm}}} = 1$$

16. $\dfrac{1}{2}k\,(A^2 - x^2) = \dfrac{1}{4}\left(\dfrac{1}{2}kA^2\right)$

$\therefore \qquad x = \dfrac{\sqrt{3}}{2}A$

$\therefore \qquad CD = CB = \dfrac{\sqrt{3}}{2}R$

or $\qquad BD = 2\,(CD)$

or $\qquad 2\,(CB) = \sqrt{3}R$

17. $K_Q = \dfrac{YA}{L}$

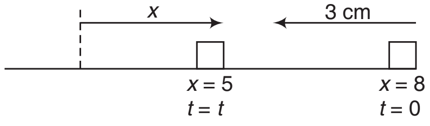
$$K_p = \frac{(2Y)\,(A/2)}{L} = \frac{YA}{L}$$

$\therefore \qquad K_P = K_Q = K = \dfrac{YA}{L}$

Half oscillation is completed with P and half with Q. But their value of K is same. Hence, we can say that in one oscillation one time period is completed with spring.

$$T = \left(\frac{2L}{v}\right) + 2\pi\sqrt{\frac{m}{K}} = \frac{2L}{v} + 2\pi\sqrt{\frac{mL}{AY}}$$

18. $X = A\cos\omega t$



$$5 = 8\cos\omega t$$

$$\omega t = \cos^{-1}(5/8) = 0.9$$

$$\therefore \quad t = \frac{0.9}{\omega} = \frac{0.9}{(2\pi/T)}$$

$$= \frac{0.9T}{2\pi} = \frac{0.9 \times 1.2}{2\pi}$$

$$= 0.17 \text{ s}$$

Ans.

19. $OP = a \sin 60° = \dfrac{\sqrt{3}\,a}{2}$

$$OC = l = \frac{2}{3}(OP) = \frac{a}{\sqrt{3}}$$

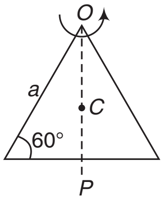
$$I = I_0 = 2\left(\frac{ma^2}{3}\right) + m\,(OP)^2 + \frac{ma^2}{12}$$

$$= \frac{2}{3}ma^2 + \frac{3}{4}ma^2 + \frac{1}{12}ma^2 = \frac{3}{2}ma^2$$

$$T = 2\pi\sqrt{\frac{I}{(3m)\,gl}}$$

$$= 2\pi\sqrt{\frac{(3/2m\,a^2)}{(3m)\,g\left(\dfrac{a}{\sqrt{3}}\right)}}$$

$$= 2\pi\sqrt{\frac{\sqrt{3}}{2}\,\frac{a}{g}}$$



Putting $a = \dfrac{1}{\sqrt{3}}$ m and $g = 10 \text{ m/s}^2$

We get, $T = \dfrac{\pi}{\sqrt{5}}$ s **Ans.**

20. $t = \dfrac{2.5\,\pi}{\omega} = \dfrac{2.5\,\pi}{(2\pi/T)}$

$$= (2.5)\left(\frac{T}{2}\right)$$

$$= 5\left(\frac{T}{4}\right)$$

Particle starts from extreme position and in every $\dfrac{T}{4}$ time it travels a distance A. So, in time $t = 5\,(T/4)$ it will travel a distance $5\,A$.

21. Half of the oscillation is completed with length l and rest half with $l/4$.

$$\therefore \text{ Time period} = \frac{T_1}{2} + \frac{T_2}{2}$$

$$= \frac{1}{2}\left[2\pi\sqrt{\frac{l}{g}} + 2\pi\sqrt{\frac{l/4}{g}}\right]$$

$$= \frac{3}{4}\left[2\pi\sqrt{\frac{l}{g}}\right] = \frac{3}{4}T$$

22. $A = \text{radius} = \dfrac{\text{Diameter}}{2} = 0.4$ m

$$f = \frac{30}{60} = \frac{1}{2} \text{ rps or } \frac{1}{2}\text{Hz}$$

$$\therefore \quad T = \frac{1}{f} = 2 \text{ s.}$$

23. $T = 0.6\pi$

$$\therefore \quad \omega = \frac{2\pi}{T} = \frac{2\pi}{0.6\,\pi}$$

$$= \frac{10}{3} \text{ rad/s}$$

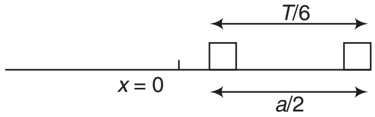
Particle starts from $y = -A = -2$ cm

$$\therefore \quad y = -A\cos\omega t$$

$$= A\sin(\omega t - \pi/2)$$

$$= 2\sin\left(\frac{10}{3}t - \pi/2\right)$$

24. Mean velocity $= \dfrac{\text{displacement}}{\text{time}}$



$$= \frac{(a/2)}{(T/6)} = \frac{3a}{T}$$

25. Maximum acceleration $= g$

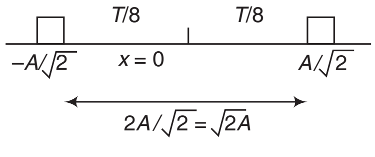
$$\therefore \quad \omega^2 A = g$$

$$\therefore \quad (2\pi f)^2\,(0.5) = g$$

$$f^2 = \frac{2g}{(2\pi)^2}$$

$$\therefore \quad f = \frac{\sqrt{2g}}{2\pi}$$

26. $\dfrac{1}{2}kX^2 = \dfrac{1}{2}k\,(A^2 - X^2)$

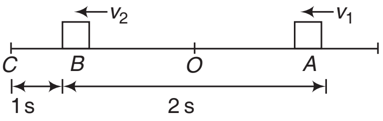


$$\therefore \quad X = \pm\frac{A}{\sqrt{2}}$$

$$\text{Average speed} = \frac{d}{t} = \frac{\sqrt{2}A}{T/8 + T/8}$$

$$= \frac{4\sqrt{2}\,A}{T}$$

27. $V_1 = V_2$



$$t_{AB} = 2\text{ s}$$

$$\therefore \quad t_{OB} = 1\text{ s}$$

$$t_{BCB} = 2\text{ s}$$

$$\therefore \quad _{BC} = 1\text{ s}$$

$$\therefore \quad t_{OB} = t_{BC}$$

$$\therefore \quad OB = \frac{A}{\sqrt{2}}$$

or

$$\frac{OB}{A} = \frac{1}{\sqrt{2}}$$

28. $t = \dfrac{\pi}{6\omega}$

$$\therefore \quad \omega t = (\pi/6)$$

According to the equation,

$$X = A\cos\omega t$$

$$X = A \text{ at } t = 0$$

and

$$X = \frac{\sqrt{3}A}{2} \text{ at } \omega t = \pi/6$$

$\therefore$ Distance travelled

$$= A - \frac{\sqrt{3}}{2}A$$

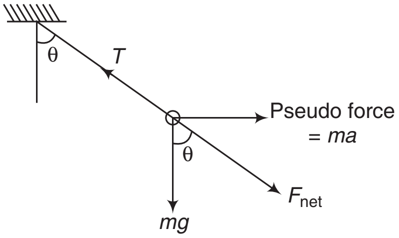
$$= (2-\sqrt{3})\frac{A}{2}$$

$$\text{Average speed} = \frac{\text{distance}}{\text{time}}$$

$$= \frac{(2-\sqrt{3})\,A/2}{(\pi/6\omega)} = \frac{3\omega A}{\pi}(2-\sqrt{3})$$

More than One Correct Options

1. $\tan\theta = \dfrac{ma}{mg} = \dfrac{a}{g}$

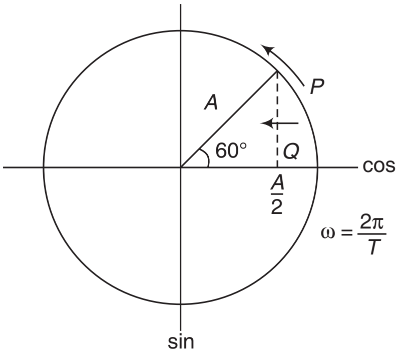


$$\therefore \quad \theta = \tan^{-1}\left(\frac{a}{g}\right)$$

$$T = F_{\text{net}}$$

$$= m\sqrt{a^2 + g^2}$$

2. $x = A\sin(\omega t + 150°)$



$$= A\sin\left(\frac{2\pi}{T}t + \frac{5\pi}{6}\right)$$

or

$$x = A\cos(\omega t + 60°)$$

$$= A\cos\left(\frac{2\pi}{T}t + \frac{\pi}{3}\right)$$

3. $kx_0 = mg$

$$\therefore \quad x_0 = \frac{mg}{k} = \frac{1\times 10}{500}$$

$$= 0.02\text{ m} = 2\text{ cm}$$

So, equilibrium is obtained after an extension of 2 cm of at a length of 42 cm. But it is released from a length of 45 cm.

$$\therefore \quad A = 3\text{cm} = 0.03\text{ m}$$

(b) $v_{\max} = \omega A = \sqrt{\dfrac{k}{m}}A$

$$= \left(\sqrt{\frac{500}{1}}\right)(0.03) = 0.3\sqrt{5}\text{ m/s}$$

$$= 30\sqrt{5}\text{ cm/s}$$

(c) $a_{\max} = \omega^2 A$

$$= \left(\frac{k}{m}\right)(A) = \left(\frac{500}{1}\right)(0.03) = 15\text{ m/s}^2$$

(d) Mean position is at 42 cm length and amplitude is 3 cm. Hence block oscillates between 45 cm length and 39 cm. Natural length 40 cm lies in between these two, where elastic potential energy = 0.

4. v or KE = 0 at $y = \pm A$

v or KE = maximum at $y = 0$

F or a is maximum at $y = \pm A$

F or a is zero at $y = 0$

5. $v = \omega\sqrt{A^2 - x^2}$

$$\therefore \qquad \frac{v^2}{\omega^2} + \frac{x^2}{(1)^2} = A^2$$

i.e. v - x graph is an ellipse.

$$a = -\omega^2 x$$

i.e. a - x graph is a straight line passing through origin with negative slope.

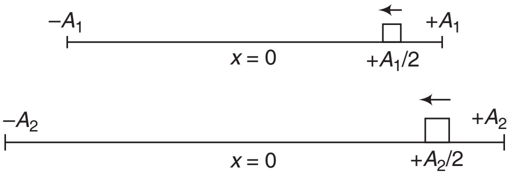
6. $a = 0$ at $x = 0.5$ m

and particle is released from $x = 2$m

Hence,

$$A = 2 - 0.5$$
$$= 1.5 \text{ m}$$
$$\omega^2 = 100$$
$$\therefore \qquad \omega = 10 \text{ rad/s}$$
$$T = \frac{2\pi}{\omega} = \frac{2\pi}{10}$$
$$= 0.63 \text{ s}$$
$$v_{\max} = \omega A = (10)(1.5)$$
$$= 15 \text{m/s}$$

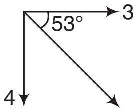
7. Two particles shown in figure are in same phase, although they have distances from the mean position at $t = 0$



8. The given equation can be written as

$$y = 3 \sin 100\,\pi t + (4 - 4 \cos 100\,\pi t) - 6$$
$$= 3 \sin 100\,\pi t + 4 \sin(100\pi t + \pi/2) - 2$$

or $\quad y = 5 \sin(100\pi - 53°) - 2$



$$y_{\max} = 5 - 2 = 3$$
$$y_{\min} = -5 - 2 = -7$$

$$\text{Mean position} = \frac{y_{\max} + y_{\min}}{2} = -2 \text{cm}$$

Comprehension Based Questions

1. $\omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{400}{2}} = 10\sqrt{2}$ rad/s

2. $Kx_0 = ma$

$$x_0 = \frac{ma}{K} = \frac{2 \times 5}{400} \text{ m}$$
$$= 0.025 \text{ m}$$
$$= 2.5 \text{cm}$$
$$\therefore \qquad A = x_0 = 2.5 \text{ cm}$$

Match the Columns

1. $x_{\min} = 2 - 2 = 0 \rightarrow$ extreme position

$x_{\min} = 2 + 2 = 4 \rightarrow$ extreme position

$$\text{Mean position} = \frac{x_{\min} + x_{\min}}{2} = 2$$

Maximum potential energy is at extreme positions.

2. $U_0 + \frac{1}{2}KA^2 = U_{\max}$

$$4 + \frac{1}{2}kA^2 = -20 \quad \text{or} \quad \frac{1}{2}kA^2 = 16\text{J}$$

(a) $\qquad U = U_0 + \frac{1}{2}kX^2$

$$= U_0 + \frac{1}{2}k\left(\frac{A}{2}\right)^2$$
$$= 4 + \frac{16}{4} = 8 \text{ J}$$

(b) $\text{KE} = \frac{1}{2}k\left(A^2 - \frac{A^2}{116}\right)$

$$= \frac{15}{16}\left(\frac{1}{2}kA^2\right) = \frac{15}{16} \times 16 = 15\text{J}$$

(c) $\text{KE} = \frac{1}{2}k\,(A^2 - 0)$

$$= \frac{1}{2}kA^2 = 16\text{J}$$

(d) $\text{KE} = \frac{1}{2}k\left(A^2 - \frac{A^2}{4}\right)$

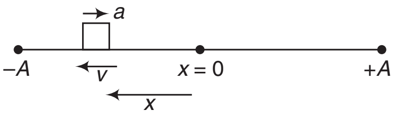
$$= \frac{3}{4}\left(\frac{1}{2}kA^2\right) = \frac{3}{4}(16\text{J}) = 12\text{J}$$

3. (a) $x \propto -\alpha$

At time t_1 acceleration is positive. Hence, X will be negative.

(b) At time $t_2 \quad a = 0 \quad \therefore \quad x = 0$

(c) At time t_1, x is negative and a is increasing. So, the particle is moving toward extreme position.



$\therefore \quad$ Velocity is negative.

(d) At mean position, velocity is maximum. Just after few seconds acceleration becomes positive. So displacement will becomes negative. Hence, the velocity should be negative.

4. $v_{\max} = \omega A = (4\pi)(2)$

$$= 25.12 \text{ m/s}$$

$$T = \frac{2\pi}{\omega} = \frac{2\pi}{4\pi}$$

$$= 0.5 \text{ s}$$

Hence the given time

$$t = 1 \text{ s} = 2T$$

$$\text{Maximum KE} = \frac{1}{2} m v_{\max}^2$$

$$= \frac{1}{2} \times 2 \times (25.12)^2$$

$$= 631 \text{ J}$$

Given kinetic energy of 400 J is less than this maximum kinetic energy. So in one time period kinetic energy becomes 400 J four times. In time $2T$ it becomes 400 J eight times.

(d) $|a_{\max}| = \omega^2 A$

$$= (4\pi)^2(2)$$

$$= 315.5 \text{ m/s}^2$$

Given acceleration is less than this. So, it becomes two times in one time period and four times in time $2T$.

5. $x_{\max} = 4 + 6 = 10 \text{m}$

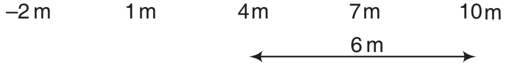
$x_{\min} = 4 - 6 = -2 \text{m}$

$$\text{Mean position} = \frac{x_{\max} + x_{\min}}{2} = 4 \text{ m}$$

$$T = \frac{2\pi}{\omega} = \frac{2\pi}{\pi} = 2 \text{ s}$$

(a) $x = 10\text{m}$ to $x = 4 \text{ m}$ $t = \frac{T}{4} = \frac{1}{2}$ s

(b) $x = 10\text{m}$ to $x = 7\text{m}$, $t = \frac{T}{6} = \frac{1}{3}$ s



(c) $x = 7\text{m}$ to x , $t = 2\left(\frac{T}{12}\right) = \frac{1}{3}$ s

(d) $x = 10\text{m}$ to $x = -2\text{m}$, $t = \frac{T}{2} = 1$ s

Subjective Questions

1. $f = \frac{1}{2\pi}\sqrt{\frac{k}{m}} = \frac{1}{2\pi}\sqrt{\frac{100}{4}} = \frac{2.5}{\pi} = 0.8 \text{ Hz}$ **Ans.**

with 1 kg mass, $f_0 = \frac{1}{2\pi}\sqrt{\frac{100}{1}} = \frac{5}{\pi}$ Hz

Further, from conservation of linear momentum (at mean position)

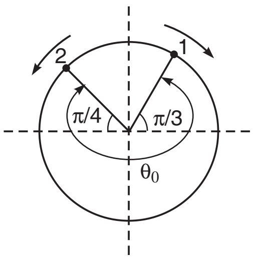
$$\omega A = \frac{1}{4}\omega_0 A_0$$

or $$fA = \frac{1}{4} f_0 A_0$$

or $$A = \frac{f_0 A_0}{4 f} - \frac{(5/\pi)(0.1)}{(4)(2.5/\pi)}$$

$$= 0.05 \text{ m}$$ **Ans.**

2. (a) $\theta_0 = \omega_1 t + \omega_2 t$



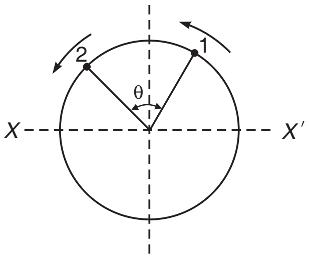
but $$\omega_1 = \omega_2 = \frac{2\pi}{T}$$

and $$\theta_0 = \pi + \frac{\pi}{3} + \frac{\pi}{4} = \frac{19}{12}\pi$$

$\therefore$ $$\frac{19\pi}{12} = \frac{2\pi}{T}t + \frac{2\pi}{T}t$$

or $$t = \frac{19}{48}T$$

(b) $\theta = 2\pi - \theta_0 = 2\pi - \frac{19}{12}\pi = \frac{5\pi}{12}$



Two particles will collide when line XX' becomes the line of bisector of angle θ.

$\therefore$ Any one of the particles (say-2) has rotated an angle

$$\omega t = \pi/4 + \theta/2$$

or $$\frac{2\pi}{T} t = \frac{\pi}{4} + \frac{5\pi}{24} = \frac{11\pi}{24}$$

$\therefore$ $$t = \frac{11T}{48}$$

3. $1.5 = \omega A = 2A \quad \Rightarrow \quad \therefore \quad A = 0.75$ m

Further, the particle will start its journey from its mean position in downward direction (−ve direction).

4. (a) $\omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{600}{2+1}} = 10\sqrt{2}$ rad/s

From conservation of linear momentum (at mean position) velocity of combined mass will be 2 m/s.

This is the maximum velocity of combined mass.

$\therefore$ $v = \omega A$

or $$A = \frac{v}{\omega} = \frac{2}{10\sqrt{2}} \text{ m}$$

$$= 0.141 \text{ m} = 14.1 \text{ cm}$$

$$T = \frac{2\pi}{\omega} = \frac{2\pi}{10\sqrt{2}} = 0.44 \text{ s}$$

(b) If the collision is elastic,

$$\omega' = \sqrt{\frac{600}{2}} = 10\sqrt{3} \text{ rad/s}$$

In elastic collision,

$$v_2' = \left(\frac{m_2 - m_1}{m_2 + m_1}\right) v_2 + \left(\frac{2m_1}{m_1 + m_2}\right) v_1$$

$$= \left(\frac{2 \times 1}{1+2}\right)(6) = 4 \text{ m/s} \qquad (\text{As } v_2 = 0)$$

This is maximum velocity.

$\therefore$ $v_2' = \omega' A'$

or $$A' = \frac{v_2'}{\omega'} = \frac{4}{10\sqrt{3}}$$

$$= 0.23 \text{ m} = 23 \text{ cm}$$

$$T' = \frac{2\pi}{\omega'} = \frac{2\pi}{10\sqrt{3}} = 0.36 \text{ s}$$

(c) In both cases journey is started from mean position

$\therefore$ $x = \pm A \sin \omega t$

will be the displacement-time equation. For impulse we can apply the equation. Impulse = change in linear momemtum.

5. $\omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{400}{4}} = 10$ rad/s

Let t_1 be the time from $x = 0$ to $x = 12$ cm and t_2 the time from $x = 0$ to $x = 9$ cm. Then,

$$12 = 15 \sin (10t_1)$$

or $$t_1 = 0.093 \text{ s}$$

$$9 = 15 \sin (10t_2)$$

or $$t_2 = 0.064 \text{ s}$$

$\therefore$ Total time $= t_1 + t_2 = 0.157$ s

6. (a) $y = a(1 - \cos \omega t)$

$$\frac{d^2y}{dt^2} = a\omega^2 \cos \omega t$$

$$N - mg = m \cdot \frac{d^2y}{dt^2}$$

or $$N = mg + ma\omega^2 \cos \omega t$$

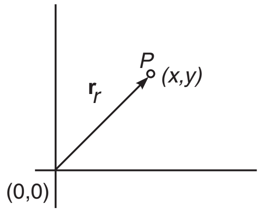
or $$N = m(g + a\omega^2 \cos \omega t)$$ **Ans.**

(b) $\left(\frac{d^2y}{dt^2}\right)_{\max} = a\omega^2$ or $a\omega^2 = g$

$\therefore$ $$a = \frac{g}{\omega^2} = \frac{980}{(11)^2}$$

$$= 8.1 \text{ cm}$$ **Ans.**

7. $\mathbf{F} = -kx\hat{\mathbf{i}} - ky\hat{\mathbf{j}}$



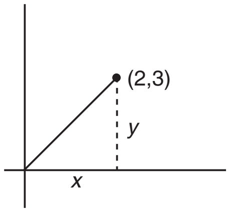
$\mathbf{F} = 0$ at $(0, 0)$

When it is displaced to a point P whose position vector is

$$\mathbf{r} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}}$$

Force on it is $\mathbf{F} = -k(x\hat{\mathbf{i}} + y\hat{\mathbf{j}}) = -k\mathbf{r}$

Since, $\mathbf{F} \propto -\mathbf{r}$, motion is simple harmonic. At $t = 0$ particle is at (2, 3)



$$\frac{y}{x}=\frac{3}{2} \quad \text{or} \quad 2y-3x=0$$

i.e. the particle will oscillate simple harmonically along this line.

8. In equilibrium, $mg\sin\theta = kx_0$ ...(i)

When displaced by x,

$$E=\frac{1}{2}mv^2+\frac{1}{2}I\omega^2+\frac{1}{2}k(x+x_0)^2-mgx\sin\theta$$

Since, $E = \text{constant}$

$$\frac{dE}{dt}=0$$

$$0=mv\left(\frac{dv}{dt}\right)+I\omega\left(\frac{d\omega}{dt}\right)+k(x+x_0)\frac{dx}{dt}-mg\sin\theta\frac{dx}{dt}$$

Substituting,

$$\frac{dv}{dt}=a,\quad \omega=\frac{v}{R},\quad I=\frac{1}{2}mR^2$$

$$\frac{d\omega}{dt}=\alpha=\frac{a}{R},\quad \frac{dx}{dt}=v$$

and $kx_0 = mg\sin\theta$

We get, $3ma = -2kx$

$$\therefore \quad f=\frac{1}{2\pi}\sqrt{\left|\frac{a}{x}\right|}=\frac{1}{2\pi}\sqrt{\frac{2k}{3m}}$$

Substituting the values,

$$f=\frac{1}{2\pi}\sqrt{\frac{2\times 200}{\frac{3\times 100}{9.8}}}$$

$$= 0.56 \text{ Hz}$$ **Ans.**

9. In the displaced position,

$$E=\frac{1}{2}mv^2+\frac{1}{2}I\omega^2+\frac{1}{2}k(2x)^2$$

$$I=\frac{1}{2}mR^2 \quad \text{and} \quad \omega=\frac{v}{R}$$

$$\therefore \quad E=\frac{3}{4}mv^2+2kx^2$$

$$E = \text{constant}$$

$$\therefore \quad \frac{dE}{dt}=0$$

$$\text{or} \quad \frac{3}{2}mv\frac{dv}{dt}+4kx\frac{dx}{dt}=0$$

Substituting, $\frac{dx}{dt}=v$ and $\frac{dv}{dt}=a$

$$a=-\frac{8k}{3m}.x$$

Comparing with, $a=-\omega^2x$

We have

$$\omega=\sqrt{\frac{8k}{3m}}=\sqrt{\frac{8\times 1000}{\frac{3\times 100}{9.8}}}=16.16\text{ rad/s}$$

$$\therefore \quad \theta=\theta_0\cos\omega t$$

$$\text{or} \quad \theta=0.4\cos(16.16t)$$ **Ans.**

10. Similar to Q.9

11. Let F be the restoring force (extra tension) on block m when displaced by x from its equilibrium position.

$$x=2x_1+2x_2$$

$$=2\left[\frac{2F}{k_1}+\frac{2F}{k_2}\right]$$

$$=4F\left(\frac{k_1+k_2}{k_1k_2}\right)$$

$$\text{or} \quad F=-\frac{k_1k_2}{4(k_1+k_2)}x$$

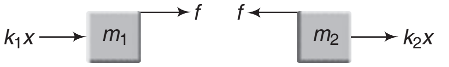
$$\therefore \quad a=-\frac{k_1k_2}{4m(k_1+k_2)}x$$

$$\omega=\sqrt{\frac{k_1k_2}{4m(k_1+k_2)}}$$ **Ans.**

12. (a) $f=\frac{1}{2\pi}\sqrt{\frac{k_{\text{eff}}}{\text{total mass}}}=\frac{1}{2\pi}\sqrt{\frac{k_1+k_2}{m_1+m_2}}$

(b) Suppose the system is displaced towards left by a distance x.

Restoring force on m_1 :



$$F=m_1\omega^2x \quad \text{(towards right)}$$

$$=m_1\left(\frac{k_1+k_2}{m_1+m_2}\right)x$$

Friction f on it will be towards right if,

$$k_1x<F$$

$$\text{or} \quad k_1x<m_1\left(\frac{k_1+k_2}{m_1+m_2}\right)x$$

$$\text{or} \quad \frac{k_1}{k_2}<\frac{m_1}{m_2}$$ **Ans.**

(c) $k_1A_m+\mu m_2g=m_1\left(\frac{k_1+k_2}{m_1+m_2}\right)A_m$

$$A_m\left(\frac{m_1k_1+m_1k_2}{m_1+m_2}-k_1\right)=\mu m_2g$$

$$\text{or} \quad A_m=\frac{\mu(m_1+m_2)m_2g}{m_1k_2-m_2k_1}$$ **Ans.**

13. (a) $\frac{1}{2}kx_0^2 = \frac{1}{2}\mu v_r^2$

Here, μ = reduced mass $= \frac{6 \times 3}{6+3}$

$$= 2 \text{ kg}$$

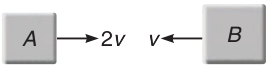
$$\therefore \quad v_r = \sqrt{\frac{k}{\mu}}\, x_0 = \left(\sqrt{\frac{200}{2}}\right)(3 \times 10^{-2})$$

$$= 0.3 \text{ m/s} = 2v + v$$

$$\therefore \quad v = 0.1 \text{ m/s}$$

$$\therefore \quad v_1 = 0.2 \text{ m/s}$$

and $\quad v_2 = 0.1 \text{ m/s}$ **Ans.**



Angular frequency

$$\omega = \sqrt{\frac{k}{\mu}} = \sqrt{\frac{200}{2}}$$

$$= 10 \text{ rad/s}$$

(b) $$v_{\text{cm}} = \frac{m_1v_1 + m_2v_2 + m_3v_3}{m_1 + m_2 + m_3}$$

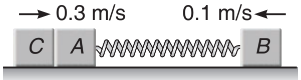
$$= \frac{(3)(0.2) - (6)(0.1) + 3(0.4)}{3 + 6 + 3}$$

$$= 0.1 \text{ m/s} \quad \text{(towards right)}$$ **Ans.**

(c) After collision velocity of combined blocks $(A + C)$

$$v_0 = \frac{(3 \times 0.2) + (3)(0.4)}{3 + 3} = 0.3 \text{ m/s}$$

and velocity of block B is $v_2 = 0.1$ m/s



The spring will compress till velocity of all the blocks become equal to the centre of mass. Applying conservation of mechanical energy,

$$\frac{1}{2}(3+3)(0.3)^2 + \frac{1}{2}(6)(0.1)^2 = \frac{1}{2}(3+3+6)(0.1)^2 + \frac{1}{2}kA^2$$

Solving this we get, $A = 0.048$ m

or $\quad A = 4.8$ cm **Ans.**

(d) $$\Delta E = \frac{1}{2}(3)(0.4)^2 + \frac{1}{2}(3)(0.2)^2 - \frac{1}{2}(3+3)(0.3)^2$$

$$= 0.24 + 0.06 - 0.27 = 0.03 \text{ J}$$ **Ans.**

14. Restoring torque

$$\tau = -(kl\theta)l - \left(k\frac{l}{2}\theta\right)\frac{l}{2} = -\frac{5}{4}kl^2\theta$$

Now, $$\left(\frac{ml^2}{3}\right)\alpha = -\left(\frac{5}{4}kl^2\right)\theta$$

$$f = \frac{1}{2\pi}\sqrt{\left|\frac{\alpha}{\theta}\right|} = \frac{1}{2\pi}\sqrt{\frac{15k}{4m}}$$

15. When the mass m is displaced from its mean position by a distance x, let F be the restoring (extra tension) force produced in the string. By this extra tension further elongation in the springs are $\frac{2F}{k_1}, \frac{2F}{k_2}, \frac{2F}{k_3}$ and $\frac{2F}{k_4}$ respectively.

Then,

$$x = 2\left(\frac{2F}{k_2}\right) + 2\left(\frac{2F}{k_2}\right) + 2\left(\frac{2F}{k_3}\right) + 2\left(\frac{2F}{k_4}\right)$$

or $$F\left(\frac{4}{k_1} + \frac{4}{k_2} + \frac{4}{k_3} + \frac{4}{k_4}\right) = -x$$

Here negative sign shows the restoring nature of force.

$$a = -\frac{x}{m\left(\frac{4}{k_1} + \frac{4}{k_2} + \frac{4}{k_3} + \frac{4}{k_4}\right)}$$

$$T = 2\pi\sqrt{\left|\frac{x}{a}\right|}$$

$$= 4\pi\sqrt{m\left(\frac{1}{k_1} + \frac{1}{k_2} + \frac{1}{k_3} + \frac{1}{k_4}\right)}$$ **Ans.**

16. Let F be the extra tension in the string, when the block is displaced x from its mean position.

Extension in spring-2 is

$$x_2 = \frac{F}{k_2}$$

Extension is spring-1 is

$$x_1 = \frac{2F}{k_1}$$

$$x = 2x_1 + x_2 = \frac{4F}{k_1} + \frac{F}{k_2}$$

Extra tension F will become restoring force for the block. Therefore, above equation can be written as,

$$F = -\left(\frac{1}{\frac{4}{k_1} + \frac{1}{k_2}}\right)x = \left(\frac{k_1k_2}{4k_2 + k_1}\right)x$$

or $$k_e = \frac{k_1 k_2}{4k_2 + k_1}$$

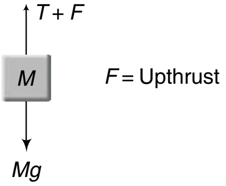
$$T = 2\pi\sqrt{\frac{m}{k_e}}$$

$$= 2\pi\sqrt{\frac{m(4k_2 + k_1)}{k_1 k_2}} \qquad \textbf{Ans.}$$

17. In equilibrium,

$$T + F = Mg \qquad \ldots\text{(i)}$$

When the block is further depressed by x, weight Mg remains unchanged, upthrust F increases by ρAxg and let ΔT be the increase in tension.



If a is the acceleration of block then,

$$\Delta T + \rho Axg = Ma \qquad \ldots\text{(ii)}$$

Restoring torque on the cylinder,

$$\tau = \left[\frac{kx}{2}\frac{R}{2} - \Delta T\, R\right] = \left[\frac{kxR}{4} - (Ma - \rho Axg)\, R\right]$$

$$\frac{1}{2}MR^2\alpha = \left[\frac{kR^2\theta}{4} - (MR\alpha - \rho AgR\theta)\, R\right]$$

or $$\frac{3}{2}MR^2\alpha = \left[\frac{kR^2}{4} + \rho AgR^2\right]\theta$$

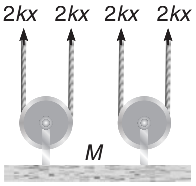
or $$\alpha = \frac{-\left[\frac{k}{4} + \rho Ag\right]}{\frac{3}{2}M}\theta$$

Here negative sign has been used for restoring nature of torque.

$$\therefore \qquad f = \frac{1}{2\pi}\sqrt{\left|\frac{\alpha}{\theta}\right|}$$

$$= \frac{1}{2\pi}\sqrt{\frac{k + 4\rho Ag}{6M}} \qquad \textbf{Ans.}$$

18. If the mass M is displaced by x from its mean position each spring further stretches by $2x$.



Net restoring force

$$F = -8kx$$

$$\therefore \quad M \cdot a = -8kx$$

$$f = \frac{1}{2\pi}\sqrt{\left|\frac{a}{x}\right|}$$

$$= \frac{1}{2\pi}\sqrt{\frac{8k}{M}}$$

$$= \frac{1}{\pi}\sqrt{\frac{2k}{M}} \qquad \textbf{Ans.}$$

15 Elasticity

INTRODUCTORY EXERCISE 15.1

1. $\Delta l = \dfrac{Fl}{AY}$ or $\Delta l \propto \dfrac{1}{Y}$

2. $\Delta l = \dfrac{Fl}{AY} = \dfrac{1000\times100}{4\times2\times10^6}$

$= 0.0125\,\text{cm}$

3. $\sigma = \dfrac{F}{A} = \dfrac{F}{\pi(R^2 - r^2)}$

$$R = \sqrt{\frac{F}{\sigma\pi} + r^2}$$

$$= \sqrt{\frac{1.6\times10^6}{90\times10^6\times3.14} + (0.1)^2}$$

$= 0.1251\ \text{m} = 125.1\ \text{mm}$

Diameter $= 2R = 250.2$ mm

4. Stress $= \dfrac{\text{Force}}{\text{Area}}$

Strain $= \dfrac{\Delta l}{l}$

Modulus of elasticity $= \dfrac{\text{Stress}}{\text{Strain}}$

INTRODUCTORY EXERCISE 15.2

1. Energy density = energy per unit volume

2. (a) Energy stored $U = \dfrac{1}{2}$ (stress) (strain) (volume)

or $U = \dfrac{1}{2}\left(\dfrac{F}{A}\right)\left(\dfrac{\Delta l}{l}\right)(Al)$

$= \dfrac{1}{2} F\cdot\Delta l$

$= \dfrac{1}{2}(100)(0.3\times10^{-3})$

$= 0.015$ J **Ans.**

(b) Work done = Potential energy stored

$= \dfrac{1}{2}k(\Delta l)^2$

$= \dfrac{1}{2}\left(\dfrac{YA}{l}\right)(\Delta l)^2$ $\left(\text{as } k = \dfrac{YA}{l}\right)$

Substituting the values, we have

$$W = \frac{1}{2}\frac{(2.0\times10^{11})(10^{-6})}{(2)}(0.1\times10^{-3})^2$$

$= 5.0\times10^{-4}$ J **Ans.**

Exercises

LEVEL 1

Assertion and Reason

2. At higher pressure, it is difficult to press the gas more. So, bulk modulus is high.

3. If length is doubled, Δl will also becomes two times and Y will remain same.

4. Bulk modulus is related to volume change and volume change is possible in all three states.

Young's modulus is related to length change, which is possible only in solids.

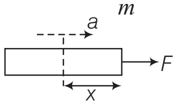
6. Stress ∝ strain only in proportionality limit.

7. $B_T = P$

$\Rightarrow \qquad B_S = \gamma p$

$\therefore \qquad \dfrac{B_T}{B_S} = \dfrac{1}{\gamma}$

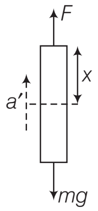
8. ***Case* I** $F = ma \Rightarrow a = \dfrac{F}{m}$



$F - T = m'a = \dfrac{m}{L}xa$

$T = F - \dfrac{m}{L}x\cdot\dfrac{F}{m} = F\left(1 - \dfrac{x}{L}\right)$ …(i)

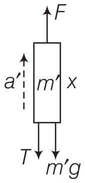
***Case* II** $F - mg = ma'$



$$a' = \frac{F}{m} - g$$

$$F - T - m'g = m'a'$$

$$F - T - m'g = m'\left(\frac{F}{m} - g\right)$$



$$F - T = m' \cdot \frac{F}{m}$$

$$F - T = \frac{m}{L}x \cdot \frac{F}{m} = \frac{x}{L}F$$

$$\Rightarrow \qquad T = F\left(1 - \frac{x}{L}\right) \qquad \text{...(ii)}$$

Tension at a point on the rod (of length L) at a distance x from point of application of force is same in both cases. [from Eqs. (i) and (ii)]

Hence, weight has no effect on tension in case (II).

Note *You can appreciate the extension of rod in first case, by comparing it with a case of many identical blocks connected by ideal springs.*

Extension in rod occurs due to force acting at any point on the rod. In certain cases, when net force acts at the centre of rod like weight, extension may not occur like the given case (II).

9. $Y_{\text{steel}} > Y_{\text{copper}}$. So, for the same strain, stress to be produced in steel is more.

Also, Work done $= \frac{1}{2}\text{Stress} \times \text{Strain}$

Volume $= \frac{1}{2} Y \times \varepsilon^2$

Single Correct Option

1. $$B = -\frac{\Delta p}{\Delta V / V}$$

$\Delta V = 0$ for an incompressible liquid.

$\therefore \quad B = \infty$

2. Young's modulus of elasticity is a materials property.

3. $$\sigma_{\max} = \frac{F_{\max}}{A}$$

$\therefore \quad F_{\max} = (\sigma_{\max})A,$

which is independent of length of wire.

4. $T = 0$ is free fall.

5. $$B = -\frac{\Delta p}{\Delta V / V}$$

$$= \frac{(1.2 \times 10^5)(1 \times 10^{-3})}{0.3 \times 10^{-3}}$$

$$= 4 \times 10^5 \text{ N/m}^2$$

Ans.

6. Length of the wire is $l = 20$ m

Radius of the wire is $r = 2 \times 10^{-3}$ m

Increase in length is

$$\Delta l = 0.031 \times 10^{-3} \text{ m}$$

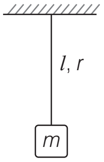
$$g = 3.1 \times \pi \text{ ms}^{-2}$$

Young's modulus is

$$Y = \frac{Fl}{A\,\Delta l} = \frac{(mg)l}{\pi r^2 (\Delta l)}$$

$$\therefore \qquad Y = \frac{4 \times 3.1 \times \pi \times 20}{\pi\,(2 \times 10^{-3})^2 \times 0.031 \times 10^{-3}}$$

$$= 2 \times 10^{12} \text{ Nm}^{-2}$$



7. Volume of wire is $V = L \times \pi r^2$

$$= 1 \times \pi (10^{-3})^2$$

$$= \pi \times 10^{-6} \text{m}^3$$

Area of square cross-section

$$= (2 \times 10^{-3})^2$$

$$= 4 \times 10^{-6} \text{m}^2$$

Length of new wire $= \frac{\text{Volume}}{\text{Area}} = \frac{\pi \times 10^{-6}}{4 \times 10^{-6}} = \frac{\pi}{4}$ m

Initially extension is $x = \frac{FL}{AY} = \frac{F}{Y}\left(\frac{1}{\pi \times 10^{-6}}\right)$

$$\therefore \qquad \frac{F}{Y} = (\pi \times 10^{-6})x$$

Finally extension is $x' = \frac{FL'}{A'Y} = \frac{F}{Y} \cdot \frac{L'}{A'}$

$$x' = (\pi \times 10^{-6})\,x \cdot \frac{\pi/4}{4 \times 10^{-6}} = \frac{\pi^2}{16}x$$

8. In the figure, the reciprocal of slope of stress-strain (x and y-axes) curve, upto proportionality limit, gives Young's modulus. The measure of ductility is obtained as the length of the stress-strain curve between yield point and ultimate load.

9. $\rho' = \dfrac{\rho}{1-\dfrac{dp}{B}} \approx \rho\left(1+\dfrac{dp}{B}\right)$

$$\Delta\rho = \rho' - \rho = \frac{\rho\,(dp)}{B} \qquad \text{...(i)}$$

$$\frac{\Delta\rho}{\rho} \times 100 = 0.1$$

$$\therefore \qquad \frac{\Delta\rho}{\rho} = 0.001$$

From Eq. (i),

$$dp \quad \text{or} \quad \Delta p = B\frac{\Delta\rho}{\rho}$$

$$= (2\times 10^9)\,(0.001) = 2\times 10^6 \text{ N/m}^2$$

10. $W = U = \dfrac{1}{2}F\,(\Delta l) = \dfrac{1}{2}\cdot\dfrac{YA\,(\Delta l)^2}{l}$

$\therefore \qquad U \propto \dfrac{A}{l}$ ($\because$ In both the cases Δl is same)

$$\frac{U_2}{U_1} = \frac{A_2}{A_1}\cdot\frac{l_1}{l_2} = \left(\frac{r_2}{r_1}\right)^2\cdot\frac{l_1}{l_2} = (4)(2)$$

$\therefore \qquad U_2 = 8U_1 = 8(2) = 16$ J

11. $U = \dfrac{1}{2}\sigma\varepsilon = \dfrac{1}{2}(Y\varepsilon)\varepsilon$

$\Rightarrow \quad U = \dfrac{1}{2}Y\varepsilon^2$ is similar to $x = ky^2$

Which is a parabola passing through origin and symmetric about x-axis.

12. Change in volume, $\Delta V = \dfrac{-\Delta p\cdot V_i}{B}$

Hence, density at depth of about 11 km is

$$= \frac{\text{Mass}}{\text{Volume}} = \frac{\rho_0\times V_i}{V_i - \dfrac{\Delta p v_i}{B}} = \frac{\rho_0 B}{(B-\Delta p)}$$

$$= \frac{\rho_0}{1-\dfrac{\Delta p}{B}} = \frac{\rho_0}{1-\dfrac{1\times 10^8}{2\times 10^9}}$$

$$= \frac{\rho_0}{1-\dfrac{1}{20}} = \frac{\rho_0}{0.95} \quad \Rightarrow \quad \rho = \frac{\rho_0}{0.95}$$

$\Rightarrow \qquad \rho_0 = 0.95\rho$

$\therefore$ % change in density $= \dfrac{\rho-\rho_0}{\rho_0}\times 100$

$$= \left[\frac{\dfrac{1}{0.95}-1}{1}\right]\times 100$$

$$\approx 5\ \%$$

13. $\Delta l = \dfrac{FL}{AY} = \dfrac{FL}{(\pi r^2)Y}$

$\therefore \qquad \Delta l \propto \dfrac{L}{r^2}$

$\therefore \qquad \dfrac{\Delta l_1}{\Delta l_2} = \dfrac{L/R^2}{2L/(2R)^2} = 2$

14. The net pressure at a depth of 1 km in the ocean is

$$p = \rho gh + p_{\text{atm}}$$
$$= (10^3)\,(9.8)\,(10^3) + 10^5$$
$$= 99\times 10^5 \text{ Pa} = 9.9\times 10^6 \text{ Pa}$$

This pressure acts uniformly on all sides of the balloon (which is in equilibrium) and the restoring forces with in the balloon are equal to external forces. So, normal stress will be same as external pressure.

15. Let T be the tension in the rope. Then,

$$2T = 10 \text{ kN}$$

$\Rightarrow \qquad T = 5000$ N

Longitudinal stress in the rope is

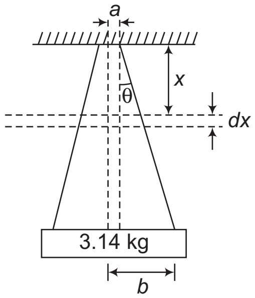
$$\sigma = \frac{T}{A} = \frac{5000 \text{ N}}{10^3 \text{ mm}^2} = 5 \text{N mm}^{-2}$$

Extension in the rope $= \dfrac{\text{Stress}}{Y}\times L$

$$= \frac{5}{10^3}\times(600+900) = 7.5 \text{ mm}$$

$\therefore$ Downward deflection of the load $= \dfrac{7.5}{2} = 3.75$ mm

16. Change in length of element is



$$d\,(\Delta L) = \frac{F\,dx}{AY}$$

Cross-sectional area of the element is

$$A = \pi\left[a + \frac{b-a}{L}x\right]^2$$

where, $a = \dfrac{b-a}{L}x$ is radius of the wire at the location of element.

$$d(\Delta L)=\frac{F}{\pi\left[a+\frac{b-a}{L}x\right]^2 Y}\,dx$$

Total change in length of wire is

$$\Delta L=\frac{F}{\pi Y}\int_0^L \frac{1}{\left(a+\frac{b-a}{L}x\right)^2}\,dx$$

Let $\quad a+\frac{b-a}{L}x=t$

$$\Rightarrow\quad \frac{b-a}{L}dx=dt \quad\Rightarrow\quad dx=\frac{L}{b-a}dt$$

When $x=0$, $t=a$ and when $x=L$, $t=b$

$$\therefore\quad \Delta L=\frac{F}{\pi Y}\int_a^b t^{-2}\cdot\frac{L}{b-a}\,dt$$

$$=\frac{FL}{\pi Y(b-a)}(-1)\left(\frac{1}{b}-\frac{1}{a}\right)$$

$$=\frac{FL}{\pi Y(b-a)}\cdot\frac{(b-a)}{ab}=\frac{FL}{\pi Y ab}$$

$$=\frac{(3.14)\,(9.8)\,(10)}{(3.14)\,(2\times10^{11})\,(5\times10^{-4})\,(9.8\times10^{-4})}$$

$$=10^{-3}\,\text{m}\quad\Rightarrow\quad\therefore\quad \Delta L=10^{-3}\,\text{m}$$

Subjective Questions

1. The changed density, $\rho'=\dfrac{\rho}{1-\dfrac{dp}{B}}$

Substituting the value, we have

$$\rho'=\frac{11.4}{1-\dfrac{2.0\times10^8}{8.0\times10^9}}\quad\text{or}\quad \rho'=11.69\ \text{g/cm}^3$$ **Ans.**

2. $\Delta l=\dfrac{Fl}{AY}=\dfrac{Fl}{(\pi d^2/4)\,Y}$

$$\therefore\quad d=\sqrt{\frac{4\,Fl}{\pi\,(\Delta l)\,Y}}$$

$$=\sqrt{\frac{4\times400\times3}{3.14\times0.2\times10^{-2}\times2.1\times10^{11}}}$$

$$=1.91\times10^{-3}\,\text{m}=1.91\ \text{mm}$$ **Ans.**

3. $\dfrac{m\,(g+a)}{A}=\dfrac{1}{3}\sigma_{\max}$

$$\therefore\quad a=\frac{\sigma_{\max}A}{3\text{m}}-g$$

$$=\frac{(3\times10^8)\,(4\times10^{-4})}{3\times900}-9.8$$

$$=34.64\ \text{m/s}^2$$ **Ans.**

4. Refer solved example 1

$$\Delta l=\frac{mgl}{2AY}=\frac{\rho\,(\pi r^2 l)\,gl}{2\,(\pi r^2)\,Y}$$

$$=\frac{gl^2\rho}{2Y}=\frac{(9.8)\,(5)^2\,(8000)}{2\times2\times10^{11}}$$

$$=4.9\times10^{-6}\text{m}$$

$$U=\frac{1}{2}k\,(\Delta l)^2=\frac{1}{2}\frac{YA}{l}(\Delta l)^2$$

$$=\frac{1}{2}\times\frac{Y\times\pi r^2}{l}(\Delta l)^2$$

$$=\frac{(2\times10^{11})\,(3.14)\,(6\times10^{-3})^2\,(4.9\times10^{-6})^2}{2\times5}$$

$$=5.43\times10^{-5}\text{J}$$ **Ans.**

5. $\sigma_{\max}$ on upper string $=\dfrac{(m_1+m_2+m)\,g}{0.006\times10^{-4}}$

$$\therefore\qquad 8\times10^8=\frac{(10+20+m)\times10}{0.006\times10^{-4}}$$

or $\qquad m=18$ kg

$\sigma_{\max}$ on lower string $=\dfrac{(m_1+m')\,g}{0.003\times10^{-4}}$

or $\qquad 8\times10^8=\dfrac{(10+m')\times10}{0.003\times10^{-4}}$

or $\qquad m'=14$ kg

So, answer is 14 kg and lower string will break earlier.

6. (a) $\sigma=\dfrac{F}{A}$

F and A both are same. Hence, the ratio is 1.

(b) Strain $=\dfrac{\text{Stress}}{Y}\propto\dfrac{1}{Y}$

$$\therefore\quad \frac{(\text{Strain})_{\text{steel}}}{(\text{Strain})_{\text{copper}}}=\frac{Y_{\text{copper}}}{Y_{\text{steel}}}=\frac{13}{20}$$ **Ans.**

7. $\rho'=\dfrac{\rho}{1-\dfrac{dp}{B}}\approx\rho\left(1+\dfrac{dp}{B}\right)$

$$\therefore\qquad \Delta\rho=\rho'-\rho=\frac{\rho\,(dp)}{B}$$

$$=\frac{\rho\,(\rho gh)}{B}$$

$$=\frac{(1030)^2\times9.8\times400}{2\times10^9}$$

$$=2.0\ \text{kg/m}^3$$ **Ans.**

8. $B = \dfrac{\Delta p}{\Delta V/V} = \dfrac{\rho g h}{(\Delta V/V)}$

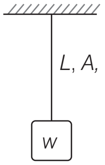
$$= \frac{(10^3)\,(9.8)\,(180)}{(0.1/100)}$$

$$= 1.76 \times 10^9 \text{ N/m}^2$$ **Ans.**

LEVEL 2

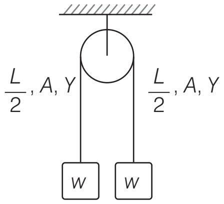
Single Correct Option

1. Extension in the first case is



$$l = \frac{FL}{AY} = \frac{wL}{AY}$$

Extension in the second case is



$$l' = \frac{w(L/2)}{AY} + \frac{w(L/2)}{AY} = \frac{wL}{AY}$$

It is clear that $l' = l$

Note *In the above problem, even if lengths of wire are unequal on two sides of the pulley, the elongation will still be l.*

2. Force on wire = Load carried

$$= m\,(g + a) = m\left(g + \frac{g}{2}\right) = \frac{3mg}{2}$$

Stress $\sigma = \dfrac{F}{A} \Rightarrow A = \dfrac{F}{\sigma}$

Hence, $A_{\min} = \dfrac{F}{\sigma_{\max}}$

$$\frac{\pi\, d_{\min}^2}{4} = \frac{\frac{3}{2} m \cdot g}{\sigma}$$

$$\Rightarrow \quad d_{\min}^2 = \frac{\frac{3}{2} mg \times 4}{\sigma \pi}$$

$$d_{\min} = \sqrt{\frac{6}{\pi} \cdot \frac{mg}{\sigma}}$$

3. $T = ml\,\omega^2$

$$\frac{T}{A} = \sigma_{\max} = \frac{ml\omega^2}{A}$$

$$\therefore \quad \omega = \sqrt{\frac{\sigma_{\max}\, A}{ml}}$$

$$= \sqrt{\frac{4.8 \times 10^7 \times 10^{-6}}{10 \times 0.3}}$$

$= 4$ rad/s **Ans.**

4. $T = \dfrac{M}{2} g = \left(\dfrac{L}{2} s\rho\right) g$

$\therefore \quad \sigma = \dfrac{T}{S} = \dfrac{1}{2}\rho g L$ **Ans.**

5. $F = -\dfrac{dU}{dr} = -$ slope of U - r graph

At B, slope $= 0$

$\therefore \quad F = 0$

Hence, atoms are in equilibrium at B. From A to B or even before A slope is negative. Hence, force is positive and positive force mean repulsion.

6.
$$l_1 - l = \frac{T_1 l}{AY} \qquad \ldots\text{(i)}$$
$$l_2 - l = \frac{T_2 l}{AY} \qquad \ldots\text{(ii)}$$

Dividing Eq. (i) by Eq. (ii) and then simplifying, we get

$$l = \frac{l_2 T_1 - l_1 T_2}{T_1 - T_2}$$ **Ans.**

7. $\Delta l = \dfrac{Fl}{AY} = \dfrac{Fl}{(V/l)\,Y}$ (V = Volume)

$$= \frac{Fl^2}{VY}$$

$\therefore \quad \Delta l \propto l^2$ (as F, V and Y = constants)

8. $\Delta l = l\alpha\, \Delta\theta$

$\therefore \quad$ Strain $= \dfrac{\Delta l}{l} = (\alpha \Delta\theta)$

Stress = $Y \times$ Strain $= Y\alpha\Delta\theta$

Energy stored per unit volume

$$= \frac{1}{2} \times \text{stress} \times \text{strain}$$

$$= \frac{1}{2} \times Y \times (\alpha\, \Delta\theta)^2$$

$$= \frac{1}{2} \times 10^{11} \times (12 \times 10^{-6} \times 20)^2$$

$= 2880$ J/m^3 **Ans.**

9. Δl due to temperature rise

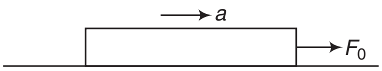
$$\begin{aligned}&= l\alpha\,\Delta\theta\\&= (1000)\,(10^{-4})\,(20)\\&= 2\,\text{mm}\end{aligned}$$

But 1 mm is allowed (1000 mm to 1001 mm)

$$\therefore \quad \Delta l_e = 1\text{ mm}$$

$$\begin{aligned}\text{Stress} &= Y \times \text{Strain}\\&= (10^{11})\left(\frac{1\text{ mm}}{1000\text{ mm}}\right)\\&= 10^8\,\text{N/m}^2\end{aligned}$$ **Ans.**

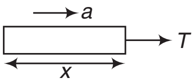
10.



$$a = \frac{F_0}{m}$$

$$T = m_x\,a = \left(\frac{m}{l}\right)x\left(\frac{F_0}{m}\right) = \left(\frac{F_0}{l}\right)x$$

$$\Delta l = \int_0^L \frac{Tdx}{SY}$$



$$= \left(\frac{F_0}{lsY}\right) \times \frac{l^2}{2}$$

$$\text{strain} = \frac{\Delta l}{l} = \frac{F_0}{2SY}$$ **Ans.**

More than One Correct Options

1. $U = \frac{1}{2}kx^2$. It is a parabola symmetric about U-axis.

At $x = 0.2$ mm, $U = 0.2$ J (from the figure)

$$\therefore \quad 0.2 = \frac{1}{2}k(2\times 10^{-4})^2$$

$$\Rightarrow \quad k = 10^7\ \text{Nm}^{-1}$$

$$k = \frac{YA}{L}$$

$$\Rightarrow \quad \frac{A}{L} = \frac{k}{Y} = \frac{10^7}{2\times 10^{11}} = 5\times 10^{-5} \qquad \ldots\text{(i)}$$

$$AL = \text{Volume} = 200\times 10^{-6}\ \text{m}^3 \qquad \ldots\text{(ii)}$$

On solving Eqs. (i) and (ii), we get

$$A = 10^{-4}\,\text{m}^2 \text{ and } L = 2\,\text{m}$$

2. W_F = elastic potential energy stored in the wire

$$\begin{aligned}&= \frac{1}{2}k\,(\Delta l)^2\\&= \frac{1}{2}\left(\frac{YA}{L}\right)(l)^2 = \frac{YAl^2}{2L}\end{aligned}$$

3.

$$\Delta x = \frac{Fl}{AY}$$

$$\therefore \quad F = \left(\frac{AY}{L}\right)\Delta x$$

i.e. F *versus* Δx graph is a straight line of slope $\frac{YA}{L}$.

$$(\text{Slope})_B > (\text{Slope})_A$$

$$\therefore \quad \left(\frac{YA}{L}\right)_B > \left(\frac{YA}{L}\right)_A$$

or $\quad (A)_B > (A)_A$

They are of same material. Hence,

$$Y_B = Y_A$$

4. Half of energy is lost in heat and rest half is stored as elastic potential energy.

$$l = \frac{Mgl}{AY} \qquad \ldots\text{(i)}$$

$$U = \frac{1}{2}Kl^2 = \frac{1}{2}\left(\frac{YA}{L}\right)l^2 \qquad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we can prove that

$$U = \frac{1}{2}Mgl$$

5. When, $T_Q = \frac{mg}{3}$

and $\quad T_P = mg + \frac{mg}{3} = \frac{4mg}{3}$

Stress, $\quad \sigma = \frac{T}{\pi r^2}$

$$\frac{\sigma_P}{\sigma_Q} = \frac{T_P}{T_Q}\cdot\left(\frac{r_Q}{r_P}\right)^2$$

If $r_P = r_Q$, $\sigma_P = 4\sigma_Q$, then P breaks.

If $r_P < 2r_Q$, $\sigma_P > \sigma_Q$, then P breaks.

If $r_P = 2r_Q$, $\sigma_A = \sigma_B$, then either P or Q may break.

6. Area of cross-section is $A = \frac{\pi d^2}{4}$

$$\Delta L = \frac{F}{\pi d^2/4}\cdot\frac{L}{Y}$$

$$\Rightarrow \quad \Delta L \propto \frac{1}{d^2}$$

$$\therefore \quad \frac{\Delta L_B}{\Delta L_A} = \frac{(2d)^2}{(d)^2}$$

$$\Rightarrow \quad \Delta L_B = 4\,\Delta L_A$$

$$\text{Strain} = \frac{\Delta L}{L} = \frac{4F}{\pi d^2 Y}$$

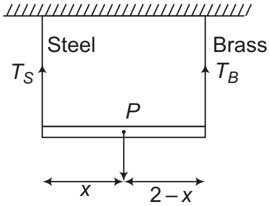
$$\Rightarrow \quad \text{Strain} \propto \frac{1}{d^2}$$

$$\therefore \quad (\text{Strain})_B = 4\,(\text{Strain})_A$$

7. If stress in steel = stress in brass,

then $$\frac{T_S}{A_S} = \frac{T_B}{A_B}$$

$$\frac{T_S}{T_B} = \frac{A_S}{A_B} = \frac{10^{-3}}{2 \times 10^{-3}} = \frac{1}{2} \qquad \ldots(\text{i})$$



System is in equilibrium. So, taking moments about P

$$T_S \cdot x = T_B (2 - x)$$

$$\Rightarrow \quad \frac{T_S}{T_B} = \frac{2-x}{x} \qquad \ldots(\text{ii})$$

From Eqs. (i) and (ii), we get $x = 1.33$ m

$$\text{Strain} = \frac{\text{Stress}}{Y}$$

If strain in steel = strain in brass,

then $$\frac{T_S/A_S}{Y_S} = \frac{T_B/A_B}{Y_B}$$

$$\therefore \quad \frac{T_S}{T_B} = \frac{A_S Y_S}{A_B Y_B} = \frac{(10^{-3})(2 \times 10^{11})}{(2 \times 10^{-3})(10^{11})} = 1 \qquad \ldots(\text{iii})$$

From Eqs. (ii) and (iii), we get $x = 1\,\text{m}$

8. Area of steel rod, $A_S = 16\ \text{cm}^2$

Area of two brass rods,

$$A_B = 2 \times 10 = 20\ \text{cm}^2$$

$$F = 5000\ \text{kg}$$

$$\sigma_S = \text{Stress in steel}$$

and $$\sigma_B = \text{Stress in brass}$$

Decrease in length of steel rod = Decrease in length of brass rod

$$\frac{\sigma_S}{Y_S} \cdot L_S = \frac{\sigma_B}{Y_B} \cdot L_B$$

$$\Rightarrow \quad \sigma_S = \frac{Y_S}{Y_B} \cdot \frac{L_B}{L_S} \cdot \sigma_B$$

or $$\sigma_S = \left(\frac{2 \times 10^6}{10^6}\right)\left(\frac{20}{30}\right)\sigma_B$$

$$\Rightarrow \quad \sigma_S = \frac{4}{3}\sigma_B \qquad \ldots(\text{i})$$

Now, $$F = \sigma_S A_S + \sigma_B A_B$$

or $$5000 = \sigma_S \times 16 + \sigma_B \times 20 \qquad \ldots(\text{ii})$$

From Eqs. (i) and (ii), we get

$$\sigma_B = 120.9\ \text{kg cm}^{-2}$$

and $$\sigma_S = 161.2\ \text{kg cm}^{-2}$$

Comprehension Based Questions

1. Initially, $$\Delta L = \frac{FL}{AY}$$

$$= \frac{10 \times 1}{10^{-3} \times 2 \times 10^5}$$

$$= 0.05\ \text{m} = 5\ \text{cm}$$

2. Force constant of string is

$$k = \frac{\text{Force}}{\text{Elongation}}$$

$$= \frac{F}{FL/AY}$$

or $$k = \frac{YA}{L} = \frac{1 \times 10^5 \times 10^{-3}}{1}$$

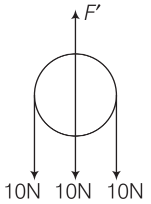
$$= 200\ \text{Nm}^{-1}$$

Initial elastic potential energy of string

$$= \frac{1}{2}k\,(0.05)^2$$

$$= \frac{1}{2}\,(200)\,(25 \times 10^{-4})$$

$$= 25 \times 10^{-2}\ \text{J}$$



Let after force $F = 10$ N is applied extra elongation is x, then

$$0.25 + 30x = \frac{1}{2}(200)\,(x^2 + 25 \times 10^{-4} + 0.1x)$$

$$0.25 + 30x = 100x^2 + 0.25 + 10x$$

$$\therefore \quad 100x^2 = 20x$$

$$\Rightarrow \quad x = \frac{20}{100} = \frac{1}{5}\,\text{m} = 0.2\ \text{m}$$

$$= 20\ \text{cm}$$

$$\therefore \quad x_{\text{max}} = 20 + 5 = 25\text{cm}$$

3. When the displacement of the pulley is 25 cm, the string gets loosened on both the sides. So, point A moves down by 50 cm.
4. Young's modulus is a material constant.
5. On crossing the yield region, the material will experience the breaking stress and further elongation causes reduction in stress and breaking of the wire.
6. Stress-strain curve flattens on crossing elastic region.

Match the Columns

1. Stress, modulus of elasticity, energy density and pressure have SI units J/m^3 or N/m^2.

   Strain, coefficient of friction and relative density are dimensionless. Force constant have SI unit N/m.
2. $\Delta l = \frac{Fl}{AY}$ and stress $= \frac{F}{A}$
3. For A and B, the rod is in equilibrium and hence internal restoring force developed per unit area across any cross-section is same and thus stress is uniform. But in C and D, the case is opposite.

Subjective Questions

1. Increase in pressure is $\Delta p = \frac{Mg}{A}$

   Bulk modulus is $B = \frac{\Delta p}{(\Delta V/V)}$

$$\therefore \qquad \frac{\Delta V}{V} = \frac{\Delta p}{B} = \frac{Mg}{AB} \qquad \ldots\text{(i)}$$

   Also, the volume of the sphere is

$$V = \frac{4}{3}\pi R^3 \Rightarrow \frac{\Delta V}{V} = \frac{3\Delta R}{R}$$

$$\text{or} \qquad \frac{\Delta R}{R} = \frac{1}{3}\cdot\frac{\Delta V}{V},$$

   Using Eq. (i), we get

$$\frac{\Delta R}{R} = \frac{Mg}{3AB} \Rightarrow \therefore \alpha = 3$$

2. Force constant of the wire is

$$k = \frac{F}{\Delta L} = \frac{F}{FL/AY} = \frac{YA}{L}$$

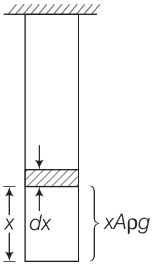
$$\omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{YA}{Lm}} \Rightarrow \therefore \sqrt{\frac{YA}{Lm}} = 140$$

$$\Rightarrow \qquad \frac{Y \times 4.9 \times 10^{-7}}{1 \times 0.1} = 140 \times 140$$

$$Y = \frac{140 \times 140}{49 \times 10^{-7}} = 4 \times 10^9$$

$$\Rightarrow \qquad p = 4$$

3. Consider an element as shown in the figure.



$$\text{Stress in the element } = \frac{\text{Force}}{\text{Area}} = \frac{xA\rho g}{A} = x\rho g$$

   Now, elastic potential energy stored in the wire is

$$dU = \frac{1}{2}\text{(Stress) (Strain) (Volume)}$$

$$= \frac{1}{2}\cdot\frac{(\text{Stress})^2}{Y}\text{(Volume)}$$

$$dU = \frac{1}{2}\cdot\frac{(x\rho g)^2}{Y} A\,dx = \frac{1}{2}\cdot\frac{\rho^2 g^2 A}{Y} x^2 dx$$

$$\text{Total elastic potential energy} = \frac{1}{2}\cdot\frac{\rho^2 g^2 A}{Y}\int_0^L x^2 dx$$

$$= \frac{\rho^2 g^2 A L^3}{6Y}$$

4. $\Delta l = \frac{Fl}{\Delta Y}$

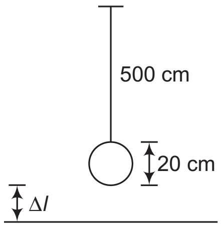
   Here, $F = \text{Upthrust} = V_i \rho_l g \Rightarrow A = \frac{\pi d^2}{4}$

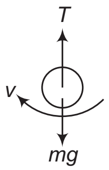
$$\therefore \qquad \Delta l = \frac{4V_i \rho_l g l}{\pi d^2 Y}$$

$$= \frac{(4)(10^{-3})(800)(9.8)(3)}{(3.14)(0.4 \times 10^{-3})^2 (8 \times 10^{10})}$$

$$= 2.34 \times 10^{-3}\text{m}$$ **Ans.**

5. $\Delta l = 521 - 500 - 20 = 1 \text{ cm} = 0.01 \text{ m}$





$$T - mg = \frac{mv^2}{R}$$

$$\therefore \qquad T = m\left(g + \frac{v^2}{R}\right) = m\left(g + \frac{v^2}{l}\right)$$

$$\Delta l = \frac{Tl}{AY} = \frac{m\left(g + \frac{v^2}{l}\right)l}{(\pi d^2/4)Y}$$

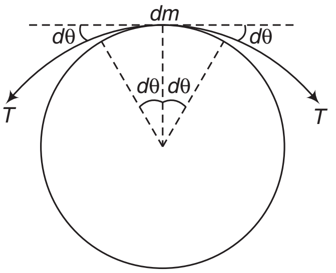
$$= \frac{mgl + mv^2}{(\pi d^2/4)\,Y}$$

$$\therefore \quad v = \sqrt{\frac{\pi d^2\,\Delta l Y}{4m} - gl}$$

$$= \sqrt{\frac{(3.14)(4\times10^{-3})^2(0.01)(2\times10^{11})}{4\times25} - 9.8\times5}$$

≈ 31 m/s **Ans.**

6. $2T\sin d\theta = (dm)\,R\omega^2$



For small angles, $\sin d\theta \approx d\theta$

$$\therefore \quad 2T(d\theta) = (2R\,d\theta)(\pi r^2)(\rho)(R)(2\pi f)$$

$$T = (4\pi^3 f^2R^2r^2\rho)$$

Now $\quad \Delta l = \dfrac{Tl}{AY}$

$$\frac{\Delta l}{l} = \frac{T}{AY} = \frac{T}{\pi r^2 Y}$$

$$l = 2\pi R$$

$$\Delta l = 2\pi(\Delta R)$$

$$\therefore \quad \frac{\Delta l}{l} = \frac{\Delta R}{R} = \frac{T}{\pi r^2 Y}$$

$$= \frac{4\pi^3 f^2R^2r^2\rho}{\pi r^2 Y}$$

7. $T - mg = ml\omega^2 = ml\,(2\pi f)^2$

$$\therefore \quad T = mg + 4\pi^2 mlf^2$$

$$= 6\times9.8 + 4\pi^2(6)(0.6)\,(2)^2$$

$$= 628 \text{ N}$$

Now, $\quad \Delta l = \dfrac{Tl}{AY}$

$$= \frac{(628)\,(0.6)}{(0.05\times10^{-4})\,(2\times10^{11})}$$

$= 3.8\times10^{-4}$ m **Ans.**

8. $2T_C + T_S = mg$ …(i)

$$\Delta l_C = \Delta l_s$$

$$\therefore \quad \frac{T_C\,l_C}{A_C Y_C} = \frac{T_S\,l_S}{A_S Y_S}$$

$$\therefore \quad T_S = 2T_C$$

(as $Y_S = 2Y_C$, $l_S = l_C$, $A_S = A_C$)

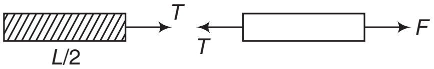
or $\quad T_S = 2T_C$ …(ii)

Solving these two equations we get,

$$T_C = \frac{mg}{4}$$ and

$$T_S = 2T_C$$

9.



(a) $T = \left(\dfrac{M}{2}\right)a_0 = \left(\dfrac{L}{2}S\rho\right)a_0$

$\therefore \quad$ Stress $= \dfrac{T}{S} = \dfrac{L\rho a_0}{2}$ **Ans.**

(b) $\quad T_x = M_x\,a_0 = x\rho Sa_0$

$$\Delta l = \int_0^L \frac{T_x dX}{SY} = \int_0^L \frac{x\rho Sa_0}{SY}\,dX$$

$= \dfrac{\rho a_0 L^2}{2Y}$ **Ans.**

10. $\Delta l = \dfrac{Fl}{AY}$

$$U = \frac{1}{2}K\,(\Delta l^2)$$

$$= \frac{1}{2}\left(\frac{YA}{l}\right)(\Delta l^2)$$

$$= \frac{1}{2}\left(\frac{YA}{l}\right)\left(\frac{Fl}{AY}\right)^2$$

$$= \frac{F^2 l}{2AY} = mS\Delta\theta$$

$$\therefore \quad \Delta\theta = \frac{F^2 l}{2AYms}$$

$$= \frac{(Mg)^2 l}{2(\pi r^2)\,Y\,(l\pi r^2)\rho s}$$

$$= \frac{M^2g^2}{2\pi^2 r^4 Y\rho s}$$

$$= \frac{(100\times9.8)^2}{2\pi^2(2\times10^{-3})^4\,(2.1\times10^{11})\,(7860)\,(420)}$$

$\approx 4.568\times10^{-3}$ °C **Ans.**

16. Fluid Mechanics

INTRODUCTORY EXERCISE 16.1

1. $p_0 + \rho_1 g h_1 = p_0 + \rho_2 g h_2$

$$\therefore \quad h_1 = \frac{\rho_2 h_2}{\rho_1} = \frac{20 \times 0.9}{1} = 18 \text{ cm}$$ **Ans.**

2. Suppose the atmospheric pressure = p_0.

Pressure at $A = p_0 + h(1000 \text{ kgm}^{-3})g$

Pressure at $B = p_0 + (0.02\text{m})(13600 \text{kgm}^{-3})g$

These pressures are equal as A and B which are at the same horizontal level. Thus,

$$h = (0.02\text{m}) \times 13.6$$
$$= 0.27\text{m} = 27\text{cm}$$

3. (a) $p = p_0 + \rho_{Hg} g \Delta h$

(b) $p = p_0 + \rho_{Hg} \; g h_{RHS}$

Here, $\Delta h = (8 - 2) = 6 \text{ cm} = 6 \times 10^{-2}$ m

and $h_{RHS} = 8 \text{ cm} = 8 \times 10^{-2}$ m

4. Let the pressure of the liquid just below the piston be p. The forces acting on the piston are:

(a) its weight, mg (downward)

(b) force due to the air above it, $p_0 A$ (downward)

(c) force due to the liquid below it, pA (upward)

It the piston is in equilibrium,

$$pA = p_0 A + mg$$

or

$$p = p_0 + \frac{mg}{A}$$

5. In equilibrium, the pressure at the two surfaces should be equal as they lie in the same horizontal level. If the atmospheric pressure is p and a force F is applied to maintain the equilibrium, the pressure are

$$p_0 + \frac{5\text{N}}{1 \text{ cm}^2} \text{ and } p_0 + \frac{F}{10 \text{ cm}^2} \text{ respectively.}$$

This gives $F = 50$ N

6. $\Delta p_1 = \Delta p_2$

$$\frac{F}{A} = (\Delta h) \rho g$$

$$\therefore \quad \Delta h = \frac{F}{A\rho g} = \frac{45g}{(900 \times 10^{-4})(10^3)g}$$

$$= 0.5 \text{ m} = 50 \text{ cm}$$

INTRODUCTORY EXERCISE 16.2

1. In vertical direction pressure increases with depth. In horizontal direction pressure decreases in the direction of acceleration.

2. $p_N + \rho_g h - \rho a \left(\frac{h}{2}\right) = p_M$

But $\quad p_N = p_M$

$\therefore \quad a = 2g$

3. $p_B = p_A + \dfrac{\rho \omega^2 x^2}{2} = p_0 + \dfrac{\rho \omega^2 x^2}{2}$

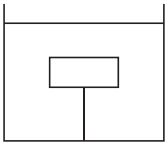
INTRODUCTORY EXERCISE 16.3

1. Weight = upthrust

$$V \rho_1 g = \left(\frac{3}{4} V\right) \rho_2 g$$

$$\therefore \quad \rho_2 = \frac{4}{3} \rho_1$$

2.



T + weight = upthrust

$$\therefore \quad T = \text{upthrust} - \text{weight}$$
$$= (71.2)\left(\frac{1}{0.75}\right) - 71.2$$
$$= 23.7 \text{ N}$$ **Ans.**

3. Reading = weight of water + magnitude of upthrust on piece of metal (acting downwards)

$$= (0.02 \times 9.8) + (10^{-6})(10^3)(9.8)$$
$$= 0.206 \text{ N}$$ **Ans.**

4. (a) $a = \dfrac{\text{upthrust} - \text{weight}}{\text{mass}}$

$$= \frac{(V)(1000)(9.8) - (V)(0.4 \times 10^{-3})(9.8)}{(V)(0.4 \times 10^3)}$$

$$= 14.7 \text{ m/s}^2$$ **Ans.**

(b) $t = \sqrt{\dfrac{2s}{a}}$

$$= \sqrt{\frac{2 \times 2.9}{14.7}}$$

$$= 0.63 \text{ s}$$ **Ans.**

INTRODUCTORY EXERCISE 16.4

1. (a) Apply continuity equation

(b) Apply Bernoulli's equation

2. (a) $\frac{dV}{dt} = Av$

(b) $\frac{dV}{dt} = Av$

(c) Apply Bernoulli's equation

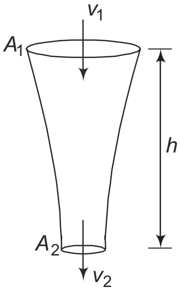
3. From conservation of energy

$$v_2^2 = v_1^2 + 2gh \qquad \text{...(i)}$$

[can also be found by applying Bernoulli's theorem]

From continuity equation

$$A_1 v_1 = A_2 v_2$$



$$v_2 = \left(\frac{A_1}{A_2}\right) v_1 \qquad \text{...(ii)}$$

Substituting value of v_2 from Eq. (ii) in Eq. (i),

$$\frac{A_1^2}{A_2^2} \cdot v_1^2 = v_1^2 + 2gh$$

or $$A_2^2 = \frac{A_1^2 v_1^2}{v_1^2 + 2gh}$$

$\therefore$ $$A_2 = \frac{A_1 v_1}{\sqrt{v_1^2 + 2gh}}$$

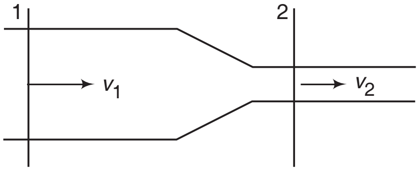
Substituting the given values, we get

$$A_2 = \frac{(10^{-4})(1.0)}{\sqrt{(1.0)^2 + 2\,(10)\,(0.15)}}$$

$$A_2 = 5.0 \times 10^{-5}\ \text{m}^2$$

4. From continuity equation,

$$A_1 v_1 = A_2 v_2$$



$\therefore$ $$v_2 = \left(\frac{A_1}{A_2}\right) v_1 = \left(\frac{10}{5}\right)(1) = 2\ \text{m/s}$$

Applying Bernoulli's theorem at 1 and 2

$$p_2 + \frac{1}{2}\rho v_2^2 = p_1 + \frac{1}{2}\rho v_1^2$$

$\therefore$ $$p_2 = p_1 + \frac{1}{2}\rho\,(v_1^2 - v_2^2)$$

$$= \left(2000 + \frac{1}{2} \times 10^3\ (1 - 4)\right)$$

$\therefore$ $$p_2 = 500\,\text{Pa}$$

INTRODUCTORY EXERCISE 16.5

1. $\Delta p = \frac{1}{2}\rho v^2$

$\therefore$ $$v = \sqrt{\frac{2\Delta p}{\rho}}$$

$$= \sqrt{\frac{2\,(3\ \text{atm} - 1\ \text{atm})}{\rho}}$$

$$= \sqrt{\frac{2 \times 2 \times 10^5}{10^3}} = 20\ \text{m/s}$$

2. $t = \frac{A}{a}\sqrt{\frac{2H}{g}}$ (to empty the complete tank)

Now, $t_{H \to 0} = t_{H \to \frac{H}{3}} + t_{\frac{H}{3} \to 0}$

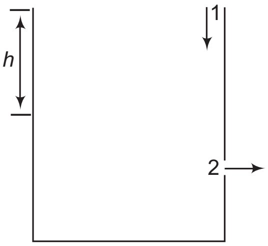
Given, $\frac{A}{a}\sqrt{\frac{2H}{g}} = t_0 + \frac{A}{a}\sqrt{\frac{2\,(H/3)}{g}}$

From here find,

$$\frac{A}{a}\sqrt{\frac{2\,(H/3)}{g}}$$

3. Applying continuity equation at 1 and 2, we have

$$A_1 v_1 = A_2 v_2 \qquad \text{...(i)}$$



Further applying Bernoulli's equation at these two points, we have

$$p_0 + \rho gh + \frac{1}{2}\rho v_1^2 = p_0 + 0 + \frac{1}{2}\rho v_2^2 \qquad \text{...(ii)}$$

Solving Eqs. (i) and (ii), we have $v_2^2 = \dfrac{2gh}{1 - \dfrac{A_2^2}{A_1^2}}$

Substituting the values, we have

$$v_2^2 = \frac{2 \times 10 \times 2.475}{1 - (0.1)^2} = 50\ \text{m}^2/\text{s}^2$$

INTRODUCTORY EXERCISE 16.6

1. Using, $V = \dfrac{2}{9}\dfrac{r^2(\rho - \sigma)g}{\eta}$

$$\eta = 1.0\ \text{mPi} = 1.0 \times 10^{-3}\ \text{Pi}$$

$$= \frac{2}{9}\frac{(20 \times 10^{-6})^2 \times (2 \times 10^3 - 10^3) \times 9.8}{1.0 \times 10^{-3}}$$

$$= 0.871\ \text{mm/s}$$

2. ∵ Volume of bigger drop

$$= n \times \text{volume of smaller drop}$$

$$\frac{4}{3}\pi R^3 = 2 \times \frac{4}{3}\pi r^3$$

$$R = 2^{1/3} r$$

Terminal velocity $\propto r^2$

∴ $$v' = 2^{2/3} v$$

3. $F = \eta A \dfrac{\Delta V}{\Delta x}$

$$= 10^{-3} \times 10 \times 2 \times 10^{-1}$$

$$= 2 \times 10^{-2}$$

$$= 0.02\ \text{N}$$

4. ∵ $F = \eta A \dfrac{\Delta V}{\Delta x}$

$$\frac{F}{A} = \text{shearing stress} = \eta \frac{\Delta V}{\Delta x}$$

$$= 10^{-3} \times \frac{5}{5} = 10^{-3}\ \text{N/m}^2$$

INTRODUCTORY EXERCISE 16.7

1. $\dfrac{4}{3}\pi R^3 = 10^6\left(\dfrac{4}{3}\pi r^3\right)$

⇒ $$r = (10^{-2}) R = 10^{-2}\ \text{cm}$$

$$A_i = 4\pi R^2$$

$$A_f = (10^6)(4\pi r^2)$$

$$\Delta A = A_f - A_i$$

∴ $$\Delta U = (T)(\Delta A)$$

2. $W = T(\Delta A)$

$$= T(2)(l)(\Delta d)$$

$$= 7.2 \times 10^{-2} \times 2 \times 0.10 \times 10^{-3}$$

$$= 1.44 \times 10^{-5}\ \text{J}$$

3. $W = T(\Delta A)$

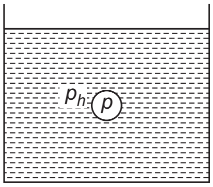
Soap bubble has two free surfaces.

∴ $$W = T(8\pi R^2)$$

4. $p - p_h = \dfrac{2T}{r}$

∴ $$p = p_h + \frac{2T}{r}$$

$$= p_0 + h\rho g + \frac{2T}{r}$$



INTRODUCTORY EXERCISE 16.8

1. $h = \dfrac{2T\cos\theta}{r\rho g}$

∴ $$hr = \frac{2T\cos\theta}{\rho g} = \text{constant}$$

∴ $$h_1 r_1 = h_2 r_2 \quad \text{or} \quad h_2 = \frac{h_1 r_1}{r_2}$$

Substituting the values, we get

$$h_2 = (2.0)(3) \qquad \left(\frac{r_2}{r_1} = \frac{1}{3}\right)$$

$$= 6.0\ \text{cm}$$ **Ans.**

2. ∵ $h = \dfrac{2T\cos\theta}{r\rho g}$

$$T_1 = \frac{h_1 \rho_1 r g}{2\cos\theta_1}$$

$$T_2 = \frac{h_2 \rho_2 r g}{2\cos\theta_2}$$

$$\frac{T_2}{T_1} = \frac{h_2}{h_1} \cdot \frac{\rho_2}{\rho_1} \cdot \frac{\cos\theta_1}{\cos\theta_2}$$

$$= 7.23$$

3. $h = \dfrac{2T}{R\rho g}$ (R = radius of meniscus at the top)

∴ $$R = \frac{2T}{h\rho g} = \frac{2 \times 0.07}{(10^{-2})(10^3)(10)}$$

$$= 1.4 \times 10^{-3}\ \text{m}$$

$$= 1.4\ \text{mm}$$

4. $p_A = p_C = (p_B + \rho g h)$

Exercise

LEVEL 1

Assertion and Reason

1. Direction of force in $p = \frac{F}{A}$ is always perpendicular to the surface or it is always specific. Hence, it is not a vector.

3.
$$p_1 = p_0 + \rho g h$$
$$p_2 = p_0 + \rho g\,(2h) \neq 2p_1$$

5. Area of cross-section is different. So, heights are different. In pressure height is more important.

6. Speed will also depend on h.

9. On moon, atmospheric pressure is zero. Hence barometer height is zero.

10. Pressure at P is less. As liquid is flowing at P while liquid is at rest at Q.

11. Force of buoyancy,
$$U = V\rho_{\text{air}}\,g$$
Since, ρ_{air} is negligible. Hence, U is negligible.

Single Correct Option

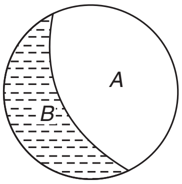
1. $v = \text{constant}$
$$\therefore \quad a = 0$$
$$\text{or} \quad F_{\text{net}} = 0$$

2. $$\left[\frac{\eta}{\rho}\right] = \left[\frac{\text{ML}^{-1}\,\text{T}^{-1}}{\text{ML}^{-3}}\right] = [\text{M}^0\text{L}^2\text{T}^{-1}]$$

9. $n = n_1 + n_2$
$$\frac{pV}{RT} = \frac{p_1V_1}{RT} + \frac{p_2V_2}{RT}$$
$$\text{or} \quad pV = p_1V_1 + p_2V_2$$
$$\therefore \quad \left(\frac{4T}{r}\right)\left(\frac{4}{3}\pi r^3\right) = \left(\frac{4T}{r_1}\right)\left(\frac{4}{3}\pi r_1^3\right) + \left(\frac{4T}{r_2}\right)\left(\frac{4}{3}\pi r_2^3\right)$$
$$\therefore \quad r = \sqrt{r_1^2 + r_2^2}$$
$$= 5 \text{ cm}$$

10. Drag force + upthrust = weight
$$\therefore \quad ku + F = mg$$
$$\text{or} \quad u = \frac{mg - F}{k}$$

11. B will have a tendency to keep its area as low as possible.



12. $m \propto r^3$ and terminal velocity $\propto r^2$ mass is eight times. So, radius is two times and terminal velocity will be four times.

14. $N\left(\frac{4}{3}\pi r^3\right) = \frac{4}{3}\pi R^3$
$$\therefore \quad r = R\left(\frac{1}{N}\right)^{1/3}$$
$$W = \sigma\,(\Delta A)$$
$$= \sigma\,(A_f - A_i)$$
$$= \sigma\,[N\,(4\pi r^2) - 4\pi R^2]$$
$$= 4\pi\sigma\left[NR^3\left(\frac{1}{N}\right)^{2/3} - R^2\right]$$
$$= 4\sigma\pi R^2\,(N^{1/3} - 1) \qquad \textbf{Ans.}$$

15. $(p_2 - p_1) = \frac{4T}{R}$

where R = radius of common surface
$$\therefore \quad \frac{4T}{R_2} - \frac{4T}{R_1} = \frac{4T}{R}$$
$$\text{or} \quad \frac{1}{R} = \frac{1}{R_2} - \frac{1}{R_1}$$

16. Pressure (and hence the level of liquid) will keep on decreasing in the direction of motion of liquid.

17. $v_t = \frac{2}{9}\,\frac{r^2\,(\rho - \sigma)\,g}{\eta}$

Ignoring the density of air σ we have,
$$v_T = \frac{2}{9}\,\frac{r^2\rho g}{\eta}$$
$$\therefore \quad r = \sqrt{\frac{9\eta\,v_T}{2\rho g}}$$
$$= \sqrt{\frac{9 \times 1.8 \times 10^{-5} \times 0.3}{2 \times 10^3 \times 9.8}}$$
$$= 0.49 \times 10^{-4} \text{ m}$$
$$\approx 0.05 \text{ mm} \qquad \textbf{Ans.}$$

18. If angle of contact in 90°, then liquid will neither rise nor fall.

19. $v_T \propto r^2$

Radius or diameter is half. So, uniform or terminal speed is $\frac{1}{4}$ th.

20.
$$h\rho g = 10^5 \text{ Pa (given)}$$
$$\therefore \quad p_x = \left(h - \frac{h}{5}\right)\rho g = 0.8\, h\rho g$$
$$= 0.8 \times 10^5 \text{ Pa}$$

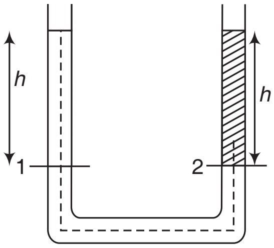
21. Fraction of volume immersed
$$f = \frac{\rho_s}{\rho_l} \quad \text{or} \quad r \propto \frac{1}{\rho_l}$$
$$\frac{f_1}{f_2} = \frac{\rho_{l_2}}{\rho_{l_1}} \quad \text{or} \quad \rho_{l_2} = \left(\frac{f_1}{f_2}\right)\rho_{l1}$$
$$= \frac{(V - V/3)}{(V/3)}\rho_{l_1}$$
$$= 2\rho_{l1}$$

22. Let ρ = density of sugar solution
$$> \rho_w$$
$$m = \text{mass of ice.}$$
In floating condition weight = upthrust
$$\therefore \quad mg = V_D \rho g$$
$$\text{or} \quad V_D = \frac{m}{\rho} \qquad \text{...(i)}$$
When ice melts, m mass of ice becomes m mass of water. Volume of this water formed.
$$V_F = \frac{m}{\rho_w} \qquad \text{...(ii)}$$
Since, $\rho_w < \rho$, $V_F > V_D$. Hence, level will increase.

23. Upthrust = $V_i \rho_l g_e$

Value of g_e will decrease. So upthrust will decrease.

24.



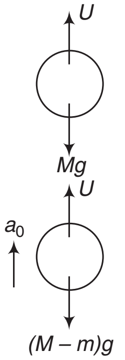
$$p_1 = p_2$$
$$\therefore \quad p_0 + \rho_w gh = p_0 + \rho gh$$
$$\Rightarrow \quad \rho = \rho_w$$

25. F_1 will decrease and F_2 will increase. So f_1 may or may not be greater than f_2.

Total weight to system in both conditions will remain same. Hence,
$$f_1 + f_2 = F_1 + F_2$$

26. $\Delta p = \frac{1}{2}\rho v^2$
$$\therefore \quad v = \sqrt{\frac{2\Delta p}{\rho}} = \sqrt{\frac{2 \times 0.5 \times 10^5}{10^3}}$$
$$= 10 \text{ m/s}$$

27.



$$Mg - U = Ma_0 \qquad \text{...(i)}$$
$$U = (M - m)g = (M - m)a_0 \qquad \text{...(ii)}$$
Solving these two equations we get,
$$m = \frac{2Ma_0}{g + a_0}$$

28. Diameter of left hand side is $\frac{1}{5}$ times. So area will be $\frac{1}{25}$ times.
$$\Delta p_{\text{LHS}} = \Delta p_{\text{RHS}} \quad \Rightarrow \quad \frac{F}{(A/25)} = \frac{(Mg)}{A}$$
$$\therefore \quad F = \frac{Mg}{25}$$
Equating the volumes

Displacement on LHS = 5 times

Displacement on RHS
$$\therefore \quad S = (5)(0.5) = 2.5 \text{ cm}$$
$$W = FS$$
$$\therefore \quad (500) = \left(\frac{Mg}{25}\right)(2.5 \times 10^{-2})$$
$$\therefore \quad M = 5 \times 10^4 \text{ kg} \qquad (\text{with } g = 10 \text{ m/s}^2)$$

29. $4 = \frac{Vd_1 + Vd_2}{2V}$
$$\text{or} \quad d_1 + d_2 = 8 \qquad \text{...(i)}$$

$$3 = \frac{m+m}{(m/d_1)+(m/d_2)} \quad \text{or} \quad \frac{2d_1d_2}{d_1+d_2} = 3 \qquad \ldots\text{(ii)}$$

Solving Eqs. (i) and (ii), we get

$$d_1 = 6 \quad \text{and} \quad d_2 = 2$$

30. Total weight = total upthrust

$(A \times 0.5 \times 900)\, g + (100)\, g = A \times 0.5 \times 1000 \times g$

$\therefore \qquad A = 2 \text{ m}^2$ **Ans.**

31. Change in weight = upthrust.

$\therefore (38.2 - 36.2)\, g = (V_{\text{gold}} + V_{\text{cavity}})\, \rho_w g$

$$\therefore \qquad 2 = \left(\frac{38.2}{19.3}\right) + V_{\text{cavity}} \left(\text{as } \rho_w = \frac{1 \text{ g}}{\text{cm}^3}\right)$$

$\therefore \qquad V_{\text{cavity}} = 0.02 \text{ cm}^3$ **Ans.**

32. See the hint of Q-No. 23 (a) of subjective questions of Level 1.

33. $v = \sqrt{2gH} \quad \Rightarrow \quad \dfrac{dV}{dt} = av = a\sqrt{2gH}$

This is independent of ρ_{liquid}.

34. $(\Sigma Q)_{\text{inflow}} = (\Sigma Q)_{\text{outflow}}$

$\therefore (4 \times 10^{-6}) + Q + (4 \times 10^{-6})$

$= (8 \times 10^{-6}) + (2 \times 10^{-6}) + (5 \times 10^{-6}) + (6 \times 10^{-4})$

$\therefore \qquad Q = 13 \times 10^{-6} \text{ m}^3/\text{s}$

35. Weight = Upthrust

$$\therefore \qquad Mg = \left(\frac{3}{4}a^3\right)\rho g$$

$$\therefore \qquad a = \left(\frac{4M}{3\rho}\right)^{1/3}$$

36. $h = \dfrac{2T\cos\theta}{r\rho g}$

$$10 = \frac{2T_1 \cos 0°}{r\rho_1 g} \qquad \ldots\text{(i)}$$

$$-3.42 = \frac{2T_2 \cos 135°}{r\rho_2 g} \qquad \ldots\text{(ii)}$$

From these two equations, we get

$$\frac{T_1}{T_2} = \frac{10.\,(\cos 135°)}{(-3.42)\,(\cos 0°)\,\rho_2}$$

$$= \frac{(10)\,(-1/\sqrt{2})\,(1)}{(-3.42)\,(1)\,(13.6)}$$

$$= 1 : 6.5$$

37. Area is halved, means radius of tube is made $\dfrac{1}{\sqrt{2}}$ times.

$$h = \frac{2T\cos\theta}{r\rho g} \quad \text{or} \quad h \propto \frac{1}{r}$$

Hence, h will become $\sqrt{2}$ times.

38. In steady state,

Volume flow rate entering the vessel

= volume flow rate leaving the vessel

$$\therefore \quad Q = av = a\sqrt{2gh} \quad \text{or} \quad h = \frac{Q^2}{2ga^2}$$

$$= \frac{(10^2)^2}{(2 \times 1000)\,(1)^2} = 5 \text{ cm}$$ **Ans.**

39. Area at other point is half. So, speed will be double. Now,

$$p_1 + \frac{1}{2}\rho v_1^2 = p_2 + \frac{1}{2}\rho v_2^2$$

$$\therefore \qquad p_2 = p_1 + \frac{1}{2}\rho\,(v_1^2 - v_2^2)$$

$$= (8000) + \frac{1}{2} \times 1000\,(4 - 16)$$

$$= 2000 \text{ Pa}$$ **Ans.**

40. Equating the volume, we have

$$8\left(\frac{4}{3}\pi r^3\right) = \frac{4}{3}\pi R^3 \quad \text{or} \quad R = 2r$$

$$v_T \propto (\text{radius})^2$$

Radius has become two times.Therefore, terminal velocity will become 4 times.

41. Under normal conditions, upward surface tension force supports the weight of liquid of height h in the capillary. In artificial satellite effective weight will be zero, but upward surface tension force will be there. Hence, liquid rises upto the top.

42. Pressure inside a soap bubble is given by,

$$P = P_0 + \frac{4T}{r}$$

So, pressure inside a smaller soap bubble will be more and air will flow from smaller drop to bigger drop.

43. $h = \dfrac{2T\cos\theta}{R\rho g} \quad \text{or} \quad h \propto \dfrac{1}{R}$

Now, $\qquad M = (\pi R^2 h)\,\rho$

or $\qquad M \propto R^2 h$

or $\qquad M \propto R$

Radius is doubled, so mass in the capillary tube will also become two times.

44. $\rho g h = \dfrac{4T}{r} \quad \Rightarrow \quad T = \dfrac{rh\rho g}{4}$

45. $h\rho g = \dfrac{2T}{r} \quad \Rightarrow \quad h = \dfrac{2T}{r\rho g}$

$$= \frac{2 \times 70}{0.005 \times 1 \times 1000} = 28 \text{ cm}$$

46. $N\left(\dfrac{4}{3}\pi a^3\right) = \dfrac{4}{3}\pi b^3 \quad \Rightarrow \quad N = \dfrac{b^3}{a^3}$

$$A_i = N\ (4\pi a^2) = \frac{4\pi b^3}{a}$$

$$A_f = 4\ \pi b^2$$

$$\Delta A = A_i - A_f = 4\ \pi b^2\left(\frac{b}{a} - 1\right)$$

$$W = T\ (\Delta A) = 4\ \pi b^2\left(\frac{b}{a} - 1\right)T$$

$$= \frac{1}{2}\ mv^2 = \frac{1}{2}\left(\frac{4}{3}\ \pi b^3 \rho\right) v^2$$

Solving we get

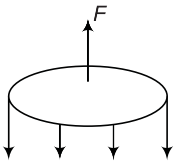
$$v = \sqrt{\frac{6T}{\rho}\left(\frac{1}{a} - \frac{1}{b}\right)}$$

47. $p = \dfrac{2T}{r} + p_0$

$$= \frac{2 \times 0.7}{0.14 \times 10^{-3}} + 10^5$$

$$= 1.01 \times 10^5 \text{ N/m}^2$$

48. From two surfaces,



S.T force

$$F = 2\ (Tl) = 2\ (T)\ (2\ \pi r)$$

$$= 2\ (T)\ (2\ \pi)\ (1.5)$$

$$= (6\ \pi T) \text{ dyne}$$

49. $\Delta p = h\rho g + \dfrac{2T}{r}$

$$= 2 \times 1 \times 980 + \frac{2 \times 70}{0.05}$$

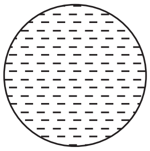
$$= 4760 \text{ dyne/cm}^2$$

Subjective Questions

1. In floating condition,
weight of liquid displaced = weight of solid

2. Weight = $V\rho_w g$

Upthrust = $V\rho_e g = V\rho_w g$



Since, weight = upthrust

Apparent weight = 0

3. $F = pA\ (\rho gh)\ B$

$\therefore \qquad F \propto h$

4. If volume is doubled, then radius becomes $(2)^{\frac{1}{3}}$ times.

$$W = T\ (8\ \pi R^2)$$

or $\qquad W \propto R^2$

Therefore $\quad W' = (2)^{\frac{2}{3}}\ W.$

5. Concept is same as in Q.No-2 of same exercise.

6. Relative density of metal in this case is given by

$$\text{RD} = \frac{\text{weight in air}}{\text{change in weight in water}}$$

$$= \frac{0.096}{0.096 - 0.071} = 3.84$$

$\therefore$ Density of metal = $3.84\ \rho_w$

$= 3840 \text{ kg/m}^3$ **Ans.**

7. Weight = upthrust

$\therefore \qquad (25 + 5)\ g = (V + 2)\ \rho_w g$

Putting $\qquad \rho_w = 1 \text{ g/cm}^3$

We get, $\qquad V = 28 \text{ cm}^3$ **Ans.**

8. Weight of both (block + woman)

= upthrust on 100% volume of block

$\therefore \quad 50\ g + V\ (850)\ g = V\ (1000)\ g$

$\therefore \qquad V = 0.33 \text{ m}^3$ **Ans.**

9. Weight of ice block + weight of metal piece
= upthrust on 100% volume of ice cube.

Let a = side of ice cube. Then,

$$[(a^3) \times 900 \times g + 0.5 \text{ g}] = (a^3)\ (1000)\ (g)$$

$\therefore \qquad a^3 = (5 \times 10^{-3})\text{m}^3$

or $\qquad a \approx 0.17 \text{ m} \quad \text{or} \quad 17 \text{cm}$ **Ans.**

10. Fraction of volume immersed is given by

$$f = \frac{\rho_s}{\rho_l}$$

In first case $\quad 0.6 = \dfrac{\rho_s}{\rho_w} = \dfrac{\rho_s}{1}$

or $\rho_s = 0.6\ \text{g/cm}^3 =$ density of wood

In second case

$$0.8 = \frac{\rho_s}{\rho_l} = \frac{0.6}{\rho_e}$$

or $$\rho_l = \frac{0.6}{0.85}$$

$$= 0.705\ \text{g/cm}^3$$ **Ans.**

11. Extra weight = extra upthrust on extra immersed volume.

$\therefore \quad (\Delta m)\, g = (\pi r^2 \Delta h)\, \rho_w g$

$\therefore \quad \Delta m = \pi r^2 \Delta h\, \rho_w$

$= (\pi)\,(0.8)^2\,(3)\,(1)$

$= 6.03$ g **Ans.**

12. $$p = \frac{F}{A} = \frac{3000 \times 9.8}{425 \times 10^{-4}}$$

$= 6.92 \times 10^5\ \text{N/m}^2$ **Ans.**

13. $p_0 + \rho_w h_w g = p_0 + \rho_s h_s g$

$$\therefore \quad \frac{\rho_s}{\rho_w} = \frac{h_w}{h_s}$$

$$= \frac{10}{12.5} = 0.8$$

= relative density of mercury

14. $(p_0 + \rho_w h_w g) - (p_0 + \rho_s h_s g) = \rho_{\text{Hg}} h_{\text{Hg}}\, g$

$$\therefore \quad h_{\text{Hg}} = \frac{\rho_w \rho_w - \rho_s h_s}{\rho_{\text{Hg}}}$$

$$= \frac{(1)\,(25) - (0.8)\,(27.5)}{13.6}$$

$= 0.221$ cm **Ans.**

15. (i) Absolute pressure in part (*a*)

= 76 cm of Hg + 20 cm of Hg

= 96 cm of Hg

Gauge pressure in part (*a*) = 20 cm of Hg

Absolute pressure in part (*b*)

= 76 cm of Hg – 18 cm of Hg = 58 cm of Hg

Gauge pressure in part (*b*) = – 18 cm of Hg.

(ii) 13.6 cm of water is equivalent to 1 cm of Hg. So the new level difference will become 19 cm.

16. $$v = \frac{p_1 - p_2}{4\eta L}\,(R^2 - r^2)$$

or $\quad v \propto R^2 - r^2$

(a) $$\frac{v_1}{v_2} = \frac{R^2 - r_1^2}{R^2 - r_2^2}$$

or $$\frac{3}{v_2} = \frac{400 - 0}{400 - 100}$$

$\therefore \quad v_2 = 2.25$ m/s **Ans.**

(b) $$v_2 = \left(\frac{R^2 - r_2^2}{R^2 - r_1^2}\right) v_1$$

$v_2 = 0 \ $ at $r_2 = R$

17. (a) $$Q = \frac{\pi}{8}\left(\frac{R^4}{\eta}\right)\left(\frac{p_1 - p_2}{L}\right)$$

$$= \left(\frac{\pi}{8}\right)\frac{(0.04)^4}{1.005 \times 10^{-1}} \times \frac{1400}{0.2}$$

$= 7 \times 10^{-2}\ \text{m}^3/\text{s}$

(b) $Q_1 = Q_2$

$\therefore \quad [(p_1 - p_2)\, R^4]_i = [(p_1 - p_2)\, R^4]_f$

Since, diameter or radius has decreased to half. Therefore gauge pressure should become 16 times.

or $\quad (p_1 - p_2)_f = 16 \times 1400$

$= 2.24 \times 10^4$ Pa **Ans.**

(c) $$Q \propto \frac{1}{\eta}$$

$$\therefore \quad \frac{Q_1}{Q_2} = \frac{\eta_2}{\eta_1}$$

or $$Q_2 = \left(\frac{\eta_1}{\eta_2}\right) Q_1$$

$$= \left(\frac{1.005}{0.469}\right)(7 \times 10^{-2})$$

$= 0.15\ \text{m}^3/\text{s}$ **Ans.**

18. (a) Relative density of metal

$$= \frac{\text{weight in air}}{\text{change in weight in water}} = \frac{10}{2} = 5$$

$\therefore$ Density of metal $= 5\rho_w = 5000\ \text{kg/m}^3$

Now, $$\text{volume} = \frac{\text{mass}}{\text{density}}$$

$$= \frac{10 \times 10^{-3}}{5000}$$

$= 2 \times 10^{-6}\ \text{m}^3$

(b) Change in weight

= upthrust on 100% volume of solid

or $\quad \Delta w = V_s \rho_l\, g$

$\therefore \quad \Delta w \propto \rho_l$

∴ $$\frac{\Delta w_l}{\Delta w_w} = \frac{\rho_l}{\rho_w}$$

or $$\rho_l = \left(\frac{\Delta w_l}{\Delta w_w}\right)\rho_w = \left(\frac{1.5}{2}\right)(1000)$$

$$= 750 \text{ kg/m}^3$$

19. Let (x) mm is in water and ($60 - x$) mm is in mercury.

Total upthrust = weight

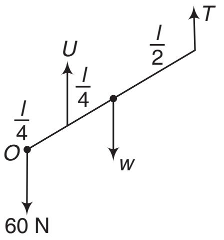
$$= (0.06)^2\,(x \times 10^{-3})\,(10^3)\,g + (0.06)^2\,(60 - x)\,(10^{-3})\,(13.6 \times 10^3)\,g$$

$$= (0.06)^3\,(7.7 \times 10^{-3})\,(g)$$

Solving this equation, we get

$$x = 28 \text{ mm} \quad \text{and} \quad 60 - x = 32 \text{ mm}$$

20. $T + U = 60 + w$ …(i)



Σ (Moments) about = O

∴ $$= U\left(\frac{l}{4}\right) + T\,(l) = W\left(\frac{l}{2}\right)$$

or $U + 4T = 2W$ …(ii)

$w = 120$ N …(iii)

Solving these three equations we get $T = 20$ N and $U = 160$ N

Now, $160\left(\frac{V}{2}\right)\rho_w g = \left(\frac{V}{2}\right)(1000)\,(10)$

∴ $V = 32 \times 10^{-3}$ m^3 **Ans.**

21. (a) Upthrust − Weight − $T = ma$

∴ T = Upthrust − Weight − ma

$$= \left(\frac{2}{500}\right)(1000)\,(10 + 2) - 20 - 4$$

$$= 48 - 20 - 4 = 24\text{N}$$ **Ans.**

(b) Downward force T suddenly becomes zero. Therefore

$$a = \frac{\text{upthrust} - \text{weight}}{m} = \frac{48 - 20}{2}$$

$$= 14 \text{ m/s}^2$$

∴ Acceleration w.r.t. tank.

$$= 14 - 2$$

$$= 12 \text{ m/s}^2$$ **Ans.**

22. (a) Force from left hand side

= force from right hand side

∴ $kx = \Delta pA$

or $$x = \frac{(\Delta p)\,A}{k}$$

$$= \frac{(30 + 101) \times 10^3 \times 0.5 \times 10^{-4}}{60}$$

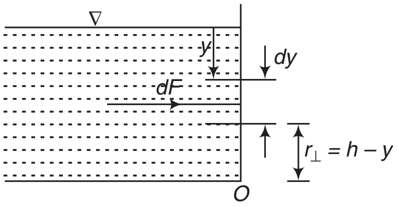
$= 0.109$ m or 10.9 cm **Ans.**

(b) $$x = \frac{(\Delta p) A}{k}$$

$$= \frac{30 \times 10^3 \times 0.5 \times 10^{-4}}{60}$$

$= 0.025$ m $= 2.5$ cm **Ans.**

23. (a) $dF = (p_y)\,(dA) = (\rho g y)\,(l dy)$



∴ $$F = \int_0^h dF = \frac{\rho g l h^2}{2}$$

(b) Perpendicular distance of about force from point O is

$$r_\perp = h - y$$

∴ $d\tau = (dF)\,r_\perp = (\rho g l y)\,(h - y)\,dy$

$$= \text{total torque } = \int_0^h d\tau$$

After substituting the values we get,

$$\tau = \frac{\rho g l h^3}{6}$$ **Ans.**

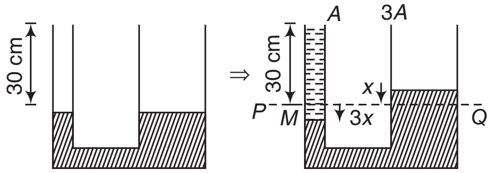
(c) $F \times r_\perp = \tau$

∴ $$r_\perp = \frac{\tau}{F}$$

Substituting the values we get,

$$r_\perp = \frac{h}{3}$$ **Ans.**

24. PQ is original level of mercury. Equating the pressures at the level of M from left hand side and right hand side.



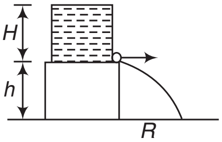
$$p_0 + \rho_w g\, h_w = p_0 + \rho_{Hg}\, g h_{Hg}$$

or $$\rho_w\, h_w = \rho_{Hg} h_{Hg}$$

∴ $$(1)\,(30 + 3x) = (13.6)\,(4x)$$

Solving we get, $x = 0.58$ cm **Ans.**

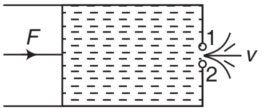
25.



$$R = 2\sqrt{Hh}$$

∴ $$H = \frac{R^2}{4h}$$ **Ans.**

26.



$$p_1 + \frac{1}{2}\rho v_1^2 = p_2 + \frac{1}{2}\rho v_2^2$$

$$\left(p_0 + \frac{F}{A}\right) + 0 = p_0 + \frac{1}{2}\rho v^2$$

∴ $$v = \sqrt{\frac{2F}{\rho A}}$$ **Ans.**

27. $\frac{1}{2}\rho_{air}\, v^2 = \rho_w g h_w$

$$v = \sqrt{\frac{2\rho_w g\, h_w}{\rho_{air}}}$$

$$= \sqrt{\frac{2 \times 10^3 \times 10 \times 10^{-2}}{1.3}}$$

$$= 12.4 \text{ m/s}$$ **Ans.**

28. $\left(\frac{Mg}{A}\right) + \rho g h = \frac{1}{2}\rho v^2$

∴ $$v = \sqrt{\frac{2Mg}{\rho A} + 2gh}$$

$$= \sqrt{\frac{2 \times 20 \times 10}{0.5 \times 10^3} + 2 \times 10 \times 0.5}$$

$$= 3.28 \text{ m/s}$$ **Ans.**

29. $$v_{max} = \frac{(p_1 - p_2)\, R^2}{4\eta L}$$

∴ $$(p_1 - p_2) = \frac{4\eta L\, v_{max}}{R^2}$$

$$= \frac{(4 \times 4 \times 10^{-3})\,(10^{-3})\,(0.66 \times 10^{-3})}{(2 \times 10^{-6})^2}$$

$$= 2.64 \times 10^3 \text{ N/m}^2 = h\rho g$$

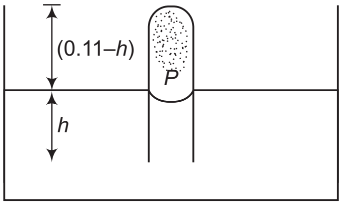
$$h = \frac{2.64 \times 10^3}{\rho g}$$

$$= \frac{2.64 \times 10^3}{13.6 \times 10^3 \times 9.81} \text{ m of Hg}$$

$$= 0.0195 \text{ m of Hg}$$

$$\approx 19.5 \text{ mm of Hg}$$

30.



$$p - \frac{2T}{R} = p_0$$

∴ $$P = \frac{2T}{R} + P_0$$

$$R = \frac{r}{\cos\theta}$$

For water $\theta = 0°$

∴ $R = r$ or $P = \frac{2T}{r} + P_0$

As temperature is constant.

$$p_1 V_1 = p_2 V_2$$

∴ $$p_0\,(0.11) = p\,(0.11 - h)$$

or $$p_0\,(0.11) = \left(p_0 + \frac{2T}{r}\right)(0.11 - h)$$

Substituting the values, we get

$$(1.01 \times 10^5\,(0.11) = \left[1.01 \times 10^5 + \frac{2 \times 5.06 \times 10^{-2}}{10^{-5}}\right](0.11 = h)$$

Solving this equation we get,

$$h = 0.01 \text{ m or } 1 \text{ cm}$$

If seal is broken, then water will rise in the capillary.

31. $W = T\,(\Delta A)$

$$= T\,(2ld)$$

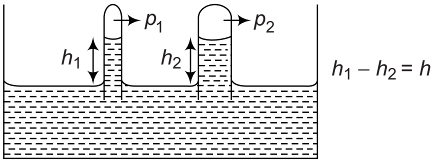
$$= (72 \times 10^{-3})\,(2)\,(0.1)\,(10^{-3})$$

$$= 14.4 \times 10^{-6} \text{ J}$$ **Ans.**

32. Let the pressures in the wide and narrow capillaries of radii r_1 and r_2 respectively be p_1 and p_2. Then pressure just below the meniscus in the wide and narrow tubes respectively are

$$\left(p_1 - \frac{2T}{r_1}\right) \text{ and } \left(p_2 - \frac{2T}{r_2}\right)$$

$$\left[\text{excess pressure} = \frac{2T}{r}\right]$$



Difference in these pressures

$$\left(p_1 - \frac{2T}{r_1}\right) - \left(p_2 - \frac{2T}{r_2}\right) = h\rho g$$

$\therefore$ True pressure difference $= p_1 - p_2$

$$= h\rho g + 2T\left(\frac{1}{r_1} - \frac{1}{r_2}\right)$$

$$= 0.2 \times 10^3 \times 9.8 + 2 \times 72 \times 10^{-3}$$

$$\left[\frac{1}{1.44 \times 10^{-3}} - \frac{1}{7.2 \times 10^{-4}}\right]$$

$$= 1.86 \times 10^3 = 1860\,\text{N/m}^2$$

33. The surface tension of the liquid is

$$T = \frac{rh\rho g}{2}$$

$$= \frac{(0.025\text{cm})(3.0\text{cm})(1.5\text{gm / cm}^3)(980\text{cm / s}^2)}{2}$$

= 55 dyne/cm

Hence, excess pressure inside a spherical bubble

$$p = \frac{4T}{R} = \frac{4 \times 55\text{dyne/cm}}{(0.5\text{cm})}$$

$$= 440 \text{ dyne / cm}^2$$

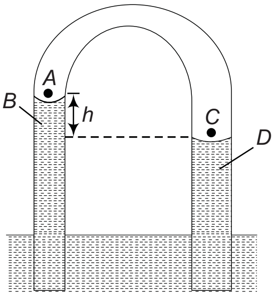
34. Suppose pressure at the points, A, B, C and D be p_A, p_B, p_C and p_D respectively.

The pressure on the concave side of the liquid surface is greater than that on the other side by $\frac{2T}{R}$.

An angle of contact θ is given to be 0°, hence

$$R\cos 0° = r \quad \text{or} \quad R = r$$

$$\therefore \quad p_A = p_B + \frac{2T}{r_1} \quad \text{and} \quad p_C = p_D + \frac{2T}{r_2}$$



where, r_1 and r_2 are the radii of the two limbs

But $\quad p_A = p_C$

$$\therefore \quad p_B + \frac{2T}{r_1} = p_D + \frac{2T}{r_2}$$

$$\text{or} \quad p_D - p_B - 2T\left(\frac{1}{r_1} - \frac{1}{r_2}\right)$$

where, h is the difference in water levels in the two limbs

$$\text{Now,} \quad h = \frac{2T}{\rho g}\left(\frac{1}{r_1} - \frac{1}{r_2}\right)$$

Given that $\quad T = 0.07\ \text{Nm}^{-1}, \rho = 1000\ \text{kgm}^{-3}$

$$r_1 = \frac{3}{2}\text{mm} = \frac{3}{20}\text{cm} = \frac{3}{20 \times 100}\text{m}$$

$$= 1.5 \times 10^{-3}\text{m},\ r_2 = 3 \times 10^{-3}\ \text{m}$$

$$\therefore \quad h = \frac{2 \times 0.07}{1000 \times 9.8}\left(\frac{1}{1.5 \times 10^{-3}} - \frac{1}{3 \times 10^{-3}}\right)\text{m}$$

$$= 4.76 \times 10^{-3}\text{m} = 4.76\text{mm}$$

35. The total pressure inside the bubble at depth h_1 is (p is atmospheric pressure)

$$= (p + h_1\rho g) + \frac{2T}{r_1} = p_1$$

and the total pressure inside the bubble at depth h_2 is

$$= (p + h_2\rho g) + \frac{2T}{r_2} = p_2$$

Now, according to Boyle's law

$$p_1V_1 = p_2V_2$$

$$\text{where,} \quad V_1 = \frac{4}{3}\pi r_1^3 \quad \text{and} \quad V_2 = \frac{4}{3}\pi r_2^3$$

Hence, we get

$$\left[(p + h_1\rho g) + \frac{2T}{r_1}\right]\frac{4}{3}\pi r_1^3$$

$$= \left[(p + h_2\rho g) + \frac{2T}{r_2}\right]\frac{4}{3}\pi r_2^3$$

or $\left[(p+h_1\rho g)+\dfrac{2T}{r_1}\right]r_1^3=\left[(p+h_2\rho g)+\dfrac{2T}{r_2}\right]r_2^3$

Given that $h_1 = 100$ cm, $r_1 = 0.1$ mm $= 0.01$ cm, $r_2 = 0.126$ mm $= 0.0126$ cm, $T = 567$ dyne/cm, $p = 76$ cm of mercury. Substituting all the values, we get

$$h_2 = 9.48\,\text{cm}.$$

36. Let n be the number of little droplets.

Since, volume will remain constant, hence volume of n little droplets = volume of single drop

$$\therefore \qquad n\times\frac{4}{3}\pi r^3=\frac{4}{3}\pi R^3$$

$$\text{or} \qquad nr^3 = R^3$$

Decrease in surface area $= n\times 4\pi r^2 - 4\pi R^2$

$$\text{or } \Delta A = 4\pi[nr^2 - R^2]$$

$$= 4\pi\left[\frac{nr^3}{r}-R^2\right]=4\pi\left[\frac{R^3}{r}-R^2\right]$$

$$= 4\pi R^3\left[\frac{1}{r}-\frac{1}{R}\right]$$

Energy evolved $W = T\times$ decrease in surface area

$$= T\times 4\pi R^3\left[\frac{1}{r}-\frac{1}{R}\right]$$

Heat produced, $Q=\dfrac{W}{J}=\dfrac{4\pi TR^3}{J}\left[\dfrac{1}{r}-\dfrac{1}{R}\right]$

But $\qquad Q = msd\theta$

where, m is the mass of big drop, s is the specific heat of water and $d\theta$ is the rise in temperature.

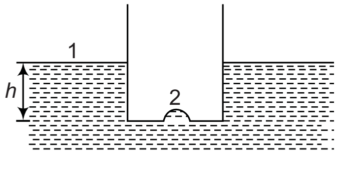
$$\therefore \quad \frac{4\pi TR^3}{J}\left[\frac{1}{r}-\frac{1}{R}\right]=\text{Volume of big drop}$$

$\times$ density of water $\times$ sp. heat of water $\times\, d\theta$

$$\text{or} \quad \frac{4}{3}\pi R^3\times1\times1\times d\theta=\frac{4\pi TR^3}{J}\left(\frac{1}{r}-\frac{1}{R}\right)$$

$$\text{or} \qquad d\theta=\frac{3T}{J}\left[\frac{1}{r}-\frac{1}{R}\right]$$

37.



Applying pressure equations between 1 and 2,

$$p_0+\rho gh-\frac{2T}{r}=p_0$$

$$\Rightarrow \qquad h=\frac{2T}{r\rho g}$$

LEVEL 2

Single Correct Option

1. When ice melts into water its volume decreases. Hence, over all level should decrease.

Now suppose m is the mass of ice, V_1 is volume immersed in water and V_2 the volume immersed in oil. Then in floating condition,

weight = upthrust

$$\therefore \qquad mg = V_1\rho_w g + V_2\rho_0 g$$

$$\therefore \qquad V_1=\frac{m-V_2\rho_0}{\rho_w}$$

$$=\frac{m}{\rho_w}-\frac{V_2\rho_0}{\rho_w} \qquad \text{...(i)}$$

When ice melts, m mass of ice converts into m mass of water. Volume of water so formed is

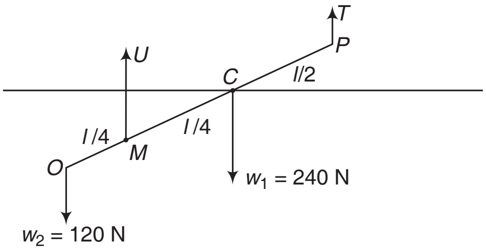
$$V_3=\frac{m}{\rho_w} \qquad \text{...(ii)}$$

From Eqs. (i) and (ii), $V_3 > V_1$

$\therefore$ Interface level will rise.

2. $g_e = 0$ so, pressure inside and pressure outside the hole will be same.

3.



$$T+U=w_1+w_2=360\text{ N} \qquad \text{...(i)}$$

$$U=\frac{V}{2}\rho_w g=(V/2)\,(10^3)\,(10)$$

$$\text{or} \qquad U = 0.5\times10^4\,V \qquad \text{...(ii)}$$

(Σ Moments) about $M = 0$

$$\therefore \qquad 120\left(\frac{l}{4}\right)+T\left(\frac{3l}{4}\right)=240\left(\frac{l}{4}\right)$$

$$\text{or} \qquad T=\frac{240-120}{3}$$

$$= 40\text{ N} = 4\text{g}$$

Now from Eqs. (i) and (ii), we get

$$V = 6.4\times10^{-2}\text{ m}^3$$ **Ans.**

4. Volume flow rate $= av = \dfrac{V}{t}$

$$\therefore \qquad v_1=\frac{V}{A_1t}=\frac{120\times10^{-3}}{5\times10^{-4}\times2\times60}$$

Now, $A_1 v_1 = A_2 v_2$

A_2 is $\frac{1}{5}$ th of A_1.

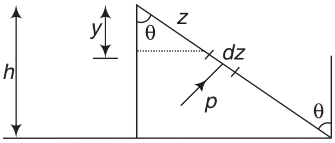
Hence, v_2 is five times of v_1 or 10 m/s.

$$t_0 = \sqrt{\frac{2h}{g}} = \sqrt{\frac{2 \times 1}{10}}$$

$$= 0.447 \text{ s}$$

$$R = v_2 t_0 = 4.47 \text{ m}$$

5.



$$z = y \sec\theta$$

$$dz = dy \sec\theta$$

$$p = (\rho g y)$$

$$dA = (b)\, dz = (b)\, dy \sec\theta$$

$$dF = p\,dA = (\rho g b \sec\theta)\; y\, dy$$

$$\therefore \quad F = \int_0^h dF = \frac{1}{2} \rho b h^2 g \sec\theta$$

6. Velocity of body just before touching the lake surface is,

$$v = \sqrt{2gh}$$

Retardation in the lake,

$$a = \frac{\text{upthrust} - \text{weight}}{\text{mass}}$$

$$= \frac{V\rho g - V\rho g}{V\rho} = \left(\frac{\sigma - \rho}{\rho}\right) g$$

Maximum depth $d_{\max} = \frac{v^2}{2a} = \frac{h\rho}{\sigma - \rho}$

7. $\rho g h = \rho a L$

$$\therefore \quad h = \frac{aL}{g}$$

8. Radius of meniscus $= \frac{R}{\cos\theta} = r$

Δp due to spherical surface $= \frac{2\sigma}{r}$

$$= \frac{2\sigma \cos\theta}{R}$$

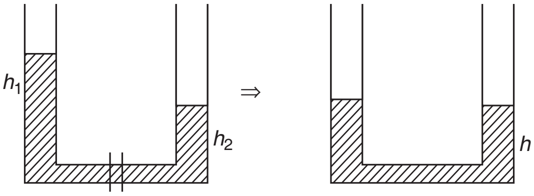
$$p_B = p_{\text{atm}}$$

9. $a_1 v_1 = a_2 v_2$

$$\therefore \quad (L^2)\sqrt{2gh} = (\pi R^2)\sqrt{2g\,(4h)}$$

$$R = \frac{L}{\sqrt{2\pi}}$$

10. Let h = final height of liquid.



Equating the volumes we have,

$$Ah_1 + Ah_2 = A\,(2h)$$

$$\therefore \quad h = \frac{h_1 + h_2}{2}$$

$$W_{mg} = -\Delta U = U_i - U_f$$

$$= \left[\left(Ah_1 \rho g \frac{h_1}{2}\right) + \left(Ah_2 \rho g \frac{h_2}{2}\right)\right] - \left[2A\left(\frac{h_1 + h_2}{2}\right)\rho\left(\frac{h_1 + h_2}{4}\right)\right]$$

Simplifying this expression we get the result.

11. $\Delta p = \rho_{0\text{il}}\; g\; h_{0\text{il}} + \rho_w\, g h_w$

$$= (600)(10)(10 \times 10^{-2}) + (1000 \times 10 \times 2 \times 10^{-2})$$

$$= 800 \text{ N/m}^2$$

12. $\Delta p = \frac{1}{2} \rho v^2$

$$\therefore \quad v = \sqrt{\frac{2\Delta p}{\rho}} = \sqrt{\frac{2 \times 5 \times 10^5}{1000}}$$

$$= 31.5 \text{ m/s}$$

13. From continuity equation,

$$v_A = v_B = v_0$$

$$\therefore \quad p_A + \rho g h = p_B + 0$$

$$\therefore \quad p_B - p_A = \rho g h \qquad \text{...(i)}$$

Now, let us make pressure equation from manometer.

$$p_A + \rho g\,(h + H) - \rho_{\text{Hg}}\; g h = p_3$$

Putting $p_B - p_A = \rho g h$ we get $h = 0$

14. $F = \frac{\Delta p}{\Delta t} = \left(\frac{\Delta m}{\Delta t}\right)(\Delta v)$

$$= \rho\left(\frac{\Delta V}{\Delta t}\right)(2v)$$

$$= \rho\,(Av)\,(2v) = 2\rho A v^2$$

15. $\Delta p_A = \rho g h$ or $\rho a l$

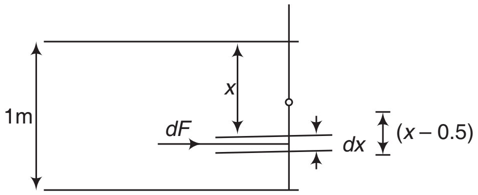
16. At every instant half of the length remains up the surface and half below the surface of liquid.

Since, $D >> d$, over all level will remain unchanged.

Let at $t = 0$, length of candle is 10 cm.

Time (s)	Length of candle (cm)	Length about the surface (cm)	Length below the surface (cm)
0	10	5	5
1	8	4	4

17.



Net torque about hinge = 0

$$dF = (\rho g x)(1 \cdot dx)$$

$$d\tau = (\rho g x)(x - 0.5)\,dx$$

∴ Net anticlockwise torque

$$= \int_0^1 d\tau = \left(\frac{\rho g}{12}\right)$$

Net clockwise torque of applied force $= F\,(0.5) = \dfrac{F}{2}$

Equating the two torques we get,

$$F = \frac{\rho g}{6}$$

18. See the typed example 12.

$$\tan\theta = \frac{\rho_1 - \rho_2}{\rho_1 + \rho_2} = \tan 30° = \frac{1}{\sqrt{3}}$$

Solving this equation we get,

$$\frac{\rho_1}{\rho_2} = \frac{\sqrt{3} + 1}{\sqrt{3} - 1}$$

19. $F = \dfrac{\Delta p}{\Delta t} = \left(\dfrac{\Delta m}{\Delta t}\right)(\Delta v)$

$$= \rho\left(\frac{\Delta V}{\Delta t}\right)(v_1 + v_2) = \rho V\,(v_1 + v_2)$$

20.

$$v_T = \frac{2}{9}\,\frac{r^2(\rho - \sigma)\,g}{\eta}$$

$$= \frac{2 \times (0.003)^2\,(1260 \times 2 - 1260) \times 10}{9 \times 1.26}$$

$$= 0.02 \text{ m/s}$$

$$t = \frac{d}{v_T} = \frac{10 \times 10^{-2}}{0.02} = 5 \text{ s.}$$

21. Torque of hydrostatic force about centre of sphere is already zero as hydrostatic force passes through the centre.

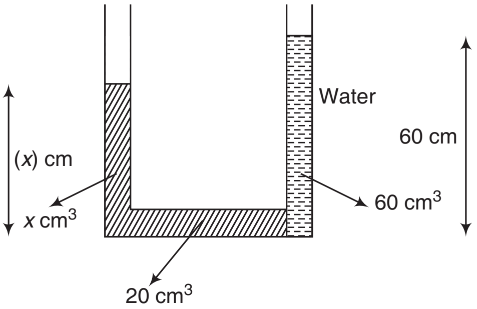
$$\therefore \quad F_{\text{LHS}} = F_{\text{RHS}}$$

For finding force refer Q-No. 23 (a) subjective questions of section Level 1.

$$\therefore \quad \frac{1}{2}(2\rho)(g)\,h^2 = \frac{1}{2}(3\rho)(g)\,R^2$$

$$\therefore \quad h = \sqrt{\frac{3}{2}}\,R$$

22.



$$\rho_1 g h_1 = \rho_2 g h_2$$

$$\therefore \quad (4)(g)(x) = (1)(g)(60)$$

or $\quad x = 15$ cm

Total volume of liquid $= (20 + 15)\text{ cm}^3$

$$= 35 \text{ cm}^3$$

23. Viscous force $= mg \sin\theta$

$$\therefore \quad \eta\,(a^2)\,\frac{v}{t} = mg \sin 37° = \frac{3}{5}\,mg$$

$$= \frac{3}{5}(a^3\rho)\,g \Rightarrow \therefore\ \eta = \frac{3\rho a g t}{5v}$$

24. Reading = weight of bucket of water + magnitude of upthrust on block

$$= (10g) + \frac{1}{2}\left(\frac{7.2}{7.2\,\rho_w}\right)\rho_w g$$

$$= 10.5 \text{ g} = 10.5 \text{ kg}$$

25. Sum of all three terms are different at three points A, B and C.

26.

$$a = \frac{\text{upthrust} - \text{weight}}{\text{mass}} \text{ (upwards)}$$

$$= \frac{V\sigma g - V\rho g}{V\rho} = \left(\frac{\sigma}{\rho} - 1\right) g \qquad \text{(upwards)}$$

27. $h_{\text{Top}} = \dfrac{2H + H}{2} = 1.5H$

Since, this point lies in the tank. So hole should be made at this point.

28. Viscous force $F \propto$ (area)

So let $\quad F = kA$

$$F_0 = k\,(A_1 + A_2) \qquad \ldots\text{(i)}$$

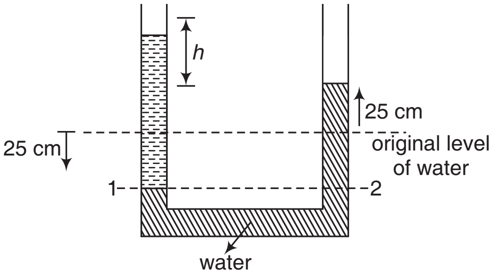
and $\quad T = k\,A_1 \qquad \ldots$(ii)

Dividing Eq. (ii) by Eq.(i) we get,

$$\frac{T}{F_0} = \frac{A_1}{A_1 + A_2}$$

$$\therefore \qquad T = \frac{F_0 A_1}{A_1 + A_2}$$

29.



$$p_1 = p_2$$

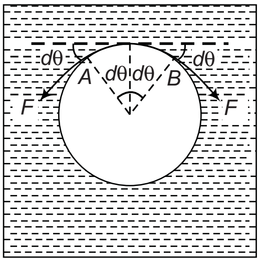
$$\therefore \qquad p_0 + \rho_0 g h_0 = p_0 + \rho_w g\, h_w$$

or $$\rho_0 h_0 = \rho_w h_w$$

or $$(0.8)\,(h + 50) = (1)\,(50)$$

or $$h = 12.5 \text{ cm}$$

30.



$$F = \text{Tension}$$

Surface tension force is radially outwards.

On AB :

$2F \sin d\theta$ = Surface tension force from two films from two sides

For small angle,

$$\sin d\theta \approx d\theta$$

$$\therefore \qquad 2F\, d\theta = 2\,(Tl) = 2\,(T)\,(2Rd\theta)$$

$$\therefore \qquad F = 2\,TR$$

31. Surface tension force on liquid is downwards. But on the disc it is upwards.

In the figure, F = Surface tension force

$$= Tl \cos\theta = T\;(2\,\pi r)\cos\theta$$

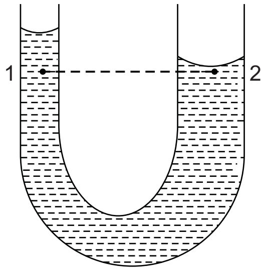
$$U = \text{upthrust} = \omega$$

$$W = \text{weight of disc}$$

For equilibrium of disc,

$$W = U + F = \omega + 2\,\pi T r \cos\theta$$

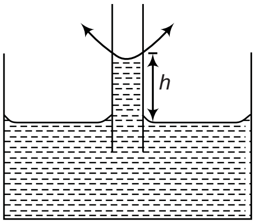
32. $p_1 = p_2$

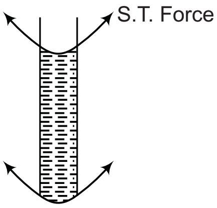


$$p_0 - \frac{2T}{r_1} + \rho g h = p_0 - \frac{2T}{r_2}$$

$$\therefore \qquad T = \frac{\rho g h r_1 r_2}{2\,(r_2 - r_1)}$$

33. When the capillary is inside the liquid, the surface tension force supports the weight of liquid of height 'h'.





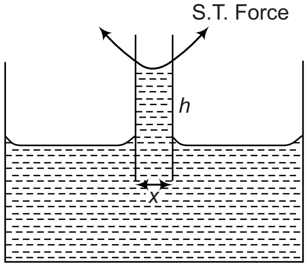
When the capillary is taken out from the liquid similar type of surface tension force acts at the bottom also, as shown in second figure. Hence, now it can support weight of a liquid of height $2h$.

34. Let L be the width of plates (perpendicular to paper inwards).

Surface tension force in upward direction

= weight of liquid of height h

$$\therefore \qquad Tl\cos\theta = Vdg \qquad (V = \text{volume})$$



or $$T\;(2L)\cos\theta = (Lxh)\;dg$$

$$\therefore \qquad h = \frac{2T\cos\theta}{xdg}$$

35. Let R_1 and R_2 are the radii of soap bubbles before and after collapsing. Then given that,

$$V = 2\left(\frac{4}{3}\pi R_1^3\right) - \frac{4}{3}\pi R_2^3 \qquad \text{...(i)}$$

$$S = 2(8\pi R_1^2) - 8\pi R_2^2 \qquad \text{...(ii)}$$

$$P_1V_1 = P_2V_2$$

$$\therefore \left(P_0 + \frac{4T}{R_1}\right)\left(2\times\frac{4}{3}\pi R_1^3\right) = \left(P_0 + \frac{4T}{R_2}\right)\left(\frac{4}{3}\pi R_2^3\right) \qquad \text{...(iii)}$$

Solving these three equation we get the desired result.

36. $p_iV_i = p_fV_f$

$$\therefore \left(p_1 + \frac{4\sigma}{r}\right)\left(\frac{4}{3}\pi r^3\right) = \left(p_2 + \frac{4\sigma}{r/2}\right)\left(\frac{4}{3}\pi\right)\left(\frac{r}{2}\right)^3$$

Solving this equation we get,

$$p_2 = 8p_1 + \frac{24\sigma}{r}$$

37. $$W = 2\pi(r_1 + r_2)T$$

$$\therefore \quad T = \frac{W}{2\pi(r_1 + r_2)} = \frac{7.48\times 10\times 10^{-3}}{2\pi\times 17\times 10^{-2}}$$

$$= 70\times 10^{-3}\ \text{N/m}$$

More than One Correct Options

1. Velocity gradient $= \dfrac{\Delta v}{\Delta h} = \dfrac{2\text{m/s}}{1\text{ m}} = 2\text{s}^{-1}$

$$F = \eta A\frac{\Delta v}{\Delta h} = (10^{-3})(10)(2)$$

$$= 0.02\ \text{N}$$

2. For contact angle $\theta = 90°$, liquid neither rises nor falls.

3. Restoring force $= -(\rho A g)x$ or $F \propto -x$

This is just like a spring-block system of force constant

$$K = \rho A g$$

4. From continuity equation $Av =$ constant

$$v_2 > v_2 \quad \text{as} \quad A_2 < A_1$$

From Bernoulli's equation,

$$p + \frac{1}{2}\rho v^2 = \text{constant} \quad (\text{as } h = \text{constant})$$

$$p_2 < p_1 \quad \text{as} \quad v_2 > v_2$$

5. Fraction of volume immersed,

$$f = \frac{\rho_s}{\rho_l}$$

This fraction is independent of atmospheric pressure. With increase in temperature ρ_s and ρ_l both will decrease.

6. $U = \sqrt{2gh_T} : t = \sqrt{\dfrac{2h_B}{g}},\ R = 2\sqrt{h_Th_B}$

Here, $h_T =$ distance of hole from top surface of liquid

and $h_B =$ distance of hole from bottom surface

7. Pressure increase with depth in vertical direction and in horizontal direction it increases in opposite direction of acceleration based on this concept pressure is maximum at point D and minimum at B.

8. In air, $a_1 = g$ (downwards)

$$\text{In liquid, } a_2 = \frac{\text{upthrust} - \text{weight}}{\text{mass}}$$

$$= \frac{(V)(2\rho)(g) - (V)(\rho)(g)}{(V\rho)}$$

$$= g \text{ (upwards)}$$

$$\therefore \quad a_1 \neq a_2$$

9. Initially

$$\frac{dV_1}{dt} = v_1a_1 = (\sqrt{2gh})(\pi)(2R)^2 \qquad \text{...(i)}$$

$$\frac{dV_2}{dt} = v_2a_2 = (\sqrt{2g(16h)})(\pi)(R)^2 \qquad \text{...(ii)}$$

From Eqs. (i) and (ii), we can see that

$$\frac{dV_1}{dt} = \frac{dV_2}{dt}$$

After some time v_1 and v_2 both will decrease, but decrease in the value of v_1 is more dominating. So,

$$a_1v_1 \quad \text{or} \quad \frac{dV_1}{dt} < a_2v_2 \quad \text{or} \quad \frac{dV_2}{dt}$$

10. Fraction of volume immersed is given by

$$f = \frac{\rho_s}{\rho_l}$$

ρ_s and ρ_l are same. Hence :

$$f_1 = f_2 = f_3$$

Base area in third case is uniform. Hence h_3 is minimum.

Comprehension Based Questions

2. $$x_3 = 2\sqrt{h_{\text{Top}}\times h_{\text{bottom}}}$$

$$= 2\sqrt{3a\times a} = 2\sqrt{3}a$$

3. $$x_1 = 2\sqrt{a\times 3a} = 2\sqrt{3}a$$

$$x_2 = 2\sqrt{2a\times 2a} = 2\sqrt{4}a$$

$$x_3 = 2\sqrt{3}a$$

$$\therefore \quad x_1 = x_3 < x_2$$

4. Weight = upthrust

$$\therefore \left(L\frac{A}{5}Dg\right)=\frac{L}{4}\times\frac{A}{5}\times 2d\times g+\frac{3L}{4}\times\frac{A}{5}\times d\times g$$

$$\therefore \qquad D=\frac{5d}{4}$$

5. $pA = p_0A +$ weight of two liquids + weight of cylinder

$$= p_0A+\left(\frac{H}{2}\right)(A)\,(d)\,(g)+\left(\frac{H}{2}\right)(A)\,(2d)\,(g)$$

$$+\,L\left(\frac{A}{5}\right)\left(\frac{5d}{4}\right)g$$

$$\therefore \qquad p=p_0+\frac{(L+6H)}{4}\,dg$$

6. Applying Bernoulli's equation just inside and just outside the hole,

$$p_0+\left(\frac{H}{2}\right)(d)g+\left(\frac{H}{2}-h\right)(2d)(g)=\frac{1}{2}\,(2d)\,v^2+p_0$$

$$\therefore \qquad v=\sqrt{\frac{g}{2}\,(3H-4h)}$$

7. $t=\sqrt{\dfrac{2h}{g}} \quad \Rightarrow \quad \therefore \quad x=vt=\sqrt{(3H-4h)\,h}$

Match the Columns

1. $v=\sqrt{2gh_T}$ and $R=2\sqrt{h_Th_B}$

Here, h_T = height of hole from top surface

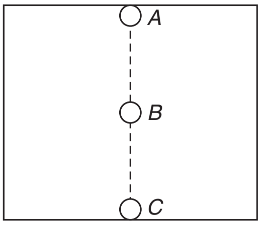
and h_B = height of hole from bottom

2. (a) and (b) In floating condition upthrust = weight

By increasing temperature of density liquid, weight remains unchanged. Hence, upthrust is unchanged.

(c) When density of solid is increased (with constant volume) mass and hence weight of solid will increase. So, upthrust will increase.

3. Ball will oscillate simple harmonically. The mean position in at depth



$$\rho=\alpha h \quad \text{or} \quad h=\frac{\rho}{\alpha}=AB$$

$$h_{\max}=\frac{2\rho}{\alpha}=AC$$

Amplitude $=\dfrac{\rho}{\alpha}=AB$ or BC

From A to B : $\rho>\rho_l$, weight > upthrust

At B, $\rho=\rho_l$, weight = upthrust

From B to C, $\rho_e>\rho$, upthrust > weight.

From A to C → upthrust will increase and gravitational potential energy will decrease.

From C to A, upthrust will decrease and gravitational potential energy will increase.

From A to B, speed will increase.

From B to C, speed will decrease.

4. Surface tension $=\dfrac{F}{e}$

Viscous force $f=\eta A\dfrac{\Delta v}{\Delta y}$

Energy density $=\dfrac{\text{Energy}}{\text{Volume}}$

Volume flow rate $=\dfrac{\text{Volume}}{\text{Time}}$

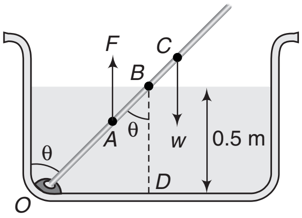
5. F_2-F_1 = upthrust

= weight of cylinder in equilibrium or floating condition.

From liquid-1, horizontal pair of forces cancel out. So, net force = 0

Subjective Questions

1. w = Weight, F = Upthrust



$$OA=\frac{OB}{2}=\frac{0.5\sec\theta}{2}=0.25\sec\theta$$

About point O, clockwise moment of w = anticlockwise moment of F.

$$\therefore \quad w\left(\frac{L}{2}\sin\theta\right)=F(OA\sin\theta)=F(0.25\sin\theta\cdot\sec\theta)$$

Given, $\qquad L=1\text{ m}$

$$\therefore \qquad \cos\theta=\frac{F}{2w}=\frac{(0.5\sec\theta)(A)(1.0)g}{2(1)(A)((0.5)g}$$

or $\qquad \cos^2\theta=\dfrac{1}{2},\ \cos\theta=\dfrac{1}{\sqrt{2}}$

$\therefore \qquad \theta=45°$ **Ans.**

2. Fraction of volume immersed before putting the new weight $= \dfrac{\rho_{\text{block}}}{\rho_{\text{water}}} = \dfrac{800}{1000} = 0.8$

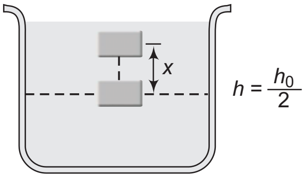
i.e. 20% of 3 cm or 0.6 cm is above water. Let w is the new weight, then spring will be compressed by 0.6 cm.

$\therefore$ w + weight of block = Upthrust on whole volume of block + spring force

or
$$w = (3\times10^{-2})^3 \times 1000\times 10 + 50\times (0.6\times10^{-2}) - (3\times10^{-2})^3\times 800\times 10$$

$\therefore$ $w = 0.354$ N **Ans.**

3. Net force on the block at a height h from the bottom is



$$F_{\text{net}} = \text{upthrust} - \text{weight} \qquad \text{(upwards)}$$
$$= \left(\frac{m}{\frac{5}{2}\rho_0}\right)\rho_0\left(4 - \frac{3h}{h_0}\right)g - mg$$
$$F_{\text{net}} = 0 \text{ at } h = \frac{h_0}{2}$$

So, $h = \dfrac{h_0}{2}$ is the equilibrium position of the block.

For $h > \dfrac{h_0}{2}$, weight > upthrust

i.e. net force is downwards and for $h < \dfrac{h_0}{2}$

weight < upthrust

i.e. net force is upwards.

For upward displacement x from mean position, net downward force is
$$F = -\left[\left(\frac{m}{\frac{5}{2}\rho_0}\right)\rho_0\left\{4 - \frac{3(h+x)}{h_0}\right\}g - mg\right]\left(h = \frac{h_0}{2}\right)$$
$$\therefore \quad F = -\frac{6mg}{5h_0}x \qquad \ldots\text{(i)}$$

(because at $h = \dfrac{h_0}{2}$ upthrust and weight are equal)

Since $\quad F \propto -x$

Oscillations are simple harmonic in nature. Rewriting Eq. (i)
$$ma = -\frac{6mgx}{5h_0}$$
or
$$a = -\frac{6g}{5h_0}x$$
$$\therefore \quad f = \frac{1}{2\pi}\sqrt{\left|\frac{a}{x}\right|}$$
$$f = \frac{1}{2\pi}\sqrt{\frac{6g}{5h_0}}$$ **Ans.**

4. (a) $v = \sqrt{2gh} = \sqrt{2\times10\times5}$
$= 10$ m/s

(b) From conservation of energy,
$$v'^2 = v^2 + 2gH$$
$$= 100 + 2\times10\times5 = 200$$
$$v' = 14.1 \text{ m/s}$$

(c)
$$t = \frac{2A}{a\sqrt{2g}}\left[\sqrt{H} - \sqrt{\frac{H}{2}}\right]$$
$$= \frac{2\times\pi\times(1)^2}{10^{-4}\sqrt{2\times10}}[\sqrt{5} - \sqrt{2.5}]$$
$$= 9200 \text{ s}$$

5. Writing equation of motion for the block
$$T - mg\sin 30° = ma \qquad \ldots\text{(i)}$$
For the sphere

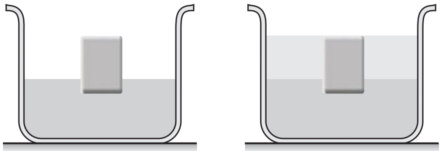
Weight − Buoyant force − $T = ma$ $\qquad\ldots$(ii)

or
$$mg - \frac{mg}{2} - T = ma$$

Solving, we get $\quad a = 0$

6. $w = (0.25)V\rho_{\text{Hg}}\, g \qquad \ldots$(i)

Let x fraction of volume is immersed in mercury in the second case. Then,



$$w = xV\rho_{\text{Hg}}g + (1-x)V\rho_w g \qquad \ldots\text{(ii)}$$

Equating Eqs. (i) and (ii), we have
$$\frac{\rho_{\text{Hg}}}{4} = x\rho_{\text{Hg}} + (1-x)\rho_w$$
$$\therefore \quad 12.6x = 2.4$$
or $\quad x = 0.19$ **Ans.**

7. (a) $p_A - \frac{1}{2}\rho v^2 + \rho g h = p_D$

But $\quad p_A = p_D = p_0$

$$\therefore \quad \frac{1}{2}\rho v^2 = \rho g h$$

$$\therefore \quad v = \sqrt{2gh}$$

Here, $\quad h = (4 + 1) = 5$ m

$$\therefore \quad v = \sqrt{2 \times 9.8 \times 5} = 9.9 \text{ m/s}$$

(b) Applying Bernoulli's equation at A and B,

$$p_A + 0 + 0 = p_B + \frac{1}{2}\rho v^2 + \rho g(1.5)$$

or $\quad p_0 = p_B + \frac{1}{2}\rho v^2 + 1.5\,\rho g$

$$\therefore \quad p_B = 1.01 \times 10^5 - \frac{1}{2} \times 900 \times (9.9)^2 - 1.5 \times 900 \times 9.8$$

$$= 4.36 \times 10^4 \text{ Pa}$$ **Ans.**

(c) Applying Bernoulli's equation at A and C,

$$p_0 = p_C + \frac{1}{2}\rho v^2 - \rho g(1.0)$$

$$\therefore \quad p_C = p_0 + \rho g - \frac{1}{2}\rho v^2$$

$$= 1.01 \times 10^5 + 900 \times 9.8 - \frac{1}{2} \times 900 \times (9.9)^2$$

$$= 6.6 \times 10^4 \text{ Pa}$$ **Ans.**

8. $\frac{1}{2}\rho v^2 = \rho g h + \frac{mg}{A}$

Here, $\quad h = 1.0 - 0.5 = 0.5$ m,

A = Area of piston = 0.5 m^2

$$\therefore \quad v = \sqrt{2gh + \frac{2mg}{\rho A}}$$

$$= \sqrt{2 \times 9.8 \times 0.5 + \frac{2 \times 20 \times 9.8}{10^3 \times 0.5}}$$

$$= 3.25 \text{ m/s}$$

∴ Speed with which it hits the surface is

$$v' = \sqrt{v^2 + 2gh'}$$

$$= \sqrt{(3.25)^2 + (2 \times 9.8 \times 0.5)}$$

$$= 4.51 \text{ m/s}$$ **Ans.**

9. $a\sqrt{2gy} = \pi x^2 \left(-\frac{dy}{dt}\right)$ ...(i)

Here, $\quad -\frac{dy}{dt} = \frac{4 \times 10^{-2}}{3600} = 1.11 \times 10^{-5}$ m/s

$$a = \pi r^2 = \pi\,(2 \times 10^{-3})^2$$

$$= 1.26 \times 10^{-5} \text{ m}^2$$

Substituting these values in Eq. (i), we have

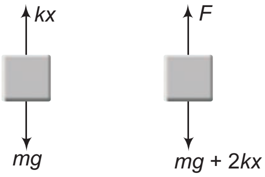
$$(1.26 \times 10^{-5})\sqrt{2 \times 9.8 \times y} = \pi(1.11 \times 10^{-5})x^2$$

or $\quad y = 0.4x^4$

This is the desired x-y relation.

10. Initially, $kx = mg$ ...(i)

In the second case,



$$F = mg + 2kx$$

or $\quad kx = \frac{F - mg}{2}$ ...(ii)

From Eqs. (i) and (ii), we have

$$mg = \frac{F - mg}{2}$$

or $\quad F = 3\,mg$

Let V be the total volume then,

$$V\rho_w g = 3mg$$

$$\therefore \quad V = \frac{3mg}{\rho_w g} = \frac{(3)(8)}{10^3} \text{ m}^3$$

$$= 0.024 \text{ m}^3$$

$$\text{Volume of wood} = \frac{\text{mass}}{\text{density}}$$

$$= \frac{8}{840} = 0.0095$$

∴ Volume of cavity = 0.024 – 0.0095

= 0.0145

∴ Percentage volume of cavity

$$= \frac{0.0145}{0.024} \times 100$$

$$= 60.41\%$$

11. $v = \sqrt{2g(10 - h)}$ ...(i)

Component of its velocity parallel to the plane is $v \cos 30°$.

Let the stream strikes the plane after time t. Then

$$0 = v\cos 30° - g\sin 30°\, t$$

$$\therefore \quad t = \frac{v\cot 30°}{g}$$

Further $$x = vt = \frac{v^2 \cot 30°}{g}$$

$$= \sqrt{3}\, y$$

or $$\frac{v^2 \cot 30°}{g} = \sqrt{3}\left(h - \frac{1}{2} g t^2\right)$$

∴ $$\frac{\sqrt{3} v^2}{g} = \sqrt{3}\left(h - \frac{g}{2}\, \frac{v^2 \cot^2 30°}{g^2}\right)$$

or $$\frac{v^2}{g} = h - \frac{3}{2}\, \frac{v^2}{g}$$

∴ $$\frac{5}{2}\, \frac{v^2}{g} = h \quad \text{or} \quad 5(10 - h) = h$$

∴ $h = 8.33$ m **Ans.**

12. In elastic collision with the surface, direction of velocity is reversed but its magnitude remains the same.

Therefore, time of fall = time of rise.

or time of fall $= \dfrac{t_1}{2}$

Hence, velocity of the ball just before it collides with liquid is

$$v = g\frac{t_1}{2} \qquad \text{...(i)}$$

Retardation inside the liquid

$$a = \frac{\text{upthrust} - \text{weight}}{\text{mass}} = \frac{Vd_L g - Vdg}{Vd}$$

$$= \left(\frac{d_L - d}{d}\right) g \qquad \text{...(ii)}$$

Time taken to come to rest under this retardation will be

$$t = \frac{v}{a} = \frac{gt_1}{2a} = \frac{gt_1}{2\left(\frac{d_L - d}{d}\right) g}$$

$$= \frac{dt_1}{2(d_L - d)}$$

Same will be the time to come back on the liquid surface.

Therefore,

(a) t_2 = time the ball takes to came back to the position from where it was released

$$= t_1 + 2t = t_1 + \frac{dt_1}{d_L - d}$$

$$= t_1\left[1 + \frac{d}{d_L - d}\right] \quad \text{or} \quad t_2 = \frac{t_1 d_L}{d_L - d}$$

(b) The motion of the ball is periodic but not simple harmonic because the acceleration of the ball is g in air and $\left(\dfrac{d_L - d}{d}\right) g$ inside the liquid which is not proportional to the displacement, which is necessary and sufficient condition for SHM.

(c) When $d_L = d$, retardation or acceleration inside the liquid becomes zero (upthrust = weight). Therefore, the ball will continue to move with constant velocity $v = \dfrac{gt_1}{2}$ inside the liquid.

13. Pressure inside the bubble $= p_0 + \rho gh + \dfrac{2T}{r}$

∴ Amount of pressure inside the bubble greater than the atmospheric pressure $= \rho gh + \dfrac{2T}{r}$

Substituting the values we get,

$$\Delta p = 10^3 \times 9.8 \times 0.1 + \frac{2 \times 0.075}{10^{-3}}$$

$$= 980 + 150 = 1130 \text{ N/m}^2$$

14. (a) $F_r = 6\pi\eta r v$

$$= 6\pi(0.8)(10^{-3})(10^{-2})$$

$$= 1.5 \times 10^{-4} \text{ N}$$ **Ans.**

(b) Hydrostatic force = Upthrust

$$= \left(\frac{4}{3}\pi r^3\right)\rho g = \frac{4}{3}\pi\, (10^{-3})^3 \times 1260 \times 9.8$$

$$= 5.2 \times 10^{-5} \text{ N}$$ **Ans.**

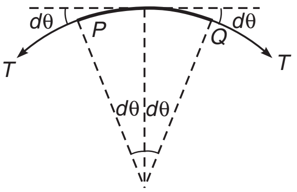
(c) At terminal velocity

w = Upthrust + viscous force

or $$(50 \times 10^{-3} \times 9.8) = (5.2 \times 10^{-5}) + 6\pi(0.8)(10^{-3})\, v_T$$

Solving we get $v_T = 32.5$ m/s **Ans.**

15. The loop will take circular shape after pricking. Radius of which is given by the relation.



$$l = 2\pi R \quad \text{or} \quad R = \frac{l}{2\pi} = \frac{6.28}{2 \times 3.14} = 1 \text{ cm}$$

$$= 10^{-2} \text{ m}$$

$2T\sin(d\theta)$ force in inward direction is balanced by surface tension force in outward direction.

$\therefore$ $2T\sin(d\theta) = (\text{Surface tension}) \times (\text{length of arc})$

For small angles, $\sin d\theta \approx d\theta$

$$\therefore \quad 2T\,d\theta = S(2Rd\theta) \quad (S = \text{Surface tension})$$

$$\therefore \quad T = SR$$

$$= (0.030)(10^{-2})$$

$$= 3.0 \times 10^{-4}\ \text{N}$$ **Ans.**

16. (a) Time taken to empty the tank (has been derived in theory) is

$$t = \frac{2A}{a\sqrt{2g}}\sqrt{H}$$

Given, $\frac{A}{a} = 400$

Substituting the values we have,

$$t = \frac{2 \times 400}{\sqrt{2 \times 9.8}}\sqrt{1}$$

$$= 180\ \text{s} = 3\ \text{min}$$ **Ans.**

(b) Rate of flow of water $Q = a\sqrt{2gH}$ = constant

Total volume of water $V = AH$

$\therefore$ Time take to empty the tank with constant rate

$$t = \frac{V}{Q} = \frac{AH}{a\sqrt{2gH}}$$

$$= \frac{400 \times 1}{\sqrt{2 \times 9.8 \times 1}}$$

$$= 90\ \text{s} = 1.5\ \text{min}$$ **Ans.**

17. (a) $\Delta p = h(\rho_w - \rho_0)g = (10)(1000 - 500)\,9.8$

$$= 49000\ \text{N/m}^2$$

Now, $\Delta p = \frac{1}{2}\rho_w v^2$

$$\therefore \quad v = \sqrt{\frac{2\Delta p}{\rho_w}} = \sqrt{\frac{2 \times 49000}{1000}}$$

$$= 9.8\ \text{m/s}$$ **Ans.**

The flow will stop when,

(b) $(10 + 5)\rho_0 g = 5\rho_0 g + h\rho_w g$

$$10\rho_0 = h\rho_w$$

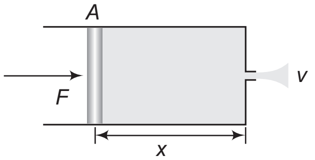
$$\therefore \quad h = \frac{10 \times 500}{1000} = 5\ \text{m}$$

i.e. flow will stop when the water-oil interface is at a height of 5.0 m. **Ans.**

18. $\frac{F}{A} = \frac{1}{2}\rho v^2$

or $F = \frac{1}{2}\rho A v^2$ ...(i)

Here, v is the velocity of liquid, with which it comes out of the hole.



Further $V = Ax$ ...(ii)

$t = \frac{V}{sv}$ ...(iii)

and $w = F \cdot x$ ...(iv)

From the above four equations,

$$w = \left(\frac{1}{2}A\rho v^2\right)\left(\frac{V}{A}\right)$$

$$= \frac{1}{2}\rho\frac{V^2}{s^2t^2}\cdot V = \frac{1}{2}\frac{\rho V^3}{s^2t^2}$$ **Ans.**

19. (a) $p_0 A = kx$

$$\therefore \quad x = \frac{p_0 A}{k} = \frac{(p_0)(\pi r^2)}{k}$$

$$= \frac{(1.01 \times 10^5)(\pi)(0.025)^2}{3600}$$

$$= 0.055\ \text{m} = 5.5\ \text{cm}$$ **Ans.**

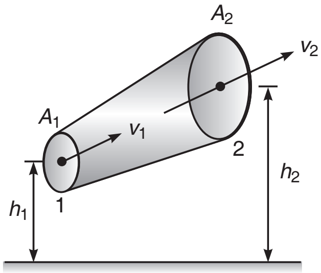
(b) Work done by atmospheric pressure

$$W = \frac{1}{2}kx^2 = \frac{1}{2}(3600)(0.055)^2$$

$$= 5.445\ \text{J}$$ **Ans.**

20. Given, $A_1 = 4 \times 10^{-3}\ \text{m}^2, A_2 = 8 \times 10^{-3}\ \text{m}^2$,

$h_1 = 2\ \text{m}, h_2 = 5\ \text{m}$, $v_1 = 1\ \text{m/s}$ and $\rho = 10^3\ \text{kg/m}^3$



From continuity equation, we have

$$A_1 v_1 = A_2 v_2$$

or $v_2 = \left(\frac{A_1}{A_2}\right) v_1$ or $v_2 = \left(\frac{4 \times 10^{-3}}{8 \times 10^{-3}}\right)(1 \text{ m/s})$

$$v_2 = \frac{1}{2} \text{ m/s}$$

Applying Bernoulli's equation at sections 1 and 2

$$p_1 + \frac{1}{2}\rho v_1^2 + \rho g h_1 = p_2 + \frac{1}{2}\rho v_2^2 + \rho g h_2$$

or $p_1 - p_2 = \rho g(h_2 - h_1) + \frac{1}{2}\rho(v_2^2 - v_1^2)$ ...(i)

(i) Work done per unit volume by the pressure as the fluid flows from *P* to *Q*.

$$w_1 = p_1 - p_2$$

$$= \rho g(h_2 - h_1) + \frac{1}{2}\rho(v_2^2 - v_1^2) \quad \text{[From Eq. (i)]}$$

$$= \left\{(10^3)(9.8)(5 - 2) + \frac{1}{2}(10)^3\left(\frac{1}{4} - 1\right)\right\} \text{ J/m}^3$$

$$= [29400 - 375] \text{ J/m}^3 = 29025 \text{ J/m}^3$$

(ii) Work done per unit volume by the gravity as the fluid flows from *P* to *Q*.

$$W_2 = \rho g(h_2 - h_1) = \{(10^3)(9.8)(5 - 2)\} \text{ J/m}^3$$

or $W_2 = 29400 \text{ J/m}^3$

21. Volume of the portion of the plate immersed in water is

$$10 \times \frac{1}{2}(1.54) \times 0.2 = 1.54 \text{ cm}^3$$

Therefore, if the density of water is taken as 1, then upthrust

= weight of the water displaced

$= 1.54 \times 1 \times 980 = 1509.2$ dynes

Now, the total length of the plate in contact with the water surface is $2(10 + 0.2) = 20.4$ cm

∴ Downward pull upon the plate due to surface tension

$= 20.4 \times 73 = 1489.2$ dynes

∴ Resultant upthrust

$= 1509.2 - 1489.2$

$= 20.0 \text{ dynes} = \frac{20}{980}$

$= 0.0204$ gm-wt

∴ Apparent weight of the plate in water

= weight of the plate in air − resultant upthrust

$= 8.2 - 0.0204 = 8.1796$ gm **Ans.**

22. Given that $r_1 = \frac{3.0}{2} = 1.5 \text{ mm} = 1.5 \times 10^{-3}$ m,

$r_2 = \frac{6.0}{2} = 3.0 \text{ mm} = 3.0 \times 10^{-3}$ m,

$T = 7.3 \times 10^{-2} \text{ Nm}^{-1}$, $\theta = 0°$ $\rho = 1.0 \times 10^3 \text{ kg/m}^3$,

$g = 9.8 \text{ m/s}^2$

When angle of contact is zero degree, the radius of the meniscus equals radius of bore.

Excess pressure in the first bore, $p_1 = \frac{2T}{r_1}$

$$= \frac{2 \times 7.3 \times 10^{-2}}{1.5 \times 10^{-3}} = 97.3 \text{ Pa}$$

Excess pressure in the second bore, $p_2 = \frac{2T}{r_2}$

$$= \frac{2 \times 7.3 \times 10^{-2}}{3 \times 10^{-3}} = 48.7 \text{ Pa}$$

Hence, pressure difference in the two limbs of the tube

$$\Delta p = p_1 - p_2 = h\rho g$$

or $h = \frac{p_1 - p_2}{\rho g}$

$$= \frac{97.3 - 48.7}{1.0 \times 10^3 \times 9.8}$$

$$\approx 5 \times 10^{-3} \text{ m}$$

$$= 5.0 \text{ mm}$$

23. $p_1 V_1 = p_2 V_2$

$$\therefore \left(p_0 + \frac{4T}{r}\right)\left(2 \times \frac{4}{3}\pi r^3\right) = \left(p_0 + \frac{4T}{R}\right)\left(\frac{4}{3}\pi R^3\right)$$

From here we can find expression of *T*.

24. $p_1 V_1 = p_2 V_2$

$$\therefore \left(p_0 + \frac{4T}{r}\right)\left(\frac{4}{3}\pi r^3\right) = \left(p_0 + \frac{4T}{R} - \frac{\sigma^2}{2\varepsilon_0}\right)\left(\frac{4}{3}\pi R^3\right)$$

Here, $V = \frac{\sigma R}{\varepsilon_0}$

or $\sigma = \frac{V\varepsilon_0}{R}$

25. $p_1 V_1 = p_2 V_2$

$$\left(p_0 + \frac{4T}{R}\right)\left(\frac{4}{3}\pi R^3\right) = \left(p_0 + \frac{4T}{2R} - \frac{\sigma^2}{2\varepsilon_0}\right)\left(\frac{4}{3}\pi\right)(2R)^3$$

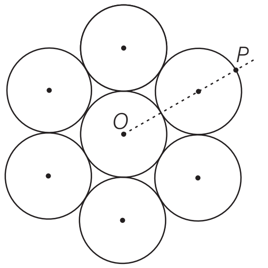
Here, $\sigma = \frac{q}{A} = \frac{q}{4\pi\,(2R)^2}$

JEE Main and Advanced

Previous Years' Questions (2018-13)

JEE Main

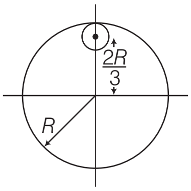
1. Seven identical circular planar discs, each of mass M and radius R are welded symmetrically as shown in the figure. The moment of inertia of the arrangement about the axis normal to the plane and passing through the point P is **(2018)**



(a) $\frac{19}{2}MR^2$ (b) $\frac{55}{2}MR^2$

(c) $\frac{73}{2}MR^2$ (d) $\frac{181}{2}MR^2$

2. From a uniform circular disc of radius R and mass $9M$, a small disc of radius $\frac{R}{3}$ is removed as shown in the figure. The moment of inertia of the remaining disc about an axis perpendicular to the plane of the disc and passing through centre of disc is **(2018)**



(a) $4MR^2$ (b) $\frac{40}{9}MR^2$ (c) $10MR^2$ (d) $\frac{37}{9}MR^2$

3. A solid sphere of radius r made of a soft material of bulk modulus K is surrounded by a liquid in a cylindrical container. A massless piston of area a floats on the surface of the liquid, covering entire cross-section of cylindrical container. When a mass m is placed on the surface of the piston to compress the liquid, the fractional decrement in the radius of the sphere, $\left(\frac{dr}{r}\right)$ is **(2018)**

(a) $\frac{Ka}{mg}$ (b) $\frac{Ka}{3mg}$ (c) $\frac{mg}{3Ka}$ (d) $\frac{mg}{Ka}$

4. The mass of a hydrogen molecule is 3.32×10^{-27} kg. If 10^{23} hydrogen molecules strike per second, a fixed wall of area 2 cm^2 at an angle of 45° to the normal and rebound elastically with a speed of 10^3 m/s, then the pressure on the wall is nearly **(2018)**

(a) $2.35 \times 10^3\text{ N/m}^2$ (b) $4.70 \times 10^3\text{ N/m}^2$

(c) $2.35 \times 10^2\text{ N/m}^2$ (d) $4.70 \times 10^2\text{ N/m}^2$

5. The moment of inertia of a uniform cylinder of length l and radius R about its perpendicular bisector is I. What is the ratio l/R such that the moment of inertia is minimum? **(2017)**

(a) $\frac{\sqrt{3}}{2}$ (b) 1 (c) $\frac{3}{\sqrt{2}}$ (d) $\sqrt{\frac{3}{2}}$

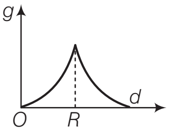
6. A slender uniform rod of mass M and length l is pivoted at one end so that it can rotate in a vertical plane (see the figure). There is negligible friction at the pivot. The free end is held vertically above the pivot and then released. The angular acceleration of the rod when it makes an angle θ with the vertical, is **(2017)**

(a) $\frac{2g}{3l}\sin\theta$ (b) $\frac{3g}{2l}\cos\theta$

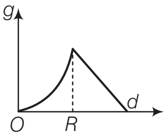
(c) $\frac{2g}{3l}\cos\theta$ (d) $\frac{3g}{2l}\sin\theta$

7. The variation of acceleration due to gravity g with distance d from centre of the Earth is best represented by (R = Earth's radius) **(2017)**

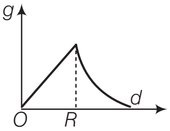
(a)



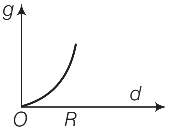
(b)



(c)

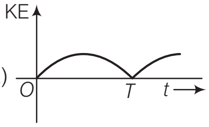


(d)

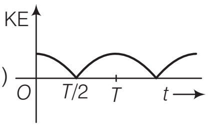


8. A particle is executing simple harmonic motion with a time period T. At time $t = 0$, it is at its position of equilibrium. The kinetic energy-time graph of the particle will look, like **(2017)**

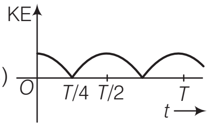
(a)



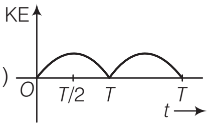
(b)



(c)



(d)



9. A magnetic needle of magnetic moment 6.7×10^{-2} Am^2 and moment of inertia 7.5×10^{-6} kg m^2 is performing simple harmonic oscillations in a magnetic field of 0.01 T. Time taken for 10 complete oscillations is **(2017)**

(a) 8.89 s (b) 6.98 s (c) 8.76 s (d) 6.65s

10. The following observations were taken for determining surface tension T of water by capillary method. Diameter of capillary, $d = 1.25 \times 10^{-2}$ m rise of water, $h = 1.45 \times 10^{-2}$m. Using $g = 9.80$ m/s^2 and the simplified relation $T = \frac{rhg}{2} \times 10^3$ N/m, the possible error in surface tension is closest to **(2017)**

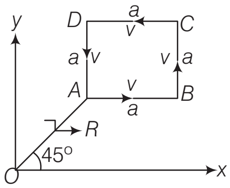
(a) 1.5% (b) 2.4% (c) 10% (d) 0.15%

11. A man grows into a giant such that his linear dimensions increase by a factor of 9. Assuming that his density remains same, the stress in the leg will change by a factor of **(2017)**

(a) $\frac{1}{9}$ (b) 81

(c) $\frac{1}{81}$ (d) 9

12. A particle of mass m is moving along the side of a square of side a, with a uniform speed v in the xy-plane as shown in the figure.



Which of the following statements is **false** for the angular momentum **L** about the origin? **(2016)**

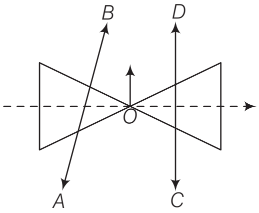
(a) $\mathbf{L} = \frac{-mv}{\sqrt{2}} R\hat{\mathbf{k}}$ when the particle is moving from A to B

(b) $\mathbf{L} = mv\left(\frac{R}{\sqrt{2}} - a\right)\hat{\mathbf{k}}$ when the particle is moving from C to D

(c) $\mathbf{L} = mv\left(\frac{R}{\sqrt{2}} + a\right)\hat{\mathbf{k}}$ when the particle is moving from B to C

(d) $\mathbf{L} = \frac{mv}{\sqrt{2}} R\hat{\mathbf{k}}$ when the particle is moving from D to A

13. A roller is made by joining together two corners at their vertices O. It is kept on two rails AB and CD which are placed asymmetrically (see the figure), with its axis perpendicular to CD and its centre O at the centre of line joining AB and CD (see the figure). It is given a light push, so that it starts rolling with its centre O moving parallel to CD in the direction shown. As it moves, the roller will tend to **(2016)**



(a) turn left

(b) turn right

(c) go straight

(d) turn left and right alternately

14. A satellite is revolving in a circular orbit at a height h from the Earth's surface (radius of earth R, $h << R$). The minimum increase in its orbital velocity required, so that the satellite could escape from the Earth's gravitational field, is close to (Neglect the effect of atmosphere) **(2016)**

(a) $\sqrt{2gR}$ (b) $\sqrt{gR}$

(c) $\sqrt{gR/2}$ (d) $\sqrt{gR}\,(\sqrt{2}-1)$

15. A student measures the time period of 100 oscillations of a simple pendulum four times. The data set is 90 s, 91s, 92s and 95s. If the minimum division in the measuring clock is 1s, then the reported mean time should be **(2016)**

(a) (92 ± 2 s) (b) (92 ± 5 s)

(c) (92 ± 1.8s) (d) (92 ± 3 s)

16. A particle performs simple harmonic motion with amplitude A. Its speed is trebled at the instant that it is at a distance $\frac{2}{3}A$ from equilibrium position. The new amplitude of the motion is **(2016)**

(a) $\frac{A}{3}\sqrt{41}$ (b) $3A$ (c) $A\sqrt{3}$ (d) $\frac{7}{3}A$

17. Distance of the centre of mass of a solid uniform cone from its vertex is z_0. If the radius of its base is R and its height is h, then z_0 is equal to **(2015)**

(a) $\frac{3h}{4}$ (b) $\frac{h^2}{4R}$ (c) $\frac{5h}{8}$ (d) $\frac{3h^2}{8R}$

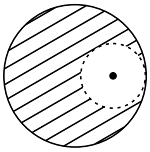
18. A particle of mass m moving in the x-direction with speed $2v$ is hit by another particle of mass $2m$ moving in the y-direction with speed v. If the collision is perfectly inelastic, the percentage loss in the energy during the collision is close to **(2015)**

(a) 50 % (b) 56 % (c) 62 % (d) 44 %

19. From a solid sphere of mass M and radius R, a cube of maximum possible volume is cut. Moment of inertia of cube about an axis passing through its centre and perpendicular to one of its faces is **(2015)**

(a) $\frac{MR^2}{32\sqrt{2}\pi}$ (b) $\frac{4MR^2}{9\sqrt{3}\pi}$ (c) $\frac{MR^2}{16\sqrt{2}\pi}$ (d) $\frac{4MR^2}{3\sqrt{3}\pi}$

20. From a solid sphere of mass M and radius R, a spherical portion of radius $\left(\frac{R}{2}\right)$ is removed as shown in the figure. Taking gravitational potential $V = 0$ at $r = \infty$, the potential at the centre of the cavity thus formed is (G = gravitational constant) **(2015)**

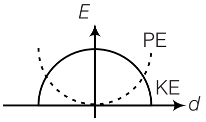


(a) $\frac{-GM}{R}$ (b) $\frac{-GM}{2R}$

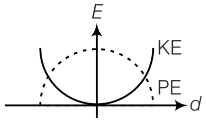
(c) $\frac{-2\,GM}{3R}$ (d) $\frac{-2\,GM}{R}$

21. For a simple pendulum, a graph is plotted between its Kinetic Energy (KE) and Potential Energy (PE) against its displacement d. Which one of the following represents these correctly? (graphs are schematic and not drawn to scale) **(2015)**

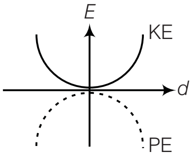
(a)



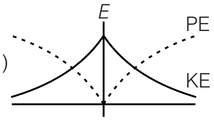
(b)



(c)



(d)



22. A pendulum made of a uniform wire of cross-sectional area A has time period T. When an additional mass M is added to its bob, the time period changes to T_M. If the Young's modulus of the material of the wire is Y, then $1/Y$ is equal to (g = gravitational acceleration) **(2015)**

(a) $\left[1-\left(\frac{T}{T_M}\right)^2\right]\frac{A}{Mg}$

(b) $\left[\left(\frac{T_M}{T}\right)^2-1\right]\frac{Mg}{A}$

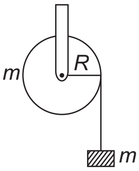
(c) $\left[1-\left(\frac{T_M}{T}\right)^2\right]\frac{A}{Mg}$

(d) $\left[\left(\frac{T_M}{T}\right)^2-1\right]\frac{A}{Mg}$

23. A bob of mass m attached to an inextensible string of length l is suspended from a vertical support. The bob rotates in a horizontal circle with an angular speed ω rad/s about the vertical support. About the point of suspension **(2014)**

(a) angular momentum is conserved
(b) angular momentum changes in magnitude but not in direction
(c) angular momentum changes in direction but not in magnitude
(d) angular momentum changes both in direction and magnitude

24. A mass m supported by a massless string wound around a uniform hollow cylinder of mass m and radius R. If the string does not slip on the cylinder, with what acceleration will the mass fall on release? **(2014)**



(a) $2g/3$ (b) $g/2$
(c) $5g/6$ (d) g

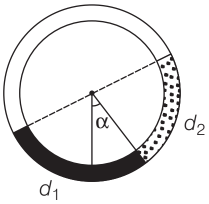
25. Four particles, each of mass M and equidistant from each other, move along a circle of radius R under the action of their mutual gravitational attraction, the speed of each particle is **(2014)**

(a) $\sqrt{\frac{GM}{R}}$ (b) $\sqrt{2\sqrt{2}\frac{GM}{R}}$
(c) $\sqrt{\frac{GM}{R}(1+2\sqrt{2})}$ (d) $\frac{1}{2}\sqrt{\frac{GM}{R}(1+2\sqrt{2})}$

26. A particle moves with simple harmonic motion in a straight line. In first τ sec, after starting from rest it travels a distance a and in next τ sec, it travels $2a$, in same direction, then **(2014)**

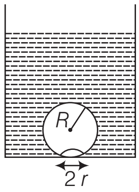
(a) amplitude of motion is $3a$
(b) time period of oscillations is 8π
(c) amplitude of motion is $4a$
(d) time period of oscillations is 6π

27. There is a circular tube in a vertical plane. Two liquids which do not mix and of densities d_1 and d_2 are filled in the tube. Each liquid subtends 90° angle at centre. Radius joining their interface makes an angle α with vertical. Ratio d_1 / d_2 is **(2014)**



(a) $\frac{1+\sin\alpha}{1-\sin\alpha}$ (b) $\frac{1+\cos\alpha}{1-\cos\alpha}$
(c) $\frac{1+\tan\alpha}{1-\tan\alpha}$ (d) $\frac{1+\sin\alpha}{1-\cos\alpha}$

28. On heating water, bubbles beings formed at the bottom of the vessel detach and rise. Take the bubbles to be spheres of radius R and making a circular contact of radius r with the bottom of the vessel. If $r << R$ and the surface tension of water is T, value of r just before bubbles detach is (density of water is ρ) **(2014)**



(a) $R^2\sqrt{\frac{2\rho_w g}{3T}}$ (b) $R^2\sqrt{\frac{\rho_w g}{6T}}$
(c) $R^2\sqrt{\frac{\rho_w g}{T}}$ (d) $R^2\sqrt{\frac{3\rho_w g}{T}}$

29. The pressure that has to be applied to the ends of a steel wire of length 10 cm to keep its length constant when its temperature is raised by 100°C is (For steel, Young's modulus is $2\times10^{11}\,\text{Nm}^{-2}$ and coefficient of thermal expansion is $1.1\times10^{-5}\,\text{K}^{-1}$) **(2014)**

(a) 2.2×10^{8} Pa
(b) 2.2×10^{9} Pa
(c) 2.2×10^{7} Pa
(d) 2.2×10^{6} Pa

30. An open glass tube is immersed in mercury in such a way that a length of 8 cm extends above the mercury level. The open end of the tube is then closed and sealed and the tube is raised vertically up by additional 46 cm. What will be length of the air column above mercury in the tube now? (Atmospheric pressure = 76 cm of Hg) **(2014)**

(a) 16 cm (b) 22 cm
(c) 38 cm (d) 6 cm

31. This question has statement I and statement II. Of the four choices given after the statements, choose the one that best describes the two statements. **(2013)**

Statement I A point particle of mass m moving with speed v collides with stationary point particle of mass M. If the maximum energy loss possible is given as $f\left(\frac{1}{2}mv^2\right)$, then $f = \left(\frac{m}{M+m}\right)$.

Statement II Maximum energy loss occurs when the particles get stuck together as a result of the collision.

(a) Statement I is true, Statement II is true, and Statement II is the correct explanation of Statement I
(b) Statement I is true, Statement II is true, but Statement II is not the correct explanation of Statement I
(c) Statement I is true, Statement II is false
(d) Statement I is false, Statement II is true

32. A hoop of radius r and mass m rotating with an angular velocity ω_0 is placed on a rough horizontal surface. The initial velocity of the centre of the hoop is zero. What will be the velocity of the centre of the hoop when it ceases to slip? **(2013)**

(a) $r\omega_0/4$ (b) $r\omega_0/3$
(c) $r\omega_0/2$ (d) $r\omega_0$

33. What is the minimum energy required to launch a satellite of mass m from the surface of a planet of mass M and radius R in a circular orbit at an altitude of $2R$? **(2013)**

(a) $\frac{5GmM}{6R}$ (b) $\frac{2GmM}{3R}$ (c) $\frac{GmM}{2R}$ (d) $\frac{GmM}{3R}$

34. Assume that a drop of liquid evaporates by decrease in its surface energy, so that its temperature remains unchanged. What should be the minimum radius of the drop for this to be possible? The surface tension is T, denstiy of liquid is ρ and L is its latent heat of vaporisation **(2013)**

(a) $\frac{\rho L}{T}$ (b) $\sqrt{\frac{T}{\rho L}}$ (c) $\frac{T}{\rho L}$ (d) $\frac{2T}{\rho L}$

35. A uniform cylinder of length L and mass M having cross-sectional area A is suspended, with its length vertical from a fixed point by a massless spring such that it is half submerged in a liquid of density σ at equilibrium position. The extension x_0 of the spring when it is in equilibrium is **(2013)**

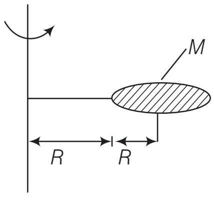
(a) $\frac{Mg}{k}$ (b) $\frac{Mg}{k}\left(1-\frac{LA\sigma}{M}\right)$
(c) $\frac{Mg}{k}\left(1-\frac{LA\sigma}{2M}\right)$ (d) $\frac{Mg}{k}\left(1+\frac{LA\sigma}{M}\right)$

Answer *with* Explanations

1. (d) **Key Idea** *First we found moment of inertia (MI) of system using parallel axis theorem about centre of mass, then we use it to find moment of inertia about given axis*.

Moment of inertia of an outer disc about the axis through centre is

$$= \frac{MR^2}{2} + M(2R)^2 = MR^2\left(4 + \frac{1}{2}\right) = \frac{9}{2}MR^2$$



For 6 such discs,

$$\text{moment of inertia} = 6 \times \frac{9}{2}MR^2 = 27MR^2$$

So, moment of inertia of system

$$= \frac{MR^2}{2} + 27MR^2 = \frac{55}{2}MR^2$$

Hence, $I_P = \frac{55}{2}MR^2 + (7M \times 9R^2)$

$$\Rightarrow \quad I_P = \frac{181}{2}MR^2 \quad \text{and} \quad I_{\text{system}} = \frac{181}{2}MR^2$$

2. (a) Moment of inertia of remaining solid
= Moment of intertia of complete solid
– Moment of inertia of removed portion

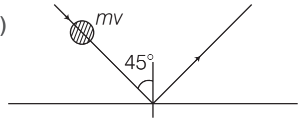
$$\therefore \quad I = \frac{9MR^2}{2} - \left[\frac{M(R/3)^2}{2} + M\left(\frac{2R}{3}\right)^2\right] \Rightarrow I = 4MR^2$$

3. **(c)** $\therefore$ Bulk modulus, $K = \dfrac{\text{Volumetric stress}}{\text{Volumetric strain}} = \dfrac{\Delta p}{\dfrac{\Delta V}{V}}$

$$\Rightarrow \quad K = \frac{mg}{a\left(\dfrac{3\Delta r}{r}\right)} \qquad \left[\because V = \frac{4}{3}\pi r^3, \text{ so } \frac{\Delta V}{V} = \frac{3\Delta r}{r}\right]$$

$$\Rightarrow \quad \frac{\Delta r}{r} = \frac{mg}{3Ka}$$

4. **(a)**



Momentum imparted due to first collision

$$= 2mv\sin 45°$$

$$= \sqrt{2}mv \qquad \left[\because \sin 45° = \frac{1}{\sqrt{2}}\right]$$

$$\therefore \text{Pressure on surface} = \frac{n\sqrt{2}mv}{\text{Area}}$$

$$= \frac{10^{23} \times \sqrt{2} \times 3.32 \times 10^{-27} \times 10^{3}}{(2 \times 10^{-2})^2}$$

$$p = 2.35 \times 10^3 \text{ N/m}^2$$

5. **(d)** MI of a solid cylinder about its perpendicular bisector of length is

$$I = M\left(\frac{l^2}{12} + \frac{R^2}{4}\right)$$

$$\Rightarrow \quad I = \frac{mR^2}{4} + \frac{ml^2}{12} = \frac{m^2}{4\pi\rho l} + \frac{ml^2}{12} \qquad [\because \rho\pi r^2 l = m]$$

For I to be maximum,

$$\frac{dI}{dl} = -\frac{m^2}{4\pi\rho}\left(\frac{1}{l^2}\right) + \frac{ml}{6} = 0 \Rightarrow \frac{m^2}{4\mu\pi\rho} = \frac{ml^3}{6}$$

$$\Rightarrow \quad l^3 = \frac{3m}{2\,\pi\rho} \Rightarrow l = \left(\frac{3}{2}\right)^{1/3}\left(\frac{m}{\pi\rho}\right)^{1/3}$$

$$\rho = \frac{m}{\pi R^2 l} \Rightarrow R^2 = \frac{m}{\pi\rho l}$$

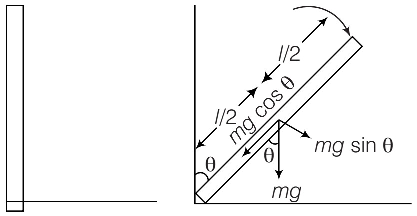
$$\Rightarrow \quad R^2 = \frac{m}{\pi\rho}\left(\frac{2}{3}\right)^{1/3}\left(\frac{\pi\rho}{m}\right)^{1/3} = \left(\frac{m}{\pi\rho}\right)^{2/3}\left(\frac{2}{3}\right)^{1/3}$$

$$\Rightarrow \quad R = \left(\frac{m}{\pi\rho}\right)^{1/3}\left(\frac{2}{3}\right)^{1/6}$$

$$\frac{l}{R} = \frac{\left(\dfrac{3}{2}\right)^{1/3}\left(\dfrac{m}{\pi\rho}\right)^{1/3}}{\left(\dfrac{m}{\pi\rho}\right)^{1/3}\left(\dfrac{2}{3}\right)^{1/6}}$$

$$= \left(\frac{3}{2}\right)^{1/3} + \left(\frac{3}{2}\right)^{1/6} \Rightarrow \frac{l}{R} = \sqrt{\frac{3}{2}}$$

6. **(d)** As the rod rotates in vertical plane so a torque is acting on it, which is due to the vertical component of weight of rod.



Initial condition At any time t

Now, Torque τ = force × perpendicular distance of line of action of force from axis of rotation

$$= mg\sin\theta \times \frac{l}{2}$$

Again, Torque, $\tau = I\alpha$

where, I = moment of inertia $= \dfrac{ml^2}{3}$

[Force and Torque frequency along axis of rotation passing through in end]

α = angular acceleration

$$\therefore \quad mg\sin\theta \times \frac{l}{2} = \frac{ml^2}{3}\alpha \Rightarrow \alpha = \frac{3g\sin\theta}{2l}$$

7. **(c)** Inside the earth surface

$$g = \frac{GM}{R^3}r \quad \text{i.e.} \quad g \propto r$$

Out the earth surface $g = \dfrac{Gm}{r^2}$ i.e. $g \propto \dfrac{1}{r^2}$

So, till earth surface g increases linearly with distance r, shown only in graph (c).

8. **(c)** KE is maximum at mean position and minimum at extreme position $\left(\text{at } t = \dfrac{T}{4}\right)$.

9. **(d)** Time period of oscillation is

$$T = 2\pi\sqrt{\frac{I}{MB}}$$

$$\Rightarrow \quad T = 2\pi\sqrt{\frac{7.5 \times 10^{-6}}{6.7 \times 10^{-2} \times 0.01}} = 0.665 \text{ s}$$

Hence, time for 10 oscillations is $t = 6.65$ s.

10. **(a)** By ascent formula, we have surface tension,

$$T = \frac{rhg}{2} \times 10^3 \frac{\text{N}}{\text{m}} = \frac{dhg}{4} \times 10^3 \frac{\text{N}}{\text{m}}$$

$$\Rightarrow \quad \frac{\Delta T}{T} = \frac{\Delta d}{d} + \frac{\Delta h}{h} \qquad \text{[given, } g \text{ is constant]}$$

$$\text{So, percentage} = \frac{\Delta T}{T} \times 100 = \left(\frac{\Delta d}{d} + \frac{\Delta h}{h}\right) \times 100$$

$$= \left(\frac{0.01\times 10^{-2}}{1.25\times 10^{-2}} + \frac{0.01\times 10^{-2}}{1.45\times 10^{-2}}\right)\times 100 = 1.5\%$$

$\therefore \quad \frac{\Delta T}{T}\times 100 = 1.5\%$

11. **(d)** Stress $= \frac{\text{Weight}}{\text{Area}} = \frac{9^3 \times W_0}{9^2 \times A_0} = 9\left(\frac{W_0}{A_0}\right)$

Hence, the stress increases by a factor of 9.

12. **(b, d)** We can apply $\mathbf{L} = m(\mathbf{r}\times\mathbf{v})$ for different parts.

For example :

In part (a), coordinates of A are $\left(\frac{R}{\sqrt{2}}, \frac{R}{\sqrt{2}}\right)$

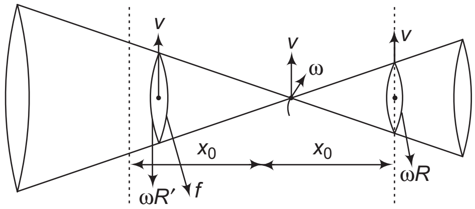
Therefore, $\quad \mathbf{r} = \frac{R}{\sqrt{2}}\hat{\mathbf{i}} + \frac{R}{\sqrt{2}}\hat{\mathbf{j}}$ and $\mathbf{v} = v\hat{\mathbf{i}}$

So, substituting in $\quad \mathbf{L} = m(\mathbf{r}\times\mathbf{v})$ we get,

$$\mathbf{L} = -\frac{mvR}{\sqrt{2}}\hat{\mathbf{k}}$$

Hence, option (a) is correct. Similarly, we can check other options also.

13. **(a)**



At distance x_0 from O, $v = \omega R$

Distance less than x_0, $v > \omega R$

Initially, there is pure rolling at both the contacts. As the cone moves forward, slipping at AB will start in forward direction, as radius at left contact decreases.

Thus, the cone will start turning towards left. As it moves, further slipping at CD will start in backward direction which will also turn the cone towards left.

14. **(d)** $v_{\text{orbital}} = \sqrt{\frac{GM}{R}} = \sqrt{gR} \quad\Rightarrow\quad v_{\text{escape}} = \sqrt{2gR}$

$\therefore$ Extra velocity required

$$= v_{\text{escape}} - v_{\text{orbital}} = \sqrt{gR}\,(\sqrt{2}-1)$$

15. **(a)** True value $= \frac{90+91+95+92}{4} = 92$

Mean absolute error

$$= \frac{|92-90|+|92-91|+|92-95|+|92-92|}{4}$$

$$= \frac{2+1+3+0}{4} = 1.5$$

Value = (92 ± 1.5)

Since, least count is 1 sec

$\therefore \qquad$ Value = (92 ± 2 s)

16. **(d)** $v = \omega\sqrt{A^2 - x^2}$ At, $x = \frac{2A}{3}$

$$v = \omega\sqrt{A^2 - \left(\frac{2A}{3}\right)^2} = \frac{\sqrt{5}}{3}\omega A$$

As, velocity is trebled, hence $v' = \sqrt{5}A\omega$

This leads to new amplitude A'

$$\therefore \qquad \omega\sqrt{A'^2 - \left(\frac{2A}{3}\right)^2} = \sqrt{5}A\omega$$

$$\Rightarrow \qquad \omega^2\left[A'^2 - \frac{4A^2}{9}\right] = 5A^2\omega^2$$

$$\Rightarrow A'^2 = 5A^2 + \frac{4}{9}A^2 = \frac{49}{9}A^2 \;\Rightarrow\; A' = \frac{7}{3}A$$

17. **(a)** Centre of mass of uniform solid cone of height h is at a height of $\frac{h}{4}$ from base. Therefore from vertex it's $\frac{3h}{4}$.

18. **(b)** In all type of collisions, momentum of the system always remains constant. In perfectly inelastic collision, particles stick together and move with a common velocity.

Let this velocity is $\mathbf{v}_c$. Then,

initial momentum of system = final momentum of system

or $\qquad m(2v)\hat{\mathbf{i}} + 2m(v)\hat{\mathbf{j}} = (m+2m)\mathbf{v}_c$

$$\therefore \qquad \mathbf{v}_c = \frac{2}{3}(v\hat{\mathbf{i}} + v\hat{\mathbf{j}})$$

$$|\mathbf{v}_c| \text{ or } v_c \text{ or speed} = \sqrt{\left(\frac{2}{3}v\right)^2 + \left(\frac{2}{3}v\right)^2} = \frac{2\sqrt{2}}{3}v$$

Initial kinetic energy

$$K_i = \frac{1}{2}(m)(2v)^2 + \frac{1}{2}(2m)(v)^2 = 3mv^2$$

Final kinetic energy

$$K_f = \frac{1}{2}(3m)\left(\frac{2\sqrt{2}}{3}v\right)^2 = \frac{4}{3}mv^2$$

$$\text{Fractional loss} = \left(\frac{K_i - K_f}{K_i}\right)\times 100$$

$$= \left[\frac{(3mv^2) - [(4/3)mv^2]}{(3mv^2)}\right]\times 100 = 56\%$$

19. **(b)** Maximum possible volume of cube will occur when

$$\sqrt{3}a = 2R \qquad (a = \text{side of cube})$$

$$\therefore \qquad a = \frac{2}{\sqrt{3}}R$$

Now, density of sphere, $\rho = \dfrac{M}{\frac{4}{3}\pi R^3}$

Mass of cube, $m =$ (volume of cube)$(\rho) = (a^3)(\rho)$

$$= \left[\frac{2}{\sqrt{3}}R\right]^3\left[\frac{m}{(4/3)\pi R^3}\right] = \left(\frac{2}{\sqrt{3}\pi}\right)M$$

Now, moment of inertia of the cube about the said axis is

$$I = \frac{ma^2}{6} = \frac{\left(\frac{2}{\sqrt{3}\pi}\right)M\left(\frac{2}{\sqrt{3}}R\right)^2}{\sigma} = \frac{4MR^2}{9\sqrt{3}\pi}$$

20. **(a)** $V_R = V_T - V_C$

$V_R =$ Potential due to remaining portion

$V_T =$ Potential due to total sphere

$V_C =$ Potential due to cavity

Radius of cavity is $\frac{R}{2}$. Hence, volume and mass is $\frac{M}{8}$.

$$\therefore\ V_R = -\frac{GM}{R^3}\left[1.5R^2 - 0.5\left(\frac{R}{2}\right)^2\right] + \frac{G(M/8)}{(R/2)}\left(\frac{3}{2}\right)$$

$$= -\frac{GM}{R}$$

21. **(a)** Taking minimum potential energy at mean position to be zero, the expression of KE and PE are

$$\text{KE} = \frac{1}{2}m\omega^2(A^2 - d^2) \text{ and PE} = \frac{1}{2}m\omega^2 d^2$$

Both graphs are parabola. At $d = 0$, the mean position,

$\text{PE} = 0$ and $\text{KE} = \frac{1}{2}m\omega^2A^2 =$ maximum

At $d = \pm A$, the extreme positions,

$\text{KE} = 0$ and $\text{PE} = \frac{1}{2}m\omega^2A^2 =$ maximum

Therefore, the correct graph is (a).

22. **(d)**

$$T = 2\pi\sqrt{\frac{L}{g}} \qquad \ldots\text{(i)}$$

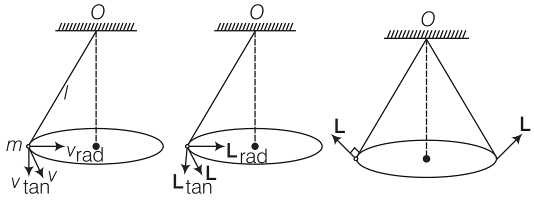
$$T_M = 2\pi\sqrt{\frac{L+\Delta L}{g}}$$

Here, $\Delta L = \frac{FL}{AY} = \frac{MgL}{AY} \Rightarrow T_M = 2\pi\sqrt{\frac{L + \frac{MgL}{AY}}{g}} \qquad \ldots\text{(ii)}$

Solving Eqs. (i) and (ii), we get

$$\frac{1}{Y} = \frac{A}{Mg}\left[\left(\frac{T_M}{T}\right)^2 - 1\right]$$

23. **(c)** Angular momentum of the pendulum about the suspension point O is

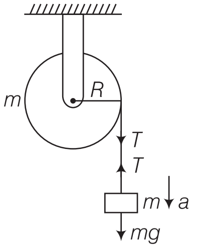


Then, v can be resolved into two components, radial component r_{rad} and tangential component $r_{\tan}$. Due to v_{rad}, L will be tangential and due to $v_{\tan}$, L will be radially outwards as shown. So, net angular momentum will be as shown in figure whose magnitude will be constant ($|L| = mvl$). But its direction will change as shown in the figure.

$$\mathbf{L} = m(\mathbf{r} \times \mathbf{v})$$

where, $r =$ radius of circle.

24. **(b)** For the mass m, $mg - T = ma$



As we know, $a = R\alpha$

So, $mg - T = mR\alpha \qquad \ldots\text{(i)}$

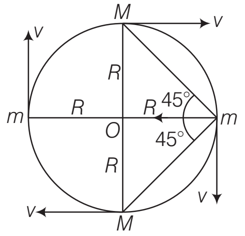
Torque about centre of pully

$$T \times R = mR^2\alpha \qquad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we get, $a = g/2$

Hence, the acceleration with the mass of a body fall is $g/2$.

25. **(d)** Net force acting on any one particle M,



$$= \frac{GM^2}{(2R)^2} + \frac{GM^2}{(R\sqrt{2})^2}\cos 45° + \frac{GM^2}{(R\sqrt{2})^2}\cos 45°$$

$$= \frac{GM^2}{R^2}\left(\frac{1}{4} + \frac{1}{\sqrt{2}}\right)$$

This force will equal to centripetal force.

So, $\frac{Mv^2}{R} = \frac{GM^2}{R^2}\left(\frac{1}{4} + \frac{1}{\sqrt{2}}\right)$

$$v = \sqrt{\frac{GM}{4R}(1 + 2\sqrt{2})}$$

$$= \frac{1}{2}\sqrt{\frac{GM}{R}(2\sqrt{2} + 1)}$$

Hence, speed of each particle in a circular motion is

$$\frac{1}{2}\sqrt{\frac{GM}{R}(2\sqrt{2} + 1)}.$$

26. **(d)** In SHM, a particle starts from rest, we have

i.e. $x = A\cos\omega t$, at $t = 0$, $x = A$

When $t = \tau$, then $x = A - a$ ...(i)

When $t = 2\tau$, then $x = A - 3a$ ...(ii)

On comparing Eqs. (i) and (ii), we get

$$A - a = A\cos\omega\tau \Rightarrow A - 3a = A\cos 2\omega\tau$$

As $\cos 2\omega\tau = 2\cos^2\omega\tau - 1$

$$\Rightarrow \frac{A-3a}{A} = 2\left(\frac{A-a}{A}\right)^2 - 1$$

$$\Rightarrow \frac{A-3a}{A} = \frac{2A^2 + 2a^2 - 4Aa - A^2}{A^2}$$

$$A^2 - 3aA = A^2 + 2a^2 - 4Aa$$

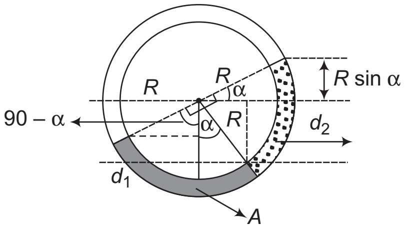
$$a^2 = 2aA \Rightarrow A = 2a$$

Now, $A - a = A\cos\omega\tau$

$$\Rightarrow \cos\omega\tau = 1/2 \Rightarrow \frac{2\pi}{T}\tau = \frac{\pi}{3} \Rightarrow T = 6\pi$$

27. **(c)** Equating pressure at A, we get

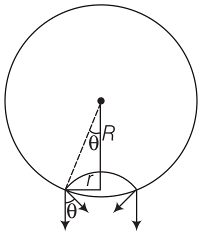
$$R\sin\alpha\, d_2 + R\cos\alpha\, d_2 + R(1-\cos\alpha)\, d_1 = R(1-\sin\alpha)\, d_1$$



$$(\sin\alpha + \cos\alpha)\, d_2 = d_1(\cos\alpha - \sin\alpha)$$

$$\Rightarrow \frac{d_1}{d_2} = \frac{1+\tan\alpha}{1-\tan\alpha}$$

28. **(a)** The bubble will detach if,



$$\int \sin\theta T \times dl = T(2\pi r)\sin\theta$$

Buoyant force ≥ Surface tension force

$$\frac{4}{3}\pi R^3 \rho_w g \geq \int T \times dl \sin\theta$$

$$(\rho_w)\left(\frac{4}{3}\pi R^3\right)g \geq (T)(2\pi r)\sin\theta \Rightarrow \sin\theta = \frac{r}{R}$$

Solving, $r = \sqrt{\dfrac{2\rho_w R^4 g}{3T}} = R^2\sqrt{\dfrac{2\rho_w g}{3T}}$

29. **(a)** If the deformation is small, then the stress in a body is directly proportional to the corresponding strain.

According to Hooke's law i.e.

$$\text{Young's modulus } (Y) = \frac{\text{Tensile stress}}{\text{Tensile strain}}$$

So, $Y = \dfrac{F/A}{\Delta L/L} = \dfrac{FL}{A\Delta L}$

If the rod is compressed, then compressive stress and strain appear. Their ratio Y is same as that for tensile case.

Given, length of a steel wire $(L) = 10$ cm

Temperature $(\theta) = 100°\text{C}$

As length is constant.

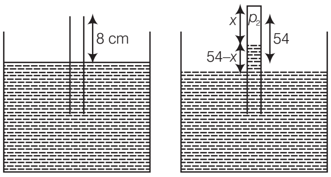
$\therefore$ $\text{Strain} = \dfrac{\Delta L}{L} = \alpha\,\Delta\theta$

Now, pressure = stress = $Y \times$ strain

[Given, $Y = 2\times10^{11}\ \text{N/m}^2$ and $\alpha = 1.1\times10^{-5}\ \text{K}^{-1}$]

$$= 2\times10^{11}\times1.1\times10^{-5}\times100 = 2.2\times10^{8}\ \text{Pa}$$

30. **(a)** **Thinking Process** In this question, the system is accelerating horizontally i.e. no component of acceleration in vertical direction. Hence, the pressure in the vertical direction will remain unaffected.



i.e. $p_1 = p_0 + \rho g h$

Again, we have to use the concept that the pressure in the same level will be same.

For air trapped in tube, $p_1V_1 = p_2V_2$

$p_1 = p_{\text{atm}} = \rho g 76 \Rightarrow V_1 = A\cdot 8$

[A = area of cross-section]

$p_2 = p_{\text{atm}} - \rho g(54 - x) = \rho g(22 + x)$

$V_2 = A\cdot x \qquad \rho g 76\times 8A = \rho g(22 + x)A\,x$

$$x^2 + 22x - 78\times 8 = 0 \Rightarrow x = 16\ \text{cm}$$

31. **(d)** Maximum energy loss

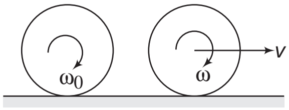
$$= \frac{p^2}{2m} - \frac{p^2}{2(m+M)} \qquad \left(\because \text{KE} = \frac{p^2}{2m}\right)$$

Before collision the mass m and after collision the mass is $m + M$

$$= \frac{p^2}{2m}\left[\frac{M}{(m+M)}\right]$$

$$= \frac{1}{2}mv^2\left\{\frac{M}{m+M}\right\} \qquad \left(f = \frac{M}{m+M}\right)$$

32. (c)



$$\omega = v/r$$

From conservation of angular momentum about bottommost point

$$mr^2\omega_0 = mvr + mr^2 \times v/r \;\Rightarrow\; v = \frac{\omega_0 r}{2}$$

33. (a) E = Energy of satellite – energy of mass on the surface of planet

$$= -\frac{GMm}{2r} - \left(-\frac{GMm}{R}\right)$$

Here, $\quad r = R + 2R = 3R$

Substituting in about equation we get, $E = \dfrac{5GMm}{6R}$

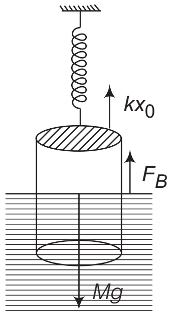
34. (d) Decrease in surface energy = heat required in vaporisation.

$\therefore \quad T(dS) = L(dm) \Rightarrow T(2)(4\pi r)dr = L(4\pi r^2 dr)\rho$

$\therefore \qquad r = \dfrac{2T}{\rho L}$

35. (c) In equilibrium, Upward force = Downward force

$$kx_0 + F_B = mg$$



Here, kx_0 is restoring force of spring and F_B is buoyancy force.

$$kx_0 + \sigma\frac{L}{2}Ag = Mg$$

$$x_0 = \frac{Mg - \dfrac{\sigma LAg}{2}}{k}$$

JEE Advanced

1. The potential energy of mass m at a distance r from a fixed point O is given by $V(r) = kr^2/2$, where k is a positive constant of appropriate dimensions. This particle is moving in a circular orbit of radius R about the point O. If v is the speed of the particle and L is the magnitude of its angular momentum about O, which of the following statements is (are) true ?

(More than One Correct Option, 2018)

(a) $v = \sqrt{\dfrac{k}{2m}}R$ (b) $v = \sqrt{\dfrac{k}{m}}R$

(c) $L = \sqrt{mk}R^2$ (d) $L = \sqrt{\dfrac{mk}{2}}R^2$

2. Consider a body of mass 1.0 kg at rest at the origin at time $t = 0$. A force $\mathbf{F} = (\alpha t\,\hat{\mathbf{i}} + \beta\,\hat{\mathbf{j}})$ is applied on the body, where $\alpha = 1.0\,\text{Ns}^{-1}$ and $\beta = 1.0\,\text{N}$. The torque acting on the body about the origin at time $t = 1.0\,\text{s}$ is τ. Which of the following statements is (are) true ?

(More than One Correct Option, 2018)

(a) $|\tau| = \dfrac{1}{3}\,\text{N-m}$

(b) The torque τ is in the direction of the unit vector $+\hat{\mathbf{k}}$

(c) The velocity of the body at $t = 1\,\text{s}$ is $\mathbf{v} = \dfrac{1}{2}(\hat{\mathbf{i}} + 2\hat{\mathbf{j}})\,\text{ms}^{-1}$

(d) The magnitude of displacement of the body at $t = 1\,\text{s}$ is $\dfrac{1}{6}\,\text{m}$

3. A uniform capillary tube of inner radius r is dipped vertically into a beaker filled with water. The water rises to a height h in the capillary tube above the water surface in the beaker. The surface tension of water is σ. The angle of contact between water and the wall of the capillary tube is θ. Ignore the mass of water in the meniscus. Which of the following statements is (are) true ?

(More than one Correct Option, 2018)

(a) For a given material of the capillary tube, h decreases with increase in r

(b) For a given material of the capillary tube, h is independent of σ

(c) If this experiment is performed in a lift going up with a constant acceleration, then h decreases

(d) h is proportional to contact angle θ

4. A ring and a disc are initially at rest, side by side, at the top of an inclined plane which makes an angle 60° with the horizontal. They start to roll without slipping at the same instant of time along the shortest path. If the time difference between their reaching the ground is $(2-\sqrt{3})/\sqrt{10}$ s, then the height of the top of the inclined plane, in metres, is .... (Take, $g = 10\text{ms}^{-2}$) **(Numerical Value, 2018)**

5. Consider a thin square plate floating on a viscous liquid in a large tank. The height h of the liquid in the tank is much less than the width of the tank. The floating plate is pulled horizontally with a constant velocity u_0. Which of the following statements is (are) true? **(More than One Correct Option, 2018)**

(a) The resistive force of liquid on the plate is inversely proportional to h

(b) The resistive force of liquid on the plate is independent of the area of the plate

(c) The tangential (shear) stress on the floor of the tank increases with u_0

(d) The tangential (shear) stress on the plate varies linearly with the viscosity η of the liquid

6. A steel wire of diameter 0.5 mm and Young's modulus 2×10^{11} N m^{-2} carries a load of mass m. The length of the wire with the load is 1.0 m. A vernier scale with 10 divisions is attached to the end of this wire. Next to the steel wire is a reference wire to which a main scale, of least count 1.0 mm, is attached. The 10 divisions of the vernier scale correspond to 9 divisions of the main scale. Initially, the zero of vernier scale coincides with the zero of main scale. If the load on the steel wire is increased by 1.2 kg, the vernier scale division which coincides with a main scale division is .... (Take, $g = 10$ ms^{-2} and $\pi = 3.2$). **(Numerical Value, 2018)**

7. A planet of mass M, has two natural satellites with masses m_1 and m_2. The radii of their circular orbits are R_1 and R_2, respectively. Ignore the gravitational force between the satellites. Define v_1, L_1, K_1 and T_1 to be respectively, the orbital speed, angular momentum, kinetic energy and time period of revolution of satellite 1; and v_2, L_2, K_2 and T_2 to be the corresponding quantities of satellite 2. Given, $m_1/m_2 = 2$ and $R_1/R_2 = 1/4$, match the ratios in List-I to the numbers in List-II. **(Matching Type, 2018)**

List-I	List-II
P. v_1/v_2	1. 1/8
Q. L_1/L_2	2. 1
R. K_1/K_2	3. 2

Passage (Q. Nos. 9-10)

One twirl is a circular ring (of mass M and radius R) near the tip of one's finger as shown in Fig. 1. In the process the finger never loses contact with the inner rim of the ring. The finger traces out the surface of a cone, shown by the dotted line. The radius of the path traced out by the point where the ring and the finger is in contact is r. The finger rotates with an angular velocity ω_0.

The rotating ring rolls without slipping on the outside of a smaller circle described by the point where the ring and the finger is in contact (Fig. 2). The coefficient of friction between the ring and the finger is μ and the acceleration due to gravity is g.

(Passage Type, 2017)

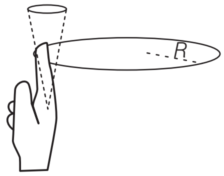

Fig. 1

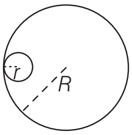

Fig. 2

9. The total kinetic energy of the ring is

(a) $M\omega_0^2(R-r)^2$ (b) $\frac{1}{2}M\omega_0^2(R-r)^2$

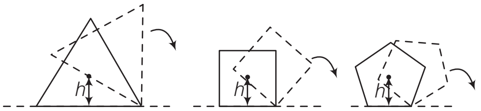
(c) $M\omega_0^2R^2$ (d) $\frac{3}{2}M\omega_0^2(R-r)^2$

10. The minimum value of ω_0 below which the ring will drop down is

(a) $\sqrt{\frac{g}{2\mu(R-r)}}$ (b) $\sqrt{\frac{3g}{2\mu(R-r)}}$

(c) $\sqrt{\frac{g}{\mu(R-r)}}$ (d) $\sqrt{\frac{2g}{\mu(R-r)}}$

11. Consider regular polygons with number of sides $n = 3, 4, 5$ …… as shown in the figure. The centre of mass of all the polygons is at height h from the ground. They roll on a horizontal surface about the leading vertex without slipping and sliding as depicted. The maximum increase in height of the locus of the centre of mass for each each polygon is Δ. Then, Δ depends on n and h as **(Single Correct Option, 2017)**

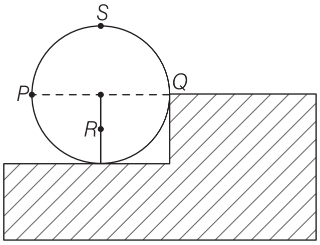


(a) $\Delta = h\sin^2\left(\frac{\pi}{n}\right)$ (b) $\Delta = h\sin\left(\frac{2\pi}{n}\right)$

(c) $\Delta = h\tan^2\left(\frac{\pi}{2n}\right)$ (d) $\Delta = h\left(\frac{1}{\cos\left(\frac{\pi}{n}\right)} - 1\right)$

12. A wheel of radius R and mass M is placed at the bottom of a fixed step of height R as shown in the figure. A constant force is continuously applied on the surface of the wheel so that it just climbs the step without slipping. Consider the torque τ about an axis normal to the plane of the paper passing through the point Q. Which of the following option(s) is/are correct?

(More than One Correct Option, 2017)



(a) If the force is applied normal to the circumference at point P, then τ is zero

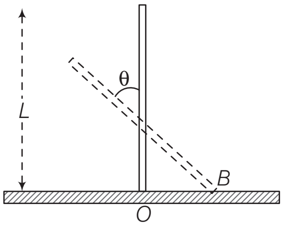
(b) If the force is applied tangentially at point S, then $\tau \neq 0$ but the wheel never climbs the step

(c) If the force is applied at point P tangentially, then τ decreases continuously as the wheel climbs

(d) If the force is applied normal to the circumference at point X, then τ is constant

13. A rigid uniform bar AB of length L is slipping from its vertical position on a frictionless floor (as shown in the figure). At some instant of time, the angle made by the bar with the vertical is θ. Which of the following statements about its motion is/are correct?

(More than One Correct Option, 2017)



(a) Instantaneous torque about the point in contact with the floor is proportional to $\sin\theta$

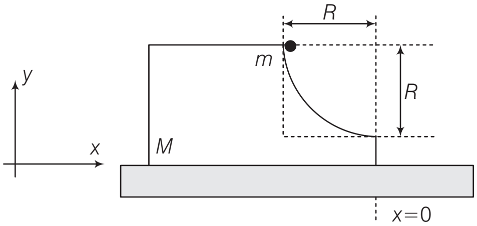
(b) The trajectory of the point A is parabola

(c) The mid-point of the bar will fall vertically downward

(d) When the bar makes an angle θ with the vertical, the displacement of its mid-point from the initial position is proportional to $(1-\cos\theta)$

14. A block of mass M has a circular cut with a frictionless surface as shown. The block rests on the horizontal frictionless surface of a fixed table. Initially, the right edge of the block is at $x = 0$, in a coordinate system fixed to the table. A point mass m is released from rest at the topmost point of the path as shown and it slides down. When the mass loses contact with the block, its position is x and the velocity is v. At that instant, which of the following option(s) is/are correct?

(More than One Correct Option, 2017)



(a) The velocity of the point mass m is $v = \sqrt{\dfrac{2gR}{1+\dfrac{m}{M}}}$

(b) The x component of displacement of the centre of mass of the block M is $-\dfrac{mR}{M+m}$

(c) The position of the point mass is $x = -\sqrt{2}\dfrac{mR}{M+m}$

(d) The velocity of the block M is $v = -\dfrac{m}{M}\sqrt{2gR}$

15. A rocket is launched normal to the surface of the Earth, away from the Sun, along the line joining the Sun and the Earth. The Sun is 3×10^5 times heavier than the Earth and is at a distance 2.5×10^4 times larger than the radius of Earth. The escape velocity from Earth's gravitational field is $v_e = 11.2 \text{ km s}^{-1}$. The minimum initial velocity (v_s) required for the rocket to be able to leave the Sun-Earth system is closest to (Ignore the rotation and revolution of the Earth and the presence of any other planet)

(Single Correct Option, 2017)

(a) $v_s = 72 \text{ km s}^{-1}$

(b) $v_s = 22 \text{ km s}^{-1}$

(c) $v_s = 42 \text{ km s}^{-1}$

(d) $v_s = 62 \text{ km s}^{-1}$

16. Consider an expanding sphere of instantaneous radius R whose total mass remains constant. The expansion is such that the instantaneous density ρ remains uniform throughout the volume. The rate of fractional change in density $\left(\dfrac{1}{p}\dfrac{d\rho}{dt}\right)$ is constant. The velocity v of any point of the surface of the expanding sphere is proportional to **(Single Correct Option, 2017)**

(a) R (b) $\dfrac{1}{R}$

(c) R^3 (d) $R^{\frac{2}{3}}$

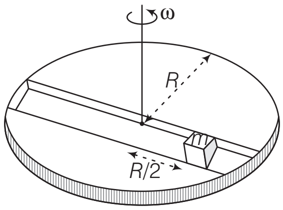
17. A drop of liquid of radius $R = 10^{-2}$ m having surface tension $S = \dfrac{0.1}{4\pi} \text{ Nm}^{-1}$ divides itself into K identical drops. In this process the total change in the surface energy $\Delta U = 10^{-3}$ J. If $K = 10^{\alpha}$, then the value of α is

(Single Integer Type, 2017)

Passage (Q. Nos. 18-19)

A frame of the reference that is accelerated with respect to an inertial frame of reference is called a non-inertial frame of reference. A coordinate system fixed on a circular disc rotating about a fixed axis with a constant angular velocity ω is an example of a non-inertial frame of reference.

The relationship between the force $\mathbf{F}_{\text{rot}}$ experienced by a particle of mass m moving on the rotating disc and the force $\mathbf{F}_{\text{in}}$ experienced by the particle in an inertial frame of reference is, $\mathbf{F}_{\text{rot}} = \mathbf{F}_{\text{in}} + 2m\,(\mathbf{v}_{\text{rot}} \times \vec{\omega}) + m\,(\vec{\omega} \times \mathbf{r}) \times \vec{\omega}$, where, $\mathbf{v}_{\text{rot}}$ is the velocity of the particle in the rotating frame of reference and $\mathbf{r}$ is the position vector of the particle with respect to the centre of the disc



Now, consider a smooth slot along a diameter of a disc of radius R rotating counter-clockwise with a constant angular speed ω about its vertical axis through its centre.

We assign a coordinate system with the origin at the centre of the disc, the X-axis along the slot, the Y-axis perpendicular to the slot and the Z-axis along th rotation axis $(\omega = \omega\mathbf{k})$. A small block of mass m is gently placed in the slot at $\mathbf{r} = (R/2)\,\hat{\mathbf{i}}$ at $t = 0$ and is constrained to move only along the slot. **(Passage Type, 2016)**

18. The distance r of the block at time t is

(a) $\frac{R}{2}\cos 2\omega t$ (b) $\frac{R}{2}\cos\omega t$

(c) $\frac{R}{4}(e^{\omega t} + e^{-\omega t})$ (d) $\frac{R}{4}(e^{2\omega t} + e^{-2\omega t})$

19. The net reaction of the disc on the block, is

(a) $m\omega^2 R\sin\omega t\,\hat{\mathbf{j}} - mg\hat{\mathbf{k}}$

(b) $\frac{1}{2}m\omega^2 R(e^{\omega t} - e^{-\omega t})\hat{\mathbf{j}} + mg\hat{\mathbf{k}}$

(c) $\frac{1}{2}m\omega^2 R(e^{2\omega t} - e^{-\omega t})\hat{\mathbf{j}} + mg\hat{\mathbf{k}}$

(d) $-m\omega^2 R\cos\omega t\,\hat{\mathbf{j}} - mg\hat{\mathbf{k}}$

20. The position vector $\mathbf{r}$ of particle of mass m is given by the following equation $\mathbf{r}(t) = \alpha t^3\hat{\mathbf{i}} + \beta t^2\hat{\mathbf{j}}$ where, $\alpha = \frac{10}{3}\,\text{ms}^{-3}$, $\beta = 5\,\text{ms}^{-2}$ and $m = 0.1$ kg. At $t = 1$ s, which of the following statement(s) is (are) true about the particle? **(More than One Correct Option, 2016)**

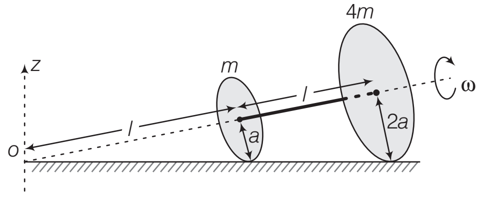
(a) The velocity $\mathbf{v}$ is given by $\mathbf{v} = (10\hat{\mathbf{i}} + 10\hat{\mathbf{j}})\text{ms}^{-1}$

(b) The angular momentum $\mathbf{L}$ with respect to the origin is given by $\mathbf{L} = (5/3)\hat{\mathbf{k}}$Nm-s

(c) The force $\mathbf{F}$ is given by $\mathbf{F} = (\hat{\mathbf{i}} + 2\hat{\mathbf{j}})$ N

(d) The torque τ with respect to the origin is given by $\tau = -\frac{20}{3}\hat{\mathbf{k}}$N-s

21. Two thin circular discs of mass m and $4m$, having radii of a and $2a$, respectively, are rigidly fixed by a massless, rigid rod of length $l = \sqrt{24}\,a$ through their centres. This assembly is laid on a firm and flat surface and set rolling without slipping on the surface so that the angular speed about the axis of the rod is ω. The angular momentum of the entire assembly about the point 'O' is $\mathbf{L}$ (see the figure). Which of the following statement(s) is (are) true? **(More than One Correct Option, 2016)**



(a) The magnitude of the z-component of $\mathbf{L}$ is $55\,ma^2\omega$

(b) The magnitude of angular momentum of centre of mass of the assembly about the point O is $81\,ma^2\omega$

(c) The centre of mass of the assembly rotates about the Z-axis with an angular speed of $\omega/5$

(d) The magnitude of angular momentum of the assembly about its centre of mass is $17\,ma^2\omega/2$

22. A block with mass M is connected by a massless spring with stiffness constant k to a rigid wall and moves without friction on a horizontal surface. The block oscillates with small amplitude A about an equilibrium position x_0. Consider two cases : (i) when the block is at x_0 and (ii) when the block is at $x = x_0 + A$. In both the cases, a particle with mass m ($< M$) is softly placed on the block after which they stick to each other. Which of the following statement(s) is (are) true about the motion after the mass m is placed on the mass M?

(More than One Correct Option, 2016)

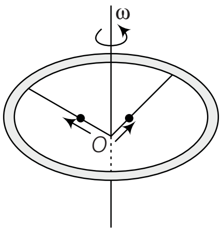
(a) The amplitude of oscillation in the first case changes by a factor of $\sqrt{\frac{M}{m+M}}$, whereas in the second case it remains unchanged

(b) The final time period of oscillation in both the cases is same

(c) The total energy decreases in both the cases

(d) The instantaneous speed at x_0 of the combined masses decreases in both the cases

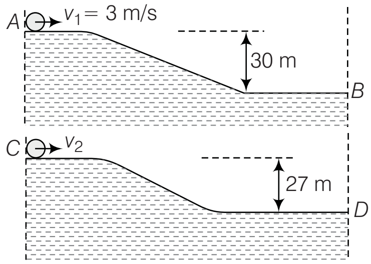
23. A ring of mass M and radius R is rotating with angular speed ω about a fixed vertical axis passing through its centre O with two point masses each of mass $M/8$ at rest at O. These masses can move radially outwards along two massless rods fixed on the ring as shown in the figure. At some instant, the angular speed of the system is $(8/9)\omega$ and one of the masses is at a distance of $\frac{3}{5}R$ from O. At this instant, the distance of the other mass from O is



(More than One Correct Option, 2015)

(a) $\frac{2}{3}R$ (b) $\frac{1}{3}R$ (c) $\frac{3}{5}R$ (d) $\frac{4}{5}R$

24. Two identical uniform discs roll without slipping on two different surfaces AB and CD (see figure) starting at A and C with linear speeds v_1 and v_2, respectively, and always remain in contact with the surfaces.



If they reach B and D with the same linear speed and $v_1 = 3$ m/s, then v_2 in m/s is ($g = 10\,\text{m/s}^2$) **(Single Integer Type, 2015)**

25. The densities of two solids spheres A and B of the same radii R vary with radial distance r as $\rho_A(r) = k\left(\frac{r}{R}\right)$ and $\rho_B(r) = k\left(\frac{r}{R}\right)^5$, respectively, where k is a constant. The moments of inertia of the individual spheres about axes passing through their centres are I_A and I_B, respectively. If $\frac{I_B}{I_A} = \frac{n}{10}$, the value of n is

(Single Integer Type, 2015)

26. A bullet is fired vertically upwards with velocity v from the surface of a spherical planet. When it reaches its maximum height, its acceleration due to the planet's gravity is $1/4$ th of its value at the surface of the planet. If the escape velocity from the planet is $v_{\text{sec}} = v\sqrt{N}$, then the value of N is (ignore energy loss due to atmosphere) **(Single Integer Type, 2015)**

27. A large spherical mass M is fixed at one position and two identical masses m are kept on a line passing through the centre of M (see figure). The point masses are connected by a rigid massless rod of length l and this assembly is free to move along the line connecting them.

All three masses interact only through their mutual gravitational interaction. When the point mass nearer to M is at a distance $r = 3l$ from M the tension in the rod is zero for $m = k\left(\frac{M}{288}\right)$. The value of k is **(Single Integer Type, 2015)**

28. A spherical body of radius R consists of a fluid of constant density and is in equilibrium under its own gravity. If $P(r)$ is the pressure at $r(r < R)$, then the correct options is/are

(More than One Correct Option, 2015)

(a) $p(r = 0) = 0$ (b) $\frac{p\left(r = \frac{3R}{4}\right)}{p\left(r = \frac{2R}{3}\right)} = \frac{63}{80}$

(c) $\frac{p\left(r = \frac{3R}{5}\right)}{p\left(r = \frac{2R}{5}\right)} = \frac{16}{21}$ (d) $\frac{p\left(r = \frac{R}{2}\right)}{p\left(r = \frac{R}{3}\right)} = \frac{20}{27}$

29. A person in a lift is holding a water jar, which has a small hole at the lower end of its side. When the lift is at rest, the water jet coming out of the hole hits the floor of the lift at a distance d of 1.2 m from the person.

In the following, state of the lift's motion is given in Column I and the distance where the water jet hits the floor of the lift is given in Column II. Match the statements from Column I with those in Column II and select the correct answer using the code given below the columns.

	Column I		Column II
P.	Lift is accelerating vertically up.	1.	$d = 1.2m$
Q.	Lift is accelerating with an acceleration loss than the gravitational acceleration.	2.	$d > 1.2m$
R.	Lift is moving vertically up with constant speed.	3.	$d < 1.2m$
S.	Lift is falling freely.	4.	No water leaks out of the jar

(More than One Correct Option, 2015)

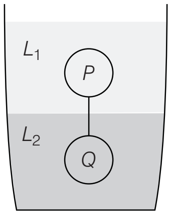
Codes

	P	Q	R	S		P	Q	R	S
(a)	2,	3,	2,	4	(b)	2,	3,	1,	4
(c)	1,	1,	1,	4	(d)	2,	3,	1,	1

30. Two spheres P and Q for equal radii have densities ρ_1 and ρ_2, respectively. The spheres are connected by a massless string and placed in liquids L_1 and L_2 of densities σ_1 and σ_2 and viscosities η_1 and η_2, respectively. They float in equilibrium with the sphere P in L_1 and sphere Q in L_2 and the string being taut (see figure).

If sphere P alone in L_2 has terminal velocity $\mathbf{v}_P$ and Q alone in L_1 has terminal velocity $\mathbf{v}_Q$, then

(Single Correct Option, 2015)

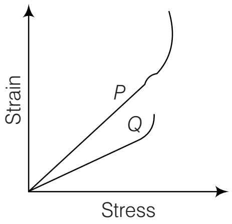


(a) $\frac{|\mathbf{v}_P|}{|\mathbf{v}_Q|} = \frac{\eta_1}{\eta_2}$ (b) $\frac{|\mathbf{v}_P|}{|\mathbf{v}_Q|} = \frac{\eta_2}{\eta_1}$

(c) $\mathbf{v}_P \cdot \mathbf{v}_Q > 0$ (d) $\mathbf{v}_P \cdot \mathbf{v}_Q < 0$

31. In plotting stress *versus* strain curves for two materials P and Q, a student by mistake puts strain on the y-axis and stress on the x-axis as shown in the figure. Then, the correct statements is/are

(More than One Correct Option, 2015)



(a) P has more tensile strength than Q

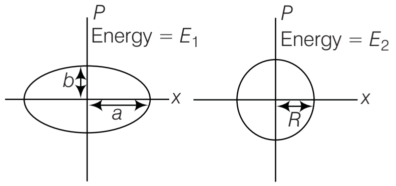
(b) P is more ductile than Q

(c) P is more brittle than Q

(d) The Young's modulus of P is more than that of Q

32. Two independent harmonic oscillators of equal masses are oscillating about the origin with angular frequencies ω_1 and ω_2 and have total energies E_1 and E_2, respectively. The variations of their momenta p with positions x are shown in the figures. If $\frac{a}{b} = n^2$ and $\frac{a}{R} = n$, then the correct equations is/are

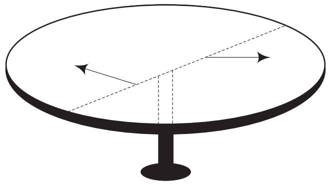
(More than One Correct Option, 2015)



(a) $E_1\omega_1 = E_2\omega_2$ (b) $\frac{\omega_2}{\omega_1} = n^2$

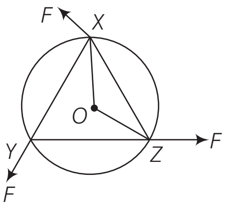
(c) $\omega_1\omega_2 = n^2$ (d) $\frac{E_1}{\omega_1} = \frac{E_2}{\omega_2}$

33. A horizontal circular platform of radius 0.5 m and mass 0.45 kg is free to rotate about its axis. Two massless spring toy-guns, each carrying a steel ball of mass 0.05 kg are attached to the platform at a distance 0.25 m from the centre on its either sides along its diameter (see figure). Each gun simultaneously fires the balls horizontally and perpendicular to the diameter in opposite directions. After leaving the platform, the balls have horizontal speed of $9\,\text{ms}^{-1}$ with respect to the ground. The rotational speed of the platform in rads^{-1} after the balls leave the platform is **(Single Integer Type, 2014)**



34. A uniform circular disc of mass 1.5 kg and radius 0.5 m is initially at rest on a horizontal frictionless surface. Three forces of equal magnitude $F = 0.5\,\text{N}$ are applied simultaneously along the three sides of an equilateral triangle XYZ with its vertices on the perimeter of the disc (see figure). One second after applying the forces, the angular speed of the disc in rad s^{-1} is

(Single Integer Type, 2014)



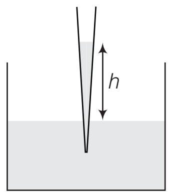
35. A planet of radius $R = 1/10 \times$ (radius of earth) has the same mass density as earth. Scientists dig a well of depth $\frac{R}{5}$ on it and lower a wire of the same length and of linear mass density $10^{-3}\ \text{kgm}^{-1}$ into it. If the wire is not touching anywhere, the force applied at the top of the wire by a person holding it in place is (take the radius of earth $= 6 \times 10^6$ m and the acceleration due to gravity of earth is $10\ \text{ms}^{-2}$) **(Single Correct Option, 2014)**

(a) 96 N (b) 108 N

(c) 120 N (d) 150 N

36. A glass capillary tube is the shape of truncated cone with an apex angle α so that its two ends have cross-sections of different radii. When dipped in water vertically, water rises in it to a height h, where the radius of its cross-section is b. If the surface tension of water is S, its density is ρ, and its contact angle with glass is θ, the value of h will be (g is the acceleration due to gravity)

(Single Correct Option, 2014)



(a) $\frac{2S}{b\rho g}\cos(\theta - \alpha)$ b) $\frac{2S}{b\rho g}\cos(\theta + \alpha)$

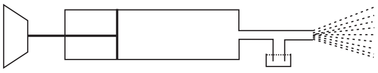
(c) $\frac{2S}{b\rho g}\cos(\theta - \alpha/2)$ (d) $\frac{2S}{b\rho g}\cos(\theta + \alpha/2)$

37. During Searle's experiment, zero of the vernier scale lies between 3.20×10^{-2} m and 3.25×10^{-2} m of the main scale. The 20th division of the vernier scale exactly coincides with one of the main scale divisions.

When an additional load of 2 kg is applied to the wire, the zero of the vernier scale still lies between 3.20×10^{-2} m and 3.25×10^{-2} m of the main scale but now the 45th division of vernier scale coincides with one of the main scale divisions. The length of the thin metallic wire is 2 m and its cross-sectional area is 8×10^{-7} m^2. The least count of the vernier scale is 1.0×10^{-5} m. The maximum percentage error in the Young's modulus of the wire is **(Single Integer Type, 2014)**

Passage (Q. Nos. 38-39)

A spray gun is shown in the figure where a piston pushes air out of nozzle. A thin tube of uniform cross-section is connected to the nozzle. The other end of the tube is in a small liquid container. As the piston pushes air through the nozzle, the liquid from the container rises into the nozzle and is sprayed out. For the spray gun shown, the radii of the piston and the nozzle are 20 mm and 1 mm respectively. The upper end of the container is open to the atmosphere. **(Passage Type, 2014)**



38. If the piston is pushed at a speed of $5\,\text{ms}^{-1}$, the air comes out of the nozzle with a speed of

(a) $0.1\,\text{ms}^{-1}$ (b) $1\,\text{ms}^{-1}$ (c) $2\,\text{ms}^{-1}$ (d) $8\,\text{ms}^{-1}$

39. If the density of air is ρ_a and that of the liquid ρ_l, then for a given piston speed the rate (volume per unit time) at which the liquid is sprayed will be proportional to

(a) $\sqrt{\frac{\rho_a}{\rho_l}}$ (b) $\sqrt{\rho_a \rho_l}$ (c) $\sqrt{\frac{\rho_l}{\rho_a}}$ (d) ρ_l

40. A particle of mass m is projected from the ground with an initial speed u_0 at an angle α with the horizontal. At the highest point of its trajectory, it makes a completely inelastic collision with another identical particle, which was thrown vertically upward from the ground with the same initial speed u_0. The angle that the composite system makes with the horizontal immediately after the collision is **(Single Correct Option, 2013)**

(a) $\frac{\pi}{4}$ (b) $\frac{\pi}{4} + \alpha$ (c) $\frac{\pi}{4} - \alpha$ (d) $\frac{\pi}{2}$

41. A bob of mass m, suspended by a string of length l_1, is given a minimum velocity required to complete a full circle in the vertical plane, At the highest point, it collides elastically with another bob of mass m suspended by a string of length l_2, which is initially at rest. Both the strings are massless and inextensible. If the second bob, after collision acquires the minimum speed required to complete a full circle in the vertical plane, the ratio l_1/l_2 is **(Single Integer Type, 2013)**

42. A uniform circular disc of mass 50 kg and radius 0.4 m is rotating with an angular velocity of 10 rad/s about its own axis, which is vertical. Two uniform circular rings, each of mass 6.25 kg and radius 0.2 m, are gently placed symmetrically on the disc in such a manner that they are touching each other along the axis of the disc and are horizontal. Assume that the friction is large enough such that the rings are at rest relative to the disc and the system rotates about the original axis. The new angular velocity (in rad s^{-1}) of the system is **(Single Integer Type, 2013)**

43. Two bodies, each of mass M, are kept fixed with a separation $2L$. A particle of mass m is projected from the mid-point of the line joining their centres, perpendicular to the line. The gravitational constant is G. The correct statement(s) is (are) **(Single Correct Option, 2013)**

(a) The minimum initial velocity of the mass m to escape the gravitational field of the two bodies is $4\sqrt{\frac{GM}{L}}$

(b) The minimum initial velocity of the mass m to escape the gravitational field of the two bodies is $2\sqrt{\frac{GM}{L}}$

(c) The minimum initial velocity of the mass m to escape the gravitational field of the two bodies is $\sqrt{\frac{2GM}{L}}$

(d) The energy of the mass m remains constant

44. One end of a horizontal thick copper wire of length $2L$ and radius $2R$ is welded to an end of another horizontal thin copper wire of length L and radius R. When the arrangement is stretched by applying forces at two ends, the ratio of the elongation in the thin wire to that in the thick wire is **(Single Correct Option, 2013)**

(a) 0.25 (b) 0.50 (c) 2.00 (d) 4.00

45. A solid sphere of radius R and density ρ is attached to one end of a massless spring of force constant k. The other end of the spring is connected to another solid sphere of radius R and density 3ρ. The complete arrangement is placed in a liquid of density 2ρ and is allowed to reach equilibrium. The correct statement(s) is (are) **(Single Correct Option, 2013)**

(a) the net elongation of the spring is $\frac{4\pi R^3 \rho g}{3k}$

(b) the net elongation of the spring is $\frac{8\pi R^3 \rho g}{3k}$

(c) the light sphere is partially submerged

(d) the light sphere is completely submerged displayed by the sensor when the temperature of the metal surface is raised to 2767°C?

46. A particle of mass m is attached to one end of a mass less spring of force constant k, lying on a frictionless horizontal plane. The other end of the spring is fixed. The particle starts moving horizontally from its equilibrium position at time $t = 0$ with an initial velocity u_0. When the speed of the particle is $0.5\,u_0$, it collides elastically with a rigid wall. After this collision **(More than One Correct Option, 2013)**

(a) the speed of the particle when it returns to its equilibrium position is u_0

(b) the time at which the particle passes through the equilibrium position for the first time is $t = \pi\sqrt{\frac{m}{k}}$

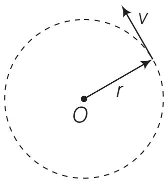
(c) the time at which the maximum compression of the spring occurs is $t = \frac{4\pi}{3}\sqrt{\frac{m}{k}}$

(d) the time at which the particle passes through the equilibrium position for the second time is $t = \frac{5\pi}{3}\sqrt{\frac{m}{k}}$

Answer *with* Explanations

1. **(b, c)** $V = \frac{kr^2}{2}$

$$F = -\frac{dV}{dr} = -kr \text{ (towards centre) } \left[F = -\frac{dV}{dr}\right]$$



At $r = R$,

$$kR = \frac{mv^2}{R} \text{ (Centripetal force)}$$

$$v = \sqrt{\frac{kR^2}{m}} = \sqrt{\frac{k}{m}}R \Rightarrow L = mvR = \sqrt{\frac{k}{m}}R^2$$

2. **(a, c)** $\mathbf{F} = (\alpha t)\hat{\mathbf{i}} + \beta\hat{\mathbf{j}}$ [at $t = 0, v = 0, \mathbf{r} = 0$]

$$\alpha = 1, \beta = 1$$

$$\mathbf{F} = t\hat{\mathbf{i}} + \hat{\mathbf{j}}$$

$$m\frac{d\mathbf{v}}{dt} = t\hat{\mathbf{i}} + \hat{\mathbf{j}}$$

On integrating, $m\mathbf{v} = \frac{t^2}{2}\hat{\mathbf{i}} + t\hat{\mathbf{j}}$ [$m = 1$ kg]

$$\frac{d\mathbf{r}}{dt} = \frac{t^2}{2}\hat{\mathbf{i}} + t\hat{\mathbf{j}} \quad [\mathbf{r} = 0 \text{ at } t = 0]$$

Again, on integrating,

$$\mathbf{r} = \frac{t^3}{6}\hat{\mathbf{i}} + \frac{t^2}{2}\hat{\mathbf{j}}$$

At $t = 1\,\text{s}$, $\tau = (\mathbf{r}\times\mathbf{F}) = \left(\frac{1}{6}\hat{\mathbf{i}}+\frac{1}{2}\hat{\mathbf{j}}\right)\times(\hat{\mathbf{i}}+\hat{\mathbf{j}})$

$$\tau = \frac{1}{3}\hat{\mathbf{k}}$$

$$v = \frac{t^3}{2}\hat{\mathbf{i}}+t\hat{\mathbf{j}}$$

At $t = 1\,\text{s}$, $\mathbf{v} = \left(\frac{1}{2}\hat{\mathbf{i}}+\hat{\mathbf{j}}\right) = \frac{1}{2}(\hat{\mathbf{i}}+2\hat{\mathbf{j}})\,\text{m/s}$

At $t = 1\,\text{s}$, $\mathbf{r}_1 - \mathbf{r}_0 = \left[\frac{1}{6}\hat{\mathbf{i}}+\frac{1}{2}\hat{\mathbf{j}}\right] - [0]$

$$\mathbf{s} = \frac{1}{6}\hat{\mathbf{i}}+\frac{1}{2}\hat{\mathbf{j}}$$

$$|\mathbf{s}| = \sqrt{\left(\frac{1}{6}\right)^2+\left(\frac{1}{2}\right)^2} \Rightarrow \frac{\sqrt{10}}{6}\,\text{m}$$

3. **(a, c)** $h = \dfrac{2\sigma\cos\theta}{r\rho g}$

(a) $\rightarrow h \propto \dfrac{1}{r}$

(b) h depends upon σ.

(c) If lift is going up with constant acceleration.

$$g_{\text{eff}} = (g+a) \quad \Rightarrow h = \frac{2\sigma\cos\theta}{r\rho(g+a)}$$

It means h decreases.

(d) h is proportional to $\cos\theta$.

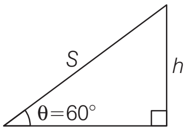
4. **(0.75 m)** $a = \dfrac{g\sin\theta}{1+\dfrac{I}{MR^2}}$

$$a_{\text{ring}} = \frac{g\sin\theta}{2} \qquad (I = MR^2)$$

$$a_{\text{disc}} = \frac{2g\sin\theta}{3} \qquad \left(I = \frac{MR^2}{2}\right)$$

$$s = \frac{h}{\sin\theta} = \frac{1}{2}at^2$$

$$= \frac{1}{2}\left(\frac{g\sin\theta}{2}\right)t_1^2$$



$$\Rightarrow \qquad t_1 = \sqrt{\frac{4h}{g\sin^2\theta}} = \sqrt{\frac{16h}{3g}}$$

$$s = \frac{h}{\sin\theta} = \frac{1}{2}at^2 = \frac{1}{2}\left(\frac{2g\sin\theta}{3}\right)t_2^2$$

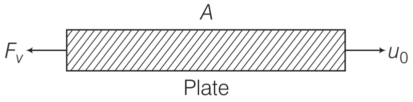
$$\Rightarrow \qquad t_2 = \sqrt{\frac{3h}{g\sin^2\theta}} = \sqrt{\frac{4h}{g}}$$

$$t_2 - t_1 = \sqrt{\frac{16h}{3g}} - \sqrt{\frac{4h}{g}} = \frac{2-\sqrt{3}}{\sqrt{10}}$$

$$\sqrt{h}\left[\frac{4}{\sqrt{3}} - 2\right] = 2 - \sqrt{3}$$

Soving this equation we get, $h = 0.75\,\text{m}$.

5. **(a, c, d)**



$$F_v = -\eta A\left(\frac{dv}{dy}\right)$$

Since, height h of the liquid in tank is very small.

$$\Rightarrow \qquad \frac{dv}{dy} = \frac{\Delta v}{\Delta y} = \left(\frac{u_0}{h}\right) \quad \Rightarrow \quad F_v = -(\eta)A\left(\frac{u_0}{h}\right)$$

$$F_v \propto \left(\frac{1}{h}\right), F_v \propto u_0, F \propto A, F_v \propto \eta$$

6. **(3)** Given, $d = 0.5\,\text{mm}$,

$Y = 2\times10^{11}\,\text{Nm}^{-2}$,

$l = 1\,\text{m}$

$$\Delta l = \frac{Fl}{AY} = \frac{mgl}{\frac{\pi d^2}{4}Y}$$

$$= \frac{1.2\times10\times1}{\frac{\pi}{4}\times(5\times10^{-4})^2\times2\times10^{11}}$$

$$= 0.3\,\text{mm}$$

LC of vernier $= \left(1-\dfrac{9}{10}\right)\text{mm} = 0.1\,\text{mm}$

So, 3rd division of vernier scale will coincide with main scale.

7. **(b)** $v = \sqrt{\dfrac{GM}{R}}$

Let $R_1 = R$, then $R_2 = 4R$

If $m_2 = m$, then $m_1 = 2m$

List-I

(P) $\dfrac{v_1}{v_2} = \sqrt{\dfrac{R_2}{R_1}} = \sqrt{\dfrac{4R}{R}} = 2:1$

(Q) $L = mvR$

$$\frac{L_1}{L_2} = \frac{R(2m)v_1}{4R(m)v_2} = \frac{1}{2}(2\ ) = 1:1$$

(R) $\dfrac{K_1}{K_2} = \dfrac{\frac{1}{2}(2m)v_1^2}{\frac{1}{2}(m)v_2^2} = 2\,(4) = 8:1$

(S) $\dfrac{T_1}{T_2} = \left(\dfrac{R_1}{R_2}\right)^{3/2} = \left(\dfrac{1}{4}\right)^{3/2} = 1:8$

8. **(a)** When force $F = 0 \Rightarrow$ potential energy $U =$ constant

$F \neq 0 \Rightarrow$ force is conservative $\Rightarrow$ Total energy $E =$ constant

List-I

(P) $\mathbf{r}(t) = \alpha t\hat{\mathbf{i}} + \beta t\hat{\mathbf{j}}$

$\frac{d\mathbf{r}}{dt} = \mathbf{v} = \alpha\hat{\mathbf{i}} + \beta\hat{\mathbf{j}} = \text{constant} \Rightarrow \mathbf{p} = \text{constant}$

$|\mathbf{v}| = \sqrt{\alpha^2 + \beta^2} = \text{constant}$

$\Rightarrow K = \text{constant}$

$\frac{d\mathbf{v}}{dt} = \mathbf{a} = 0 \Rightarrow F = 0 \Rightarrow U = \text{constant}$

$E = U + K = \text{constant}$

$\mathbf{L} = m(\mathbf{r} \times \mathbf{v}) = 0$

$\mathbf{L} = \text{constant}$

$P \rightarrow 1, 2, 3, 4, 5$

(Q) $\mathbf{r}(t) = \alpha\cos\omega t\hat{\mathbf{i}} + \beta\sin\omega t\hat{\mathbf{j}}$

$\frac{d\mathbf{r}}{dt} = \mathbf{v} = \alpha\omega\sin\omega t(-\hat{\mathbf{i}}) + \beta\omega\cos\omega t\hat{\mathbf{j}} \neq \text{constant}$

$\Rightarrow \mathbf{p} \neq \text{constant}$

$|\mathbf{v}| = \omega\sqrt{(\alpha\sin\omega t)^2 + (\beta\cos\omega t)^2} \neq \text{constant}$

$\Rightarrow K \neq \text{constant}$

$\mathbf{a} = \frac{d\mathbf{v}}{dt} = -\omega^2\mathbf{r} \neq 0$

$\Rightarrow E = \text{constant} = K + U$

But $K \neq \text{constant} \Rightarrow U \neq \text{constant}$

$\mathbf{L} = m(\mathbf{r} \times \mathbf{v}) = m\omega\alpha\beta(\hat{\mathbf{k}}) = \text{constant}$

$Q \rightarrow 2, 5$

(R) $\mathbf{r}(t) = \alpha(\cos\omega t\hat{\mathbf{i}} + \sin\omega t\hat{\mathbf{j}})$

$\frac{d\mathbf{r}}{dt} = \mathbf{v} = \alpha\omega[\sin\omega t(-\hat{\mathbf{i}}) + \cos\omega t\hat{\mathbf{j}}] \neq \text{constant}$

$\Rightarrow \mathbf{p} \neq \text{constant}$

$|\mathbf{v}| = \alpha\omega = \text{constant} \Rightarrow K = \text{constant}$

$\mathbf{a} = \frac{d\mathbf{v}}{dt} = -\omega^2\mathbf{r} \neq 0 \Rightarrow E = \text{constant}, U = \text{constant}$

$\mathbf{L} = m(\mathbf{r} \times \mathbf{v}) = m\omega\alpha^2\hat{\mathbf{k}} = \text{constant}$

$R \rightarrow 2, 3, 4, 5$

(S) $\mathbf{r}(t) = \alpha t\hat{\mathbf{i}} + \frac{\beta}{2}t^2\hat{\mathbf{j}}$

$\frac{d\mathbf{r}}{dt} = \mathbf{v} = \alpha\hat{\mathbf{i}} + \beta t\hat{\mathbf{j}} \neq \text{constant} \Rightarrow \mathbf{p} \neq \text{constant}$

$|\mathbf{v}| = \sqrt{\alpha^2 + (\beta t)^2} \neq \text{constant} \Rightarrow K \neq \text{constant}$

$\mathbf{a} = \frac{d\mathbf{v}}{dt} = \beta\hat{\mathbf{j}} \neq 0 \Rightarrow E = \text{constant} = K + U$

But $K \neq \text{constant}$

$\therefore U \neq \text{constant}$

$\mathbf{L} = m(\mathbf{r} \times \mathbf{v}) = \frac{1}{2}\alpha\beta t^2\hat{\mathbf{k}} \neq \text{constant}$

$S \rightarrow 5$

9. Question is not very clear.

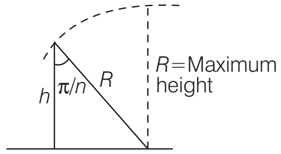
10. **(c)** If height of the cone $h >> r$

Then, $\mu N = mg$

$\mu m(R - r)\omega_0^2 = mg$

$\omega_0 = \sqrt{\frac{g}{\mu(R - r)}}$

11. **(d)**

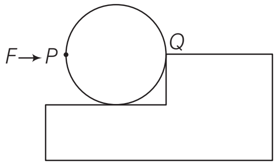


$\cos\left(\frac{\pi}{n}\right) = \frac{h}{R}$

$\Delta = R - h = \frac{h}{\cos(\pi/n)} - h$

$= h\left[\frac{1}{\cos(\pi/n)} - 1\right]$

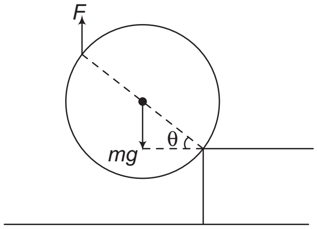
12. **(a, c)**



(a) If force is applied normal to surface at P, then line of action of force will pass from Q and thus, $\tau = 0$.

(b) Wheel can climb.

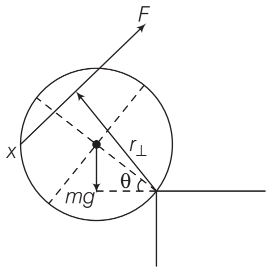
(c) $\tau = F(2R\cos\theta) - mgR\cos\theta$, $\tau \propto \cos\theta$



Hence, as θ increases

τ decreases. So its correct.

(d)



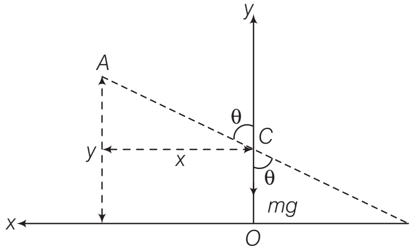
$\tau = Fr_\perp - mg\cos\theta$; τ increases with θ.

13. **(a, c, d)** When the bar makes an angle θ, the height of its COM (mid-point) is $\frac{L}{2}\cos\theta$.

$\therefore$ Displacement $= L - \frac{L}{2}\cos\theta = \frac{L}{2}(1-\cos\theta)$

Since, force on COM is only along the vertical direction, hence COM is falling vertically downward. Instantaneous torque about point of contact is

$$\tau = mg \times \frac{L}{2}\sin\theta \quad \text{or} \quad \tau \propto \sin\theta$$



Now,
$$x = \frac{L}{2}\sin\theta$$
$$y = L\cos\theta$$
$$\frac{x^2}{(L/2)^2} + \frac{y^2}{L^2} = 1$$

Path of A is an ellipse.

14. **(a, b)** Δx_{cm} of the block and point mass system $= 0$

$\therefore$ $$m(x+R) + Mx = 0$$

where, x is displacement of the block.

Solving this equation, we get

$$x = -\frac{mR}{M+m}$$

From conservation of momentum and mechanical energy of the combined system

$$0 = mv - MV$$
$$mgR = \frac{1}{2}mv^2 + \frac{1}{2}MV^2$$

Solving these two equations, we get

$\therefore$ $$v = \sqrt{\frac{2gR}{1+\frac{m}{M}}}$$

15. **(c)** Given, $v_e = 11.2\ \text{km/s} = \sqrt{\frac{2GM_e}{R_e}}$

From energy conservation,

$$K_i + U_i = K_f + U_f$$
$$\frac{1}{2}mv_s^2 - \frac{GM_s m}{r} - \frac{GM_e m}{R_e} = 0 + 0$$

Here, r = distane of rocket from sun

$$\Rightarrow \quad v_s = \sqrt{\frac{2GM_e}{R_e} + \frac{2GM_s}{r}}$$

Given, $M_s = 3\times10^5\ M_e$

and $r = 2.5\times10^4\ R_e$

$$\Rightarrow v_s = \sqrt{\frac{2GM_e}{R_e} + (2G)\left(\frac{3\times10^5 M_e}{2.5\times10^4 R_e}\right)}$$
$$= \sqrt{\frac{2GM_e}{R_e}\left(1+\frac{3\times10^5}{2.5\times10^4}\right)}$$
$$= \sqrt{\frac{2GM_e}{R_e}\times 13}$$
$$\Rightarrow v_s \simeq 42\ \text{km/s}$$

16. **(a)** $m = \frac{4\pi R^3}{3}\times\rho$

On taking log both sides, we have

$$\ln(m) = \text{in}\left(\frac{4\pi}{3}\right) + \ln(\rho) + 3\ln(R)$$

On differentiating with respect to time,

$$0 = 0 + \frac{1}{\rho}\frac{d\rho}{dt} + \frac{3}{R}\frac{dR}{dt}$$
$$v = \frac{dR}{dt} = KR \quad \Rightarrow \quad v \propto R$$

17. **(6)** From mass conservation,

$$\rho\cdot\frac{4}{3}\pi R^3 = \rho\cdot K\cdot\frac{4}{3}\pi r^3 \quad \Rightarrow \quad R = K^{1/3}r$$

$\therefore$ $$\Delta U = T\Delta A = T(K\cdot 4\pi r^2 - 4\pi R^2)$$
$$= T(K\cdot 4\pi R^2 K^{-2/3} - 4\pi R^2)$$
$$\Delta U = 4\pi R^2 T[K^{1/3}-1]$$

Putting the values, we get

$$10^{-3} = \frac{10^{-1}}{4\pi}\times 4\pi\times10^{-4}[K^{1/3}-1]$$
$$100 = K^{1/3} - 1 \quad \Rightarrow \quad K^{1/3} \cong 100 = 10^2$$

Given that $K = 10^\alpha$

$\therefore$ $$10^{\alpha/3} = 10^2 \Rightarrow \frac{\alpha}{3} = 2 \Rightarrow \alpha = 6$$

18. **(c)** Force on block along slot

$$= m\omega^2 r = ma = m\left(\frac{vdv}{dr}\right)$$
$$\int_0^v vdv = \int_{R/2}^r \omega^2 rdr$$
$$\Rightarrow \frac{v^2}{2} = \frac{\omega^2}{2}\left(r^2 - \frac{R^2}{4}\right)$$
$$\Rightarrow \quad v = \omega\sqrt{r^2 - \frac{R^2}{4}} = \frac{dr}{dt}$$
$$\Rightarrow \int_{R/4}^r \frac{dr}{\sqrt{r^2-\frac{R^2}{4}}} = \int_0^t \omega\, dt$$

$$\ln\left(\frac{r+\sqrt{r^2-\frac{R^2}{4}}}{\frac{R}{2}}\right)-\ln\left(\frac{R/2+\sqrt{\frac{R^2}{4}-\frac{R^2}{4}}}{\frac{R}{2}}\right)=\omega t$$

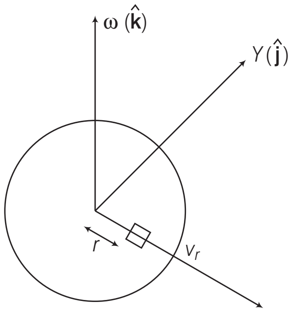
$$\Rightarrow \quad r+\sqrt{r^2-\frac{R^2}{4}}=\frac{R}{2}e^{\omega t}$$

$$\Rightarrow \quad r^2-\frac{R^2}{4}=\frac{R^2}{4}e^{2\omega t}+r^2-2r\frac{R}{2}e^{\omega t}$$

$$\Rightarrow \quad r=\frac{\frac{R^2}{4}e^{2\omega t}+\frac{R^2}{4}}{Re^{\omega t}}$$

$$=\frac{R}{4}(e^{\omega t}+e^{-\omega t})$$

19. (b)



$$\mathbf{F}_{\text{rot}}=\mathbf{F}_{\text{in}}+2m(v_{\text{rot}}\hat{\mathbf{i}})\times\omega\hat{\mathbf{k}}+m(\omega\hat{\mathbf{k}}\times r\hat{\mathbf{i}})\times\omega\hat{\mathbf{k}}$$

$$mr\omega^2\hat{\mathbf{i}}=\mathbf{F}_{\text{in}}+2mv_{\text{rot}}\omega(-\hat{\mathbf{j}})+m\omega^2r\hat{\mathbf{i}}$$

$$\mathbf{F}_{\text{in}}=2mv_r\omega\hat{\mathbf{j}}$$

$$r=\frac{R}{4}[e^{\omega t}+e^{-\omega t}]$$

$$\frac{dr}{dt}=v_r=\frac{R}{4}[\omega e^{\omega t}-\omega e^{-\omega t}]$$

$$\mathbf{F}_{\text{in}}=2m\frac{R\omega}{4}[e^{\omega t}-e^{-\omega t}]\omega\hat{\mathbf{j}}$$

$$\mathbf{F}_{\text{in}}=\frac{mR\omega^2}{2}[e^{\omega t}-e^{-\omega t}]\hat{\mathbf{j}}$$

Also, reaction is due to disc surface then

$$\mathbf{F}_{\text{reaction}}=\frac{mR\omega^2}{2}[e^{\omega t}-e^{-\omega t}]\hat{\mathbf{j}}+mg\hat{\mathbf{k}}$$

20. (a,b,d) $\mathbf{r}=\alpha t^3\hat{\mathbf{i}}+\beta t^2\hat{\mathbf{j}}$

$$\mathbf{v}=\frac{d\mathbf{r}}{dt}=3\alpha t^2\hat{\mathbf{i}}+2\beta t\hat{\mathbf{j}}$$

$$\mathbf{a}=\frac{d^2\mathbf{r}}{dt^2}=6\alpha t\hat{\mathbf{i}}+2\beta\hat{\mathbf{j}}$$

At $t=1$ s,

(a) $\mathbf{v}=3\times\frac{10}{3}\times1\hat{\mathbf{i}}+2\times5\times1\hat{\mathbf{j}}$

$=(10\hat{\mathbf{i}}+10\hat{\mathbf{j}})$m / s

(b) $\mathbf{L}=\mathbf{r}\times\mathbf{p}=\left(\frac{10}{3}\times1\hat{\mathbf{i}}+5\times1\hat{\mathbf{j}}\right)\times0.1(10\hat{\mathbf{i}}+10\hat{\mathbf{j}})$

$=\left(-\frac{5}{3}\hat{\mathbf{k}}\right)$N - ms

(c) $\mathbf{F}=m\mathbf{a}=m\times\left(6\times\frac{10}{3}\times1\hat{\mathbf{i}}+2\times5\hat{\mathbf{j}}\right)$

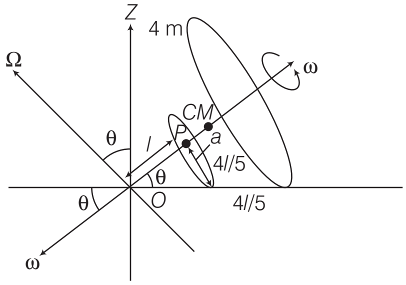
$=(2\hat{\mathbf{i}}+\hat{\mathbf{j}})$ N

(d) $\tau=r\times\mathbf{F}=\left(\frac{10}{3}\hat{\mathbf{i}}+5\hat{\mathbf{j}}\right)\times(2\hat{\mathbf{i}}+\hat{\mathbf{j}})$

$=+\frac{10}{3}\hat{\mathbf{k}}+10(-\hat{\mathbf{k}})$

$=\left(-\frac{20}{3}\hat{\mathbf{k}}\right)$ N - m

21. (c,d)



$$\cos\theta=\frac{l}{\sqrt{l^2+a^2}}=\frac{\sqrt{24}}{5}$$

(a) $L_z=L_{\text{CM}-O}\cos\theta-L_{D-\text{CM}}\sin\theta$

$$=\frac{81\sqrt{24}}{5}a^2m\omega\times\frac{\sqrt{24}}{5}-\frac{17\,ma^2\omega}{2}\times\frac{1}{\sqrt{24}}$$

$$=\frac{81\times24ma^2\omega}{25}-\frac{17ma^2\omega}{2\sqrt{24}}$$

(b) $L_{\text{CM}-O}=(5m)\left[\frac{9l}{5}\Omega\right]\frac{9l}{5}=\frac{81ml^2\omega}{5}=\frac{81ml^2}{5}\times\frac{a\omega}{l}$

$$L_{\text{CM}-O}=\frac{81mla\omega}{5}=\frac{81\sqrt{24}\,a^2m\omega}{5}$$

(c) Velocity of point P : $a\omega=1\,\Omega$ then

$\Omega=\frac{a\omega}{1}$ = Angular velocity of C.M. w.r.t point O.

Angular velocity fo CM w.r.t Z-axis

$=\Omega\cos\theta$

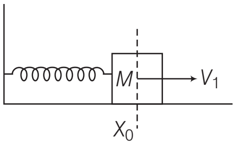
$$\omega_{\text{CM}-z}=\frac{a\omega}{1}\frac{\sqrt{24}}{5}$$

$$\omega_{\text{CM}-z}=\frac{a\omega}{5}=\frac{a\omega}{\sqrt{24}a}\frac{\sqrt{24}}{5}$$

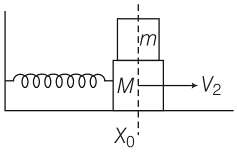
(d) $L_{D-\text{CM}}=\frac{ma^2}{2}\omega+\frac{4m(2a)^2}{2}\omega=\frac{17\,ma^2\omega}{2}$

22. **(a,b,d)** **Case 1**

Just before m is placed



Just after m is placed



In case 1, $Mv_1 = (M+m)v_2$

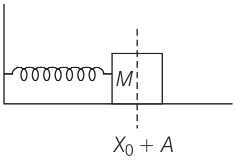
$$v_2 = \left(\frac{M}{M+m}\right)v_1$$

$$\sqrt{\frac{k}{M+m}}\,A_2 = \left(\frac{M}{M+m}\right)\sqrt{\frac{k}{M}}\,A_1$$

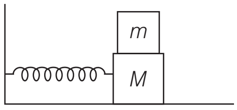
$$A_2 = \sqrt{\frac{k}{M+m}}\,A_1$$

Case 2

Just before m is placed



Just after m is placed



In case 2, $A_2 = A_1$

$$T = 2\pi\sqrt{\frac{M+m}{k}} \text{ in both cases.}$$

Total energy decreases in first case whereas remain same in 2nd case. Instantaneous speed at x_0 decreases in both cases.

23. **(d)** Let the other mass at this instant is at a distance of x from the centre O.

Applying law of conservation of angular momentum, we have $I_1\omega_1 = I_2\omega_2$

$$\therefore (MR^2)(\omega) = \left[MR^2 + \frac{M}{8}\left(\frac{3}{5}R\right)^2 + \frac{M}{8}x^2\right]\left(\frac{8}{9}\omega\right)$$

Solving this equation, we get $x = \frac{4}{5}R$.

24. **(7)** In case of pure rolling, mechanical energy remains constant (as work-done by friction is zero). Further in case of a disc,

$$\frac{\text{translational kinetic energy}}{\text{rotational kinetic energy}} = \frac{K_T}{K_R} = \frac{\frac{1}{2}mv^2}{\frac{1}{2}I\omega^2}$$

$$= \frac{mv^2}{\left(\frac{1}{2}mR^2\right)\left(\frac{v}{R}\right)^2} = \frac{2}{1}$$

or, $K_T = \frac{2}{3}$ (Total kinetic energy)

or, Total kinetic energy

$$K = \frac{3}{2}K_T = \frac{3}{2}\left(\frac{1}{2}mv^2\right) = \frac{3}{4}mv^2$$

Decrease in potential energy = increase in kinetic energy

or, $mgh = \frac{3}{4}m(v_f^2 - v_i^2)$ or $v_f = \sqrt{\frac{4}{3}gh + v_i^2}$

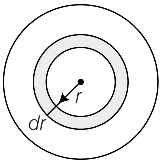
As final velocity in both cases is same.

So, value of $\sqrt{\frac{4}{3}gh + v_i^2}$ should be same in both cases.

$$\therefore \quad \sqrt{\frac{4}{3}\times 10\times 30 + (3)^2} = \sqrt{\frac{4}{3}\times 10\times 27 + (v_2)^2}$$

Solving this equation we get, $v_2 = 7$ m/s

25. **(6)** Consider a shell of radius r and thickness dr



$$dI = (dm)\,r^2 \Rightarrow dI = \frac{2}{3}(\rho 4\pi r^2 dr)r^2 \Rightarrow I = \int dI$$

$$\frac{I_B}{I_A} = \frac{\int_0^R \frac{2}{3}k\frac{r^5}{R^5}\cdot 4\pi r^2 dr\, r^2}{\int_0^R \frac{2}{3}k\frac{r}{R}\,4\pi r^2 dr\, r^2} = \frac{6}{10}$$

So, $n = 6$

26. **(2)** At height h

$$g' = \frac{g}{\left(1+\frac{h}{R}\right)^2} \qquad \ldots\text{(i)}$$

Given, $g' = \frac{g}{4}$

Substituting in Eq. (i) we get, $h = R$

Now, from A to B,

decrease in kinetic energy = increase in potential energy

$$\Rightarrow \quad \frac{1}{2}mv^2 = \frac{mgh}{1+\frac{h}{R}}$$

$$\Rightarrow \quad \frac{v^2}{2} = \frac{gh}{1+\frac{h}{R}} = \frac{1}{2}gR \qquad (h = R)$$

$$\Rightarrow \quad v^2 = gR$$

or $\quad v = \sqrt{gR}$

Now, $\quad v_{\text{esc}} = \sqrt{2gR} = v\sqrt{2}$

$$\Rightarrow \quad N = 2$$

27. **(7)** For point mass at distance $r = 3l$

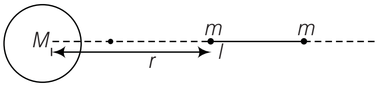
$$\frac{GMm}{(3l)^2} - \frac{Gm^2}{l^2} = ma \qquad \text{...(i)}$$

For point mass at distance $r = 4l$

$$\frac{GMm}{(4l)^2} + \frac{Gm^2}{l^2} = ma \qquad \text{...(ii)}$$

Equating the two equations we have,

$$\frac{GMm}{9l^2} - \frac{Gm^2}{l^2} = \frac{GMm}{16l^2} + \frac{Gm^2}{l^2}$$



$$\frac{7GMm}{144} = \frac{2Gm^2}{l^2}$$

$$m = \frac{7M}{288}$$

$$\therefore \quad k = 7$$

28. **(c)** Gravitational field at a distance r due to mass 'm'

$$E = \frac{G\rho\frac{4}{3}\pi r^3}{r^2} = \frac{4G\rho\pi r}{3}$$

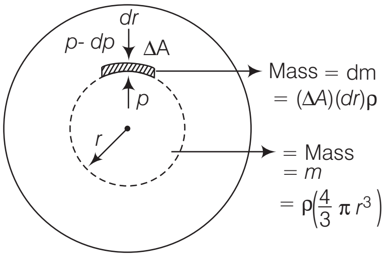
Consider a small element of width dr and area ΔA at a distance r.

Pressure force on this element outwards

= gravitational force on 'dm' from 'm' inwards

$$\Rightarrow \quad (dp)\Delta A = E(dm)$$

$$\Rightarrow \quad -dp \cdot \Delta A = \left(\frac{4}{3}G\pi\rho r\right)(\Delta A\, dr \cdot \rho)$$



$$-\int_O^P dp = \int_R^r \left(\frac{4G\rho^2\pi}{3}\right) r\,dr$$

$$-p = \frac{4G\rho^2\pi}{3\times 2}[r^2 - R^2]$$

$$\Rightarrow \quad p = c(R^2 - r^2)$$

$$r = \frac{3R}{4}, \; p_1 = c\left(R^2 - \frac{9R^2}{16}\right)$$

$$= c\left(\frac{7R^2}{16}\right)$$

$$r = \frac{2R}{3}, \quad p_2 = c\left(R^2 - \frac{4R^2}{9}\right) = c\left(\frac{5R^2}{9}\right)$$

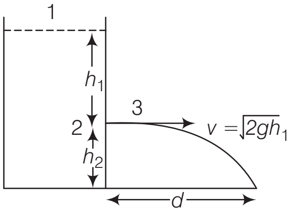
$$\frac{p_1}{p_2} = \frac{63}{80}\; r = \frac{3R}{5}, \; p_3 = c\left(R^2 - \frac{9}{25}R^2\right)$$

$$= c\left(\frac{16R^2}{25}\right)$$

$$r = \frac{2R}{5}, \; p_4 = c\left(R^2 - \frac{4R^2}{25}\right) = c\left(\frac{21R^2}{25}\right)$$

$$\Rightarrow \quad \frac{p_3}{p_4} = \frac{16}{21}$$

29. **(c)** $d = 2\sqrt{h_1h_2} = \sqrt{4h_1h_2}$



This is independent of the value of g.

(P) $g_{\text{eff}} > g$

$$d = \sqrt{4h_1h_2} = 1.2 \text{ m}$$

(Q) $g_{\text{eff}} < g$

$$d = \sqrt{4h_1h_2} = 1.2 \text{ m}$$

(R) $g_{\text{eff}} = g$

$$d = \sqrt{4h_1h_2} = 1.2 \text{ m}$$

(S) $g_{\text{eff}} = 0$

No water leaks out of jar. As there will be no pressure difference between top of the container and any other point. $P_1 = P_2 = P_3 = P_0$

30. **(a)** For floating, net weight of system = net upthrust

$$\Rightarrow \quad (\rho_1 + \rho_2)Vg = (\sigma_1 + \sigma_2)Vg$$

Since string is taut, $\rho_1 < \sigma_1$ and $\rho_2 > \sigma_2$

$$v_P = \frac{2r^2g}{2\eta_2}(\sigma_2 - \rho_1) \text{ (upward terminal velocity)}$$

$$v_Q = \frac{2r^2g}{9\eta_1}(\rho_2 - \sigma_1)$$

(downward terminal velocity)

$$\left|\frac{v_P}{v_Q}\right| = \frac{\eta_1}{\eta_2}$$

Further, $\bar{v}_P \cdot \bar{v}_Q$ will be negative as they are opposite to each other.

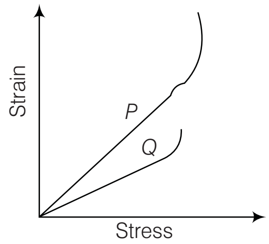
31. **(a, b)** $Y = \frac{\text{stress}}{\text{strain}}$ or $Y \propto \frac{1}{\text{strain}}$

(for same stress say σ)

$$(\text{strain})_Q < (\text{strain})_P$$

$$\Rightarrow \quad Y_Q > Y_P$$

So, P is more ductile than Q. Further, from the given figure we can also see that breaking stress of P is more than Q. So, it has more tensile strength.



32. **(b,d)** **Ist Particle**

$$P = 0 \text{ at } x = a$$

$\Rightarrow$ 'a' is the amplitude of oscillation 'A_1'.

At $x = 0, P = b$ (at mean position)

$$\Rightarrow mv_{\max} = b \Rightarrow v_{\max} = \frac{b}{m}$$

$$E_1 = \frac{1}{2}mv_{\max}^2 = \frac{m}{2}\left[\frac{b}{m}\right]^2 = \frac{b^2}{2m}$$

$$A_1\omega_1 = v_{\max} = \frac{b}{m}$$

$$\Rightarrow \quad \omega_1 = \frac{b}{ma} = \frac{1}{mn^2} \qquad \left(A_1 = a, \frac{a}{b} = n^2\right)$$

IInd Particle

$$P = 0 \text{ at } x = R \Rightarrow A_2 = R$$

At $\qquad x = 0, P = R$

$$\Rightarrow \quad v_{\max} = \frac{R}{m}$$

$$E_2 = \frac{1}{2}mv_{\max}^2 = \frac{m}{2}\left[\frac{R}{m}\right]^2 = \frac{R^2}{2m}$$

$$A_2\omega_2 = \frac{R}{m}$$

$$\Rightarrow \quad \omega_2 = \frac{R}{mR} = \frac{1}{m}$$

(b) $\frac{\omega_2}{\omega_1} = \frac{1/m}{1/mn^2} = n^2$

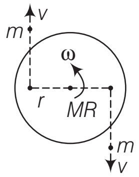
(c) $\omega_1\omega_2 = \frac{1}{mn^2} \times \frac{1}{m} = \frac{1}{m^2n^2}$

(d) $\frac{E_1}{\omega_1} = \frac{b^2/2m}{1/mn^2} = \frac{b^2n^2}{2} = \frac{a^2}{2n^2} = \frac{R^2}{2}$

$$\frac{E_2}{\omega_2} = \frac{R^2/2m}{1/m} = \frac{R^2}{2} \Rightarrow \frac{E_1}{\omega_1} = \frac{E_2}{\omega_2}$$

33. **(4)** Applying conservation of angular momentum

$$2mvr - \frac{MR^2}{2}\omega = 0, \omega = \frac{4mvr}{MR^2}$$



Substituting the values, we get

$$\omega = \frac{(4)(5 \times 10^{-2})(9)\left(\frac{1}{4}\right)}{45 \times 10^{-2} \times \frac{1}{4}}$$

$$\omega = 4 \text{ rad/s}$$

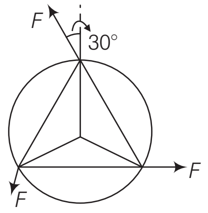
34. **(2)** Angular impulse = change in angular momentum

$$\therefore \int \tau\, dt = I\omega$$

$$\Rightarrow \qquad \omega = \frac{\int \tau\, dt}{I} = \frac{\int_0^t 3F \sin 30^\circ R\, dt}{I}$$

Substituting the values, we have

$$\omega = \frac{3\,(0.5)\,(0.5)\,(0.5)\,(1)}{\frac{1.5\,(0.5)^2}{2}} = 2 \text{ rad/s}$$



35. **(b)** Given, $R_{\text{planet}} = \frac{R_{\text{earth}}}{10}$ and density,

$$\rho = \frac{M_{\text{earth}}}{\frac{4}{3}\pi R^3_{\text{earth}}} = \frac{M_{\text{planet}}}{\frac{4}{3}\pi R^3_{\text{planet}}}$$

$$\Rightarrow \quad M_{\text{planet}} = \frac{M_{\text{earth}}}{10^3}$$

$$g_{\text{surface of planet}} = \frac{GM_{\text{planet}}}{R^2_{\text{planet}}} = \frac{GM_e \cdot 10^2}{10^3 \cdot R_e^2}$$

$$= \frac{GM_e}{10R_e^2} = \frac{g_{\text{surface of earth}}}{10}$$

$$g_{\text{depth of planet}} = g_{\text{surface of planet}} \left(\frac{x}{R}\right)$$

where, x = distance from centre of planet.

$\therefore$ Total force on wire

$$F = \int_{4R/5}^{R} \lambda\, dx\, g \left(\frac{x}{R}\right) = \frac{\lambda g}{R}\left[\frac{x^2}{2}\right]_{4R/5}^{R}$$

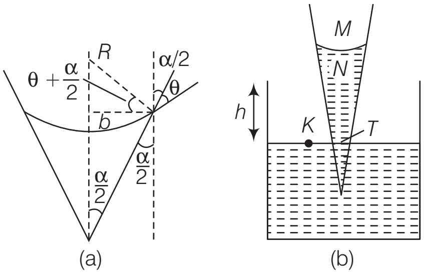
Here, $g = g_{\text{surface of planet}}$,

$R = R_{\text{planet}}$

Substituting the given values, we get

$$F = 108\text{ N}$$

36. **(d)** Using geometry



(a) (b)

$$\frac{b}{R} = \cos\left(\theta + \frac{\alpha}{2}\right)$$

$$\Rightarrow \qquad R = \frac{b}{\cos\left(\theta + \frac{\alpha}{2}\right)}$$

Using pressure equation along the path *MNTK*

$$p_0 - \frac{2S}{R} + h\rho g = p_0$$

Substituting the value of R, we get

$$h = \frac{2S}{R\rho g} = \frac{2S}{b\rho g}\cos\left(\theta + \frac{\alpha}{2}\right)$$

37. **(4)** $Y = \dfrac{F/A}{\dfrac{\Delta l}{l}}$, $\Delta l = 25 \times 10^{-50}$ m

$$\frac{\Delta Y}{Y} \times 100 = \frac{10^{-5}}{25 \times 10^{-5}} \times 100 = 4\%$$

38. **(c)** From continuity equation,

$$A_1 v_1 = A_2 v_2$$

Here, $A_1 = 400 A_2$

because $r_1 = 20 r_2$

and $A = \pi r^2$

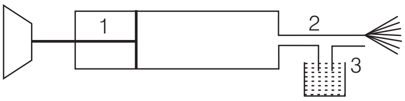
$$\therefore \qquad v_2 = \frac{A_1}{A_2}(v_1) = 400 v_1$$

$$= 400(5)\text{ mm/s}$$

$$= 2000\text{ mm/s}$$

$$= 2\text{ m/s}$$

39. **(a)** $p_1 - p_2 = \frac{1}{2}\rho_a v_a^2$



$$p_3 - p_2 = \frac{1}{2}\rho_l v_l^2$$

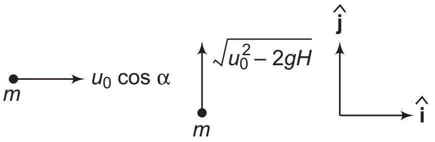
$$p_3 = p_1$$

$$\therefore \qquad \frac{1}{2}\rho_l v_l^2 = \frac{1}{2}\rho_a v_a^2$$

$$\Rightarrow \qquad v_l = \sqrt{\frac{\rho_a}{\rho_l}}\, v_a$$

$$\therefore \qquad \text{Volume flow rate} \propto \sqrt{\frac{\rho_a}{\rho_l}}$$

40. **(a)** From momentum conservation equation, we have,



$$\mathbf{p}_i = \mathbf{p}_f$$

$$\therefore\ m(u_0\cos\alpha)\hat{\mathbf{i}} + m(\sqrt{u_0^2 - 2gH})\hat{\mathbf{j}}$$

$$= (2m)\mathbf{v} \qquad \text{...(I)}$$

$$H = \frac{u_0^2 \sin^2\alpha}{2g} \qquad \text{...(ii)}$$

From Eqs. (i) and (ii)

$$\mathbf{v} = \frac{u_0\cos\alpha}{2}\hat{\mathbf{i}} + \frac{u_0\cos\alpha}{2}\hat{\mathbf{j}}$$

Since both components of **v** are equal. Therefore, it is making 45° with horizontal.

41. **(5)** Velocity of first bob at highest point

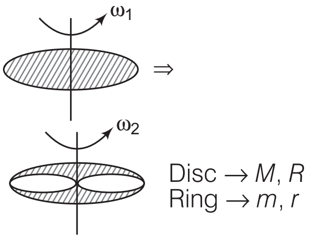
$.v_1 = \sqrt{gR} = \sqrt{gl_1}$ (to just complete the vertical circle)

= velocity of second bob just after elastic collision.

= velocity of second bob at the bottommost point

$= \sqrt{5gl_2} \quad \Rightarrow \quad \dfrac{l_1}{l_2} = 5$

42. **(8)** $I_1\omega_1 = I_2\omega_2$

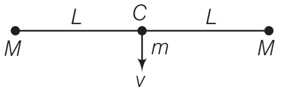


$$\therefore\ \omega_2 = \left(\frac{I_1}{I_2}\right)\omega_1 = \left[\frac{\frac{1}{2}MR^2}{\frac{1}{2}MR^2 + 2(mr^2)}\right]\omega_1$$

$$= \left[\frac{50(0.4)^2}{50(0.4)^2 + 8\times(6.25)\times(0.2)^2}\right](10)$$

$$= 8 \text{ rad/s}$$

43. **(b)**



Let v is the minimum velocity. From energy conservation,

$$U_c + K_c = U_\infty + K_\infty$$

$$\therefore\qquad mV_c + \frac{1}{2}mv^2 = 0 + 0$$

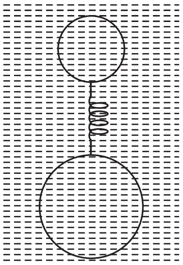
$$\therefore\qquad v = \sqrt{-2V_c} = \sqrt{(-2)\left(\frac{-2GM}{L}\right)} = 2\sqrt{\frac{GM}{L}}$$

44. **(c)** $\Delta l = \dfrac{FL}{AY} = \dfrac{FL}{(\pi r^2)Y}$

$$\therefore\qquad \Delta l \propto \frac{L}{r^2}$$

$$\therefore\qquad \frac{\Delta l_1}{\Delta l_2} = \frac{L/R^2}{2L/(2R)^2} = 2$$

45. **(a)**



On small sphere

$$\frac{4}{3}\pi R^3(\rho)g + kx = \frac{4}{3}\pi R^3(2\rho)g \qquad \text{...(i)}$$

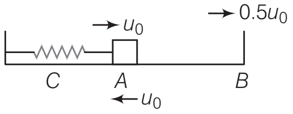
On second sphere (large)

$$\frac{4}{3}\pi R^3(3\rho)g = \frac{4}{3}\pi R^3(2\rho)g + kx \qquad \text{...(ii)}$$

By Eqs. (i) and (ii), we get

$$x = \frac{4\pi R^3\rho g}{3k}$$

46. **(a,d)** (a) At equilibrium ($t = 0$) particle has maximum velocity u_0. Therefore velocity at time t can be written as



$$u = u_{\max}\cos\omega t = u_0\cos\omega t$$

when, $\quad u = 0.5\,u_0 = u_0\cos\omega t$

$$\therefore\qquad \omega t = \frac{\pi}{3}$$

$$\therefore\qquad \frac{2\pi}{T}t = \frac{\pi}{3}$$

$$\therefore\qquad t = \frac{T}{6}$$

(b) $t = t_{AB} + t_{BA} = \dfrac{T}{6} + \dfrac{T}{6}$

$$= \frac{T}{3} = \frac{2\pi}{3}\sqrt{\frac{m}{k}}$$

(c) $t = t_{AB} + t_{BA} + t_{AC}$

$$= \frac{T}{6} + \frac{T}{6} + \frac{T}{4}$$

$$= \frac{7}{12}T = \frac{7\pi}{6}\sqrt{\frac{m}{k}}$$

(d) $t = t_{AB} + t_{BA} + t_{AC} + t_{CA}$

$$= \frac{T}{6} + \frac{T}{6} + \frac{T}{4} + \frac{T}{4} = \frac{5}{6}T$$

$$= \frac{5\pi}{3}\sqrt{\frac{m}{k}}$$

PREFACE

The overwhelming response to the previous editions of this book gives me an immense feeling of satisfaction and I take this an opportunity to thank all the teachers and the whole student community who have found this book really beneficial.

In the present scenario of ever-changing syllabus and the test pattern of JEE Main & Advanced, the NEW EDITION of this book is an effort to cater all the difficulties being faced by the students during their preparation of JEE Main & Advanced. The exercises in this book have been divided into two sections viz., JEE Main & Advanced. Almost all types and levels of questions are included in this book. My aim is to present the students a fully comprehensive textbook which will help and guide them for all types of examinations. An attempt has been made to remove all the printing errors that had crept in the previous editions. I am extremely thankful to (Dr.)Mrs. Sarita Pandey, Mr. Anoop Dhyani and Nisar Ahmad for their endless efforts during the project.

Comments and criticism from readers will be highly appreciated and incorporated in the subsequent editions.

DC Pandey

CONTENTS

17. WAVE MOTION **1-50**

17.1 Introduction
17.2 Classification of a Wave
17.3 Equation of a Travelling Wave
17.4 Sine Wave
17.5 Two Graphs in Sine Wave
17.6 Wave Speed
17.7 Energy in Wave Motion

18. SUPERPOSITION OF WAVES **51-98**

18.1 Principle of Superposition
18.2 Resultant Amplitude and Intensity due to Coherent Sources
18.3 Interference
18.4 Standing Wave
18.5 Normal Modes of a String
18.6 Reflection and Transmission of a Wave

19. SOUND WAVES **99-170**

19.1 Introduction
19.2 Displacement Wave, Pressure Wave and Density Wave
19.3 Speed of a Longitudinal Wave
19.4 Sound Waves in Gases
19.5 Sound Intensity
19.6 Interference in Sound Wave and Stationary Wave
19.7 Standing Longitudinal Waves in Organ Pipes
19.8 Beats
19.9 The Doppler's Effect

20. THERMOMETRY, THERMAL EXPANSION & KINETIC THEORY OF GASES 171-236

20.1 Thermometers and The Celsius Temperature Scale
20.2 The Constant Volume Gas Thermometer and The Absolute Temperature Scale
20.3 Heat and Temperature
20.4 Thermal Expansion
20.5 Behaviour of Gases
20.6 Degree of Freedom
20.7 Internal Energy of an Ideal Gas
20.8 Law of Equipartition of Energy
20.9 Molar Heat Capacity
20.10 Kinetic Theory of Gases

21. LAWS OF THERMODYNAMICS 237-305

21.1 The First Law of Thermodynamics
21.2 Further Explanation of Three Terms Used in First Law
21.3 Different Thermodynamic Processes
21.4 Heat Engine and its Efficiency
21.5 Refrigerator
21.6 Zeroth Law of Thermodynamics
21.7 Second Law of Thermodynamics

22. CALORIMETRY & HEAT TRANSFER 307-352

22.1 Calorimetry
22.2 Heat Transfer

- **Hints & Solutions 353-434**
- **JEE Main & Advanced Previous Years' Questions (2018-13) 1-19**

SYLLABUS

JEE Main

HEAT AND THERMODYNAMICS

Heat, temperature, thermal expansion; specific heat capacity, calorimetry; change of state, latent heat. Heat transfer-conduction, convection and radiation, Newton's law of cooling.

Thermal equilibrium, Zeroth law of thermodynamics, concept of temperature. Heat, work and internal energy. First law of thermodynamics. Second law of thermodynamics: reversible and irreversible processes. Carnot engine and its efficiency.

Equation of state of a perfect gas, work done on compressing a gas. Kinetic theory of gases – assumptions, concept of pressure. Kinetic energy and temperature: rms speed of gas molecules; Degrees of freedom, Law of equipartition of energy, applications to specific heat capacities of gases; Mean free path, Avogadro's number.

WAVES

Wave motion. Longitudinal and transverse waves, speed of a wave. Displacement relation for a progressive wave. Principle of superposition of waves, reflection of waves, Standing waves in strings and organ pipes, fundamental mode and harmonics, Beats, Doppler's effect in sound.

JEE Advanced

GENERAL

Specific heat of a liquid using calorimeter. Speed of sound using resonance column.

WAVES

Wave motion (plane waves only), longitudinal and transverse waves, superposition of waves, Progressive and stationary waves, Vibration of strings and air columns, Resonance, Beats, Speed of sound in gases, Doppler's effect (in sound).

HEAT and THERMODYNAMICS

Thermal expansion of solids, liquids and gases, calorimetry, latent heat, Heat conduction in one dimension, Elementary concepts of convection and radiation, Newton's law of cooling, Ideal gas laws, Specific heats (and for monoatomic and diatomic gases), Isothermal and adiabatic processes, bulk modulus of gases, Equivalence of heat and work, First law of thermodynamics and its applications (only for ideal gases), Black body radiation: absorptive and emissive powers, Kirchhoff's law, Wien's displacement law, Stefan's law.

This book is dedicated to my honourable grandfather

(Late) Sh. Pitamber Pandey

a Kumaoni poet and a resident of Village
Dhaura (Almora), Uttarakhand

Wave Motion

Chapter Contents

17.1 Introduction
17.2 Classification of a Wave
17.3 Equation of a Travelling Wave
17.4 Sine Wave
17.5 Two Graphs in Sine Wave
17.6 Wave Speed
17.7 Energy in Wave Motion

17.1 Introduction

In every wave, a physical quantity y is made to oscillate at one point and gradually these oscillations of y propagate to other points also without transport of matter. In general, a wave also transports energy and momentum (in addition to oscillations of y).

Thus, in a wave, the following three physical quantities transfer from one point to another point.

(i) oscillations of y
(ii) energy and
(iii) momentum

In different situations, the physical quantity y may be different. For example:

y is displacement of medium particles (between $+A$ and $-A$) from the mean position in case of string wave, where A is the amplitude of oscillations. Similarly, y is electric and magnetic fields for electromagnetic waves and it is displacement, pressure and density which oscillate in longitudinal (or sound) wave. A wave is said to be **travelling** or **progressive** if it travels from one point to another. A **plane wave** is a wave of constant frequency and amplitude with wavefronts that are infinitely long straight lines. Plane waves travel in the perpendicular direction to the wavefronts. Many physical waves are approximate plane waves far from their sources.

17.2 Classification of a Wave

A wave can be classified in the following three manners :

1-D, 2-D and 3-D Wave

In 1-D wave, oscillations of y (or energy and momentum also) transfer in a straight line or we can say that wave travels in a straight line. String wave is the best example of a 1-D wave. In 2-D wave, it travels in a plane. Wave travelling on the surface of water is an example of a 2-D wave. In 3-D wave, it travels in whole space. Sound or light wave produced by a point source is an example of a 3-D wave.

Transverse and Longitudinal Wave

In transverse waves, oscillations of y are perpendicular to wave velocity and wave velocity is the direction in which oscillations (or energy and momentum) transfer from one point to another.

Electromagnetic waves and string waves are transverse in nature.In longitudinal waves, oscillations are along the wave velocity. Sound wave is a longitudinal wave.

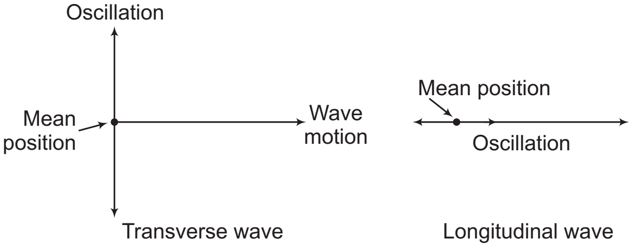

Fig. 17.1

Mechanical and Non-mechanical Wave

The waves which require medium for their propagation from one point to another point are called mechanical waves. Although this medium may be a gas also. Sound wave is a mechanical wave. Over the moon, sound waves cannot travel, as there is no gas on its surface.

Non-mechanical waves can travel with or without medium. Electromagnetic waves are non-mechanical waves.

✓ Extra Points to Remember

- Apart from mechanical and non-mechanical waves, there is also another kind of waves called "**matter waves**".
- Sound wave is basically a part of longitudinal waves with frequency varying from 20 Hz to 20,000 Hz. Similarly, light wave is a part of electromagnetic waves with wavelength varying from approximately 4000 Å to 7000 Å.
- In the propagation of mechanical waves, elasticity and inertia of the medium play an important role.
- Waves traveling through a solid medium can be either transverse or longitudinal waves. But waves travelling through a fluid (such as a liquid or a gas) are always longitudinal waves. Transverse waves require a relatively rigid medium in order to transmit their energy. As one particle begins to move it must be able to exert a pull on its nearest neighbor. If the medium is not rigid as is the case with fluids, the particles will slide past each other. This sliding action that is characteristic of liquids and gases prevents one particle from displacing its neighbour in a direction perpendicular to wave direction. It is for this reason that only longitudinal waves are observed moving through the bulk of liquids such as our ocean.
- While waves that travel within the depths of the ocean are longitudinal waves, the waves that travel along the surface of the oceans are referred to as surface waves. A **surface wave** is a wave in which particles of the medium undergo a circular motion. Surface waves are neither longitudinal nor transverse. The radius of the circles decreases as the depth into the water increases.
- Earthquakes are capable of producing both types of waves transverse as well as longitudinal. The **P-waves (Primary waves)** in an earthquake are examples of longitudinal waves. The P-waves travel with the fastest velocity and are the first to arrive. The **S-waves (Secondary waves)** in an earthquake are examples of transverse waves. S-waves propagate with a velocity slower than P-waves, arriving several seconds later.

17.3 Equation of a Travelling Wave

As we have already read, in a wave motion a physical quantity y is made to oscillate at one point and these oscillations of y propagate to other places also.

Therefore, in a wave, several particles oscillate (unlike SHM in which normally a single oscillates).

So, to determine the value of y (from its mean position between $+A$ and $-A$) we will have to tell position of the particle and time. Thus,

$$\boxed{y = f\ (\text{position of particle, time})}$$

In three dimensional space, position of the particle can be represented by three variable co-ordinates. Thus, in general, y is a function of four variables, three in co-ordinates and the fourth one is time.

But in physics, we normally keep least number of variables. If the wave is one-dimensional, then position of the particle can be represented by a single variable co-ordinate (say x).

Thus, in a one-dimensional wave y is a function of two variables x and t. Here, x is used for position of the particle and t for time or

$$\boxed{y = f\,(x, t)}$$

Note *Since, there are two variables in y, therefore whenever required, y is always differentiated partially. For example,*

$$\frac{\partial y}{\partial x}, \frac{\partial y}{\partial t}, \frac{\partial^2 y}{\partial x^2} \text{ etc.}$$

Now, the question is, there may be infinite number of functions of x and t, like

$$y = x + t$$

$$y = xt + t^3 x^2 \text{ etc}$$

Obviously, all functions will not represent a wave function. Only those functions of x and t will represent a wave function which satisfies the following three conditions.

Condition 1 The given function must satisfy the following differential equation :

$$\boxed{\left(\frac{\partial^2 y}{\partial t^2}\right) = k\left(\frac{\partial^2 y}{\partial x^2}\right)} \qquad \text{...(i)}$$

Here, k is a constant which is equal to square of the wave velocity or

$$\boxed{k = v^2}$$

Condition 2 The wave function must be single valued. For given values of x and t there should be only one value of y.

Condition 3 The wave function and its first derivative must be continuous. Therefore, there should not be a sudden change in the value of y and its first derivative (in some cases it will be called slope).

Note *Last two conditions are slightly difficult to explain at this stage. So, students need not to go in detail of those.*

The general solution of Eq. (i) discussed above is of the form :

$$\boxed{y(x, t) = f\,(ax \pm bt)} \qquad \text{...(ii)}$$

Thus, any function of x and t which satisfies Eq. (i) and which can be written as Eq. (ii) represents a wave, provided conditions (2) and (3) are also satisfied.

Further, if these conditions are satisfied, then speed of wave (v) is given by

$$\boxed{v = \frac{\text{coefficient of } t}{\text{coefficient of } x} = \frac{b}{a}}$$

If ax and bt are of same sign (both positive or both negative), then wave will be travelling along negative x-direction. If one is positive and other is negative, then wave travels in negative x-direction.

Alternate Method of Understanding the Wave Equation

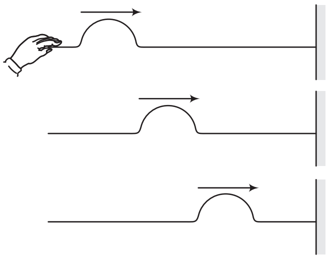

Fig. 17.2

Let us consider a long string with one end fixed to a wall and the other held by a person. The person pulls on the string keeping it tight. Suppose the person snaps his hand a little up and down producing a bump in the string near his hand.

Experiments shows that, as time passes the bump travels on the string towards right.

Suppose the man starts snapping his hand at time $t=0$ and finishes his job at $t=\Delta t$. The vertical displacement y of the left end of the string is a function of time.

$$y=0 \text{ for } t<0 \text{ and } t>\Delta t$$

$$y\neq 0 \text{ for } 0<t<\Delta t$$

Let us represent this function by $f(t)$.

Thus,

$$y(x=0,t)=f(t)$$

Here, $x=0$ is the extreme left end of the string.

The disturbance travels on the string towards right with a constant speed v. Thus, the displacement produced at the left end at time t, reaches the point x at time $t+\frac{x}{v}$.

But the displacement of the particle at point x at time t was originated at $x=0$ at time $t-\frac{x}{v}$.

$$\therefore \qquad y(x,t)=y\left(x=0,\,t-\frac{x}{v}\right)=f\left(t-\frac{x}{v}\right)$$

Thus, $$\boxed{y(x,t)=f\left(t-\frac{x}{v}\right)} \qquad \text{...(iii)}$$

Eq. (iii) represents a wave travelling in the positive x-direction with a constant speed v. The time t and the position x must appear in the wave equation in the combination $t-\frac{x}{v}$. If the wave travels in the negative x-direction, its general equation may be written as

$$y(x,t)=f\left(t+\frac{x}{v}\right)$$

Note *In the wave equation,*

$$y=(x,t)=f\left(t-\frac{x}{v}\right)$$

Coefficient of t is 1 and coefficient of x is $\frac{1}{v}$.

$$\therefore \qquad \text{wave speed}=\frac{\text{coefficient of } t}{\text{coefficient of } x}=\frac{1}{(1/v)}=v$$

Example 17.1 *In a wave motion* $y = a\sin(kx - \omega t)$, *y can represent:* **(JEE 1999)**

(a) *electric field* (b) *magnetic field*

(c) *displacement* (d) *pressure*

Solution (a, b, c, d)

In case of sound wave, y can represent pressure and displacement, while in the case of electromagnetic wave, it represents electric and magnetic fields.

Example 17.2 *Show that the equation,* $y = a\sin(\omega t - kx)$ *satisfies the wave equation* $\frac{\partial^2 y}{\partial t^2} = v^2 \frac{\partial^2 y}{\partial x^2}$. *Find speed of wave and the direction in which it is travelling.*

Solution $\frac{\partial^2 y}{\partial t^2} = -\omega^2 a\sin(\omega t - kx)$ and $\frac{\partial^2 y}{\partial x^2} = -k^2 a\sin(\omega t - kx)$

We can write these two equations as

$$\frac{\partial^2 y}{\partial t^2} = \frac{\omega^2}{k^2}\cdot\frac{\partial^2 y}{\partial x^2}$$

Comparing this with,
$$\frac{\partial^2 y}{\partial t^2} = v^2 \frac{\partial^2 y}{\partial x^2}$$

We get wave speed $v = \frac{\omega}{k}$ **Ans.**

The negative sign between ωt and kx implies that wave is travelling along positive x-direction.

INTRODUCTORY EXERCISE 17.1

1. Prove that the equation $y = a\sin\omega t$ does not satisfy the wave equation and hence it does not represent a wave.
2. A wave pulse is described by $y(x, t) = ae^{-(bx - ct)^2}$, where a, b and c are positive constants. What is the speed of this wave?
3. You have learnt that a travelling wave in one dimension is represented by a function $y = f(x, t)$ where x and t must appear in the combination $ax \pm bt$ or $x - vt$ or $x + vt$, i.e. $y = f(x \pm vt)$. Is the converse true? Examine if the following functions for y can possibly represent a travelling wave
   (a) $(x - vt)^2$ (b) $\log[(x + vt)/x_0]$ (c) $1/(x + vt)$
4. The equation of a wave travelling on a string stretched along the X-axis is given by
$$y = Ae^{-\left(\frac{x}{a} + \frac{t}{T}\right)^2}$$
   (a) Write the dimensions of A, a and T.
   (b) Find the wave speed.
   (c) In which direction is the wave travelling?
   (d) Where is the maximum of the pulse located at $t = T$ and at $t = 2T$?

17.4 Sine Wave

If oscillations of y are simple harmonic in nature, then $y(x, t)$ function is sine or cosine function. Such type of wave is called **sine wave** or **sinusoidal wave**. For better understanding, we can visualize a sine wave travelling on a string.

The general expression of a sine wave is

$$\boxed{y = A\sin(\omega t \pm kx \pm \phi)} \quad \text{and} \quad \boxed{y = A\cos(\omega t \pm kx \pm \phi)}$$

In the above equations,

(i) A is the amplitude of oscillations of y.

(ii) ω is called the angular frequency. Here,

$$\boxed{\omega = 2\pi f = \frac{2\pi}{T} \quad \text{and} \quad f = \frac{1}{T}}$$

where, f is normal frequency of oscillations and T is the time period of oscillations. SI unit of ω is radian/sec while that of f is Hz or s^{-1}.

(iii) k is called the angular wave number, where

$$\boxed{k = \frac{2\pi}{\lambda}}$$

Here, λ is the wavelength of wave.

Wavelength (λ)

In a **transverse wave motion,** the particles of the medium oscillate about their mean or equilibrium position at right angles to the direction of propagation of wave motion itself.

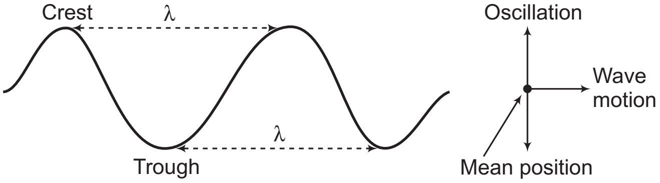

Fig. 17.3

This form of wave motion travels in the form of **crests and troughs**, for example, waves travelling along a stretched string. The distance between two successive crests or troughs is known as **wavelength (λ)** of the wave. In a **longitudinal wave motion,** particles of the medium oscillate about their mean or equilibrium position along the direction of propagation of the wave motion itself. This type of wave motion travels in the form of **compressions** and **rarefactions**.

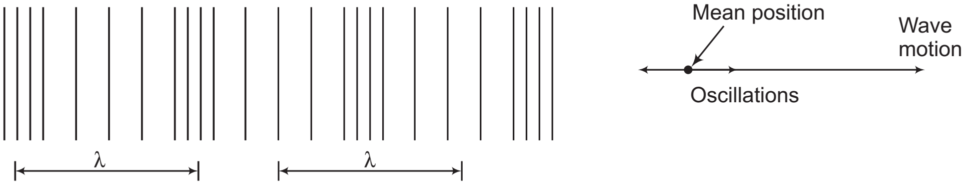

Fig. 17.4

The distance between two successive compressions or rarefactions constitute one wavelength.

Note *Numerically, $k=\frac{2\pi}{\lambda}$ or angular wave number is defined as the number of waves in 2π length. Similarly, there is one another word called wave number. This is equal to $\frac{1}{\lambda}$ and numerically this is equal to number of waves in unit length.*

(iv) Wave speed v,

$$=\frac{\text{coefficient of } t}{\text{coefficient of } x}$$

$$\therefore \qquad \boxed{v=\frac{\omega}{k}}$$

But $$\omega=2\pi f$$

and $$k=\frac{2\pi}{\lambda}$$

Substituting in the above equation, we also get

$$\boxed{v=f\lambda}$$

(v) $\frac{\partial y}{\partial t}$ is SHM velocity of the particle executing oscillations (lying between $+\omega A$ and $-\omega A$).

Similarly, $\frac{\partial^2 y}{\partial t^2}$ is SHM acceleration (lying between $+\omega^2 A$ and $-\omega^2 A$).

Let us take an example: suppose a sine wave travelling on a string is

$$y=A\sin(\omega t-kx+\phi) \qquad \ldots\text{(i)}$$

Then, $$\frac{\partial y}{\partial t}=\omega A\cos(\omega t-kx+\phi) \qquad \ldots\text{(ii)}$$

and $$\frac{\partial^2 y}{\partial \tau^2}=-\omega^2 A\sin(\omega t-kx+\phi) \qquad \ldots\text{(iii)}$$

From Eq. (i), we can determine y-displacement of SHM of any particle at position x and at time t. Value of y lies between $+A$ and $-A$.

From Eq. (ii), we can determine $\frac{\partial y}{\partial t}$ or SHM velocity and from Eq. (iii), we can find $\frac{\partial^2 y}{\partial t^2}$ or SHM acceleration.

Angle $(\omega t-kx+\phi)$ is same in all three equations which is also called phase angle of three functions. With the help of this phase angle, we can determine values of y, $\frac{\partial y}{\partial t}$ and $\frac{\partial^2 y}{\partial t^2}$ at any position x at time t. If we put $x=0$ and $t=0$, then this angle is only ϕ. This is called initial phase angle of the particle at co-ordinate $x=0$. With the help of this angle, we can find the initial values of y, $\frac{\partial y}{\partial t}$ and $\frac{\partial^2 y}{\partial t^2}$ of this string particle (which is executing SHM at position $x=0$).

Extra Points to Remember

- Alternate expressions of a sine wave travelling along positive x-direction are

$$y = A \sin k(x - vt) = A \sin (kx - \omega t) = A \sin \frac{2\pi}{\lambda}(x - vt) = A \sin 2\pi\left(\frac{x}{\lambda} - \frac{t}{T}\right)$$

Similarly, the expression, $y = A \sin k(x + vt) = A \sin (kx + \omega t) = A \sin 2\pi\left(\frac{x}{\lambda} + \frac{t}{T}\right)$ etc.

represent a sine wave travelling along negative x-direction.

- **Difference between two equations**

$$y = A\sin(kx - \omega t) \text{ and } y = A\sin(\omega t - kx)$$

It hardly matters whether we write the first or the second equation. Both the equations represent a wave travelling in positive x-direction with speed $v = \frac{\omega}{k}$. The difference between them is that they are out of phase, i.e. phase difference between them is π. It means, if a particle in position $x = 0$ at time $t = 0$ is in its mean position and moving upwards (represented by first wave) then the same particle will be in its mean position but moving downwards (represented by the second wave). Similarly, the waves

$$y = A \sin (kx - \omega t) \text{ and } y = -A \sin (kx - \omega t) \text{ are also out of phase.}$$

Example 17.3 *A wave travelling along a string is described by*

$$y(x, t) = 0.005 \sin (80.0\, x - 3.0\, t).$$

in which the numerical constants are in SI units (0.005 *m*, 80.0 *rad* m^{-1} *and* 3.0 *rad* s^{-1}). *Calculate (a) the amplitude. (b) the wavelength (c) the period and frequency of the wave. Also, calculate the displacement y of the wave at a distance x* = 30.0 *cm and time t* = 20 *s?* **(NCERT Solved Example)**

Solution On comparing the given equation with

$$y(x, t) = A \sin (kx - \omega t), \text{ we find}$$

(a) the amplitude $A = 0.005 \text{ m} = 5 \text{ mm}$.

(b) the angular wave number k and angular frequency ω are

$$k = 80.0 \text{ m}^{-1} \quad \text{and} \quad \omega = 3.0 \text{ s}^{-1}$$

$$\therefore \quad \lambda = 2\pi/k = \frac{2\pi}{80.0} = 0.0785 \text{ m}$$

$$= 7.85 \text{ cm}$$ **Ans.**

(c) $T = 2\pi/\omega = \frac{2\pi}{3.0} = 2.09 \text{ s}$ **Ans.**

and frequency, $f = 1/T = 0.48 \text{ Hz}$ **Ans.**

The displacement y at $x = 30.0$ cm and time $t = 20$ s is given by

$$y = (0.005 \text{ m}) \sin (80.0 \times 0.3 - 3.0 \times 20)$$
$$= (0.005 \text{ m}) \sin (-36)$$
$$= (0.005 \text{ m}) \sin (-36 + 12\pi)$$
$$= (0.005 \text{ m}) \sin (1.714)$$
$$= (0.005 \text{ m}) \sin (98.27^\circ) = 4.94 \text{ mm}$$ **Ans.**

Example 17.4 *The equation of a wave is*

$$y(x,t)=0.05\sin\left[\frac{\pi}{2}(10x-40t)-\frac{\pi}{4}\right]m$$

Find : *(a) the wavelength, the frequency and the wave velocity*

(b) the particle velocity and acceleration at $x=0.5$ *m and* $t=0.05$ *s.*

Solution (a) The equation may be rewritten as

$$y(x,t)=0.05\sin\left(5\pi x-20\pi t-\frac{\pi}{4}\right)\text{ m}$$

Comparing this with equation of plane progressive harmonic wave,

$$y(x,t)=A\sin(kx-\omega t+\phi)\text{ we have,}$$

Wave number, $k=\dfrac{2\pi}{\lambda}=5\pi$ rad/m

$\therefore$ $\lambda=0.4$ m **Ans.**

The angular frequency is

$$\omega=2\pi f=20\pi\text{ rad/s}$$

$\therefore$ $f=10$ Hz **Ans.**

The wave velocity is,

$$v=f\lambda=\frac{\omega}{k}=4\text{ m/s in }+x\text{-direction}$$ **Ans.**

(b) The particle velocity and particle acceleration at the given values of x and t are

$$\frac{\partial y}{\partial t}=-(20\pi)(0.05)\cos\left(\frac{5\pi}{2}-\pi-\frac{\pi}{4}\right)$$

$$=2.22\text{ m/s}$$ **Ans.**

$$\frac{\partial^2 y}{\partial t^2}=-(20\pi)^2(0.05)\sin\left(\frac{5\pi}{2}-\pi-\frac{\pi}{4}\right)$$

$$=140\text{ m/s}^2$$ **Ans.**

INTRODUCTORY EXERCISE 17.2

1. Consider the wave $y=(5\text{ mm})\sin[1\text{cm}^{-1}x-(60\text{s}^{-1})t]$. Find (a) the amplitude, (b) the angular wave number, (c) the wavelength, (d) the frequency, (e) the time period and (f) the wave velocity.

2. A wave is described by the equation $y=(1.0\text{ mm})\sin\pi\left(\dfrac{x}{2.0\text{ cm}}-\dfrac{t}{0.01\text{ s}}\right)$.

   (a) Find time period and wavelength.
   (b) Find the speed of particle at $x=1.0$ cm and time $t=0.01$ s.
   (c) What are the speeds of the particles at $x=3.0$ cm, 5.0 cm and 7.0 cm at $t=0.01$ s?
   (d) What are the speeds of the particles at $x=1.0$ cm at $t=0.011, 0.012$ and 0.013 s?

17.5 Two Graphs in Sine Wave

As we have learned in the above article that $y(x, t)$ equation of a sine wave is either sine or cosine equation. Now, corresponding to this equation we can have two graphs and two simple equations.

First Graph

In $y(x, t)$ equation, if value of t is fixed (or substituted), then the equation left is $y(x)$ equation.So, we can plot y-x graph corresponding to this equation. And obviously the graph (or the equation) will be a sine or cosine graph.

For example Suppose a sine wave is travelling along positive x-direction on a string. At a given time (say at 9 AM), the y-x graph may be as shown in the figure.

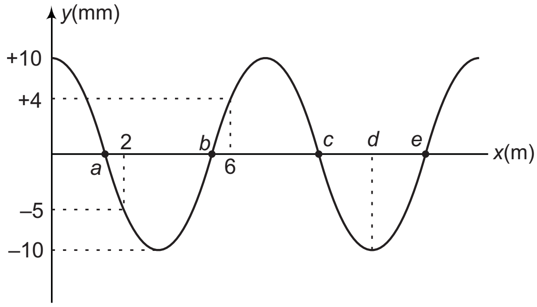

Fig. 17.5

The important points in the above graph are

(i) amplitude of oscillation is 10 mm.

(ii) at 9 AM, y-displacement of the string particle at $x = 2$ m is -5 mm and of the particle at $x = 6$ m is $+4$ mm. Or, we can say that this graph represents SHM y-displacements of different string particles (at different x-coordinates) at 9 AM. Hence, this is a photograph (or snapshot) of the string at 9 AM.

(iii) Slope of this graph at any point is $\frac{\partial y}{\partial x}\left(\text{not } \frac{dy}{dx}\right)$, as y has two variables x and t.

(iv) Two string particles at different locations are in different phases. The phase difference between them is given by

$$\boxed{\Delta\phi = \left(\frac{2\pi}{\lambda}\right)(\Delta x)}$$

Here, Δx is the path difference between them.

For example

Particles 'a' and 'b' have a path difference of $\frac{\lambda}{2}$. So, phase difference between them is π.

Particle 'a' and 'c' have a path difference of λ. So, phase difference is 2π.

Similarly, particles 'c' and 'd' have a path difference of $\frac{\lambda}{4}$. Therefore, the phase difference is $\frac{\pi}{2}$.

(v) From the above graph, we cannot determine the direction of wave velocity. For that, wave equation will be required.

Second Graph

In $y(x, t)$ equation, if the value of x is fixed (or substituted) then the equation left is $y(t)$ equation. So, we can plot y-t graph corresponding to this equation. Again, the graph (or the equation) will be a sine or cosine graph.

For example Suppose a sine wave is travelling along positive x-direction on a string. At a given position (say $x = 4$ m), the y-t graph may be as shown in the figure.

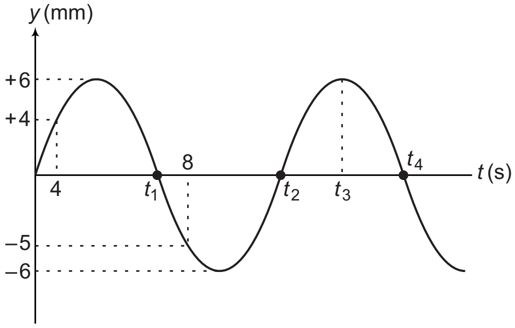

Fig. 17.6

The important points in this graph are

(i) amplitude of oscillations is 6 mm.

(ii) y-displacement of the particle at $x = 4$ m is 4 mm at 4 s. Similarly, y-displacement of the particle at $x = 4$ m is -5 mm at 8 s or we can say that this graph is basically SHM y-t graph of the string particle at $x = 4$ m, which shows different SHM y-displacements of this particle at different times or it is videography of SHM oscillations of this particle.

(iii) Slope of this particle at any time is $\frac{\partial y}{\partial t}$ and this is SHM velocity $(= \pm\omega\sqrt{A^2 - y^2})$ of the particle at $x = 4$ m at that time.

(iv) The same particle at two different times will have different phase angles.

The phase difference in a time interval of Δt is given by

$$\boxed{\Delta\phi = \left(\frac{2\pi}{T}\right)\Delta t}$$

For example,

t_1 and t_2 have a time interval of $\frac{T}{2}\cdot$ So, phase difference is π.

t_2 and t_3 have a time interval of $\frac{T}{4}\cdot$ So, the phase difference is $\frac{\pi}{2}$.

Similarly, t_1 and t_4 have a time interval of T.

Therefore, phase difference is 2π.

Wave velocity (v), particle velocity (v_p) and particle acceleration (a_p) in a Sinusoidal wave

Wave velocity (v) is the velocity by which oscillations of y (or energy) transfer from one point to another point. Later, we will see that this velocity depends on characteristics of medium.

Particle velocity (v_P) and particle acceleration (a_P) are different.

In a sinusoidal wave, particles of the medium oscillate simple harmonically about their mean position. Therefore, all the formulae we have read in SHM apply to the particles here also. For example, maximum particle velocity is $\pm A\omega$ at mean position and it is zero at extreme positions etc. Similarly, maximum particle acceleration is $\pm \omega^2 A$ at extreme positions and zero at mean position.

However, the wave velocity is different from the particle velocity. This depends on certain characteristics of the medium. Unlike the particle velocity which oscillates simple harmonically (between $+A\omega$ and $-A\omega$) the wave velocity is constant for given characteristics of the medium.

Suppose, a sine wave travelling along positive x-axis is

$$y(x, t) = A \sin(kx - \omega t) \quad \text{...(i)}$$

Let us differentiate this function partially with respect to t and x.

$$\frac{\partial y(x, t)}{\partial t} = -A\omega \cos(kx - \omega t) \quad \text{...(ii)}$$

$$\frac{\partial y(x, t)}{\partial x} = Ak \cos(kx - \omega t) \quad \text{...(iii)}$$

Now, these can be written as

$$\frac{\partial y(x, t)}{\partial t} = -\left(\frac{\omega}{k}\right)\frac{\partial y(x, t)}{\partial x}$$

Here, $$\frac{\partial y(x, t)}{\partial t} = \text{particle velocity } v_P$$

$$\frac{\omega}{k} = \text{wave velocity } v$$

and $$\frac{\partial y(x, t)}{\partial x} = \text{slope of the wave}$$

Thus, $$\boxed{v_P = -v\,(\text{slope})} \quad \text{...(iv)}$$

i.e. particle velocity at a given position and time is equal to negative of the product of wave velocity with slope of the wave at that point at that instant.

Acceleration of the particle is the second partial derivative of $y(x, t)$ with respect to t,

$$\therefore \quad a_P = \frac{\partial^2 y(x, t)}{\partial t^2} = -\omega^2 A \sin(kx - \omega t) = -\omega^2 y(x, t)$$

i.e. acceleration of the particle equals $-\omega^2$ times its displacement, which is the same result we obtained in SHM. Thus,

$$\boxed{a_P = -\omega^2\,(\text{displacement})} \quad \text{...(v)}$$

We can also show that,

$$\frac{\partial^2 y(x,t)}{\partial t^2}=\left(\frac{\omega^2}{k^2}\right)\cdot\frac{\partial^2 y(x,t)}{\partial x^2}$$

or $$\boxed{\frac{\partial^2 y(x,t)}{\partial t^2}=v^2\frac{\partial^2 y(x,t)}{\partial x^2}} \quad \ldots\text{(vi)}$$

which is also the wave equation.

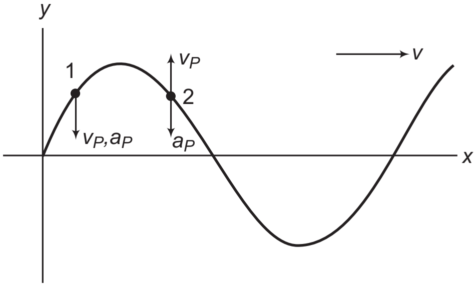

Fig. 17.7

Fig. 17.7 shows velocity (v_P) and acceleration (a_P) given by Eqs. (iv) and (v) for two points 1 and 2 on a string. The sinusoidal wave is travelling along positive x-direction.

At 1 Slope of the curve is positive. Hence, from Eq. (iv) particle velocity (v_P) is negative or downwards. Similarly, displacement of the particle is positive, so from Eq. (v) acceleration will also be negative or downwards.

At 2 Slope is negative while displacement is positive. Hence, v_P will be positive (upwards) and a_P is negative (downwards).

Note *Direction of v_P will change if the wave travels along negative x-direction.*

Example 17.5 *Under what condition, maximum particle velocity is four times the wave velocity corresponding to the equation,*

$$y=A\sin(\omega t-kx)$$

Solution Maximum particle velocity is ωA and wave velocity is $\frac{\omega}{k}$.

Now, given that

maximum particle velocity = 4 (wave velocity)

or $$\omega A=4\left(\frac{\omega}{k}\right)$$

∴ $$A=\frac{4}{k}$$

So, this is the required condition.

Example 17.6 *A transverse sinusoidal wave moves along a string in the positive x-direction at a speed of 10 cm/s. The wavelength of the wave is 0.5 m and its amplitude is 10 cm. At a particular time t, the snapshot of the wave is shown in figure. The velocity of point P when its displacement is 5 cm is*

(JEE 2008)

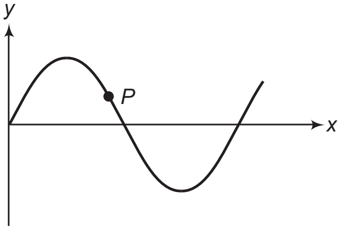

Fig. 17.8

(a) $\frac{\sqrt{3}\pi}{50}\hat{\mathbf{j}}\ m/s$ (b) $-\frac{\sqrt{3}\pi}{50}\hat{\mathbf{j}}\ m/s$

(c) $\frac{\sqrt{3}\pi}{50}\hat{\mathbf{i}}\ m/s$ (d) $-\frac{\sqrt{3}\pi}{50}\hat{\mathbf{i}}\ m/s$

Solution Particle velocity $v_P = -v$ (slope of y-x graph)

Here, $v = +$ ve, as the wave is travelling in positive x-direction.Slope at P is negative.

$\therefore$ Velocity of particle is in positive y (or $\hat{\mathbf{j}}$) direction.

$\therefore$ Correct option is (a).

Note *We can also find the magnitude of particle velocity by the relation.*

$$v_P = \omega\sqrt{A^2 - y^2}$$

Here, $A = 10$ cm $= 0.1$m, $y = 5$ cm $= 0.05$ m *and* $\omega = 2\pi f = 2\pi\left(\frac{v}{\lambda}\right) = 2\pi\left(\frac{0.1}{0.5}\right) = \frac{2\pi}{5}$ *rad* s^{-1}

Example 17.7 *Equation of a transverse wave travelling in a rope is given by*

$$y = 5\sin(4.0t - 0.02x)$$

where y and x are expressed in cm and time in seconds. Calculate

(a) the amplitude, frequency, velocity and wavelength of the wave.

(b) the maximum transverse speed and acceleration of a particle in the rope.

Solution (a) Comparing this with the standard equation of wave motion,

$$y = A\sin(\omega t - kx) = A\sin\left(2\pi ft - \frac{2\pi}{\lambda}x\right)$$

where A, f and λ are amplitude, frequency and wavelength respectively.

Thus, amplitude $A = 5$ cm

$\Rightarrow$ $2\pi f = 4 \Rightarrow$ Frequency, $f = \frac{4}{2\pi} = 0.637$ Hz

Again $\frac{2\pi}{\lambda} = 0.02$ or Wavelength, $\lambda = \frac{2\pi}{0.02} = (100\pi)$ cm

Velocity of the wave, $v = f\lambda = \frac{4}{2\pi}\ \frac{2\pi}{0.02} = 200$ cm/s **Ans.**

(b) Transverse velocity of the particle,

$$v_P = \frac{\partial y}{\partial t} = 5\times 4\cos(4.0t - 0.02x) = 20\cos(4.0t - 0.02x)$$

Maximum velocity of the particle = 20 cm/s

Particle acceleration, $a_P = \dfrac{\partial^2 y}{\partial t^2} = -20 \times 4 \sin(4.0t - 0.02x)$

Maximum particle acceleration = $80\ \text{cm/s}^2$

Example 17.8 *In the above example, find phase difference* $\Delta\phi$.

(a) of same particle at two different times with a time interval of 1 *s*

(b) of two different particles located at a distance of 10 *cm at same time*

Solution (a) $\Delta\phi = \left(\dfrac{2\pi}{T}\right)\Delta t$, but $\dfrac{2\pi}{T} = \omega = 4.0$ rad/s

$$\therefore \qquad \Delta\phi = \omega\,\Delta t = (4.0)(1.0)$$
$$= 4 \text{ rad}$$ **Ans.**

(b) $\Delta\phi = \left(\dfrac{2\pi}{\lambda}\right)\Delta x$, but $\dfrac{2\pi}{\lambda} = k = 0.02\ \text{cm}^{-1}$

$$\therefore \qquad \Delta\phi = (0.02)(10)$$
$$= 0.2 \text{ rad}$$ **Ans.**

INTRODUCTORY EXERCISE 17.3

1. The equation of a wave travelling on a string is
$$y = (0.10\ \text{mm}) \sin[(31.4\ \text{m}^{-1})x + (314\ \text{s}^{-1})t]$$
   (a) In which direction does the wave travel?
   (b) Find the wave speed, the wavelength and the frequency of the wave.
   (c) What is the maximum displacement and the maximum speed of a portion of the string?
2. The equation for a wave travelling in x-direction on a string is
$$y = (3.0\ \text{cm}) \sin[(3.14\ \text{cm}^{-1})x - (314\ \text{s}^{-1})t].$$
   (a) Find the maximum velocity of a particle of the string.
   (b) Find the acceleration of a particle at $x = 6.0$ cm at time $t = 0.11$ s
3. The equation of a travelling wave is
$$y(x, t) = 0.02 \sin\left(\frac{x}{0.05} + \frac{t}{0.01}\right) \text{m}$$
   Find
   (a) the wave velocity and
   (b) the particle velocity at $x = 0.2$ m and $t = 0.3$ s.
   Given $\cos\theta = -0.85$, where $\theta = 34$ rad
4. A wave of frequency 500 Hz has a wave velocity of 350 m/s.
   (a) Find the distance between two points which are 60° out of phase.
   (b) Find the phase difference between two displacements at a certain point at time 10^{-3} s apart.

17.6 Wave Speed

Wave speed (v) depends on the medium or characteristics of the medium. Waves of all frequencies or all wavelengths travel in a given medium with same speed. For examples, all electromagnetic waves travel in vacuum with same speed ($\approx 3 \times 10^8$ m/s).

In water, this speed will be different. Similarly, all longitudinal waves (including the sound wave) travel in air with the same speed (≈ 330 m/s).

Now, frequency of a wave depends on source and wavelength is self adjusted in a value,

$$\boxed{\lambda = \frac{v}{f}}$$

In the above expression, v is same (obviously in a given medium) for all sources (or frequencies). So, with increase in value of f, wavelength λ automatically decreases.

For example, usually frequency of female voice is more than frequency of male voice.

So, wavelength of female voice will be less.

Example 17.9 *Speed of sound in air is 330 m/s. Find maximum and minimum wavelength of audible sound in air.*

Solution Frequency of audible sound varies from 20 Hz to 20000 Hz.

Speed of all frequencies in air will be same (= 330 m/s).

$$\therefore \qquad \lambda_{\min} = \frac{v}{f_{\max}} = \frac{330}{20000}$$

$$= 0.0165 \text{ m}$$ **Ans.**

Similarly,

$$\lambda_{\max} = \frac{v}{f_{\min}} = \frac{330}{20}$$

$$= 16.5 \text{ m}$$ **Ans.**

INTRODUCTORY EXERCISE 17.4

1. Speed of light in vacuum is 3×10^8 m/s. Range of wavelength of visible light is 4000 Å - 7000 Å. Find the range of frequency of visible light.
2. Speed of sound in air is 330 m/s. Frequency of Anoop's voice is 1000 Hz and of Shubham's voice is 2000 Hz. Find the wavelength corresponding to their voice.

Speed of Different Waves

Normally, two wave speeds are required at this stage.

(i) Transverse wave speed on a string.

(ii) Longitudinal wave speed in all three states: solid, liquid and gas.

Transverse Wave Speed on a String

Speed of transverse wave on a string is given by

$$v = \sqrt{\frac{T}{\mu}}$$

Here, μ = mass per unit length of the string

$$= \frac{m}{l} = \frac{mA}{lA} \qquad (A = \text{area of cross-section of the string})$$

$$= \left(\frac{m}{V}\right) A \qquad (V = \text{volume of string})$$

$$= \rho A \qquad (\rho = \text{density of string})$$

Hence, the above expression can also be written as

$$\boxed{v = \sqrt{\frac{T}{\rho A}}}$$

Proof

Consider a pulse travelling along a string with a speed v to the right. If the amplitude of the pulse is small compared to the length of the string, the tension T will be approximately constant along the string. In the reference frame moving with speed v to the right, the pulse is stationary and the string moves with a speed v to the left.

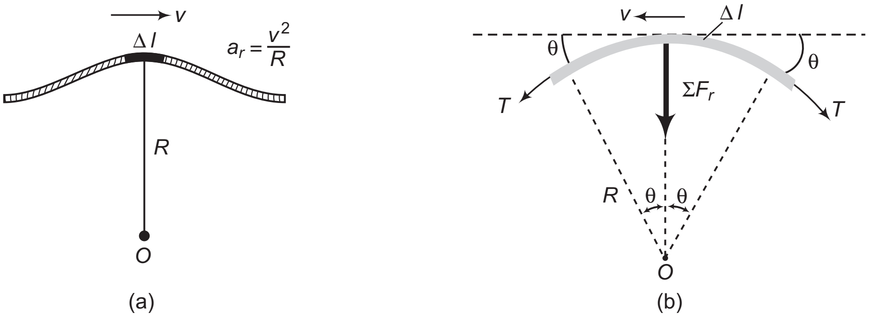

Fig. 17.9 (a) To obtain the speed v of a wave on a stretched string, it is convenient to describe the motion of a small segment of the string in a moving frame of reference. (b) In the moving frame of reference, the small segment of length Δl moves to the left with speed v. The net force on the segment is in the radial direction because the horizontal components of the tension forces are cancelled.

Figure shows a small segment of the string of length Δl. This segment forms a part of a circular arc of radius R. Instantaneously, the segment is moving with speed v in a circular path, so it has a centripetal acceleration $\frac{v^2}{R}$. The forces acting on the segment are the tension T at each end. The horizontal components of these forces are equal and opposite and thus cancel. The vertical components of these forces point radially inward toward the centre of the circular arc. These radial forces provide the centripetal acceleration. Let the angle subtended by the segment at centre be 2θ. The net radial force acting on the segment is

$$\Sigma F_r = 2T \sin\theta = 2T\theta$$

Where we have used the approximation $\sin\theta \approx \theta$ for small θ.

If μ is the mass per unit length of the string, the mass of the segment of length Δl is

$$m = \mu\Delta l = 2\mu R\theta \qquad (\text{as } \Delta l = 2R\theta)$$

From Newton's second law, $\Sigma F_r = ma = \dfrac{mv^2}{R}$ or $2T\theta = (2\mu R\theta)\left(\dfrac{v^2}{R}\right)$

$$\therefore \qquad v = \sqrt{\frac{T}{\mu}}$$

Longitudinal Wave Speed in Three States

Speed of longitudinal wave through a gas (or a liquid) is given by

$$\boxed{v = \sqrt{\frac{B}{\rho}}}$$

Here, B = Bulk modulus of the gas (or liquid)

and ρ = density of the gas (or liquid)

Now Newton, who first deduced this relation for v, assumed that during the passage of a sound wave through a gas (or air), the temperature of the gas remains constant, i.e. sound wave travels under isothermal conditions and hence took B to be the isothermal elasticity of the gas and which is equal to its pressure p. So, **Newton's** formula for the velocity of a sound wave (or a longitudinal wave) in a gaseous medium becomes

$$\boxed{v = \sqrt{\frac{p}{\rho}}}$$

If, however, we calculate the velocity of sound in air at NTP with the help of this formula by substituting.

$$p = 1.01 \times 10^5 \text{ N/m}^2 \quad \text{and} \quad \rho = 1.29 \times 10^{-3} \text{ kg/m}^3$$

then v comes out to be nearly 280 m/s. Actually, the velocity of sound in air at NTP as measured by Newton himself, is found to be 332 m/s. Newton could not explain this large discrepancy between his theoretical and experimental results.

Laplace after 140 years correctly argued that a sound wave passes through a gas (or air) very rapidly. So, adiabatic conditions are developed. So, he took B to be the adiabatic elasticity of the gas, which is equal to γp where γ is the ratio of C_p (molar heat capacity at constant pressure) and C_V (molar heat capacity at constant volume). Thus, Newton's formula as corrected by Laplace becomes

$$\boxed{v = \sqrt{\frac{\gamma p}{\rho}}}$$

For air, $\gamma = 1.41$, so that in air, $v = \sqrt{\dfrac{1.41\,p}{\rho}}$

which gives 331.6 m/s as the velocity of sound (in air) at NTP which is in agreement with Newton's experimental result.

Speed of longitudinal wave in a thin rod or wire is given by

$$\boxed{v = \sqrt{\frac{Y}{\rho}}}$$

Here, Y is the Young's modulus of elasticity.

Note *In the chapter of sound wave (Chapter-19), we will discuss longitudinal wave speed in detail (with proof and examples). In the present chapter, we are taking examples of only transverse wave speed on a string.*

Example 17.10 *One end of 12.0 m long rubber tube with a total mass of 0.9 kg is fastened to a fixed support. A cord attached to the other end passes over a pulley and supports an object with a mass of 5.0 kg. The tube is struck a transverse blow at one end. Find the time required for the pulse to reach the other end.* $(g = 9.8\ m/s^2)$

Solution Tension in the rubber tube AB, $T = mg$

or $$T = (5.0)(9.8) = 49\text{ N}$$

Mass per unit length of rubber tube, $\mu = \dfrac{0.9}{12} = 0.075\text{ kg/m}$

$\therefore$ Speed of wave on the tube, $v = \sqrt{\dfrac{T}{\mu}} = \sqrt{\dfrac{49}{0.075}} = 25.56\text{ m/s}$

$\therefore$ The required time is, $t = \dfrac{AB}{v} = \dfrac{12}{25.56} = 0.47\text{ s}$ **Ans.**

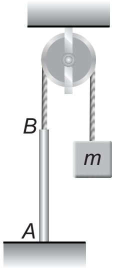

Fig. 17.10

Example 17.11 *A wire of uniform cross-section is stretched between two points 100 cm apart. The wire is fixed at one end and a weight is hung over a pulley at the other end. A weight of 9 kg produces a fundamental frequency of 750 Hz.*

(a) What is the velocity of the wave in wire?

(b) If the weight is reduced to 4 kg, what is the velocity of wave?

Note *Fundamental frequency is given by*

$$f = \frac{v}{2L}$$

Solution (a) $L = 100\text{ cm}$, $f_1 = 750\text{ Hz}$

$$v_1 = 2Lf_1 = 2 \times 100 \times 750$$

$$= 150000\text{ cms}^{-1} = 1500\text{ ms}^{-1}$$ **Ans.**

(b) $v_1 = \sqrt{\dfrac{T_1}{\mu}}$ and $v_2 = \sqrt{\dfrac{T_2}{\mu}}$

$$\frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1}}$$

$\therefore$ $$\frac{v_2}{1500} = \sqrt{\frac{4}{9}}$$

$\therefore$ $$v_2 = 1000\text{ ms}^{-1}$$ **Ans.**

INTRODUCTORY EXERCISE 17.5

1. Figure shows a string of linear mass density $1.0\ \text{g cm}^{-1}$ on which a wave pulse is travelling. Find the time taken by the pulse in travelling through a distance of 50 cm on the string. Take $g = 10\ \text{ms}^{-2}$.

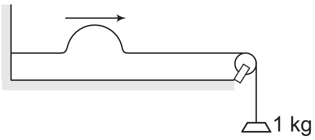

Fig. 17.11

2. A steel wire of length 64 cm weighs 5 g. If it is stretched by a force of 8 N, what would be the speed of a transverse wave passing on it?

3. Two blocks each having a mass of 3.2 kg are connected by a wire *CD* and the system is suspended from the ceiling by another wire *AB*. The linear mass density of the wire *AB* is $10\ \text{gm}^{-1}$ and that of *CD* is $8\ \text{g m}^{-1}$. Find the speed of a transverse wave pulse produced in *AB* and in *CD*.

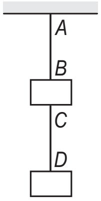

Fig. 17.12

4. In the arrangement shown in figure, the string has a mass of 4.5 g. How much time will it take for a transverse disturbance produced at the floor to reach the pulley? Take $g = 10\ \text{ms}^{-2}$.

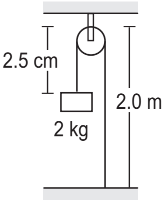

Fig. 17.13

5. A copper wire 2.4 mm in diameter is 3 m long and is used to suspend a 2 kg mass from a beam. If a transverse disturbance is sent along the wire by striking it lightly with a pencil, how fast will the disturbance travel? The density of copper is $8920\ \text{kg/m}^3$.

6. One end of a horizontal rope is attached to a prong of an electrically driven tuning fork that vibrates at 120 Hz. The other end passes over a pulley and supports a 1.50 kg mass. The linear mass density of the rope is 0.0550 kg/m.
   (a) What is the speed of a transverse wave on the rope?
   (b) What is the wavelength?
   (c) How would your answers to parts (a) and (b) change if the mass were increased to 3.00 kg?

17.7 Energy in Wave Motion

In a wave, many particles oscillate. In a sinusoidal wave, these oscillations are simple harmonic in nature. Each particle has some energy of oscillation. At the same time, energy transfer also takes place. Related to energy of oscillation and energy transfer, there are three terms, namely, energy density (u), power (P) and intensity (I).

Energy density (u)

Energy of oscillation per unit volume is called energy density (u). Its SI unit is $\mathrm{J/m^3}$. In case of SHM, energy of oscillation (of a single particle) is $E = \frac{1}{2} m\omega^2 A^2$. In a sinusoidal wave, each particle of the string oscillates simple harmonically.

Therefore,

$$\text{Energy density} = \frac{\text{energy of oscillation}}{\text{volume}} \quad \text{or} \quad u = \frac{E}{V} = \frac{\frac{1}{2} m\omega^2 A^2}{V}$$

But, $$\frac{m}{V} = \text{density or } \rho$$

∴ $$\boxed{u = \frac{1}{2} \rho\omega^2 A^2}$$

Power (P)

Energy transferred per unit time is called power. The expression of power is

$$\boxed{P = \frac{1}{2} \rho\omega^2 A^2 S v}$$

Here, S is area of cross-section of the medium in which wave is travelling and v is the wave speed. SI unit of power is J/s or Watt. Now, let us derive the above expression for a sinusoidal travelling wave on a string. Area of cross-section of string is S and the wave speed is v.

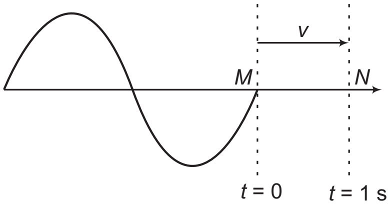

Fig. 17.14

Suppose at time $t = 0$, wave is at point M. In 1 s, it will travel a distance v and it will reach at point N. Or, we can say that v new length of string will start oscillating. Area of cross-section of string is S. Therefore, in 1 s, Sv new volume of string will start oscillating. Energy of oscillation per unit volume is called energy density (u). So, in 1 s, (uSv) new energy will be added or (uSv) energy will be transferred from the source. Energy transferred in one second is called power.

$$\therefore \quad P = uSv$$
$$= \frac{1}{2} \rho\omega^2 A^2 S v \qquad \left(\text{as } u = \frac{1}{2} \rho\omega^2 A^2\right)$$

or $$P = \frac{1}{2} \rho\omega^2 A^2 S v$$

This is the desired expression of power.

Intensity (*I*)

Energy transferred per unit cross-sectional area per unit time is called intensity.

Thus,

$$I = \frac{\text{Energy transferred}}{(\text{time})(\text{cross - sectional area})} = \frac{\text{Power}}{\text{cross - sectional area}} = \frac{P}{S}$$

$$= \frac{\frac{1}{2}\rho\omega^2 A^2 S v}{S} \quad \text{or} \quad \boxed{I = \frac{1}{2}\rho\omega^2 A^2 v}$$

The SI unit of intensity is J/s-m^2 or Watt/m^2.

Extra Points to Remember

- Although the above relations for power and intensity have been discussed for a transverse wave on a string, they hold good for other waves also.
- In SHM, potential energy is maximum (and kinetic energy is zero) at the extreme positions.
- For a string segment, the potential energy depends on the slope of the string and is maximum when the slope is maximum, which is at the equilibrium position of the segment, the same position for which the kinetic energy is maximum.

  At *A* : Kinetic energy and potential energy both are zero.

  At *B* : Kinetic energy and potential energy both are maximum.

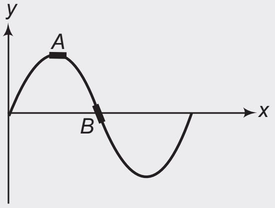

Fig. 17.15

- **Intensity due to a point source** If a point source emits wave uniformly in all directions, the energy at a distance *r* from the source is distributed uniformly on a spherical surface of radius *r* and area $S = 4\pi r^2$. If *P* is the power emitted by the source, the power per unit area at a distance *r* from the source is $\frac{P}{4\pi r^2}$. The average power per unit area that is incident perpendicular to the direction of propagation is called the intensity. Therefore,

$$I = \frac{P}{4\pi r^2} \quad \text{or} \quad I \propto \frac{1}{r^2}$$

Example 17.12 *A stretched string is forced to transmit transverse waves by means of an oscillator coupled to one end. The string has a diameter of 4 mm. The amplitude of the oscillation is 10^{-4} m and the frequency is 10 Hz. Tension in the string is 100 N and mass density of wire is $4.2 \times 10^3 \text{ kg/m}^3$. Find*

(a) the equation of the waves along the string
(b) the energy per unit volume of the wave
(c) the average energy flow per unit time across any section of the string and
(d) power required to drive the oscillator.

Solution (a) Speed of transverse wave on the string is

$$v = \sqrt{\frac{T}{\rho S}} \qquad (\text{as } \mu = \rho S)$$

Substituting the values, we have

$$v = \sqrt{\frac{100}{(4.2 \times 10^3)\left(\frac{\pi}{4}\right)(4.0 \times 10^{-3})^2}} = 43.53 \text{ m/s}$$

$$\omega = 2\pi f = 20\pi = 62.83 \text{ rad/s}$$

$$k = \frac{\omega}{v} = 1.44 \text{ m}^{-1}$$

$\therefore$ Equation of the waves along the string, $y(x, t) = A \sin(kx - \omega t)$

$$= (10^{-4} \text{ m}) \sin [(1.44 \text{ m}^{-1})x - (62.83 \text{ rad/s})t]$$ **Ans.**

(b) Energy per unit volume of the string, u = energy density $= \frac{1}{2}\rho\omega^2 A^2$

Substituting the values, we have

$$u = \left(\frac{1}{2}\right)(4.2 \times 10^3)(62.83)^2 (10^{-4})^2$$

$$= 8.29 \times 10^{-2} \text{ J/m}^3$$ **Ans.**

(c) Average energy flow per unit time, $P = \text{power} = \left(\frac{1}{2}\rho\omega^2 A^2\right)(Sv) = (u)(Sv)$

Substituting the values, we have $P = (8.29 \times 10^{-2})\left(\frac{\pi}{4}\right)(4.0 \times 10^{-3})^2 (43.53)$

$$= 4.53 \times 10^{-5} \text{ J/s}$$ **Ans.**

(d) Therefore, power required to drive the oscillator is 4.53×10^{-5} W. **Ans.**

INTRODUCTORY EXERCISE 17.6

1. Spherical waves are emitted from a 1.0 W source in an isotropic non-absorbing medium. What is the wave intensity 1.0 m from the source?
2. A line source emits a cylindrical expanding wave. Assuming the medium absorbs no energy, find how the amplitude and intensity of the wave depend on the distance from the source?
3. A certain 120 Hz wave on a string has an amplitude of 0.160 mm. How much energy exists in an 80 g length of the string?
4. A taut string for which $\mu = 5.00 \times 10^{-2}$ kg/m is under a tension of 80.0 N. How much power must be supplied to the string to generate sinusoidal waves at a frequency of 60.0 Hz and an amplitude of 6.00 cm?
5. A 200 Hz wave with amplitude 1 mm travels on a long string of linear mass density 6 g/m kept under a tension of 60 N.
   (a) Find the average power transmitted across a given point on the string.
   (b) Find the total energy associated with the wave in a 2.0 m long portion of the string.
6. A transverse wave of amplitude 0.50 mm and frequency 100 Hz is produced on a wire stretched to a tension of 100 N. If the wave speed is 100 m/s. What average power is the source transmitting to the wire?

List of Formulae

1. **Wave Equation** Only those functions of x and t or $y(x, t)$ represent a wave function which satisfies the following three conditions

   Condition 1
   $$\left(\frac{\partial^2 y}{\partial t^2}\right) = k\left(\frac{\partial^2 y}{\partial x^2}\right)$$

   Here, $k = v^2$ (v = wave speed)

   Condition 2 $y(x, t)$ should be a single valued function for all values of x and t.

   Condition 3 The wave function and its first derivative must be continuous.

2. If $y(x, t)$ is of type $f(ax \pm bt)$, then

   $$\text{wave speed } v = \frac{\text{coefficient of } t}{\text{coefficient of } x}$$

   Further, wave travels in positive x-direction if ax and bt are of opposite sign and it travels along negative x-direction if ax and bt are of same sign.

3. **Sine wave** General equation of this wave is

   $$y = A\sin(\omega t \pm kx \pm \phi)$$

   or
   $$y = A\cos(\omega t \pm kx \pm \phi)$$

   In these equations,

   (i) A is amplitude of oscillation,

   (ii) ω is angular frequency,

   $$T = \frac{2\pi}{\omega} \quad \Rightarrow \quad \omega = 2\pi f$$

   and
   $$f = \frac{1}{T} = \frac{\omega}{2\pi}$$

   (iii) k is angular wave number,

   $$k = \frac{2\pi}{\lambda}$$ ($\lambda \rightarrow$ wavelength)

   (iv) Wave speed, $v = \frac{\omega}{k} = f\lambda$

   (v) ϕ is initial phase angle at $x = 0$ and

   (vi) $(\omega t \pm kx \pm \phi)$ is phase angle at time t at coordinate x.

4. **Particle velocity (v_P) and wave velocity (v) in sine wave**

   (i) $y = f(x, t)$

   Then,
   $$v_P = \frac{\partial y}{\partial x}$$

   (ii) In sine wave, particles are executing SHM. Therefore, all equations of SHM can be applied for particles also.

   (iii) Relation between v_P and v

   $$v_P = -v \cdot \frac{\partial y}{\partial x}$$

   Here, $\partial y / \partial x$ is the slope of y - x graph when t is kept constant.

5. Phase Difference ($\Delta\phi$)

Case I $\Delta\phi = \omega(t_1 - t_2)$

or $\Delta\phi = \frac{2\pi}{T} \cdot \Delta t$

$=$ phase difference of one particle at a time interval of Δt.

Case II $\Delta\phi = k(x_1 \sim x_2)$

$= \frac{2\pi}{\lambda} \cdot \Delta x$

$=$ phase difference at one time between two particles at a path difference of Δx.

6. Wave Speed

(i) Speed of transverse wave on a stretched wire

$$v = \sqrt{\frac{T}{\mu}} = \sqrt{\frac{T}{\rho S}}$$

(ii) Speed of longitudinal wave

$$v = \sqrt{\frac{E}{\rho}}$$

(a) In solids, $E = Y =$ Young's modulus of elasticity

$\therefore$ $$v = \sqrt{\frac{Y}{\rho}}$$

(b) In liquids, $E = B =$ Bulk modulus of elasticity

$\therefore$ $$v = \sqrt{\frac{B}{\rho}}$$

(c) In gases, $E =$ adiabatic bulk modulus $= \gamma p$

$\therefore$ $$v = \sqrt{\frac{\gamma p}{\rho}} = \sqrt{\frac{\gamma RT}{M}}$$

7. Energy Density (u), Power (P) and Intensity (I) in sine Wave

(i) Energy density, $u = \frac{1}{2}\rho\omega^2 A^2 =$ energy of oscillation per unit volume

(ii) Power, $P = \frac{1}{2}\rho\omega^2 A^2 S v =$ energy transferred per unit time

(iii) Intensity, $I = \frac{1}{2}\rho\omega^2 A^2 v =$ energy transferred per unit time per unit area

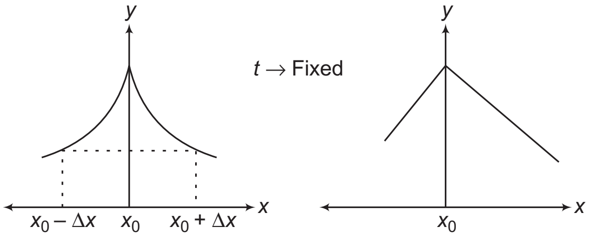
Solved Examples

TYPED PROBLEMS

Type 1. *Based on symmetry of a wave pulse*

Concept

To check symmetry of a wave pulse or wave velocity, always concentrate on maximum or minimum value of y. For example,



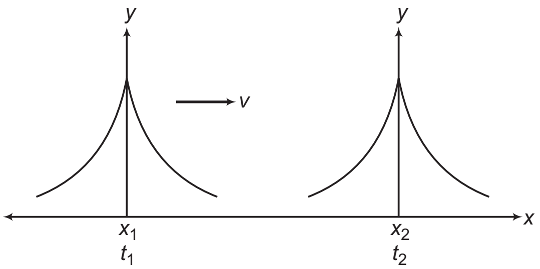
(i) (ii)

Wave pulse shown in Fig. (i) is symmetric but the wave pulse shown in Fig. (ii) is asymmetric. Now, the question is how will you check whether the pulse is symmetric or not.

The answer is

In both cases maximum value of y at the given time (say t_0) is at $x = x_0$.

Now, if $y(t = t_0, x = x_0 + \Delta x) = y(t = t_0, x = x_0 - \Delta x)$, then the pulse is symmetric otherwise not. So, at a given time (or any other time of your choice) first of all you have to find that x coordinate where you are getting the maximum value of y.



Further, suppose that maximum value of y is at x_1 at time t_1 and at x_2 at time $t_2 (> t_1)$. Then, from the figure we can see that peak of the wave pulse is travelling towards positive x-direction. In time $(t_2 - t_1)$, it has travelled a distance $(x_2 - x_1)$ along positive x-direction. Hence, the wave velocity is

$$v = + \frac{(x_2 - x_1)}{(t_2 - t_1)}$$

Example 1 *$y(x,t) = \dfrac{0.8}{[(4x+5t)^2+5]}$ represents a moving pulse where x and y are in metre and t in second. Then, choose the correct alternative(s):* **(JEE 1999)**

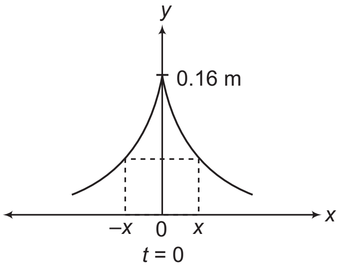
(a) pulse is moving in positive x-direction

(b) in 2 s it will travel a distance of 2.5 m

(c) its maximum displacement is 0.16 m

(d) it is a symmetric pulse

Solution (b), (c) and (d) are correct options.



The shape of pulse at $x=0$ and $t=0$ would be as shown in figure

$$y\,(0,0) = \frac{0.8}{5} = 0.16 \text{ m}$$

From the equation it is clear that $y_{\max} = 0.16$ m

Pulse will be symmetric (symmetry is checked about $y_{\max}$) if

At $t=0$; $\quad y\,(x) = y\,(-x)$

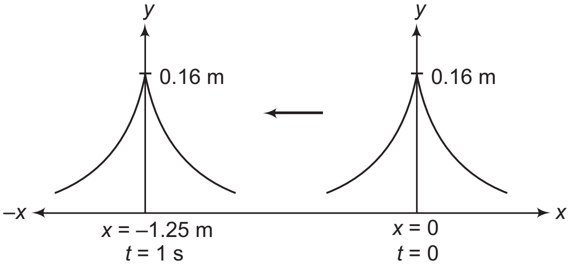
From the given equation

$$\left.\begin{aligned} y\,(x) &= \frac{0.8}{16x^2+5} \\ \text{and} \qquad y\,(-x) &= \frac{0.8}{16x^2+5} \end{aligned}\right\} \text{at } t=0$$

or $$y\,(x) = y\,(-x)$$

Therefore, pulse is symmetric.

Speed of pulse



At $t = 1$ s and $x = -1.25$ m, value of y is again 0.16 m, i.e. pulse has travelled a distance of 1.25 m in 1 second in negative x-direction or we can say that the speed of pulse is 1.25 m/s and it is travelling in negative x-direction. Therefore, it will travel a distance of 2.5 m in 2 seconds.

Type 2. *To find wave velocity from two $y(x)$ equations given at two different times.*

Concept

In $y(x,t)$ equation, if value of t is substituted then the equation left is $y(x)$ equation.

In this type of problem, $y(x)$ equation will be given at two different times and we have to find the wave velocity.

How to Solve?

- At the given time find the x-coordinates where you are getting the maximum (or minimum) value of y. From these two x-coordinates and two times we can calculate the wave velocity by the method discussed in Type 1.

Example 2 *At time $t=0$, $y(x)$ equation of a wave pulse is*

$$y=\frac{10}{2+(x-2)^2}$$

and at $t=2\,s$, $y(x)$ equation of the same wave pulse is

$$y=\frac{10}{2+(x+4)^2}$$

Here, y is in mm and x in metres. Find the wave velocity.

Solution From the given $y(x)$ equations at two different times we can see that value of y is maximum $\left(=\frac{10}{2}\text{ or }5\text{ mm}\right)$ at $x=2\,\text{m}$ at time $t=0$ and at $x=-4\,\text{m}$ at time $t=2\,\text{s}$.

So, peak of the wave pulse has travelled a distance of 6 m (from $x=2$ m to $x=-4$ m) in 2 s along negative x-direction.

Hence, the wave velocity is

$$v=-\frac{6}{2}=-3\text{ m/s}$$ **Ans.**

Type 3. *To make complete $y(x,t)$ function if $y(x)$ function at some given time and wave velocity are given*

Concept

(i) Wave speed, $v=\dfrac{\text{coefficient of } t}{\text{coefficient of } x}$

$\therefore$ Coefficient of $t=(v)(\text{coefficient of } x)$

(ii) Sign of coefficient of t will be opposite to the sign of coefficient of x if wave travels along positive x-direction and they are of same sign if the wave travels along negative x-direction.

Example 3 *A wave is travelling along positive x-direction with velocity 2 m/s. Further, $y(x)$ equation of the wave pulse at $t = 0$ is*

$$y = \frac{10}{2 + (2x + 4)^2}$$

(a) From the given information make complete $y(x, t)$ equation.

(b) Find $y(x)$ equation at $t = 1$ s

Solution (a) Here, coefficient to x is 2.

Wave speed is 2 m/s. Therefore, coefficient of $t = v$ (coefficient of x) $= 2 \times 2 = 4$ units.

Further, coefficient of x is positive and the wave is travelling along positive x-direction. Hence, coefficient of t must be negative.

Now, suppose the $y(x, t)$ function is

$$y = \frac{10}{2 + (2x - 4t + \alpha)^2} \qquad \text{...(i)}$$

Here, α is a constant.

At time $t = 0$, Eq. (i) becomes

$$y = \frac{10}{2 + (2x + \alpha)^2}$$

and the given function is

$$y = \frac{10}{2 + (2x + 4)^2}$$

Therefore, the value of α is 4.

Substituting in Eq. (i), we have

$$y = \frac{10}{2 + (2x - 4t + 4)^2}$$

(b) At $t = 1$ s

$$y = \frac{10}{2 + (2x - 4 \times 1 + 4)^2}$$

or

$$y = \frac{10}{2 + 4x^2}$$

Ans.

Type 4. *Based on transverse wave speed on a string*

Concept

(i) We know that transverse wave speed is given by

$$v = \sqrt{\frac{T}{\mu}} \quad \text{or} \quad \sqrt{\frac{T}{\rho S}}$$

(ii) If tension is uniform, then v is also uniform and we can calculate the time taken by the wave pulse in travelling from one point to another point by the direct relation

$$t = \frac{\text{distance}}{\text{speed}}$$

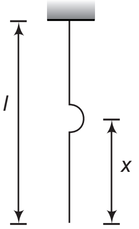
If tension is non-uniform, then v will be non-uniform and in that case time can be obtained by integration.

Example 4 *A uniform rope of mass* 0.1 *kg and length* 2.45 *m hangs from a ceiling.*

(a) Find the speed of transverse wave in the rope at a point 0.5 *m distant from the lower end.*

(b) Calculate the time taken by a transverse wave to travel the full length of the rope.

Solution (a) As the string has mass and it is suspended vertically, tension in it will be different at different points. For a point at a distance x from the free end, tension will be due to the weight of the string below it. So, if m is the mass of string of length l, the mass of length x of the string will be $\left(\frac{m}{l}\right)x$.



$$\therefore \quad T = \left(\frac{m}{l}\right) xg = \mu xg \qquad \left(\frac{m}{l} = \mu\right)$$

$$\therefore \quad \frac{T}{\mu} = xg$$

$$\text{or} \quad v = \sqrt{\frac{T}{\mu}} = \sqrt{xg} \qquad \text{...(i)}$$

$$\text{At } x = 0.5 \text{ m}, \quad v = \sqrt{0.5 \times 9.8}$$

$$= 2.21 \text{ m/s}$$

(b) From Eq. (i), we can see that velocity of the wave is different at different points. So, if at point x the wave travels a distance dx in time dt, then

$$dt = \frac{dx}{v} = \frac{dx}{\sqrt{gx}}$$

$$\therefore \quad \int_0^t dt = \int_0^l \frac{dx}{\sqrt{gx}}$$

$$\text{or} \quad t = 2\sqrt{\frac{l}{g}} = 2\sqrt{\frac{2.45}{9.8}}$$

$$= 1.0 \text{ s}$$

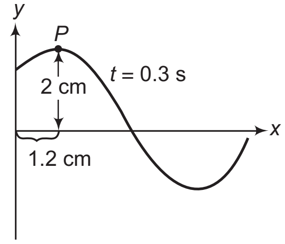
Ans.

Type 5. *To write the equation corresponding to given y - x graph (or a snapshot) at a given time*

Concept

From the given y - x graph, we can easily determine A, ω and k. Secondly, we have to check whether the wave is travelling along positive x -direction or negative x -direction. Because this factor will decide whether, ωt and kx should be of same sign or opposite sign.

Example 5 *Figure shows a snapshot of a sinusoidal travelling wave taken at $t = 0.3$ s. The wavelength is 7.5 cm and the amplitude is 2 cm. If the crest P was at $x = 0$ at $t = 0$, write the equation of travelling wave.*



Solution Given, $A = 2$ cm, $\lambda = 7.5$ cm

$$\therefore \qquad k = \frac{2\pi}{\lambda} = 0.84 \text{ cm}^{-1}$$

The wave has travelled a distance of 1.2 cm in 0.3 s. Hence, speed of the wave,

$$v = \frac{1.2}{0.3} = 4 \text{ cm/s}$$

$\therefore$ Angular frequency $\omega = (v)(k) = 3.36$ rad/s

Since the wave is travelling along positive x-direction and crest (maximum displacement) is at $x = 0$ at $t = 0$, we can write the wave equation as

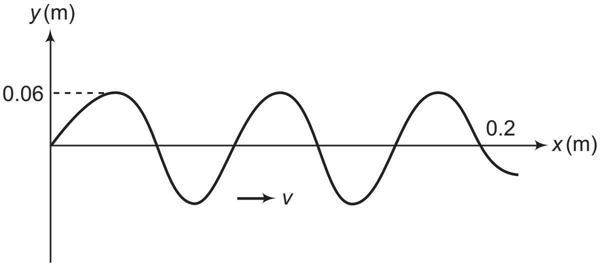
$$y(x, t) = A \cos (kx - \omega t)$$

or $$y(x, t) = A \cos (\omega t - kx) \quad \text{as} \quad \cos(-\theta) = \cos\theta$$

Therefore, the desired equation is

$$y(x, t) = (2 \text{ cm}) \cos [(0.84 \text{ cm}^{-1})\, x - (3.36 \text{ rad/s})\, t] \text{ cm}$$ **Ans.**

Example 6 *For the wave shown in figure, write the equation of this wave if its position is shown at $t = 0$. Speed of wave is $v = 300$ m/s.*



Solution The amplitude $A = 0.06$ m

$$\frac{5}{2}\lambda = 0.2 \text{ m}$$

$$\therefore \qquad \lambda = 0.08 \text{ m}$$

$$f = \frac{v}{\lambda} = \frac{300}{0.08} = 3750 \text{ Hz}$$

$$k = \frac{2\pi}{\lambda} = 78.5 \text{ m}^{-1}$$

and $\omega = 2\pi f = 23562$ rad/s

At $t = 0$, $x = 0$, $\frac{\partial y}{\partial x} = \text{positive}$

and the given curve is a sine curve.

Hence, equation of wave travelling in positive x-direction should have the form,

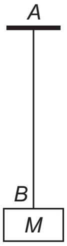
$$y(x, t) = A \sin (kx - \omega t)$$

Substituting the values, we have

$$y(x, t) = (0.06 \text{ m}) \sin [(78.5 \text{ m}^{-1})\, x - (23562 \text{ s}^{-1})\, t] \text{ m}$$ **Ans.**

Miscellaneous Examples

Example 7 *A block of mass $M = 2$ kg is suspended from a string AB of mass 6 kg as shown in figure. A transverse wave pulse of wavelength λ_0 is produced at point B. Find its wavelength while reaching at point A.*



Concept

While moving from B to A, tension will increase. So, wave speed will also increase (as $v = \sqrt{T/\mu}$). Frequency will remain unchanged because it depends on source. Therefore, wavelength will also increase (as $\lambda = \frac{v}{f}$ or $\lambda \propto v$).

Solution $\lambda = \frac{v}{f} = \frac{\sqrt{T/\mu}}{f}$

or $\lambda \propto \sqrt{T}$ (as μ and f are constants)

$\therefore$ $$\frac{\lambda_B}{\lambda_A} = \sqrt{\frac{T_B}{T_A}}$$

$\therefore$ $$\lambda_B = \left(\sqrt{\frac{T_B}{T_A}}\right) \lambda_A$$

$$= \left[\sqrt{\frac{(2+6)g}{2g}}\right]$$

$$= 2\lambda$$ **Ans.**

Example 8 *A wave moves with speed* 300 *m/s on a wire which is under a tension of* 500 *N. Find how much tension must be changed to increase the speed to* 312 *m/s?*

Solution Speed of a transverse wave on a wire is,

$$v = \sqrt{\frac{T}{\mu}} \qquad \text{...(i)}$$

Differentiating with respect to tension, we have

$$\frac{dv}{dT} = \frac{1}{2\sqrt{\mu T}} \qquad \text{...(ii)}$$

Dividing Eq. (ii) by Eq. (i), we have

$$\frac{dv}{v} = \frac{1}{2}\frac{dT}{T} \quad \text{or} \quad dT = (2T)\frac{dv}{v}$$

Substituting the proper values, we have

$$dT = \frac{(2)(500)(312 - 300)}{300}$$

$$= 40 \text{ N}$$ **Ans.**

i.e. tension should be increased by 40 N.

Example 9 *For a wave described by* $y = A \sin(\omega t - kx)$*, consider the following points (a)* $x = 0$ *(b)* $x = \frac{\pi}{4k}$ *(c)* $x = \frac{\pi}{2k}$ *and (d)* $x = \frac{3\pi}{4k}$.

For a particle at each of these points at $t = 0$*, describe whether the particle is moving or not and in what direction and describe whether the particle is speeding up, slowing down or instantaneously not accelerating?*

Solution $y = A \sin(\omega t - kx)$

Particle velocity $v_P(x, t) = \frac{\partial y}{\partial t} = \omega A \cos(\omega t - kx)$ and particle acceleration

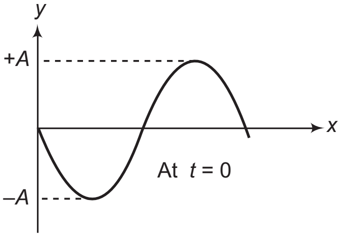
$$a_P(x, t) = \frac{\partial^2 y}{\partial t^2} = -\omega^2 A \sin(\omega t - kx)$$

(a) $t = 0,\ x = 0:$ $v_P = +\omega A$ and $a_P = 0$

i.e. particle is moving **upwards** but its **acceleration is zero**.

Note *Direction of velocity can also be obtained in a different manner as under,*

At $t = 0$, $y = A \sin(-kx) = -A \sin kx$



i.e. y-x graph is as shown in figure. At $x = 0$*, slope is negative. Therefore, particle velocity is positive* ($v_P = -v \times$ *slope), as the wave is travelling along positive x-direction.*

(b) $t = 0, x = \frac{\pi}{4k}$ $\quad x = \frac{\pi}{4k}$

$\therefore$ $$kx = \frac{\pi}{4}$$

$$v_P = \omega A \cos\left(-\frac{\pi}{4}\right) = +\frac{\omega A}{\sqrt{2}}$$

and $$a_P = -\omega^2 A \sin\left(-\frac{\pi}{4}\right) = +\frac{\omega^2 A}{\sqrt{2}}$$

Velocity of particle is positive, i.e. the particle is moving **upwards** (along positive y-direction). Further v_P and a_P are in the same direction (both are positive). Hence, the particle is **speeding up**.

(c) $t = 0, x = \frac{\pi}{2k}$ $\quad x = \frac{\pi}{2k} \quad \therefore \quad kx = \frac{\pi}{2}$

$$v_P = \omega A \cos(-\pi/2) = 0$$

$$a_P = -\omega^2 A \sin(-\pi/2) = \omega^2 A$$

i.e. particle is **stationary** or at its extreme position ($y = -A$). So, it is **speeding up** at this instant.

(d) $t = 0, \ x = \frac{3\pi}{4k}$ $\quad x = \frac{3\pi}{4k} \quad \therefore \quad kx = \frac{3\pi}{4}$

$\therefore$ $$v_P = \omega A \cos\left(-\frac{3\pi}{4}\right) = -\frac{\omega A}{\sqrt{2}}$$

$$a_P = -\omega^2 A \sin\left(-\frac{3\pi}{4}\right) = +\frac{\omega^2 A}{\sqrt{2}}$$

Velocity of particle is negative, i.e. the particle is moving **downwards**. Further v_P and a_P are in opposite directions, i.e. the particle is **slowing down**.

Example 10 *A thin string is held at one end and oscillates vertically so that,*

$$y\,(x = 0, t) = 8 \sin 4t \text{ (cm)}$$

Neglect the gravitational force. The string's linear mass density is 0.2 kg/m and its tension is 1 N. The string passes through a bath filled with 1 kg water. Due to friction heat is transferred to the bath. The heat transfer efficiency is 50%. Calculate how much time passes before the temperature of the bath rises one degree kelvin?

Solution Comparing the given equation with equation of a travelling wave,

$$y = A \sin(kx \pm \omega t) \quad \text{at} \quad x = 0 \quad \text{we find,}$$

$$A = 8 \text{ cm} = 8 \times 10^{-2} \text{ m}$$

$$\omega = 4 \text{ rad/s}$$

Speed of travelling wave, $$v = \sqrt{\frac{T}{\mu}} = \sqrt{\frac{1}{0.2}} = 2.236 \text{ m/s}$$

Further, $\rho S = \mu = 0.2$ kg/m

The average power over a period is

$$P = \frac{1}{2}(\rho S)\,\omega^2 A^2 v$$

Substituting the values, we have

$$P = \frac{1}{2}(0.2)(4)^2(8\times10^{-2})^2(2.236)$$

$$= 2.29\times10^{-2}\text{ J/s}$$

The power transferred to the bath is,

$$P' = 0.5\,P = 1.145\times10^{-2}\text{ J/s}$$

Now let, it takes t second to raise the temperature of 1 kg water by 1 degree kelvin. Then

$$P'\,t = ms\Delta t$$

Here, s = specific heat of water $= 4.2\times10^3$ J/kg-° K

$$\therefore \qquad t = \frac{ms\Delta t}{P'} = \frac{(1)(4.2\times10^3)(1)}{1.145\times10^{-2}}$$

$$= 3.6\times10^5\text{ s} \approx 4.2\text{ day}$$ **Ans.**

Example 11 *Consider a wave propagating in the negative x-direction whose frequency is 100 Hz. At t = 5 s, the displacement associated with the wave is given by*

$$y = 0.5\cos(0.1\,x)$$

where x and y are measured in centimetres and t in seconds. Obtain the displacement (as a function of x) at t = 10 s. What is the wavelength and velocity associated with the wave?

Solution A wave travelling in negative x-direction can be represented as

$$y(x, t) = A\cos(kx + \omega t + \phi)$$

At $t = 5$ s,

$$y(x, t = 5) = A\cos(kx + 5\omega + \phi)$$

Comparing this with the given equation,

We have,

$$A = 0.5\text{ cm}, k = 0.1\text{ cm}^{-1}$$

and $$5\omega + \phi = 0 \qquad \text{...(i)}$$

Now, $$\lambda = \frac{2\pi}{k} = \frac{2\pi}{0.1} = (20\pi)\text{ cm}$$ **Ans.**

$$\omega = 2\pi f = (200\pi)\text{ rad/s}$$

$$\therefore \qquad v = \frac{\omega}{k} = \frac{200\pi}{0.1} = (2000\,\pi)\text{ cm/s}$$ **Ans.**

From Eq. (i), $$\phi = -5\omega$$

At $t = 10$ s,

$$y(x, t = 10) = 0.5\cos(0.1\,x + 10\,\omega - 5\,\omega)$$

$$= 0.5\cos(0.1\,x + 5\,\omega)$$

Substituting $\omega = 200\,\pi$,

$$y(x, t = 10) = 0.5\cos(0.1\,x + 1000\pi)$$

$$= 0.5\cos(0.1\,x)$$ **Ans.**

Example 12 *A simple harmonic wave of amplitude 8 units travels along positive x-axis. At any given instant of time, for a particle at a distance of 10 cm from the origin, the displacement is + 6 units, and for a particle at a distance of 25 cm from the origin, the displacement is + 4 units. Calculate the wavelength.*

Solution $y = A \sin \frac{2\pi}{\lambda}(vt - x)$

or $$\frac{y}{A} = \sin 2\pi\left(\frac{t}{T} - \frac{x}{\lambda}\right)$$

In the first case,

$$\frac{y_1}{A} = \sin 2\pi\left(\frac{t}{T} - \frac{x_1}{\lambda}\right)$$

Here, $y_1 = +6, \quad A = 8, \quad x_1 = 10$ cm

$\therefore$ $$\frac{6}{8} = \sin 2\pi\left(\frac{t}{T} - \frac{10}{\lambda}\right) \qquad \text{...(i)}$$

Similarly in the second case,

$$\frac{4}{8} = \sin 2\pi\left(\frac{t}{T} - \frac{25}{\lambda}\right) \qquad \text{...(ii)}$$

From Eq. (i),

$$2\pi\left(\frac{t}{T} - \frac{10}{\lambda}\right) = \sin^{-1}\left(\frac{6}{8}\right) = 0.85 \text{ rad}$$

or $$\frac{t}{T} - \frac{10}{\lambda} = 0.14 \qquad \text{...(iii)}$$

Similarly from Eq. (ii),

$$2\pi\left(\frac{t}{T} - \frac{25}{\lambda}\right) = \sin^{-1}\left(\frac{4}{8}\right) = \frac{\pi}{6} \text{ rad}$$

or $$\frac{t}{T} - \frac{25}{\lambda} = 0.08 \qquad \text{...(iv)}$$

Subtracting Eq. (iv) from Eq. (iii), we get

$$\frac{15}{\lambda} = 0.06$$

$\therefore$ $$\lambda = 250 \text{ cm}$$ **Ans.**

Example 13 *A wave pulse on a horizontal string is represented by the function*

$$y(x, t) = \frac{5.0}{1.0 + (x - 2t)^2} \qquad (\textit{CGS units})$$

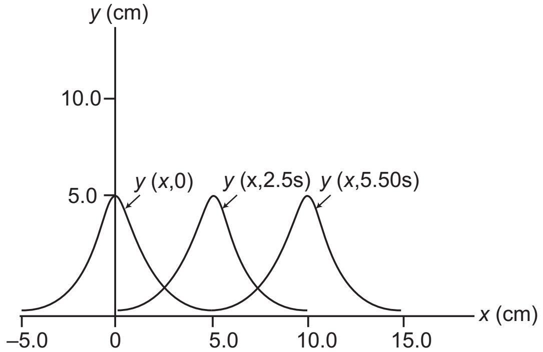
Plot this function at $t = 0$, 2.5 and 5.0 s.

Solution At the given times the function representing the wave pulse is

$$y\,(x, 0) = \frac{5.0}{1.0 + x^2}$$

$$y\,(x, 2.5 \text{ s}) = \frac{5.0}{1.0 + (x - 5.0)^2}$$

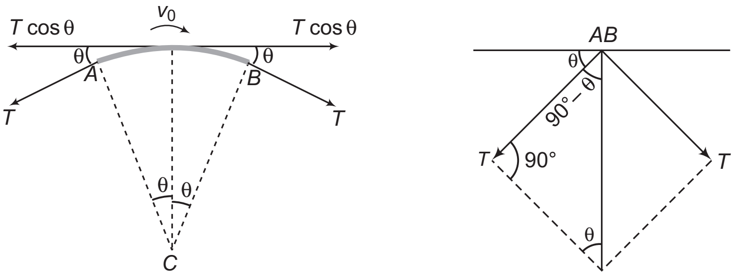
$$y\,(x, 5.0\text{ s}) = \frac{5.0}{1.0 + (x - 10.0)^2}$$



The maximum of $y(x, 0)$ is 5.0 cm; at $t = 0$, it is located at $x = 0$. At $t = 2.5$ and 5.0 s, the maximum of the pulse has moved to $x = 5.0$ and 10.0 cm, respectively. So, in each 2.5 s time interval, the pulse moves 5.0 cm in the positive x-direction. Its velocity is therefore +2.0 cm/s.

Example 14 *A uniform circular hoop of string is rotating clockwise in the absence of gravity. The tangential speed is* v_0. *Find the speed of the wave travelling on this string.*

Solution



(a) (b)

Let T be the tension in the string. Consider a small circular element AB of the string of length,

$$\Delta l = R\,(2\theta) \qquad (R = \text{radius of hoop})$$

The components of tension $T\cos\theta$ are equal and opposite and thus cancel out. The components towards centre C (i.e. $T\sin\theta$) provides the necessary centripetal force to element AB.

$$\therefore \qquad 2T\sin\theta = \frac{mv_0^2}{R} \qquad \text{...(i)}$$

Here, $$m = \mu\Delta l = 2\mu R\theta \qquad \left(\mu = \frac{\text{mass}}{\text{length}}\right)$$

As θ is small, $$\sin\theta \approx \theta$$

Substituting in Eq. (i), we get

$$2T\theta = \frac{2\mu R\theta\, v_0^2}{R}$$

or $$\frac{T}{\mu} = v_0^2$$

or $$\sqrt{\frac{T}{\mu}} = v_0 \qquad \text{...(ii)}$$

Speed of wave travelling on this string,

$$v = \sqrt{\frac{T}{\mu}} = v_0 \qquad \text{[from Eq. (ii)]}$$

i.e. the velocity of the transverse wave along the hoop of string is the same as the velocity of rotation of the hoop, *viz.* v_0. **Ans.**

Example 15 *A sinusoidal wave travelling in the positive direction on a stretched string has amplitude* 2.0 *cm, wavelength* 1.0 *m and wave velocity* 5.0 *m/s. At* $x = 0$ *and* $t = 0$, *it is given that* $y = 0$ *and* $\frac{\partial y}{\partial t} < 0$. *Find the wave function* $y(x, t)$.

Solution We start with a general equation for a rightward moving wave,

$$y(x, t) = A \sin (kx - \omega t + \phi)$$

The amplitude given is

$$A = 2.0 \text{ cm} = 0.02 \text{ m}$$

The wavelength is given as

$$\lambda = 1.0 \text{ m}$$

$\therefore$ Angular wave number,

$$k = \frac{2\pi}{\lambda} = (2\pi) \text{ m}^{-1}$$

Angular frequency,

$$\omega = vk = (10\pi) \text{ rad/s}$$

$$\therefore \qquad y(x, t) = (0.02) \sin [2\pi (x - 5.0t) + \phi]$$

We are given that for $x = 0$, $t = 0$,

$$y = 0$$

and $$\frac{\partial y}{\partial t} < 0$$

i.e. $$0.02 \sin \phi = 0 \qquad (\text{as } y = 0)$$

and $$-0.2\pi \cos \phi < 0$$

From these conditions, we may conclude that

$$\phi = 2n\pi \qquad \text{where } n = 0, 2, 4, 6 \ldots$$

Therefore,

$$y(x, t) = (0.02 \text{ m}) \sin [(2\pi \text{ m}^{-1}) x - (10\pi \text{ rad s}^{-1}) t] \text{ m}$$ **Ans.**

Exercises

LEVEL 1

Assertion and Reason

Directions : *Choose the correct option.*

(*a*) *If both **Assertion** and **Reason** are true and the **Reason** is correct explanation of the **Assertion.***

(*b*) *If both **Assertion** and **Reason** are true but **Reason** is not the correct explanation of **Assertion.***

(*c*) *If **Assertion** is true, but the **Reason** is false.*

(*d*) *If **Assertion** is false but the **Reason** is true.*

1. **Assertion :** Mechanical transverse waves can't travel in gaseous medium.
Reason : They do not possess modulus of rigidity.

2. **Assertion :** Surface waves are neither transverse nor longitudinal.
Reason : In surface wave particles undergo circular motion.

3. **Assertion :** Two equations of wave are $y_1 = A \sin(\omega t - kx)$ and $y_2 = A \sin(kx - \omega t)$. These two waves have a phase difference of π.
Reason : They are travelling in opposite directions.

4. **Assertion :** Wave speed is given by $v = f\lambda$. If frequency f is doubled, v will become two times.
Reason : For given conditions of medium wave speed remains constant.

5. **Assertion :** On moon you cannot hear your friend standing at some distance from you.
Reason : There is a vacuum on moon.

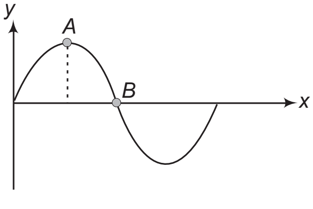
6. **Assertion :** Wave number is the number of waves per unit length.
Reason : Wave number $= \dfrac{1}{\lambda}$.

7. **Assertion :** Electromagnetic waves do not require medium for their propagation.
Reason : They can't travel in a medium.

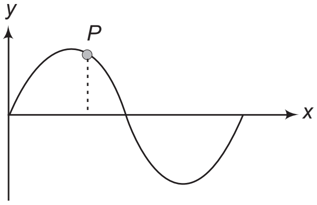
8. **Assertion :** Two strings shown in figure have the same tension. Speed of transverse waves in string-1 will be more.

Reason : $v \propto \dfrac{1}{\sqrt{\mu}}$, Here μ is mass per unit length of string.

9. **Assertion :** y-x graph of a transverse wave on a string is as shown in figure. At point A potential energy and kinetic energy both are minimum.
Reason : At point B kinetic energy and potential energy both are maximum.



10. **Assertion :** y-x graph of a transverse wave on a string is as shown in figure. At the given instant point P is moving downwards. Hence, we can say that wave is moving towards positive y-direction.



Reason : Particle velocity is given by

$$v_P = -v\frac{\partial y}{\partial x}$$

Objective Questions

1. Equation of progressive wave is given by $y = 4\sin\left[\pi\left(\frac{t}{5}-\frac{x}{9}\right)+\frac{\pi}{6}\right]$, where x and y are in metre.

Then,

(a) $v = 5$ m/s (b) $\lambda = 18$ m
(c) $A = 0.04$ m (d) $f = 50$ Hz

2. The equation of a wave is given by $Y = 5\sin 10\pi(t - 0.01x)$ along the x-axis. (All the quantities are expressed in SI units). The phase difference between the points separated by a distance of 10 m along x-axis is

(a) $\frac{\pi}{2}$ (b) π (c) 2π (d) $\frac{\pi}{4}$

3. The displacement function of a wave travelling along positive x-direction is $y = \frac{1}{2+3x^2}$ at $t = 0$ and by $y = \frac{1}{2+3(x-2)^2}$ at $t = 2$ s, where y and x are in metre. The velocity of the wave is

(a) 2 m/s (b) 0.5 m/s
(c) 1 m/s (d) 3 m/s

4. The angle between wave velocity and particle velocity in a travelling wave may be

(a) zero (b) $\frac{\pi}{2}$ (c) π (d) All of these

5. A source oscillates with a frequency 25 Hz and the wave propagates with 300 m/s. Two points A and B are located at distances 10 m and 16 m away from the source. The phase difference between A and B is

(a) $\frac{\pi}{4}$ (b) $\frac{\pi}{2}$ (c) π (d) 2π

6. The equation of a transverse wave propagating in a string is given by

$$y = 0.02\sin(x + 30t)$$

where, x and y are in metre and t is in second.

If linear density of the string is 1.3×10^{-4} kg/m, then the tension in the string is

(a) 0.12 N (b) 1.2 N (c) 12 N (d) 120 N

7. A harmonic oscillator vibrates with amplitude of 4 cm and performs 150 oscillations in one minute. If the initial phase is 45° and it starts moving away from the origin, then the equation of motion is

(a) $0.04 \sin\left(5\pi t + \frac{\pi}{4}\right)$ (b) $0.04 \sin\left(5\pi t - \frac{\pi}{4}\right)$

(c) $0.04 \sin\left(4\pi t + \frac{\pi}{4}\right)$ (d) $0.04 \sin\left(4\pi t - \frac{\pi}{4}\right)$

Subjective Questions

1. A certain transverse wave is described by

$$y(x, t) = (6.50 \text{ mm}) \cos 2\pi \left(\frac{x}{28.0 \text{ cm}} - \frac{t}{0.0360 \text{ s}}\right).$$

Determine the wave's

(a) amplitude (b) wavelength

(c) frequency (d) speed of propagation and

(e) direction of propagation.

2. For the wave $y = 5 \sin 30\pi\,[t - (x/240)]$, where x and y are in cm and t is in seconds, find the

(a) displacement when $t = 0$ and $x = 2$ cm

(b) wavelength

(c) velocity of the wave and

(d) frequency of the wave

3. The displacement of a wave disturbance propagating in the positive x-direction is given by

$$y = \frac{1}{1 + x^2} \text{ at } t = 0 \quad \text{and} \quad y = \frac{1}{1 + (x - 1)^2} \quad \text{at} \quad t = 2 \text{ s}$$

where, x and y are in metre. The shape of the wave disturbance does not change during the propagation. What is the velocity of the wave?

4. A travelling wave pulse is given by $y = \dfrac{10}{5 + (x + 2t)^2}$

Here, x and y are in metre and t in second. In which direction and with what velocity is the pulse propagating? What is the amplitude of pulse?

5. Is there any relationship between wave speed and the maximum particle speed for a wave travelling on a string? If so, what is it?

6. Calculate the velocity of a transverse wave along a string of length 2 m and mass 0.06 kg under a tension of 500 N.

7. Calculate the speed of a transverse wave in a wire of 1.0 mm^2 cross-section under a tension of 0.98 N. Density of the material of wire is $9.8 \times 10^3 \text{ kg/m}^3$

8. If at $t = 0$, a travelling wave pulse on a string is described by the function,

$$y = \frac{10}{(x^2 + 2)}$$

Here, x and y are in metre and t in second. What will be the wave function representing the pulse at time t, if the pulse is propagating along positive x-axis with speed 2 m/s?

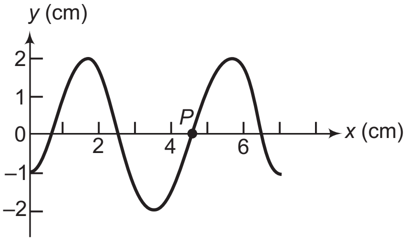
9. Consider a sinusoidal travelling wave shown in figure. The wave velocity is + 40 cm/s.
Find

(a) the frequency

(b) the phase difference between points 2.5 cm apart

(c) how long it takes for the phase at a given position to change by 60°

(d) the velocity of a particle at point P at the instant shown.



10. The equation of a travelling wave is

$$y\,(x,t) = 0.02 \sin\left(\frac{x}{0.05} + \frac{t}{0.01}\right) \text{ m}$$

Find

(a) The wave velocity and

(b) the particle velocity at $x = 0.2$ m and $t = 0.3$ s.

Given, $\cos\theta = -\,0.85$, where, $\theta = 34$ rad

11. Transverse waves on a string have wave speed 12.0 m/s, amplitude 0.05 m and wavelength 0.4 m. The waves travel in the + x- direction and at $t = 0$ the $x = 0$ end of the string has zero displacement and is moving upwards.

(a) Write a wave function describing the wave.

(b) Find the transverse displacement of a point at $x = 0.25$ m at time $t = 0.15$ s.

(c) How much time must elapse from the instant in part (b) until the point at $x = 0.25$ m has zero displacement?

12. A wave is described by the equation

$$y = (1.0 \text{ mm}) \sin\pi\left(\frac{x}{2.0 \text{ cm}} - \frac{t}{0.01 \text{ s}}\right)$$

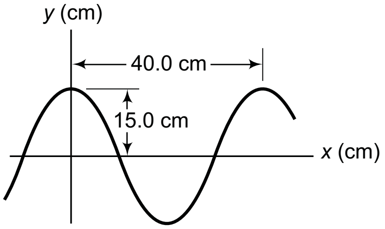
(a) Find the time period and the wavelength.

(b) Write the equation for the velocity of the particles. Find the speed of the particle at $x = 1.0$ cm at time $t = 0.01$ s.

(c) What are the speeds of the particles at $x = 3.0$ cm, 5.0 cm and 7.0 cm at $t = 0.01$ s ?

(d) What are the speeds of the particles at $x = 1.0$ cm at $t = 0.011$, 0.012 and 0.013 s ?

13. A sinusoidal wave travelling in the positive x-direction has an amplitude of 15.0 cm, a wavelength of 40.0 cm and a frequency of 8.00 Hz. The vertical displacement of the medium at $t = 0$ and $x = 0$ is also 15.0 cm as shown in figure.

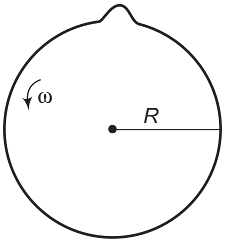


(a) Find the angular wave number k, period T, angular frequency ω and speed v of the wave.

(b) Write a general expression for the wave function.

14. A flexible steel cable of total length L and mass per unit length μ hangs vertically from a support at one end. (a) Show that the speed of a transverse wave down the cable is $v = \sqrt{g(L - x)}$, where x is measured from the support. (b) How long will it take for a wave to travel down the cable?

15. A loop of rope is whirled at a high angular velocity ω, so that it becomes a taut circle of radius R. A kink develops in the whirling rope.



(a) Show that the speed of the kink in the rope is $v = \omega R$.

(b) Under what conditions does the kink remain stationary relative to an observer on the ground?

16. A non-uniform wire of length L and mass M has a variable linear mass density given by $\mu = kx$, where x is distance from one end of wire and k is a constant. Find the time taken by a pulse starting at one end to reach the other end when the tension in the wire is T.

LEVEL 2

Single Correct Option

1. The speed of propagation of a wave in a medium is 300 m/s. The equation of motion of point at $x = 0$ is given by $y = 0.04 \sin 600\,\pi t$ (metre). The displacement of a point $x = 75$ cm at $t = 0.01$ s is

(a) 0.02 m (b) 0.04 m (c) zero (d) 0.028 m

2. A 100 Hz sinusoidal wave is travelling in the positive x-direction along a string with a linear mass density of 3.5×10^{-3} kg/m and a tension of 35 N. At time $t = 0$, the point $x = 0$, has maximum displacement in the positive y-direction. Next when this point has zero displacement, the slope of the string is $\pi/20$. Which of the following expression represent (s) the displacement of string as a function of x (in metre) and t (in second)

(a) $y = 0.025 \cos (200\pi t - 2\pi x)$ (b) $y = 0.5 \cos (200\,\pi t - 2\pi x)$

(c) $y = 0.025 \cos (100\,\pi t - 10\,\pi x)$ (d) $y = 0.5 \cos (100\,\pi t - 10\,\pi x)$

3. Vibrations of period 0.25 s propagate along a straight line at a velocity of 48 cm/s. One second after the emergence of vibrations at the initial point, displacement of the point, 47 cm from it is found to be 3 cm. [Assume that at initial point particle is in its mean position at $t = 0$ and moving upwards]. Then,

(a) amplitude of vibrations is 6 cm (b) amplitude of vibrations is $3\sqrt{2}$ cm

(c) amplitude of vibrations is 3 cm (d) None of these

4. Transverse waves are generated in two uniform steel wires A and B by attaching their free ends to a fork of frequency 500 Hz. The diameter of wire A is half that of B and tension in wire A is half the tension in wire B. What is the ratio of velocities of waves in A and B?

(a) 1 : 2 (b) $\sqrt{2} : 1$ (c) 2 : 1 (d) $1 : \sqrt{2}$

5. The frequency of A note is 4 times that of B note. The energies of two notes are equal. The amplitude of B note as compared to that of A note will be

(a) double (b) equal

(c) four times (d) eight times

6. If at $t = 0$, a travelling wave pulse on a string is described by the function.

$$y = \frac{6}{x^2 + 3}$$

What will be the wave function representing the pulse at time t, if the pulse is propagating along positive x-axis with speed 4 m/s?

(a) $y = \frac{6}{(x + 4t)^2 + 3}$ (b) $y = \frac{6}{(x - 4t)^2 + 3}$

(c) $y = \frac{6}{(x - t)^2}$ (d) $y = \frac{6}{(x - t)^2 + 12}$

More than One Correct Options

1. A transverse wave travelling on a stretched string is represented by the equation $y = \frac{2}{(2x - 6.2\,t)^2 + 20}$. Then,

(a) velocity of the wave is 3.1 m/s

(b) amplitude of the wave is 0.1 m

(c) frequency of the wave is 20 Hz

(d) wavelength of the wave is 1 m

2. For energy density, power and intensity of any wave choose the correct options.

(a) u = energy density $= \frac{1}{2}\rho\omega^2 A^2$ (b) P = power $= \frac{1}{2}\rho\,\omega^2 A^2 v$

(c) I = intensity $= \frac{1}{2}\rho\,\omega^2 A^2 S v$ (d) $I = \frac{P}{S}$

3. For the transverse wave equation $y = A \sin(\pi x + \pi t)$, choose the correct options at $t = 0$

(a) points at $x = 0$ and $x = 1$ are at mean positions

(b) points at $x = 0.5$ and $x = 1.5$ have maximum accelerations

(c) points at $x = 0.5$ and $x = 1.5$ are at rest

(d) the given wave is travelling in negative x- direction

4. In the wave equation,

$$y = A \sin \frac{2\pi}{a}(x - bt)$$

(a) speed of wave is a (b) speed of wave is b

(c) wavelength of wave is a/b (d) wavelength of wave is a

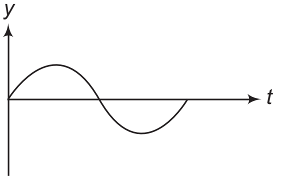
5. In the wave equation,

$$y = A \sin 2\pi\left(\frac{x}{a} - \frac{t}{b}\right)$$

(a) speed of wave is a/b (b) speed of wave is b/a

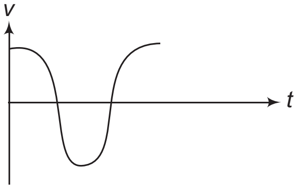
(c) wavelength of wave is a (d) time period of wave is b

6. Corresponding to y-t graph of a transverse harmonic wave shown in figure,

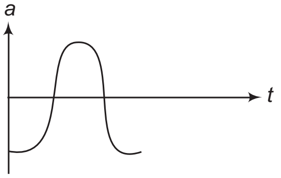


choose the correct options at same position.

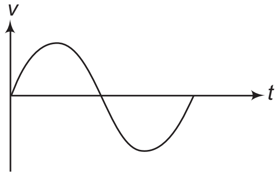
(a)



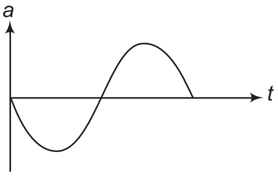
(b)



(c)



(d)



Match the Columns

1. For the wave equation, $y = a \sin(bt - cx)$

Match the following two columns.

Column I	Column II
(a) wave speed	(p) $\frac{b}{2\pi}$
(b) maximum particle speed	(q) $\frac{c}{2\pi}$
(c) wave frequency	(r) $\frac{b}{c}$
(d) wavelength	(s) None of these

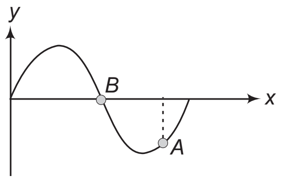
2. For the wave equation,

$$y = (4\text{ cm}) \sin[\pi t + 2\pi x]$$

Here, t is in second and x in metres.

Column I	Column II
(a) at $x = 0$, particle velocity is maximum at $t =$	(p) 0.5 s
(b) at $x = 0$, particle acceleration is maximum at $t =$	(q) 1.0 s
(c) at $x = 0.5$ m, particle velocity is maximum at $t =$	(r) zero
(d) at $x = 0.5$ m, particle acceleration is maximum at $t =$	(s) 1.5 s

3. y-x graph of a transverse wave at a given instant is shown in figure. Match the following two columns.



Column I	Column II
(a) velocity of particle A	(p) positive
(b) acceleration of particle A	(q) negative
(c) velocity of particle B	(r) zero
(d) acceleration of particle B	(s) can't tell

4. For a travelling wave, match the following two columns.

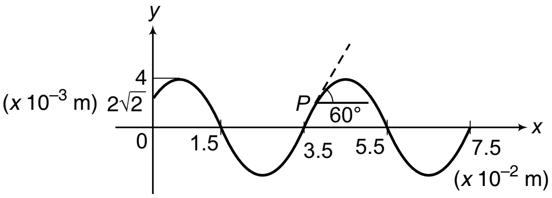
Column I	Column II
(a) energy density	(p) $[\mathrm{ML}^2\mathrm{T}^{-3}]$
(b) power	(q) $\frac{1}{2}\rho\omega^2A^2Sv$
(c) intensity	(r) $[\mathrm{M}^0\mathrm{L}^{-1}\mathrm{T}]$
(d) wave number	(s) None

5. Match the following two columns.

Column I	Column II
(a) $y = A\sin(\omega t - kx)$	(p) travelling in positive x-direction
(b) $y = A\sin(kx - \omega t)$	(q) travelling in negative x-direction
(c) $y = -A\cos(\omega t + kx)$	(r) at $t = 0$, velocity of particle is positive at $x = 0$
(d) $y = -A\cos(kx - \omega t)$	(s) at $t = 0$ acceleration of particle is positive at $x = 0$

Subjective Questions

1. The figure shows a snap photograph of a vibrating string at $t = 0$. The particle P is observed moving up with velocity $20\sqrt{3}$ cm / s. The tangent at P makes an angle 60° with x-axis.



(a) Find the direction in which the wave is moving.

(b) Write the equation of the wave.

(c) The total energy carried by the wave per cycle of the string. Assuming that the mass per unit length of the string is 50 g/m.

2. A long string having a cross-sectional area 0.80 mm^2 and density 12.5 g/cm^3 is subjected to a tension of 64 N along the positive x-axis. One end of this string is attached to a vibrator at $x = 0$ moving in transverse direction at a frequency of 20 Hz. At $t = 0$, the source is at a maximum displacement $y = 1.0$ cm.

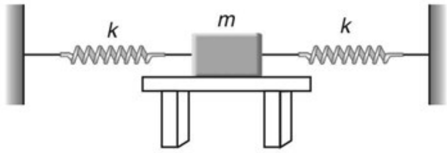
(a) Find the speed of the wave travelling on the string.

(b) Write the equation for the wave.

(c) What is the displacement of the particle of the string at $x = 50$ cm at time $t = 0.05$ s?

(d) What is the velocity of this particle at this instant?

3. One end of each of two identical springs, each of force constant 0.5 N/m are attached on the opposite sides of a wooden block of mass 0.01 kg. The other ends of the springs are connected to separate rigid supports such that the springs are unstretched and are collinear in a horizontal plane. To the wooden piece is fixed a pointer which touches a vertically moving plane paper. The wooden piece kept on a smooth horizontal table is now displaced by 0.02 m along the line of springs and released. If the speed of paper is 0.1 m/s, find the equation of the path traced by the pointer on the paper and the distance between two consecutive maximas on this path.

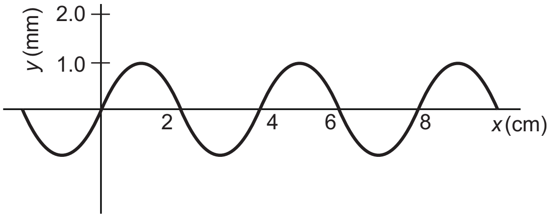


4. A wave pulse is travelling on a string with a speed v towards the positive x-axis. The shape of the string at $t = 0$ is given by $y(x) = A \sin(x/a)$, where A and a are constants.

(a) What are the dimensions of A and a?

(b) Write the equation of the wave for a general time t, if the wave speed is v.

5. Figure shows a plot of the transverse displacement of the particle of a string at $t = 0$ through which a travelling wave is passing in the positive x-direction. The wave speed is 20 cm/s. Find (a) the amplitude (b) the wavelength (c) the wave number and (d) the frequency of the wave.



6. Two wires of different densities but same area of cross-section are soldered together at one end and are stretched to a tension T. The velocity of a transverse wave in the first wire is double of that in the second wire. Find the ratio of the density of the first wire to that of the second wire.

7. Two long strings A and B, each having linear mass density 1.2×10^{-2} kg/m are stretched by different tensions 4.8 N and 7.5 N respectively and are kept parallel to each other with their left ends at $x = 0$. Wave pulses are produced on the strings at the left ends at $t = 0$ on string A and at $t = 20$ ms on string B. When and where will the pulse on B overtake that on A?

8. A sinusoidal transverse wave travels on a string. The string has length 8.00 m and mass 6.00 g. The wave speed is 30.0 m/s and the wavelength is 0.200 m. (a) If the wave is to have an average power of 50.0 W, what must be the amplitude of the wave? (b) For this same string, if the amplitude and wavelength are the same as in part (a) what is the average power for the wave if the tension is increased such that the wave speed is doubled?

9. A uniform rope with length L and mass m is held at one end and whirled in a horizontal circle with angular velocity ω. You can ignore the force of gravity on the rope. Find the time required for a transverse wave to travel from one end of the rope to the other.

Hint : $\int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1}\left(\frac{x}{a}\right)$

Superposition of Waves

Chapter Contents

18.1 Principle of Superposition

18.2 Resultant Amplitude and Intensity due to Coherent Sources

18.3 Interference

18.4 Standing Wave

18.5 Normal Modes of a String

18.6 Reflection and Transmission of a Wave

18.1 Principle of Superposition

Suppose there are two sources of waves S_1 and S_2.

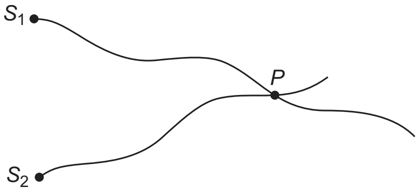

Fig. 18.1

Now, the two waves from S_1 and S_2 meet at some point (say P). Then, according to principle of superposition net displacement at P (from its mean position) at any time is given by

$$\boxed{y = y_1 + y_2}$$

Here, y_1 and y_2 are the displacements of P due to two waves individually.

For example, suppose at 9AM, displacement of P above its mean position should be 6 mm accordingly to wave-1 and the same time its displacement should be 2 mm below its mean position accordingly to wave-2, then at 9AM net displacement of P will be 4 mm above its mean position.

Now, based upon the principle of superposition we have two phenomena in physics, interference and beats. Stationary waves (or standing waves) and Young's double slit experiment (or YDSE) are two examples of interference.

Based on principle of superposition means two or more than two waves meet at one point or several points and at every point net displacement is $y = y_1 + y_2$ or $y = y_1 + y_2 + y_3$ etc.

18.2 Resultant Amplitude and Intensity due to Coherent Sources

In article 18.1, we have seen that the two waves from two sources S_1 and S_2 were meeting at point P. Suppose they meet at P in a phase difference $\Delta\phi$ (or ϕ). If this phase difference remains constant with time, then sources are called coherent, otherwise incoherent.

For sources to be coherent the frequencies (f, ω or T) of the two sources must be same. This can be explained by the following example.

Suppose the phase difference is 0°. It means they are in same phase. Both reach their extremes ($+A$ or $-A$), simultaneously. They cross their mean positions (in the same direction) simultaneously. Now, if we want their phase difference to remain constant or we want that the above situation is maintained all the time, then obviously their time periods (or frequencies) must be same.

Resultant Amplitude

1. Consider the superposition of two sinusoidal waves of same frequency (means sources are coherent) at a point. Let us assume that the two waves are travelling in the same direction with same velocity. The equation of the two waves reaching at a point can be written as

$$y_1 = A_1 \sin (kx - \omega t)$$

and $$y_2 = A_2 \sin (kx - \omega t + \phi)$$

The resultant displacement of the point where the waves meet is

$$\begin{aligned} y &= y_1 + y_2 \\ &= A_1 \sin (kx - \omega t) + A_2 \sin (kx - \omega t + \phi) \\ &= A_1 \sin (kx - \omega t) + A_2 \sin (kx - \omega t) \cos \phi + A_2 \cos (kx - \omega t) \sin \phi \\ &= (A_1 + A_2 \cos \phi) \sin (kx - \omega t) + A_2 \sin \phi \cos (kx - \omega t) \\ &= A \cos \theta \sin (kx - \omega t) + A \sin \theta \cos (kx - \omega t) \end{aligned}$$

or $$y = A \sin (kx - \omega t + \theta)$$

Here, $$A_1 + A_2 \cos \phi = A \cos \theta$$

and $$A_2 \sin \phi = A \sin \theta$$

or $$A^2 = (A_1 + A_2 \cos \phi)^2 + (A_2 \sin \phi)^2$$

or $$\boxed{A = \sqrt{A_1^2 + A_2^2 + 2A_1 A_2 \cos \phi}} \qquad \text{...(i)}$$

and $$\tan \theta = \frac{A \sin \theta}{A \cos \theta} = \frac{A_2 \sin \phi}{A_1 + A_2 \cos \phi}$$

2. The above result can be obtained by graphical method as well. Assume a vector $\mathbf{A}_1$ of length A_1 to represent the amplitude of firstwave.

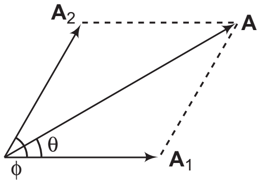

Fig. 18.2

Another vector $\mathbf{A}_2$ of length A_2, making an angle ϕ with $\mathbf{A}_1$ represent the amplitude of second wave. The resultant of $\mathbf{A}_1$ and $\mathbf{A}_2$ represent the amplitude of resulting function y. The angle θ represents the phase difference between the resulting function and the first wave.

Resultant Intensity

In the previous chapter, we have read that intensity of a wave is given by

$$I = \frac{1}{2} \rho \omega^2 A^2 v \quad \text{or} \quad I \propto A^2$$

So, if ρ, ω and v are same for the both interfering waves, then Eq. (i) can also be written as

$$\boxed{I = I_1 + I_2 + 2\sqrt{I_1 I_2} \cos \phi} \qquad \text{...(ii)}$$

Here, proportionality constant ($I \propto A^2$) cancels out on right hand side and left hand side.

Note *(i) Eqs (i) and (ii) are two equations for finding resultant amplitude and resultant intensity at some point due to two coherent sources.*

(ii) In the above equations ϕ is the constant phase difference at that point. As the sources are coherent value of this constant phase difference will be different at different points.

(iii) *The special case of above two equations is, when the individual amplitudes (or intensities) are equal.*

or $A_1 = A_2 = A_0$ *(say)* $\Rightarrow$ $I_1 = I_2 = I_0$ *(say)*

In this case, Eqs. (i) and (ii) become

$$\boxed{A = 2A_0 \cos\frac{\phi}{2}} \qquad \text{...(iii)}$$

and

$$\boxed{I = 4I_0 \cos^2\frac{\phi}{2}} \qquad \text{...(iv)}$$

(iv) *From Eqs. (i) to (iv) we can see that, for given values of A_1, A_2, I_1 and I_2 the resultant amplitude and the resultant intensity are the functions of only ϕ.*

(v) *If three or more than three waves (due to coherent sources) meet at some point then there is no direct formula for finding resultant amplitude or resultant intensity. In this case, first of all we will find resultant amplitude by vector method (either by using polygon law of vector addition or component method) and then by the relation $I \propto A^2$, we can also determine the resultant intensity.*

For example, if resultant amplitude comes out to be $\sqrt{2}$ times then resultant intensity will become two times.

18.3 Interference

For interference phenomena to take place, sources must be coherent. So, phase difference at some point should remain constant. The value of this constant phase difference will be different at different points. And since the sources are coherent, therefore the following four equations can be applied for finding resultant amplitude and intensity (in case of two sources)

$$A = \sqrt{A_1^2 + A_2^2 + 2A_1A_2\cos\phi} \qquad \text{...(i)}$$

$$I = I_1 + I_2 + 2\sqrt{I_1 I_2}\cos\phi \qquad \text{...(ii)}$$

$$A = 2A_0\cos\frac{\phi}{2} \qquad (\text{if } A_1 = A_2 = A_0) \qquad \text{...(iii)}$$

$$I = 4I_0\cos^2\frac{\phi}{2} \qquad (\text{if } I_1 = I_2 = I_0) \qquad \text{...(iv)}$$

For given values of A_1, A_2, I_1 and I_2 the resultant amplitude and resultant intensity are the functions of only ϕ.

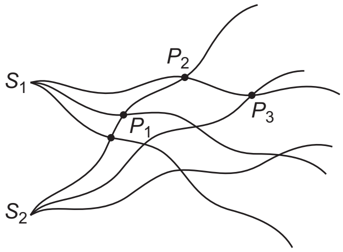

Fig. 18.3

Now, suppose S_1 and S_2 are two coherent sources, then we can see that the two waves are meeting at several points (P_1, P_2, P_3 … etc). At different points path difference Δx will be different and therefore phase difference $\Delta\phi$ or ϕ will also be different. Because the phase difference depends on the path difference ($\Delta\phi$ or $\phi = \frac{2\pi}{\lambda}\cdot\Delta x$).

And since phase difference at different points is different, therefore from the above four equations we can see that resultants amplitude and intensity will also be different. But whatever is the intensity at some point, it will remain constant at that point because the sources are coherent and the phase difference is constant at that point.

Constructive Interference

These are the points where resultant amplitude or intensity is maximum or

$$A_{\max} = A_1 + A_2 \qquad \text{[from Eq. (i)]}$$

or $$A_{\max} = \pm 2A_0 \qquad \text{[from Eq. (iii)]}$$

and $$I_{\max} = (\sqrt{I_1} + \sqrt{I_2})^2 \qquad \text{[from Eq. (ii)]}$$

or $$I_{\max} = 4I_0 \qquad \text{[from Eq. (iv)]}$$

at those points where

$$\cos\phi = +1 \qquad \text{[from Eqs. (i) or (ii)]}$$

or $$\phi = 0, 2\pi, 4\pi, \ldots, 2n\pi \qquad \text{(where, } n = 0, 1, 2\text{)}$$

$\therefore$ $$\Delta x = 0, \lambda, 2\lambda, \ldots, n\lambda \qquad \left[\text{as } \Delta x = \phi\left(\frac{\lambda}{2\pi}\right)\right]$$

Destructive Interference

These are the points where resultant amplitude or intensity is minimum or

$$A_{\min} = A_1 \sim A_2 \qquad \text{[from Eq. (i)]}$$

or $$A_{\min} = 0 \qquad \text{[from Eq. (iii)]}$$

and $$I_{\min} = (\sqrt{I_1} - \sqrt{I_2})^2 \qquad \text{[from Eq. (ii)]}$$

or $$I_{\min} = 0 \qquad \text{[from Eq. (iv)]}$$

at those points where,

$$\cos\phi = -1 \qquad \text{[from Eqs. (i) or (ii)]}$$

or $$\phi = \pi, 3\pi \ldots (2n-1)\pi \qquad \text{(where, } n = 1, 2\ldots\text{)}$$

$\therefore$ $$\Delta x = \frac{\lambda}{2}, \frac{3\lambda}{2} \ldots (2n-1)\frac{\lambda}{2} \qquad \left[\text{as } \Delta x = \phi\left(\frac{\lambda}{2\pi}\right)\right]$$

✓ Extra Points to Remember

- In amplitude it hardly matters whether its $+2A_0$ or $-2A_0$. This is the reason we have taken, $A_{\max} = \pm 2A_0$
- In interference, two or more than two waves from coherent sources meet at several points. At different points Δx, $\Delta\phi$ or ϕ, resultant amplitude and therefore resultant intensity will be different (varying from $I_{\max}$ to $I_{\min}$). But whatever is the resultant intensity at some point, it remains constant at that point.
- In interference,

$$\frac{I_{\max}}{I_{\min}} = \left(\frac{\sqrt{I_1} + \sqrt{I_2}}{\sqrt{I_1} - \sqrt{I_2}}\right)^2 = \left(\frac{\sqrt{I_1/I_2} + 1}{\sqrt{I_1/I_2} - 1}\right)^2$$

$$= \left(\frac{A_1/A_2 + 1}{A_1/A_2 - 1}\right)^2 = \left(\frac{A_1 + A_2}{A_1 - A_2}\right)^2 = \left(\frac{A_{\max}}{A_{\min}}\right)^2$$

Example 18.1 *In interference, two individual amplitudes are A_0 each and the intensity is I_0 each. Find resultant amplitude and intensity at a point, where*

(a) phase difference between two waves is 60°

(b) path difference between two waves is $\frac{\lambda}{3}$.

Solution (a) Substituting $\phi = 60°$ in the equations,

$$A = 2A_0 \cos\frac{\phi}{2} \qquad \ldots\text{(i)}$$

and

$$I = 4I_0 \cos^2\frac{\phi}{2} \qquad \ldots\text{(ii)}$$

We get,

$$A = \sqrt{3}A_0 \text{ and } I = 3I_0 \qquad \textbf{Ans.}$$

(b) Given,

$$\Delta x = \frac{\lambda}{3}$$

$$\therefore \qquad \phi \text{ or } \Delta\phi = \left(\frac{2\pi}{\lambda}\right)\cdot\Delta x$$

$$= \left(\frac{2\pi}{\lambda}\right)\left(\frac{\lambda}{3}\right) = \frac{2\pi}{3} \text{ or } 120°$$

Now, substituting $\phi = 120°$ in the above two equations we get

$$A = A_0 \text{ and } I = I_0 \qquad \textbf{Ans.}$$

Example 18.2 *Three waves from three coherent sources meet at some point. Resultant amplitude of each is A_0. Intensity corresponding to A_0 is I_0. Phase difference between first wave and second wave is* 60°. *Path difference between first wave and third wave is* $\frac{\lambda}{3}$. *The first wave lags behind in phase angle from second and third wave. Find resultant intensity at this point.*

Solution Here, the sources are three. So, we don't have any direct formula for finding the resultant intensity. First we will find the resultant amplitude by vector method and then by the relation $I \propto A^2$, we can also find the resulting intensity.

Further, a path difference of $\frac{\lambda}{3}$ is equivalent to a phase difference of 120° ($\Delta\phi$ or $\phi = \frac{2\pi}{\lambda}\cdot\Delta x$).

Hence, the phase difference first and second is 60° and between first and third is 120°. So, vector diagram for amplitude is as shown below.

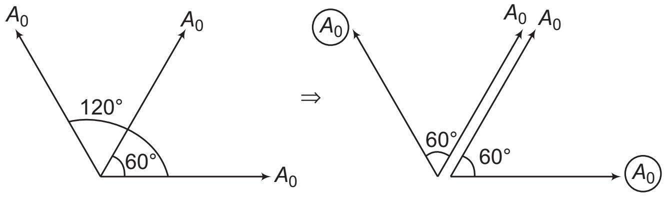

Fig. 18.4

Now, resultant of first and third acting at 120° is also A_0 (as $A = 2A_0 \cos\frac{\phi}{2}$ and $\phi = 120°$) and since the first and third are equal, so this resultant A_0 passes through the bisector line of these two or in the direction of second amplitude vector. Therefore, the resultant amplitude is

$$A = A_0 + A_0 = 2A_0$$

and the resultant intensity is

$$I = 4I_0 \qquad (\text{as } I \propto A^2) \qquad \textbf{Ans.}$$

Example 18.3 *Two waves of equal frequencies have their amplitudes in the ratio of* $3:5$. *They are superimposed on each other. Calculate the ratio of maximum and minimum intensities of the resultant wave.*

Solution Given, $\frac{A_1}{A_2} = \frac{3}{5}$

$$\therefore \qquad \sqrt{\frac{I_1}{I_2}} = \frac{3}{5} \qquad (\text{as } I \propto A^2)$$

Maximum intensity is obtained, where

$$\cos\phi = 1$$

and

$$I_{\max} = (\sqrt{I_1} + \sqrt{I_2})^2$$

Minimum intensity is found, where

$$\cos\phi = -1$$

and

$$I_{\min} = (\sqrt{I_1} - \sqrt{I_2})^2$$

Hence,

$$\frac{I_{\max}}{I_{\min}} = \left(\frac{\sqrt{I_1} + \sqrt{I_2}}{\sqrt{I_1} - \sqrt{I_2}}\right)^2 = \left(\frac{\sqrt{\frac{I_1}{I_2}} + 1}{\sqrt{\frac{I_1}{I_2}} - 1}\right)^2$$

$$= \left(\frac{3/5 + 1}{3/5 - 1}\right)^2 = \frac{64}{4} = \frac{16}{1} \qquad \textbf{Ans.}$$

Example 18.4 *In interference,* $\frac{I_{\max}}{I_{\min}} = \alpha$, *find*

(a $\frac{A_{\max}}{A_{\min}}$ *(b)* $\frac{A_1}{A_2}$ *(c)* $\frac{I_1}{I_2}$

Solution (a) $$\frac{A_{\max}}{A_{\min}} = \sqrt{\frac{I_{\max}}{I_{\min}}} = \sqrt{\alpha} \qquad \textbf{Ans.}$$

(b) $$\frac{A_{\max}}{A_{\min}} = \sqrt{\alpha} = \frac{A_1 + A_2}{A_1 - A_2} = \frac{A_1/A_2 + 1}{A_1/A_2 - 1}$$

Solving this equation, we get

$$\frac{A_1}{A_2} = \frac{\sqrt{\alpha}+1}{\sqrt{\alpha}-1}$$ **Ans.**

(c) $$\frac{I_1}{I_2} = \left(\frac{A_1}{A_2}\right)^2 \left(\frac{\sqrt{\alpha}+1}{\sqrt{\alpha}-1}\right)^2$$

INTRODUCTORY EXERCISE 18.1

1. The ratio of intensities of two waves is 9:16. If these two waves interfere, then determine the ratio of the maximum and minimum possible intensities.
2. In Interference two individual amplitudes are 5 units and 3 units. Find

   (a) $\frac{A_{\max}}{A_{\min}}$ (b) $\frac{I_{\max}}{I_{\min}}$
3. Three waves due to three coherent sources meet at one point. Their amplitudes are $\sqrt{2}A_0$, $3A_0$ and $\sqrt{2}A_0$. Intensity corresponding to A_0 is I_0. Phase difference between first and second is 45°. Path difference between first and third $\frac{\lambda}{4}$. In phase angle, first wave lags behind from the other two waves. Find resultant intensity at this point.

18.4 Standing Wave

Standing wave is an example of interference. When two identical waves travel in opposite directions, then they superimpose almost at every point. Now, since the waves are identical (or their frequencies are same), sources are coherent. So, interference will take place. By their superposition (or interference) standing waves (also called stationary waves) are formed. By identical wave we mean that all properties (like f, ω, T, λ and k) are same. Only amplitudes may be different but still we prefer equal amplitudes ($A_1 = A_2 = A_0$). The following are listed some of the important points in standing wave.

(i) Here, the constructive interference points are called antinodes (denoted by A) and destructive interference points are called nodes (denoted by N).

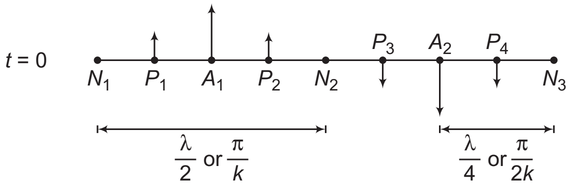
(ii) Distance between two successive nodes (or two successive antinodes) is $\frac{\lambda}{2}$ or $\frac{\pi}{k}$ $\left(\text{as } k = \frac{2\pi}{\lambda}\right)$.

Similarly, distance between a node and its adjacent antinode is $\frac{\lambda}{4}$ or $\frac{\pi}{2k}$. Here, λ and k are the values corresponding to constituent waves by which stationary waves are formed.

(iii) Amplitude of oscillation in stationary wave varies from a maximum value ($A_1 + A_2$ or $2A_0$ at antinode) to a minimum value ($A_1 \sim A_2$ or zero at node). But now onwards (unless mentioned in the question) we will talk about the equal amplitudes. So, amplitude at antinode will be $2A_0$ and at node it is zero.

Thus, now we can say that, in stationary wave all particles (except nodes for the case when $A_1 = A_2$) oscillate with same frequency but different amplitudes.

(iv) All points lying between two successive nodes are in same phase. They cross their mean positions (in the same direction) simultaneously and reach their extreme positions also simultaneously. But they are out of phase with the particles lying between adjacent two nodes. This can be shown by the following figure.



t = 0
N_1
P_1
A_1
P_2
N_2
P_3
A_2
P_4
N_3
$\frac{\lambda}{2}$ or $\frac{\pi}{k}$
$\frac{\lambda}{4}$ or $\frac{\pi}{2k}$

Fig. 18.5

In the above figure N_1, N_2 and N_3 are nodes and A_1, A_2 are antinodes. Amplitude at nodes is zero and amplitude at antinodes is $2A_0$. In between them we have taken four more points P_1, P_2, P_3 and P_4. Suppose amplitude at these points is A_0 (between $2A_0$ and 0). Now, at $t = 0$ all particles are at their mean positions. Particles P_1, A_1 and P_2 are moving upwards (as they are in same phase) and the particles P_3, A_2 and P_4 are moving downwards. At this time, they have maximum speed. For example, in case of sine wave,

$$v_{P_1} = \omega A_0 \qquad (v_{\max} = \omega A \text{ in SHM})$$

$$v_{A_1} = \omega(2A_0)$$

Now, in the chapter of SHM we have read that at time $t = \frac{T}{12}$ a particle reaches from its mean position to half its extreme position and in time $t = \frac{T}{4}$ it reaches from mean position to extreme position. So, at different times positions of different particles are as shown below.

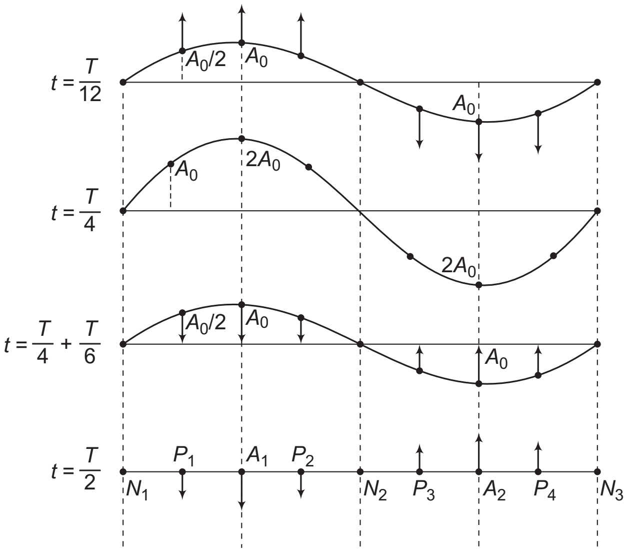


Fig. 18.6

(v) Equation of a stationary wave depends on the equations of constituent waves by which stationary wave is formed. Let us take an example

Suppose the two identical waves travelling in opposite directions are

$$y_1 = A\sin(kx - \omega t)$$

and $$y_2 = A\sin(kx + \omega t)$$

By the principle of superposition, their sum is

$$y = y_1 + y_2$$

or $$y = A[\sin(kx - \omega t) + \sin(kx + \omega t)]$$

By using the identity,

$$\sin A + \sin B = 2\sin\left(\frac{A+B}{2}\right)\cos\left(\frac{A-B}{2}\right), \quad \text{we obtain}$$

$$\boxed{y = 2A\sin kx\cos\omega t} \qquad \text{...(i)}$$

This expression is different from wave representations that we have encountered upto now. It doesn't have the form $f(x \pm vt)$ or $f(ax \pm bt)$ and therefore, does not describe a travelling wave. Instead Eq. (i) represents what is known as a **standing wave.**

Eq. (i) can also be written as

$$y = A(x)\cos\omega t \qquad \text{...(ii)}$$

where, $$A_x = 2A\sin kx \qquad \text{...(iii)}$$

This equation of a standing wave [Eq. (ii)] is really an equation of simple harmonic motion, whose amplitude [Eq. (iii)] is a function of x.

$$A_x = 0, \text{ where } \sin kx = 0$$

or $$kx = 0, \pi, 2\pi, \dots, n\pi \qquad (n = 0, 1, 2, \dots)$$

Substituting $k = \frac{2\pi}{\lambda}$, we have

$$A_x = 0 \qquad \text{where,} \quad \boxed{x = 0, \frac{\lambda}{2}, \lambda, \dots, \frac{n\lambda}{2}}$$

These are the points which never displace from their mean position. These are known as the **nodes** of the standing wave. The distance between two adjacent nodes is $\frac{\lambda}{2}$.

Further, from Eq. (iii), we can see that maximum value of $|A_x|$ is $2A$, where

$$\sin kx = \pm 1$$

or $$kx = \frac{\pi}{2}, \frac{3\pi}{2}, \dots, (2n-1)\frac{\pi}{2} \qquad (n = 0, 1, 2, \dots)$$

or $$\boxed{x = \frac{\lambda}{4}, \frac{3\lambda}{4}, \dots, (2n-1)\frac{\lambda}{4}} \qquad \left(k = \frac{2\pi}{\lambda}\right)$$

These are the points of maximum displacement called **antinodes**. The distance between two adjacent antinodes is also $\frac{\lambda}{2}$, while that between a node and an antinode is $\frac{\lambda}{4}$.

Extra Points to Remember

Table 18.1 comparison between travelling and stationary waves

S.No.	Travelling waves	Stationary waves
1.	In these waves, all particles of the medium oscillate with same frequency and amplitude	In these waves, all particles except nodes oscillate with same frequency but different amplitudes. Amplitudes is zero at nodes and maximum at antinodes
2.	At any instant phase difference between any two particles can have any value between 0 and 2π.	At any instant phase difference between any two particles can be either zero or π.
3.	In these waves, at no instant all the particles of the medium pass through their mean positions simultaneously.	In these waves, all particles of the medium pass through their mean positions simultaneously twice in each time period.
4.	These waves transmit energy in the medium.	These waves do not transmit energy in the medium provided $A_1 = A_2$.

Example 18.5 *The displacement of a standing wave on a string is given by*

$$y(x, t) = 0.4 \sin(0.5x) \cos(30t)$$

where x and y are in centimetres.

(a) Find the frequency, amplitude and wave speed of the component waves.

(b) What is the particle velocity at x = 2.4 cm at t = 0.8 s ?

Solution (a) The given equation can be written as the sum of two component waves as

$$y(x, t) = 0.2 \sin(0.5x - 30t) + 0.2 \sin(0.5x + 30t)$$

Hence, the two component waves are

$$y_1(x, t) = 0.2 \sin(0.5x - 30t)$$

travelling in positive x-direction and

$$y_2(x, t) = 0.2 \sin(0.5x + 30t)$$

travelling in negative x-direction.

Now, $\omega = 30 \text{ rad/s}$

and $k = 0.5 \text{cm}^{-1}$

$$\text{Frequency, } f = \frac{\omega}{2\pi} = \frac{15}{\pi} \text{ Hz}$$ **Ans.**

$$\text{Amplitude, } A = 0.2 \text{ cm}$$ **Ans.**

and $$\text{wave speed, } v = \frac{\omega}{k} = \frac{30}{0.5}$$

$$= 60 \text{ cm/s}$$ **Ans.**

(b) Particle velocity,

$$v_P(x,t) = \frac{\partial y}{\partial t} = -12\sin(0.5x)\sin(30t)$$

$$\therefore \quad v_P(x = 2.4\text{ cm},\ t = 0.8\text{ s})$$

$$= -12\sin(1.2)\sin(24)$$

$$= 10.12\text{ cm/s}$$

Ans.

Example 18.6 *The vibrations of a string of length* 60 *cm fixed at both ends are represented by the equation* $y = 4\sin\left(\frac{\pi x}{15}\right)\cos(96\pi t)$, *where x and y are in cm and t in seconds.*

(a) What is the maximum displacement of a point at x = 5 *cm?*

(b) Where are the nodes located along the string?

(c) What is the velocity of the particle at x = 7.5 *cm and t =* 0.25 *s?*

(d) Write down the equations of the component waves whose superposition gives the above wave.

Solution (a) At $x = 5$ cm, the standing wave equation gives

$$y = 4\sin\left(\frac{5\pi}{15}\right)\cos(96\pi t)$$

$$= 4\sin\frac{\pi}{3}\cos(96\pi t)$$

$$= 4\times\frac{\sqrt{3}}{2}\cos(96\pi t)$$

$\therefore$ Maximum displacement $= 2\sqrt{3}$ cm

(b) The nodes are the points of permanent rest. Thus, they are those points for which

$$\sin\left(\frac{\pi x}{15}\right) = 0$$

i.e. $$\frac{\pi x}{15} = n\pi, \text{ where } n = 0, 1, 2, 3, 4 \ldots$$

$x = 15n$, i.e. at $x = 0$, 15, 30, 45 and 60 cm.

(c) The particle velocity is equal to

$$\left(\frac{\partial y}{\partial t}\right) = 4\sin\left(\frac{\pi x}{15}\right)(96\pi)(-\sin 96\pi t)$$

$$= -384\,\pi\sin\left(\frac{\pi x}{15}\right)\sin(96\pi t)$$

At $x = 7.5$ cm and $t = 0.25$ s, we get

$$\left(\frac{\partial y}{\partial t}\right) = -384\,\pi\sin\left(\frac{\pi}{2}\right)\sin(24\pi) = 0$$

(d) The equations of the component waves are

$$y_1 = 2\sin\left(\frac{\pi x}{15} + 96\pi t\right)$$

and $$y_2 = 2\sin\left(\frac{\pi x}{15} - 96\pi t\right)$$

as we can see that $$y = y_1 + y_2$$

INTRODUCTORY EXERCISE 18.2

1. In stationary wave, phase difference between two particles can't be $\frac{\pi}{3}$. Is this statement true or false?
2. A string vibrates according to the equation $y = 5\sin\frac{\pi x}{3}\cos 40\pi t$

   where, x and y are in centimetres and t is in seconds
   (a) What is the speed of the component wave?
   (b) What is the distance between the adjacent nodes?
   (c) What is the velocity of the particle of the string at the position $x = 1.5$ cm when $t = \frac{9}{8}$ s?
3. If two waves differ only in amplitude and are propagated in opposite directions through a medium, will they produce standing waves. Is energy transported?
4. Two sinusoidal waves travelling in opposite directions interfere to produce a standing wave described by the equation

   $$y = (1.5\text{ m})\sin(0.400\,x)\cos(200\,t)$$

   where, x is in metres and t is in seconds. Determine the wavelength, frequency and speed of the interfering waves.

18.5 Normal Modes of a String

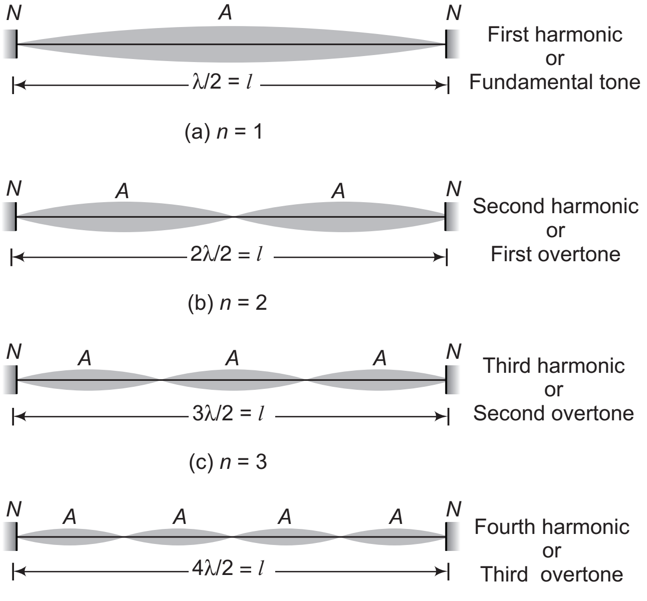
In an unbounded continuous medium, there is no restriction on the frequencies or wavelengths of the standing waves. However, if the waves are confined in space, for example, when a string is tied at both ends,standing waves can be set-up for a discrete set of frequencies or wavelengths. Consider a string of definite length *l,* rigidly held at both ends. When we setup a sinusoidal wave on such a string, it gets reflected from the fixed ends. By the superposition of two identical waves travelling in opposite directions standing waves are established on the string. The only requirement we have to satisfy is that the end points be nodes as these points cannot oscillate. They are permanently at rest. There may be any number of nodes in between or none at all, so that the wavelength associated with the standing waves can take many different values. The distance between adjacent nodes is $\lambda/2$, so that in a string of length l there must be exactly an integral number n of half wavelengths $\lambda/2$. That is,

$$\frac{n\lambda}{2} = l$$

or $$\lambda = \frac{2l}{n} \qquad (n = 1, 2, 3 \ldots)$$

But $\lambda = \dfrac{v}{f}$ and $v = \sqrt{\dfrac{T}{\mu}}$, so that the natural frequencies of oscillation of the system are

$$\boxed{f = n\left(\frac{v}{2l}\right) = \frac{n}{2l}\sqrt{\frac{T}{\mu}}} \qquad (n = 1, 2, 3 \ldots)$$



(a) $n = 1$

(b) $n = 2$

(c) $n = 3$

(d) $n = 4$

Fig. 18.7

The smallest frequency f_1 corresponds to the largest wavelength $(n = 1)$, $\lambda_1 = 2l$.

$$f_1 = \frac{v}{2l}$$

This is called the **fundamental frequency**. The other standing wave frequencies are

$$f_2 = \frac{2v}{2l} = 2f_1$$

$$f_3 = \frac{3v}{2l} = 3f_1 \quad \text{and so on}$$

These frequencies are called **harmonics**. Musicians sometimes call them **overtones**. Students are advised to remember these frequencies by name.

For example,

f_1 = fundamental tone or first harmonic

$f_2 = 2f_1$ = first overtone or second harmonic

$f_3 = 3f_1$ = second overtone or third harmonic and so on.

Extra Points to Remember

- We have seen that the natural frequencies of oscillation of a stretched wire are given by

$$f = \frac{n}{2l}\sqrt{\frac{T}{\mu}}$$

Now, tension in the wire can be produced by the following two methods.

Method 1

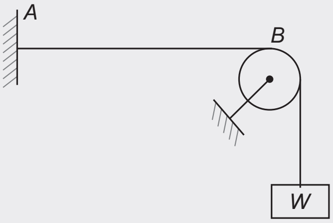


Fig. 18.8

By suspending a weight W from the wire AB as shown. In this case, transverse stationary waves are produced in wire AB.

Method 2 Wire AB is stretched at some higher temperature (than the normal room temperature). When temperature decreases, thermal stresses are produced and the wire comes under tension. Detailed discussion of thermal expansion will be covered in chapter 20.

- If by somehow, tension is decreased (for example: when weight is partially or fully immersed in a liquid), then from the above expression we can see that the set of frequencies decrease.
- As n increases, T, μ, l and therefore $v\left(=\sqrt{\frac{T}{\mu}}\right)$ remain unchanged. Frequency increases, therefore wavelength $\left(\lambda=\frac{v}{f}\right)$ and the loop size $(=\lambda/2)$ decrease.
- Even and odd both harmonics $(n=1, 2, 3, \ldots)$ are obtained with stretched wire fixed at both ends.

Example 18.7 *In terms of T, μ and l, find frequency of*

(a) fourth overtone mode

(b) third harmonic

Solution (a) Fourth overtone mode means

$$n = 5 \qquad (n=1, 2, 3, 4, 5)$$

Therefore, using the equation

$$f = \frac{n}{2l}\sqrt{\frac{T}{\mu}} = \frac{5}{2l}\sqrt{\frac{T}{\mu}}$$ **Ans.**

(b) Third harmonic means

$$n = 3$$

$$\therefore \qquad f = \frac{3}{2l}\sqrt{\frac{T}{\mu}}$$ **Ans.**

Example 18.8 *A massless rod BD is suspended by two identical massless strings AB and CD of equal lengths. A block of mass m is suspended from point P such that BP is equal to x. If the fundamental frequency of the left wire is twice the fundamental frequency of right wire, then the value of x is* **(JEE 2006)**

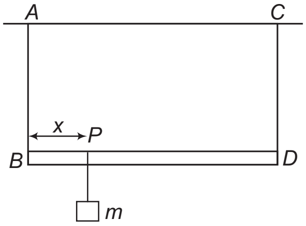

Fig. 18.9

(a) $l/5$ (b) $l/4$ (c) $4l/5$ (d) $3l/4$

Solution $f \propto v \propto \sqrt{T} \quad \Rightarrow \quad f_{AB} = 2f_{CD}$

$\therefore$ $$T_{AB} = 4T_{CD} \qquad \text{...(i)}$$

Further $$\Sigma\tau_P = 0$$

$\therefore$ $$T_{AB}(x) = T_{CD}(l - x)$$

or $$4x = l - x \qquad (\text{as } T_{AB} = 4T_{CD})$$

or $$x = l/5$$

$\therefore$ The correct option is (a).

Example 18.9 *An object of specific gravity* ρ *is hung from a thin steel wire. The fundamental frequency for transverse standing waves in the wire is* 300 *Hz. The object is immersed in water, so that one half of its volume is submerged. The new fundamental frequency (in Hz) is* **(JEE 1995)**

(a) $300\left(\dfrac{2\rho - 1}{2\rho}\right)^{1/2}$ (b) $300\left(\dfrac{2\rho}{2\rho - 1}\right)^{1/2}$ (c) $300\left(\dfrac{2\rho}{2\rho - 1}\right)$ (d) $300\left(\dfrac{2\rho - 1}{2\rho}\right)$

Solution The diagrammatic representation of the given problem is shown in figure. The expression of fundamental frequency is

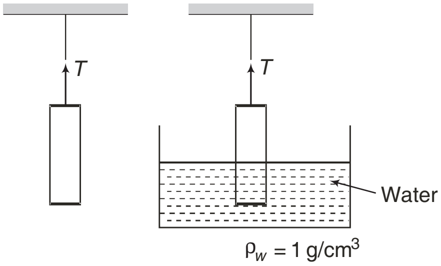

Fig. 18.10

$$\nu = \frac{1}{2l}\sqrt{\frac{T}{\mu}}$$

In air, $T = mg = (V\rho)g$

$\therefore$ $$\nu = \frac{1}{2l}\sqrt{\frac{V\rho g}{\mu}} \qquad \text{...(i)}$$

When the object is half immersed in water, then

$$T' = mg - \text{upthrust} = V\rho g - \left(\frac{V}{2}\right)\rho_w g = \left(\frac{V}{2}\right) g\,(2\rho - \rho_w)$$

The new fundamental frequency is

$$\nu' = \frac{1}{2l} \times \sqrt{\frac{T'}{\mu}} = \frac{1}{2l}\sqrt{\frac{(Vg/2)(2\rho - \rho_w)}{\mu}} \qquad \text{...(ii)}$$

$\therefore$ $$\frac{\nu'}{\nu} = \left(\sqrt{\frac{2\rho - \rho_w}{2\rho}}\right) \quad \text{or} \quad \nu' = \nu\left(\frac{2\rho - \rho_w}{2\rho}\right)^{1/2}$$

$$= 300\left(\frac{2\rho - 1}{2\rho}\right)^{1/2} \text{Hz}$$ **Ans.**

$\therefore$ The correct option is (a).

INTRODUCTORY EXERCISE 18.3

1. Sound waves of frequency 660 Hz fall normally on a perfectly reflecting wall. The shortest distance from the wall at which the air particles have maximum amplitude of vibration is …… m. Speed of sound = 330 m/s. **(JEE 1984)**
2. If the frequencies of the second and fifth harmonics of a string differ by 54 Hz. What is the fundamental frequency of the string?
3. A wire is attached to a pan of mass 200 g that contains a 2.0 kg mass as shown in the figure. When plucked, the wire vibrates at a fundamental frequency of 220 Hz. An additional unknown mass *M* is then added to the pan and a fundamental frequency of 260 Hz is detected. What is the value of *M*?

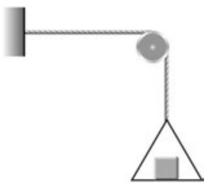

Fig. 18.11

4. A wire fixed at both ends is 1.0 m long and has a mass of 36 g. One of its oscillation frequencies is 250 Hz and the next higher one is 300 Hz.
   (a) Which harmonics do these frequencies represent?
   (b) What is the tension in the wire?
5. Two different stretched wires have same tension and mass per unit length. Fifth overtone frequency of the first wire is equal to second harmonic frequency of the second wire. Find the ratio of their lengths.

18.6 Reflection and Transmission of a Wave

Following points are important in reflection and transmission of a wave :

(i) Speed From wave point of view that medium is called a denser medium in which speed of wave is less.

For example, for a sound wave (or longitudinal wave) air is denser medium compared to water because speed of sound in air is less. On the other hand, air is rarer medium for an electromagnetic wave as speed of electromagnetic wave in air is more. When a wave strikes the boundary separating two different media, part of it is reflected and part is transmitted.

Since, wave speed depends upon the medium, in reflection wave speed does not change because medium does not change. In transmission, medium changes, therefore wave speed also changes. In denser medium it decreases.

(ii) Frequency Frequency (ω and T also) depends on source. In reflection as well as transmission source does not change. Therefore, frequency does not change.

(iii) Wavelength Wavelength (and therefore wave number $k = \frac{2\pi}{\lambda}$ also) is self adjusted in a value, $\lambda = \frac{v}{f}$. In reflection v and f do not change, therefore λ and k do not change. In transmission, f remains unchanged but v changes. Therefore, λ and k both change. In a denser medium, v decreases, therefore λ also decreases but k increases.

(iv) Phase change A phase change of π or 180° occurs only during the reflection from a denser medium. In any other case (in transmission or reflection from a rarer medium) phase change is zero.

(v) Amplitude In reflection as well as transmission, amplitude changes.

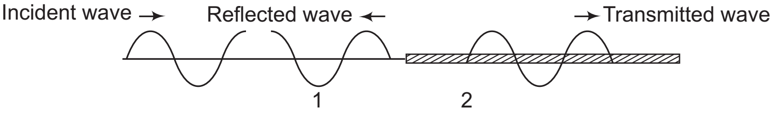

Fig. 18.12

If amplitude of incident wave in medium-1 is A_i, it is partly reflected and partly transmitted at the boundary of two media-1 and 2. Wave speeds in two media are v_1 and v_2. If amplitudes of reflected and transmitted waves are A_r and A_t, then

$$\boxed{A_r = \left(\frac{v_2 - v_1}{v_2 + v_1}\right) A_i} \quad \text{and} \quad \boxed{A_t = \left(\frac{2v_2}{v_1 + v_2}\right) A_i}$$

From the above two expressions, we can make the following conclusions :

Conclusion 1 If $v_1 = v_2$, then $A_r = 0$ and $A_t = A_i$

Basically $v_1 = v_2$ means both media are same from wave point of view. So, in this case there is no reflection ($A_r = 0$), only transmission ($A_t = A_i$) is there.

Conclusion 2 If $v_2 < v_1$, then A_r comes out to be negative. Now, $v_2 < v_1$ means the second medium is denser. A_r in this case is negative means, there is a phase change of π.

Conclusion 3 If $v_2 > v_1$, then $A_t > A_i$. This implies that amplitude always increases as the wave travels from a denser medium to rarer medium (as $v_2 > v_1$, so second medium is rarer).

(vi) Power At the boundary of two media,
energy incident per second = energy reflected per second + energy transmitted per second.

or

Power incident = power reflected + power transmitted

or

$$\boxed{P_i = P_r + P_t}$$

Let us summarise the above discussion in tabular form as below.

Table 18.2

Wave property	Reflection	Transmission (Refraction)
v	does not change	changes
f, T, ω	do not change	do not change
λ, k	do not change	change
A, I	change	change
ϕ	$\Delta\phi = 0$, from a rarer medium $\Delta\phi = \pi$, from a denser medium	$\Delta\phi = 0$

Example 18.10 *Two strings* 1 *and* 2 *are taut between two fixed supports (as shown in figure) such that the tension in both strings is same. Mass per unit length of* 2 *is more than that of* 1. *Explain which string is denser for a transverse travelling wave.*

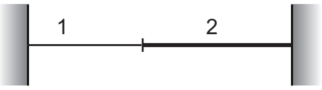

Fig. 18.13

Solution Speed of a transverse wave on a string,

$$v = \sqrt{\frac{T}{\mu}} \quad \text{or} \quad v \propto \frac{1}{\sqrt{\mu}}$$

Now, $\mu_2 > \mu_1$ (given)

$\therefore$ $v_2 < v_1$

i.e. medium 2 is denser and medium 1 is rarer.

Example 18.11 *A sound wave and a light wave are reflected and refracted (or transmitted) from water surface. Show the changes in different physical quantities associated with a wave.*

Solution **Sound wave** We have seen in article 18.6, that water is a rarer medium for sound. When a wave travels from a denser to rarer medium, it bends away from normal. Its speed, wavelength and amplitude increase but angular wave number decreases. Further, in reflection from a rarer medium and in transmission there is no change in phase angle.

In the figure shown, 1 is incident wave 2 is reflected wave and 3 is transmitted wave.

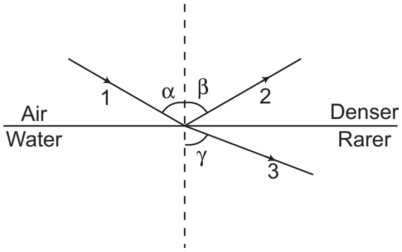

Fig. 18.14

$\alpha = \beta, \gamma > \alpha, f_1 = f_2 = f_3, v_1 = v_2, \lambda_1 = \lambda_2, k_1 = k_2, v_1 < v_3, \lambda_3 > \lambda_1 = \lambda_2, k_3 < k_1$

$\Delta\phi_{12} = \Delta\phi_{13} = 0°$.

Electromagnetic Wave For electromagnetic wave, water is denser medium. So, in water, ray of light will bend towards normal.

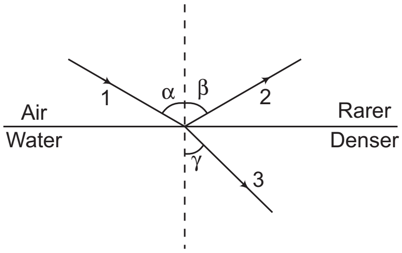

Fig. 18.15

Further, speed and wavelength in this medium will decrease. But value of k will increase.

$\alpha = \beta, \gamma < \alpha, f_1 = f_2 = f_3, v_1 = v_2, \lambda_1 = \lambda_2, k_1 = k_2, v_3 < v_1, \lambda_3 < \lambda_1, k_3 > k_1$

$\Delta\phi_{12} = \pi$ and $\Delta\phi_{13} = 0°$

Example 18.12 *A harmonic wave is travelling on string 1. At a junction with string 2 it is partly reflected and partly transmitted. The linear mass density of the second string is four times that of the first string, and that the boundary between the two strings is at $x = 0$. If the expression for the incident wave is*

$$y_i = A_i \cos(k_1 x - \omega_1 t)$$

(a) What are the expressions for the transmitted and the reflected waves in terms of A_i, k_1 and ω_1?

(b) Show that the average power carried by the incident wave is equal to the sum of the average power carried by the transmitted and reflected waves.

Solution (a) Since, $v = \sqrt{T/\mu}$, $T_2 = T_1$ and $\mu_2 = 4\mu_1$

We have,
$$v_2 = \frac{v_1}{2} \qquad \text{...(i)}$$

From Table 18.2, we can see that the frequency does not change, that is

$$\omega_1 = \omega_2 \qquad \text{...(ii)}$$

Also, because $k = \dfrac{\omega}{v}$, the wave numbers of the harmonic waves in the two strings are related by

$$k_2 = \frac{\omega_2}{v_2} = \frac{\omega_1}{v_1/2} = 2\frac{\omega_1}{v_1} = 2k_1 \qquad \ldots\text{(iii)}$$

The amplitudes are $$A_t = \left(\frac{2v_2}{v_1 + v_2}\right)A_i = \left[\frac{2(v_1/2)}{v_1 + (v_1/2)}\right] = \frac{2}{3}A_i \qquad \ldots\text{(iv)}$$

and $$A_r = \left(\frac{v_2 - v_1}{v_1 + v_2}\right)A_i = \left[\frac{(v_1/2) - v_1}{v_1 + (v_1/2)}\right]A_i = -\frac{A_i}{3} \qquad \ldots\text{(v)}$$

Now with Eqs. (ii), (iii) and (iv), the transmitted wave can be written as

$$y_t = \frac{2}{3}A_i \cos(2k_1 x - \omega_1 t)$$ **Ans.**

Similarly the reflected wave can be expressed as

$$y_r = -\frac{A_i}{3}\cos(k_1 x + \omega_1 t)$$

$$= \frac{A_i}{3}\cos(k_1 x + \omega_1 t + \pi)$$ **Ans.**

(b) The average power of a harmonic wave on a string is given by

$$P = \frac{1}{2}\rho A^2 \omega^2 S v = \frac{1}{2}A^2\omega^2 \mu v \qquad (\text{as } \rho S = \mu)$$

Now, $$P_i = \frac{1}{2}\omega_1^2 A_i^2 \mu_1 v_1 \qquad \ldots\text{(vi)}$$

$$P_t = \frac{1}{2}\omega_1^2\left(\frac{2}{3}A_i\right)^2 (4\mu_1)\left(\frac{v_1}{2}\right) = \frac{4}{9}\omega_1^2 A_i^2 \mu_1 v_1 \qquad \ldots\text{(vii)}$$

and $$P_r = \frac{1}{2}\omega_2^2\left(-\frac{A_i}{3}\right)^2 (\mu_1)(v_1) = \frac{1}{18}\omega_1^2 A_i^2 \mu_1 v_1 \qquad \ldots\text{(viii)}$$

From Eqs. (vi), (vii) and (viii), we can show that

$$P_i = P_t + P_r$$ **Hence proved.**

Example 18.13 *From energy conservation principle prove the relations,*

$$A_r = \left(\frac{v_2 - v_1}{v_1 + v_2}\right)A_i \quad \text{and} \quad A_t = \left(\frac{2v_2}{v_1 + v_2}\right)A_i$$

Here, symbols have their usual meanings.

Solution By conservation of energy, the average incident power equals the average reflected power plus the average transmitted power

or $$P_i = P_r + P_t$$

$\therefore$ $$\frac{1}{2}\mu_1\omega^2 A_i^2 v_1 = \frac{1}{2}\mu_1\omega^2 A_r^2 v_1 + \frac{1}{2}\mu_2\omega^2 A_t^2 v_2$$

or $$\left(\frac{T}{v_1^2}\right)\omega^2 A_i^2 v_1 = \left(\frac{T}{v_1^2}\right)\omega^2 A_r^2 v_1 + \left(\frac{T}{v_2^2}\right)\omega^2 A_t^2 v_2$$

or $$\frac{A_i^2}{v_1} = \frac{A_r^2}{v_1} + \frac{A_t^2}{v_2} \qquad \ldots\text{(i)}$$

Further $$A_i + A_r = A_t \qquad \ldots\text{(ii)}$$

Solving these two equations for A_r and A_t, we get

$$A_r = \left(\frac{v_2 - v_1}{v_1 + v_2}\right) A_i$$

and $$A_t = \left(\frac{2v_2}{v_1 + v_2}\right) A_i$$ **Hence proved.**

INTRODUCTORY EXERCISE 18.4

1. Two pulses of identical shape overlap such that the displacement of the rope is momentarily zero at all points, what happens to the energy at this time?
2. The pulse shown in figure has a speed of 10 cm/s.

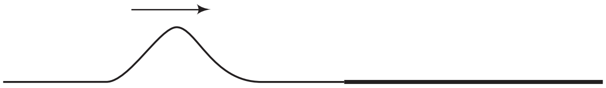

Fig. 18.16

   (a) If the linear mass density of the right string is 0.25 that of the left string, at what speed does the transmitted pulse travel?
   (b) Compare the heights of the transmitted pulse and the reflected pulse to that of the incident pulse.
3. The harmonic wave $y_i = (2.0 \times 10^{-3})\cos \pi(2.0x - 50t)$ travels along a string toward a boundary at $x = 0$ with a second string. The wave speed on the second string is 50 m/s. Write expressions for reflected and transmitted waves. Assume SI units.

Final Touch Points

1. Until now, we have come across the following three sets of equations

$$\left.\begin{array}{l} y = A\sin(\omega t \pm \phi) \\ y = A\cos(\omega t \pm \phi) \end{array}\right\} \text{SHM}$$

$$\left.\begin{array}{l} y = A\sin(kx \pm \omega t \pm \phi) \\ y = A\cos(kx \pm \omega t \pm \phi) \end{array}\right\} \text{Travelling wave}$$

$$\left.\begin{array}{lll} y = A\sin kx\cos\omega t & \text{or} & 2A\sin kx\cos\omega t \\ y = 2A\sin\omega t\cos kx & \text{or} & A\sin\omega t\cos kx \\ y = A\sin kx\sin\omega t & \text{or} & 2A\sin kx\sin\omega t \\ y = 2A\cos kx\cos\omega t & \text{or} & A\cos kx\cos\omega t \end{array}\right\} \text{Standing wave}$$

Note *In standing waves, we have given four sets of equations. The equation of standing wave basically depends on the component waves. Further, if the maximum amplitude is 2A, it means amplitude of travelling waves is A and if it is A, then amplitude of travelling waves is* $\frac{A}{2}$.

2. **Resonance** If the string (discussed in Art 18.5) is set vibrating in anyone of the normal modes and left to itself, the oscillations gradually die out. The motion is damped by dissipation of energy through the elastic supports at the ends and by the resistance of the air to the motion. We can pump energy into the system by applying a driving force. If the driving frequency is equal to any natural frequency of the string, the string will vibrate at that frequency with a larger amplitude. This phenomenon is called **resonance**. Because the string has a large number of natural frequencies, resonance can occur at many different frequencies.

3. **Reason of phase change of π in reflection from a denser medium** When a transverse wave is reflected at the rigid support, a phase change of π takes place in the displacement. Suppose a transverse pulse is produced along a string PQ whose end Q is attached to a rigid support. If the pulse travels in the form of a crest, then on reaching the rigid support, the pulse would exert an upward force. Since the support is rigid, it remains unaffected but a reaction force act in the downward direction on the string which reverses the sign of the displacement of the particle at Q. As a result, an inverted pulse in the form of a trough travels back as shown.

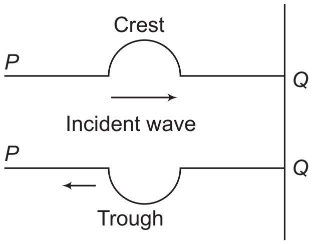

Fig. 18.17

This concept can also be understood by a second thought process. Incident wave and reflected wave are two identical waves travelling in opposite directions. So, they should produce a stationary wave. Point Q is a fixed point, which cannot oscillate at all. So, Q should become a node. This is possible only when the two displacements (one due to incident wave y_1 and the other due to reflected wave y_2) are always equal and opposite ($y = y_1 + y_2 = 0$ or $y_1 = -y_2$). Or, they have a phase difference of π.

Solved Examples

TYPED PROBLEMS

Type 1. *To find length of oscillating wire from the equation of stationary wave*

How to Solve?

- From the given equation of stationary wave find the value of wave number k and then λ. Now, from the given mode of oscillations we can also find number of loops. Suppose number of loops are n and one loop size is $\frac{\lambda}{2}$. Then, total length of wire will be

$$l = n\left(\frac{\lambda}{2}\right)$$

Example 1 *A stretched wire is oscillating in third overtone mode. Equation of transverse stationary wave produced in this wire is*

$$y = A\sin(6\pi x)\sin(20\pi t)$$

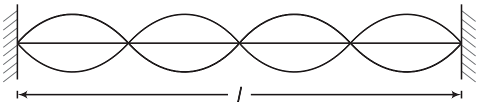
Here, x is in metres. Find the length of the wire.

Solution From the given equation we can see that

$$k = 6\pi \text{ m}^{-1}$$

$$\therefore \quad \lambda = \frac{2\pi}{k} = \frac{2\pi}{6\pi} = \frac{1}{3}\text{ m}$$

Now, third overtone mode means four loops as shown below



One loop size is $\frac{\lambda}{2}$, therefore total length of wire,

$$l = 4\left(\frac{\lambda}{2}\right) = 2\lambda$$

$$= 2\left(\frac{1}{3}\right)\text{ m}$$

$$= \frac{2}{3}\text{ m}$$

Ans.

Type 2. *To find amplitude at some given point in stationary wave*

Concept

In a stationary wave amplitude at different points varies from 0 at node (when $A_1 = A_2 = A_0$) to maximum (= $2A_0$) at antinode. If by some how, $A_{\max}$, k and position of node or position of antinode is known then we can find amplitude at any general point. For example, if position of node is known, then take this point as $x = 0$. Now, amplitude at any general point x is

$$A_x = A_{\max} \sin kx$$

In this expression we can see that $A_x = 0$ at $x = 0$.

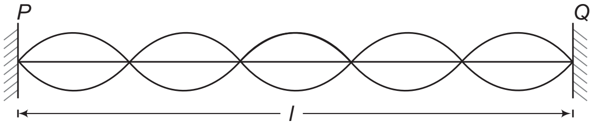
Similarly, if position of antinode is known then amplitude at general point x is

$$A_x = A_{\max} \cos kx$$

Again we can see that, $A_x = A_{\max}$ at $x = 0$.

Example 2 *Length of a stretched wire is 2m. It is oscillating in its fourth overtone mode. Maximum amplitude of oscillations is 2mm. Find amplitude of oscillation at a distance of 0.2 m from one fixed end.*

Solution Fourth overtone mode means five loops.



$$\therefore \qquad l = 5\left(\frac{\lambda}{2}\right)$$

$$\text{or} \qquad \lambda = \frac{2l}{5}$$

$$= \frac{2 \times 2}{5} = 0.8 \text{ m}$$

$$k = \frac{2\pi}{\lambda} = \frac{2\pi}{0.8}$$

$$= (2.5\,\pi)\ \text{m}^{-1}$$

Now, P is a node. So, take $x = 0$ at P.

Then, at a distance x from P,

$$A_x = A_{\max} \sin kx$$

$$= (2 \text{ mm}) \sin (2.5\,\pi)(0.2)$$

$$= (2 \text{ mm}) \sin \left(\frac{\pi}{2}\right)$$

$$= 2 \text{ mm}$$

Ans.

Note *At $x = 0.2$ m, we are getting $A_x = A_{\max}$.*

Hence, $x = 0.2$ m is an antinode.

Type 3. *To find energy of oscillation in a given portion in stationary wave*

Concept

In SHM, energy of oscillation of a single particle is given by

$$E = \frac{1}{2} m\omega^2 A^2$$

In a travelling sine wave, all particles oscillate with same amplitude and same frequency. Energy density (or energy per unit volume) is given by

$$u = \frac{1}{2}\rho\omega^2 A^2$$

Since ρ, ω and A is same at all points. Therefore, energy density will be same at all points. So, in each unit volume equal amount of energy will be stored. Therefore, to find total energy of oscillation in a given volume, we just multiply the given volume by this constant energy density.

In stationary wave, amplitude is different at different positions. So, energy density will be non-uniform. Hence, total energy of oscillation in a given volume can be obtained by integration.

There is an alternate method also. By adding two energy densities of the travelling waves (from which standing wave is formed) first of all we find the total energy density. Then, we multiply the given volume with this energy density.

Example 3 *A standing wave is formed by two harmonic waves, $y_1 = A\sin(kx - \omega t)$ and $y_2 = A\sin(kx + \omega t)$ travelling on a string in opposite directions. Mass density of the string is ρ and area of cross-section is s. Find the total mechanical energy between two adjacent nodes on the string.*

Solution The distance between two adjacent nodes is $\frac{\lambda}{2}$ or $\frac{\pi}{k}$.

∴ Volume of string between two nodes will be

$$V = (\text{area of cross-section}) \times (\text{distance between two nodes})$$

$$= (S)\left(\frac{\pi}{k}\right)$$

Energy density (energy per unit volume) of a travelling wave is given by

$$u = \frac{1}{2}\rho A^2\omega^2$$

A standing wave is formed by two identical waves travelling in opposite directions. Therefore, the energy stored between two nodes in a standing wave.

$$E = 2\left[\text{energy stored in a distance of } \frac{\pi}{k} \text{ of a travelling wave}\right]$$

$$= 2\,(\text{energy density})\,(\text{volume})$$

$$= 2\left(\frac{1}{2}\rho A^2\omega^2\right)\left(\frac{\pi S}{k}\right)$$

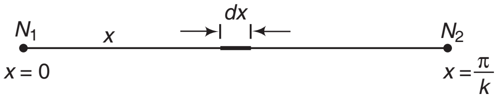
or
$$E = \frac{\rho A^2\omega^2\pi S}{k}$$
Ans.

Alternate Method The equation of the standing wave

$$y = y_1 + y_2 = 2A \sin kx \cos \omega t = A_x \cos \omega t$$

Here, $A_x = 2A \sin kx$

i.e. first node is at $x = 0$ and the next node is at $x = \frac{\pi}{k}$. Let us take an element of length dx at a distance x from N_1. Mass of this element is dm $(= \rho S dx)$. This can be treated as point mass. This element oscillates simple harmonically with angular frequency ω and amplitude $2A \sin kx$.



Hence, energy of this element

$$dE = \frac{1}{2}(dm)\,(2A \sin kx)^2(\omega^2)$$

$$dE = \frac{1}{2}(\rho S dx)\,(2A \sin kx)^2 \omega^2$$

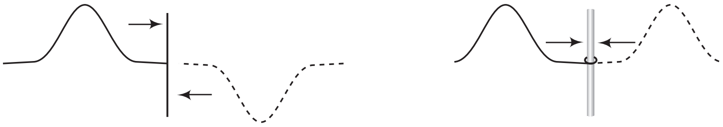
Integrating this with the limits from $x = 0$ to $x = \frac{\pi}{k}$, we get the same result.

Type 4. *Based on the formation of the reflected pulse, either from a rigid boundary or from a free boundary*

Concept

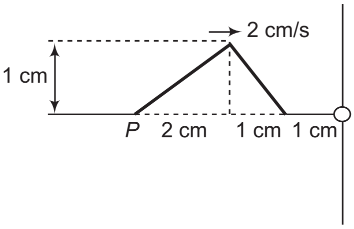
The formation of the reflected pulse can be obtained by overlapping two pulses travelling in opposite directions.

The net displacement at any point is given by the principle of superposition.



(a) Rigid boundary (b) Free boundary

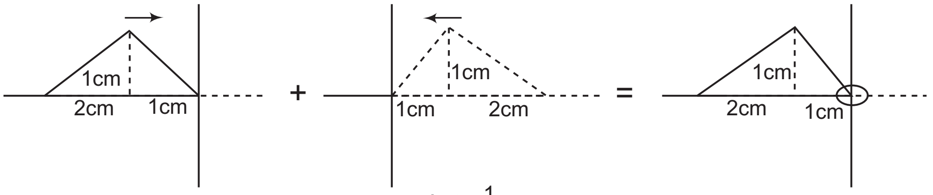
Example 4 *A triangular wave pulse moving at 2 cm/s on a rope approached an end at which it is free to slide on a vertical pole.*



(a) *Draw the pulse at $\frac{1}{2}$ s interval until it is completely reflected.*

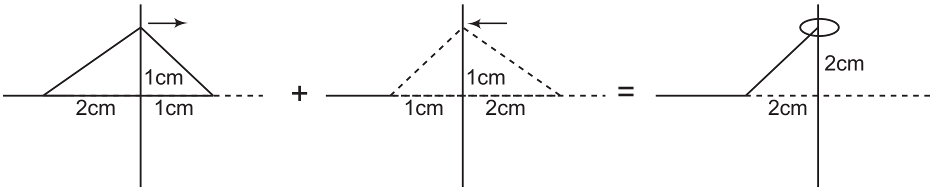
(b) *What is the particle speed on the trailing edge P at the instant depicted?*

Solution (a) Reflection of pulse from a free boundary is really the superposition of two identical waves travelling in opposite directions. This can be shown as under.



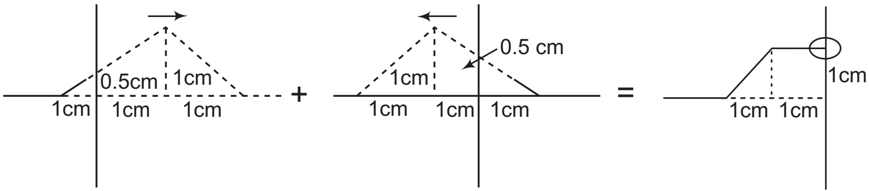
At $t = \frac{1}{2}$ s

(a) (b) (c)



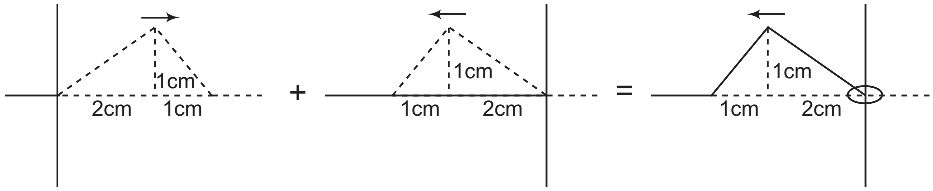
At $t = 1$ s

(d) (e) (f)



At $t = 1\frac{1}{2}$ s

(g) (h) (i)



At $t = 2$ s

(j) (k) (l)

In every $\frac{1}{2}$ s, each pulse (one real moving towards right and one imaginary moving towards left) travels a distance of 1 cm as the wave speed is 2 cm/s.

(b) Particle speed, $v_P = |-v(\text{slope})|$

Here, $v = \text{wave speed} = 2$ cm/s

and $\text{slope} = \frac{1}{2}$

$\therefore$ Particle speed $= 1$ cm/s

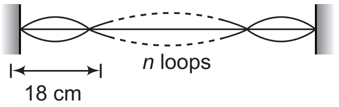
Miscellaneous Examples

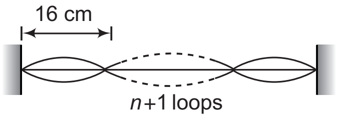
Example 5 *A string fixed at both ends has consecutive standing wave modes for which the distances between adjacent nodes are* 18 *cm and* 16 *cm, respectively.*

(a) What is the minimum possible length of the string?

(b) If the tension is 10 *N and the linear mass density is* 4 *g/m, what is the fundamental frequency?*

Solution (a)





Let l be the length of the string. Then,

$$18n = l \qquad \text{...(i)}$$

$$16(n + 1) = l \qquad \text{...(ii)}$$

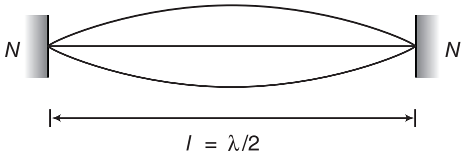
From Eqs. (i) and (ii), wet get

$$n = 8$$

and $$l = 144 \text{ cm}$$

Therefore, the minimum possible length of the string can be 144 cm. **Ans.**

(b) For fundamental frequency, $l = \dfrac{\lambda}{2}$



or $$\lambda = 2l = 288 \text{ cm}$$
$$= 2.88 \text{ m}$$

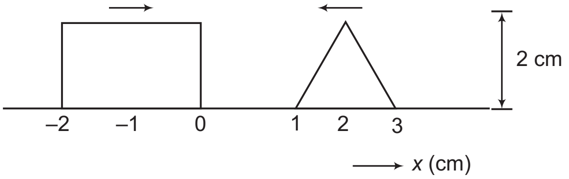
Speed of wave on the string,

$$v = \sqrt{\frac{T}{\mu}}$$
$$= \sqrt{\frac{10}{4 \times 10^{-3}}} = 50 \text{ m/s}$$

$\therefore$ Fundamental frequency,

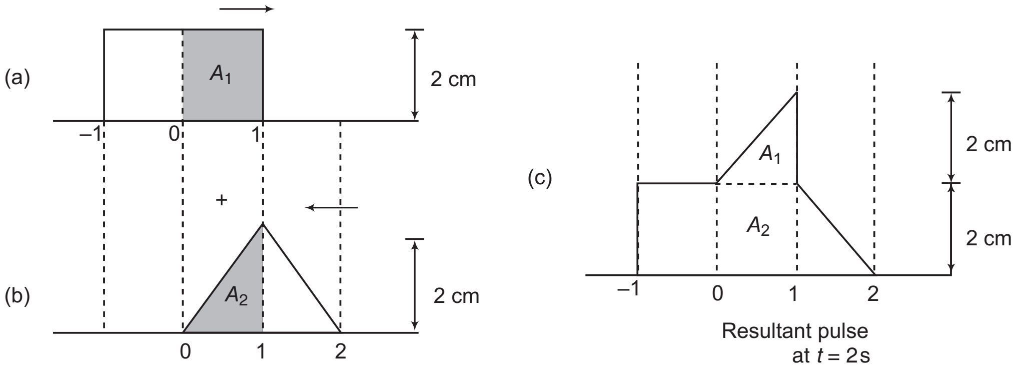
$$f = \frac{v}{\lambda} = \frac{50}{2.88}$$
$$= 17.36 \text{ Hz}$$ **Ans.**

Example 6 *Figure shows a rectangular pulse and triangular pulse approaching towards each other. The pulse speed is* 0.5 *cm/s. Sketch the resultant pulse at* $t = 2$ *s.*



Solution In 2 s each pulse will travel a distance of 1 cm.

The two pulses overlap between 0 and 1 cm as shown in figure. So, A_1 and A_2 can be added as shown in Fig. (c).



Example 7 *Two wires are fixed on a sonometer. Their tensions are in the ratio* $8:1$, *their lengths are in the ratio* $36:35$, *the diameters are in the ratio* $4:1$ *and densities are in the ratio* $1:2$. *Find the value of lower frequency if higher frequency is* 360 *Hz.*

Solution Given,

$$\frac{T_1}{T_2} = \frac{8}{1}, \frac{L_1}{L_2} = \frac{36}{35}$$

$$\frac{D_1}{D_2} = \frac{4}{1}, \frac{\rho_1}{\rho_2} = \frac{1}{2}$$

Let μ_1 and μ_2 be the linear mass densities, then

$$\therefore \quad \mu_1 = \pi \times \frac{D_1^2}{4} \times \rho_1 \text{ and } \mu_2 = \pi \times \frac{D_2^2}{4} \times \rho_2 \qquad (\mu = \rho S)$$

$$\therefore \quad \frac{\mu_1}{\mu_2} = \left(\frac{D_1}{D_2}\right)^2 \times \frac{\rho_1}{\rho_2} = \left(\frac{4}{1}\right)^2 \times \frac{1}{2} = \frac{8}{1}$$

$$\therefore \quad \frac{f_1}{f_2} = \frac{L_2}{L_1} \times \sqrt{\frac{T_1}{T_2} \times \frac{\mu_2}{\mu_1}} = \frac{35}{36}\sqrt{\frac{8}{1} \times \frac{1}{8}} = \frac{35}{36} \qquad \left(f = \frac{1}{2L}\sqrt{\frac{T}{\mu}}\right)$$

$$f_2 > f_1$$

We have $f_2 = 360$

$\therefore$ $f_1 = 350$ **Ans.**

Example 8 *In a stationary wave pattern that forms as a result of reflection of waves from an obstacle the ratio of the amplitude at an antinode and a node is* $\beta = 1.5$. *What percentage of the energy passes across the obstacle?*

Solution
$$\frac{A_{\max}}{A_{\min}} = \frac{A_i + A_r}{A_i - A_r}$$

This ratio is given as 1.5 or $\frac{3}{2}$.

$$\therefore \qquad \frac{A_i + A_r}{A_i - A_r} = \frac{3}{2} \quad \text{or} \quad \frac{1 + \frac{A_r}{A_i}}{1 - \frac{A_r}{A_i}} = \frac{3}{2}$$

Solving this equation, we get
$$\frac{A_r}{A_i} = \frac{1}{5}$$

$$\therefore \qquad \frac{I_r}{I_i} = \left(\frac{A_r}{A_i}\right)^2 = \frac{1}{25}$$

or
$$I_r = 0.04\, I_i$$

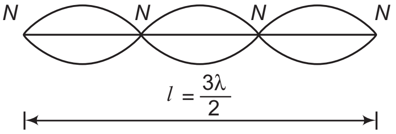
i.e. 4% of the incident energy is reflected or 96% energy passes across the obstacle. **Ans.**

Example 9 *A string of linear mass density* 5.0×10^{-3} *kg/m is stretched under a tension of* 65 N *between two rigid supports* 60 cm *apart.*

(a) If the string is vibrating in its second overtone so that the amplitude at one of its antinodes is 0.25 cm*, what are the maximum transverse speed and acceleration of the string at antinodes?*

(b) What are these quantities at a distance 5.0 cm *from an node?*

Solution (a) In second overtone,



$$l = \frac{3\lambda}{2}$$

or
$$\lambda = \frac{2l}{3} = \frac{2 \times 60}{3}$$
$$= 40 \text{ cm} = 0.4 \text{ m}$$
$$k = \frac{2\pi}{\lambda} = \frac{2\pi}{0.4} = 5\pi \text{ m}^{-1}$$
$$v = \sqrt{\frac{T}{\mu}} = \sqrt{\frac{65}{5.0 \times 10^{-3}}}$$
$$= 114 \text{ m/s}$$
$$\therefore \qquad \omega = kv = 570\pi \text{ rad/s}$$

Maximum transverse speed at antinode = $A_0\omega$

Here, A_0 = amplitude of antinode = 0.25 cm = 2.5×10^{-3} m

$\therefore$ $\qquad$ Maximum speed $= (2.5 \times 10^{-3})(570\,\pi)$ m/s

$= 4.48$ m/s **Ans.**

Maximum acceleration $= \omega^2 A_0$

$= (570\pi)^2\,(2.5 \times 10^{-3})$ m/s^2

$= 8.0 \times 10^3$ m/s^2 **Ans.**

(b) At a distance *x* from the node, the amplitude can be written as

$$A = A_0 \sin kx = (2.5 \times 10^{-3}) \sin(5\pi x) \text{ metre}$$

Here, *x* is in metres.

Therefore, at $\qquad x = 5.0 \text{ cm} = 5.0 \times 10^{-2}$ m

$$A = (2.5 \times 10^{-3}) \sin(5\pi \times 5.0 \times 10^{-2})$$

$$= 1.8 \times 10^{-3} \text{ m}$$

Maximum speed $= A\omega$

$= (1.8 \times 10^{-3})\,(570\pi)$ m/s

$= 3.22$ m/s **Ans.**

and maximum acceleration $= \omega^2 A$

$= (570\pi)^2\,(1.8 \times 10^{-3})$ m/s^2

$= 5.8 \times 10^3$ m/s^2 **Ans.**

Example 10 *An aluminium wire of cross-sectional area* 10^{-6} m^2 *is joined to a steel wire of the same cross-sectional area. This compound wire is stretched on a sonometer pulled by a weight of* 10 *kg. The total length of the compound wire between the bridges is* 1.5 *m of which the aluminium wire is* 0.6 *m and the rest is steel wire. Transverse vibrations are setup in the wire by using an external source of variable frequency. Find the lowest frequency of excitation for which the standing waves are formed such that the joint in the wire is a node. What is the total number of nodes at this frequency? The density of aluminium is* 2.6×10^3 kg/m^3 *and that of steel is* 1.04×10^4 $kg/m^3 (g = 10\ m/s^2)$.

Solution Let n_a loops are formed in aluminium wire and n_s in steel. Then,

$$f_a = f_s$$

or
$$n_a\left(\frac{v_a}{2l_a}\right) = n_s\left(\frac{v_s}{2l_s}\right)$$

or
$$\frac{n_a}{n_s} = \left(\frac{v_s}{v_a}\right)\left(\frac{l_a}{l_s}\right)$$

But,
$$v = \sqrt{\frac{T}{\mu}} = \sqrt{\frac{T}{\rho s}} \propto \frac{1}{\sqrt{\rho}}$$

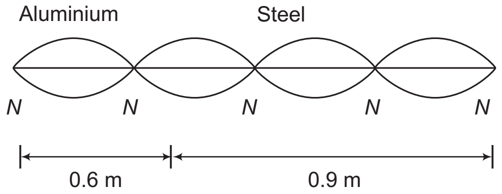
Therefore,
$$\frac{v_s}{v_a} = \sqrt{\frac{\rho_a}{\rho_s}}$$

$\therefore$
$$\frac{n_a}{n_s} = \sqrt{\frac{\rho_a}{\rho_s}} \cdot \frac{l_a}{l_s}$$

Substituting the values, we have

$$\frac{n_a}{n_s} = \sqrt{\frac{2.6 \times 10^3}{1.04 \times 10^4}} \cdot \frac{0.6}{0.9} = \frac{1}{3}$$

i.e. at lowest frequency, one loop is formed in aluminium wire and three loops are formed in steel wire as shown in figure.



$$\therefore \qquad f_{\min} = n_a\left(\frac{v_a}{2l_a}\right) = \frac{1}{2l_a}\sqrt{\frac{T}{\rho_a S}} \qquad (T = mg = 100\text{ N})$$

$$= \frac{1}{2 \times 0.6}\sqrt{\frac{10 \times 10}{2.6 \times 10^3 \times 10^{-6}}}$$

or $f_{\min} = 163.4$ Hz **Ans.**

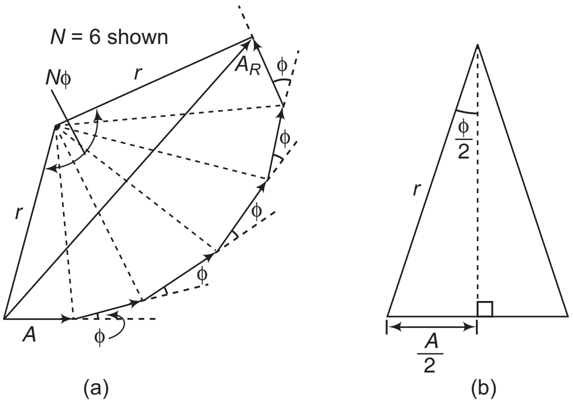
Total number of nodes are five as shown is figure. **Ans.**

Note *In such type of problems nature of junction will be known to us. Then, we have to equate frequencies on the two sides. By equating the frequencies, we find* $\frac{n_1}{n_2}$. *Suppose this comes out to be* 0.4 . *Write it,* $\frac{n_1}{n_2} = \frac{2}{5}$.

At lowest oscillation frequency 2 *loops are formed on side* 1 *and* 5 *on side* 2. *At next higher frequency* 4 *loops will be formed on side* 1 *and* 10 *on side* 2 *and so on.*

Example 11 *Find the resultant amplitude and phase of a point at which N sinusoidal waves interfere. All the waves have same amplitude A and their phases increase in arithmetic progression of common difference* ϕ.

Solution The diagram for their sum is shown in figure for $N = 6$. The resultant amplitude is A_R. The apex angle of every isosceles triangle is ϕ. So, the angle subtended by the resultant is $N\phi$. Since, the heads of the vectors are all at the same distance r from the apex of the diagram.



(a) (b)

From Fig. (a),

$$\frac{A_R}{2} = r \sin \frac{N\phi}{2} \qquad \text{...(i)}$$

and from Fig. (b),

$$\frac{A}{2} = r \sin \frac{\phi}{2} \qquad \text{...(ii)}$$

Dividing Eq. (i) by Eq. (ii), we get

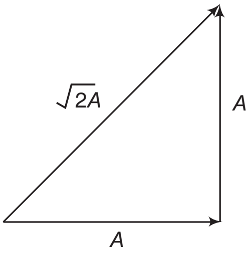
$$\frac{A_R}{A} = \frac{\sin \frac{N\phi}{2}}{\sin \frac{\phi}{2}}$$

or

$$\boxed{A_R = A\left(\frac{\sin \frac{N\phi}{2}}{\sin \frac{\phi}{2}}\right)} \qquad \textbf{Ans.}$$

Note *Suppose $N = 2$ and $\phi = 90°$, then*

$$A_R = \sqrt{2}A$$



Similarly, we can also check the above result for other special cases.

Exercises

LEVEL 1

Assertion and Reason

Directions : *Choose the correct option.*

(*a*) *If both **Assertion** and **Reason** are true and the **Reason** is correct explanation of the **Assertion.***

(*b*) *If both **Assertion** and **Reason** are true but **Reason** is not the correct explanation of **Assertion.***

(*c*) *If **Assertion** is true, but the **Reason** is false.*

(*d*) *If **Assertion** is false but the **Reason** is true.*

1. Assertion : Two waves $y_1 = A\sin(\omega t + kx)$ and $y_2 = A\cos(\omega t - kx)$ are superimposed, then $x = 0$ becomes a node.

Reason : At node net displacement due to two waves should be zero.

2. Assertion : Stationary waves are so called because particles are at rest in stationary waves.

Reason : They are formed by the superposition of two identical waves travelling in opposite directions.

3. Assertion : When a wave travels from a denser medium to rarer medium, then amplitude of oscillation increases.

Reason : In denser medium, speed of wave is less compared to a rarer medium.

4. Assertion : A wire is stretched and then fixed at two ends. It oscillates in its second overtone mode. There are total four nodes and three antinodes.

Reason : In second overtone mode, length of wire should be $l = \frac{3\lambda}{2}$, where λ is wavelength.

5. Assertion : If we see the oscillations of a stretched wire at higher overtone mode, frequency of oscillation increases but wavelength decreases.

Reason : From $v = f\lambda$, $\lambda \propto \frac{1}{f}$ as v = constant.

6. Assertion : Standing waves are formed when amplitudes of two constituent waves are equal.

Reason : At any point net displacement at a given time is resultant of displacement of constituent waves.

7. Assertion : In a standing wave $x = 0$ is a node. Then, total mechanical energy lying between $x = 0$ and $x = \frac{\lambda}{8}$ is not equal to the energy lying between $x = \frac{\lambda}{8}$ and $x = \frac{\lambda}{4}$.

Reason : In standing waves different particles oscillate with different amplitudes.

8. Assertion : Ratio of maximum intensity and minimum intensity in interference is 25 : 1.

The amplitude ratio of two waves should be 3 : 2.

Reason : $\frac{I_{\max}}{I_{\min}} = \left(\frac{A_1 + A_2}{A_1 - A_2}\right)^2$

9. **Assertion :** Three waves of equal amplitudes interfere at a point. Phase difference between two successive waves is $\frac{\pi}{2}$. Then, resultant intensity is same as the intensity due to individual wave.

   Reason : For interference to take place sources must be coherent.

10. **Assertion :** For two sources to be coherent phase difference between two waves at all points should be same.

    Reason : Two different light sources are never coherent.

Objective Questions

1. Two identical harmonic pulses travelling in opposite directions in a taut string approach each other. At the instant when they completely overlap, the total energy of the string will be

   (a) zero (b) partly kinetic and partly potential
   (c) purely kinetic (d) purely potential

2. Three coherent waves having amplitudes 12 mm, 6 mm and 4 mm arrive at a given point with successive phase difference of $\pi/2$. Then, the amplitude of the resultant wave is
   (a) 7 mm (b) 10 mm
   (c) 5 mm (d) 4.8 mm

3. Two transverse waves A and B superimpose to produce a node at $x = 0$. If the equation of wave A is $y = a\cos(kx + \omega t)$, then the equation of wave B is
   (a) $+a\cos(kx - \omega t)$ (b) $-a\cos(kx + \omega t)$
   (c) $-a\cos(kx - \omega t)$ (d) $+a\cos(\omega t - kx)$

4. In a stationary wave system, all the particles of the medium
   (a) have zero displacement simultaneously at some instant
   (b) have maximum displacement simultaneously at some instant
   (c) are at rest simultaneously at some instant
   (d) all of the above

5. In a standing wave on a string
   (a) In one time period all the particles are simultaneously at rest twice
   (b) All the particles must be at their positive extremes simultaneously once in a time period
   (c) All the particles may be at their positive extremes simultaneously twice in a time period
   (d) All the particles are never at rest simultaneously

6. If λ_1, λ_2 and λ_3 are the wavelength of the waves giving resonance to the fundamental, first and second overtone modes respectively in a string fixed at both ends. The ratio of the wavelengths $\lambda_1 : \lambda_2 : \lambda_3$ is
   (a) 1 : 2 : 3 (b) 1 : 3 : 5
   (c) $1 : \frac{1}{2} : \frac{1}{3}$ (d) $1 : \frac{1}{3} : \frac{1}{5}$

7. In a standing wave, node is a point of
   (a) maximum strain (b) maximum pressure
   (c) maximum density (d) All of these

8. For a certain stretched string, three consecutive resonance frequencies are observed as 105, 175 and 245 Hz respectively. Then, the fundamental frequency is

(a) 30 Hz
(b) 45 Hz
(c) 35 Hz
(d) None of these

9. A string 1 m long is drawn by a 300 Hz vibrator attached to its end. The string vibrates in three segments. The speed of transverse waves in the string is equal to

(a) 100 m/s
(b) 200 m/s
(c) 300 m/s
(d) 400 m/s

10. Three resonant frequencies of string with both rigid ends are 90, 150 and 210 Hz. If the length of the string is 80 cm, what is the speed of the transverse wave in the string?

(a) 45 m/s
(b) 75 m/s
(c) 48 m/s
(d) 80 m/s

11. The period of oscillations of a point is 0.04 s and the velocity of propagation of oscillation is 300 m/s. The difference of phases between the oscillations of two points at distance 10 m and 16 m respectively from the source of oscillations is

(a) 2π
(b) $\frac{\pi}{2}$
(c) $\frac{\pi}{4}$
(d) π

12. A transverse wave described by an equation $y = 0.02 \sin (x + 30t)$, where x and t are in metre and second, is travelling along a wire of area of cross-section 1 mm^2 and density 8000 kgm^{-3}. What is the tension in the string?

(a) 20 N
(b) 7.2 N
(c) 30 N
(d) 14.4 N

Subjective Questions

1. Two waves are travelling in the same direction along a stretched string. The waves are 90° out of phase. Each wave has an amplitude of 4.0 cm. Find the amplitude of the resultant wave.

2. Two wires of different densities are soldered together end to end then stretched under tension T. The wave speed in the first wire is twice that in the second wire.

(a) If the amplitude of incident wave is A, what are amplitudes of reflected and transmitted waves?
(b) Assuming no energy loss in the wire, find the fraction of the incident power that is reflected at the junction and fraction of the same that is transmitted.

3. A wave is represented by

$$y_1 = 10 \cos (5x + 25\,t)$$

where, x is measured in metres and t in seconds. A second wave for which

$$y_2 = 20 \cos \left(5x + 25t + \frac{\pi}{3}\right)$$

interferes with the first wave. Deduce the amplitude and phase of the resultant wave.

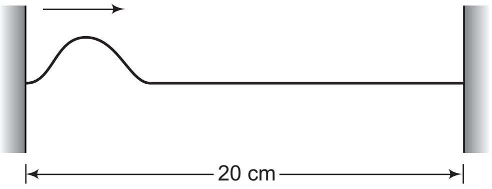
4. Two waves passing through a region are represented by

$$y_1 = (1.0\text{ cm}) \sin [(3.14\text{ cm}^{-1})\ x - (157\text{ s}^{-1})\ t]$$

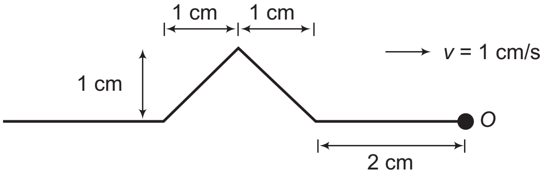
and
$$y_2 = (1.5\text{ cm}) \sin [(1.57\text{ cm}^{-1})\ x - (314\text{ s}^{-1})\ t]$$

Find the displacement of the particle at $x = 4.5$ cm at time $t = 5.0$ ms.

5. A string of length 20 cm and linear mass density 0.4 g/cm is fixed at both ends and is kept under a tension of 16 N. A wave pulse is produced at $t = 0$ near an end as shown in figure which travels towards the other end. (a) When will the string have the shape shown in the figure again? (b) Sketch the shape of the string at a time half of that found in part (a).



6. A wave pulse on a string has the dimensions shown in figure. The wave speed is $v = 1$ cm/s.



(a) If point O is a fixed end, draw the resultant wave on the string at $t = 3$ s and $t = 4$ s.

(b) Repeat part (a) for the case in which O is a free end.

7. Two sinusoidal waves combining in a medium are described by the equations

$$y_1 = (3.0\text{ cm})\sin\pi(x + 0.60\,t)$$

and
$$y_2 = (3.0\text{ cm})\sin\pi(x - 0.60\,t)$$

where, x is in centimetres and t is in seconds. Determine the maximum displacement of the medium at

(a) $x = 0.250$ cm,

(b) $x = 0.500$ cm and

(c) $x = 1.50$ cm.

(d) Find the three smallest values of x corresponding to antinodes.

8. A standing wave is formed by the interference of two travelling waves, each of which has an amplitude $A = \pi$ cm, angular wave number $k = (\pi/2)$ per centimetre.

(a) Calculate the distance between two successive antinodes.

(b) What is the amplitude of the standing wave at $x = 0.50$ cm from a node?

9. Find the fundamental frequency and the next three frequencies that could cause a standing wave pattern on a string that is 30.0 m long, has a mass per unit length of 9.00×10^{-3} kg/m and is stretched to a tension of 20.0 N.

10. A string vibrates in its first normal mode with a frequency of 220 vibrations/s. The vibrating segment is 70.0 cm long and has a mass of 1.20 g.

(a) Find the tension in the string.

(b) Determine the frequency of vibration when the string vibrates in three segments.

11. A 60.0 cm guitar string under a tension of 50.0 N has a mass per unit length of 0.100 g/cm. What is the highest resonance frequency of the string that can be heard by a person able to hear frequencies upto 20000 Hz?

12. A wire having a linear density of 0.05 g/cm is stretched between two rigid supports with a tension of 450 N. It is observed that the wire resonates at a frequency of 420 Hz. The next higher frequency at which the same wire resonates is 490 Hz. Find the length of the wire.

13. The vibrations from an 800 Hz tuning fork set up standing waves in a string clamped at both ends. The wave speed in the string is known to be 400 m/s for the tension used. The standing wave is observed to have four antinodes. How long is the string?

14. A string vibrates in 4 segments to a frequency of 400 Hz.

(a) What is its fundamental frequency?

(b) What frequency will cause it to vibrate into 7 segments?

15. A sonometer wire has a total length of 1 m between the fixed ends. Where should the two bridges be placed below the wire so that the three segments of the wire have their fundamental frequencies in the ratio 1 : 2 : 3 ?

16. A guitar string is 90 cm long and has a fundamental frequency of 124 Hz. Where should it be pressed to produce a fundamental frequency of 186 Hz?

17. Adjacent antinodes of a standing wave on a string are 15.0 cm apart. A particle at an antinode oscillates in simple harmonic motion with amplitude 0.850 cm and period 0.0750 s. The string lies along the $+x$-axis and is fixed at $x = 0$.

(a) Find the displacement of a point on the string as a function of position and time.

(b) Find the speed of propagation of a transverse wave in the string.

(c) Find the amplitude at a point 3.0 cm to the right of an antinode.

18. A 1.50 m long rope is stretched between two supports with a tension that makes the speed of transverse waves 48.0 m/s. What are the wavelength and frequency of

(a) the fundamental?

(b) the second overtone?

(c) the fourth harmonic?

19. A thin taut string tied at both ends and oscillating in its third harmonic has its shape described by the equation $y(x,t) = (5.60 \text{ cm}) \sin[(0.0340 \text{ rad/cm})x] \sin[(50.0 \text{ rad/s})t]$, where the origin is at the left end of the string, the x-axis is along the string and the y-axis is perpendicular to the string.

(a) Draw a sketch that shows the standing wave pattern.

(b) Find the amplitude of the two travelling waves that make up this standing wave.

(c) What is the length of the string?

(d) Find the wavelength, frequency, period and speed of the travelling wave.

(e) Find the maximum transverse speed of a point on the string.

(f) What would be the equation $y(x, t)$ for this string if it were vibrating in its eighth harmonic?

20. A wire with mass 40.0 g is stretched so that its ends are tied down at points 80.0 cm apart. The wire vibrates in its fundamental mode with frequency 60.0 Hz and with an amplitude at the antinodes of 0.300 cm.

(a) What is the speed of propagation of transverse wave in the wire?

(b) Compute the tension in the wire.

(c) Find the maximum transverse velocity and acceleration of particles in the wire.

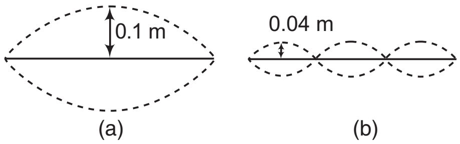
21. Two harmonic waves are represented in SI units by

$$y_1(x, t) = 0.2 \sin(x - 3.0\,t) \quad \text{and} \quad y_2(x, t) = 0.2 \sin(x - 3.0\,t + \phi)$$

(a) Write the expression for the sum $y = y_1 + y_2$ for $\phi = \dfrac{\pi}{2}$ rad.

(b) Suppose the phase difference ϕ between the waves is unknown and the amplitude of their sum is 0.32 m, what is ϕ?

22. Figure shows different standing wave patterns on a string of linear mass density 4.0×10^{-2} kg/m under a tension of 100 N. The amplitude of antinodes is indicated in each figure. The length of the string is 2.0 m.



(i) Obtain the frequencies of the modes shown in figures (a) and (b).

(ii) Write down the transverse displacement y as a function of x and t for each mode. (Take the initial configuration of the wire in each mode to be as shown by the dark lines in the figure).

23. A 160 g rope 4 m long is fixed at one end and tied to a light string of the same length at the other end. Its tension is 400 N.

(a) What are the wavelengths of the fundamental and the first two overtones?

(b) What are the frequencies of these standing waves?

[**Hint :** In this case, fixed end is a node and the end tied with the light string is antinode.]

24. A string fastened at both ends has successive resonances with wavelengths of 0.54 m for the nth harmonic and 0.48 m for the $(n+1)$ th harmonic.

(a) Which harmonics are these?

(b) What is the length of the string?

(c) What is the wavelength of the fundamental frequency?

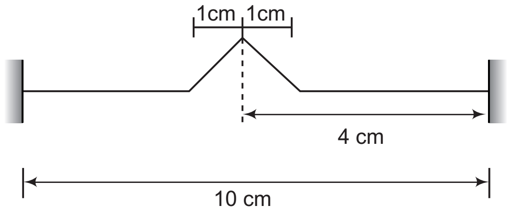
25. A wave $y_i = 0.3\cos(2.0x - 40t)$ is travelling along a string toward a boundary at $x = 0$. Write expressions for the reflected waves if

(a) the string has a fixed end at $x = 0$ and

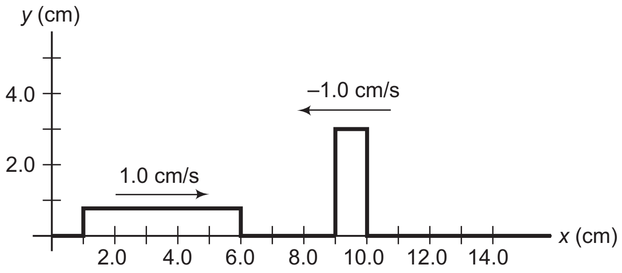
(b) the string has a free end at $x = 0$.

Assume SI units.

26. A string that is 10 cm long is fixed at both ends. At $t = 0$, a pulse travelling from left to right at 1 cm/s is 4.0 cm from the right end as shown in figure. Determine the next two times when the pulse will be at that point again. State in each case whether the pulse is upright or inverted.



27. Two pulses travelling in opposite directions along a string are shown for $t = 0$ in the figure. Plot the shape of the string at $t = 1.0$, 2.0, 3.0, 4.0 and 5.0 s respectively.



LEVEL 2

Single Correct Option

1. When tension of a string is increased by 2.5 N, the initial frequency is altered in the ratio of 3 : 2. The initial tension in the string is

(a) 6 N (b) 5 N (c) 4 N (d) 2 N

2. The lengths of two wires of same material are in the ratio 1 : 2, their tensions are in the ratio 1 : 2 and their diameters are in the ratio 1 : 3. The ratio of the notes they emit when sounded together by the same source is

(a) $\sqrt{2}$ (b) $\sqrt{3}$ (c) $2\sqrt{3}$ (d) $3\sqrt{2}$

3. If f_1, f_2 and f_3 are the fundamental frequencies of three segments into which a string is divided, then the original fundamental frequency f_0 of the whole string is

(a) $f_0 = f_1 + f_2 + f_3$ (b) $\frac{1}{f_0} = \frac{1}{f_1} + \frac{1}{f_2} + \frac{1}{f_3}$

(c) $\frac{1}{\sqrt{f_0}} = \frac{1}{\sqrt{f_1}} + \frac{1}{\sqrt{f_2}} + \frac{1}{\sqrt{f_3}}$ (d) None of these

4. Three one-dimensional mechanical waves in an elastic medium is given as

$$y_1 = 3A\sin(\omega t - kx), \quad y_2 = A\sin(\omega t - kx + \pi) \text{ and } \quad y_3 = 2A\sin(\omega t + kx)$$

are superimposed with each other. The maximum displacement amplitude of the medium particle would be

(a) $4A$ (b) $3A$
(c) $2A$ (d) A

5. A string is stretched so that its length is increased by $\frac{1}{\eta}$ of its original length. The ratio of fundamental frequency of transverse vibration to that of fundamental frequency of longitudinal vibration will be

(a) $\eta : 1$ (b) $1 : \eta$
(c) $\sqrt{\eta} : 1$ (d) $1 : \sqrt{\eta}$

6. A string of length 1 m and linear mass density 0.01 kg/m is stretched to a tension of 100 N. When both ends of the string are fixed, the three lowest frequencies for standing wave are f_1, f_2 and f_3. When only one end of the string is fixed, the three lowest frequencies for standing wave are n_1, n_2 and n_3. Then,

(a) $n_3 = 5n_1 = f_3 = 125$ Hz (b) $f_3 = 5f_1 = n_2 = 125$ Hz

(c) $f_3 = n_2 = 3f_1 = 150$ Hz (d) $n_2 = \frac{f_1 + f_2}{2} = 75$ Hz

7. A sonometer wire has a length 114 cm between two fixed ends. Where should two bridges be placed so as to divide the wire into three segments whose fundamental frequencies are in the ratio 1 : 3 : 4

(a) $l_1 = 72$ cm, $l_2 = 24$ cm, $l_3 = 18$ cm (b) $l_1 = 60$ cm, $l_2 = 40$ cm, $l_3 = 14$ cm
(c) $l_1 = 52$ cm, $l_2 = 30$ cm, $l_3 = 32$ cm (d) $l_1 = 65$ cm, $l_2 = 30$ cm, $l_3 = 19$ cm

8. The frequency of a sonometer wire is f. The frequency becomes $f/2$ when the mass producing the tension is completely immersed in water and on immersing the mass in a certain liquid, frequency becomes $f/3$. The relative density of the liquid is

(a) 1.32 (b) 1.67 (c) 1.41 (d) 1.18

9. A string of length 1.5 m with its two ends clamped is vibrating in fundamental mode. Amplitude at the centre of the string is 4 mm. Distance between the two points having amplitude 2 mm is

(a) 1 m
(b) 75 cm
(c) 60 cm
(d) 50 cm

10. A man generates a symmetrical pulse in a string by moving his hand up and down. At $t = 0$, the point in his hand moves downwards from mean position. The pulse travels with speed 3 m/s on the string and his hand passes 6 times in each second from the mean position. Then, the point on the string at a distance 3 m will reach its upper extreme first time at $t =$

(a) 1.25 s
(b) 1 s
(c) 11/12 s
(d) $\frac{23}{24}$ s

11. Among two interfering sources, let S_1 be ahead of the phase by 90° relative to S_2. If an observation point P is such that $PS_1 - PS_2 = 1.5\,\lambda$, the phase difference between the waves from S_1 and S_2 reaching P is

(a) 3π
(b) $\frac{5\pi}{2}$
(c) $\frac{7\pi}{2}$
(d) 4π

12. A wire having a linear density 0.1 kg/m is kept under a tension of 490 N. It is observed that it resonates at a frequency of 400 Hz. The next higher frequency is 450 Hz. Find the length of the wire.

(a) 0.4 m
(b) 0.7 m
(c) 0.6 m
(d) 0.49 m

13. A string vibrates in 5 segments to a frequency of 480 Hz. The frequency that will cause it to vibrate in 2 segments will be

(a) 96 Hz
(b) 192 Hz
(c) 1200 Hz
(d) 2400 Hz

14. A wave travels on a light string. The equation of the waves is $y = A \sin(kx - \omega t + 30°)$. It is reflected from a heavy string tied to an end of the light string at $x = 0$. If 64% of the incident energy is reflected, then the equation of the reflected wave is

(a) $y = 0.8\,A \sin(kx - \omega t + 30° + 180°)$
(b) $y = 0.8\,A \sin(kx + \omega t + 30° + 180°)$
(c) $y = 0.8\,A \sin(kx - \omega t - 30°)$
(d) $y = 0.8\,A \sin(kx - \omega t + 30°)$

15. The tension, length, diameter and density of a string B are double than that of another string A. Which of the following overtones of B is same as the fundamental frequency of A?

(a) 1st
(b) 2nd
(c) 3rd
(d) 4th

More than One Correct Options

1. If the tension in a stretched string fixed at both ends is increased by 21%, the fundamental frequency is found to be changed by 15 Hz. Then, the

(a) original frequency is 150 Hz
(b) velocity of propagation of the transverse wave along the string increases by 5%
(c) velocity of propagation of the transverse wave along the string increases by 10%
(d) fundamental wavelength on the string does not change

2. For interference to take place

(a) sources must be coherent
(b) sources must have same amplitude
(c) waves should travel in opposite directions
(d) sources must have same frequency

3. Regarding stationary waves, choose the correct options.

(a) This is an example of interference
(b) Amplitudes of waves may be different
(c) Particles at nodes are always at rest
(d) Energy is conserved

4. When a wave travels from a denser to rarer medium, then

(a) speed of wave increases
(b) wavelength of wave decreases
(c) amplitude of wave increases
(d) there is no change in phase angle

5. A wire is stretched and fixed at two ends. Transverse stationary waves are formed in it. It oscillates in its third overtone mode. The equation of stationary wave is

$$y = A \sin kx \cos \omega t$$

Choose the correct options.

(a) Amplitude of constituent waves is $\frac{A}{2}$
(b) The wire oscillates in three loops
(c) The length of the wire is $\frac{4\pi}{k}$
(d) Speed of stationary wave is $\frac{\omega}{k}$

6. Which of the following equations can form stationary waves?

(i) $y = A \sin(\omega t - kx)$
(ii) $y = A \cos(\omega t - kx)$
(iii) $y = A \sin(\omega t + kx)$
(iv) $y = A \cos(\omega t + kx)$

(a) (i) and (ii)
(b) (i) and (iii)
(c) (iii) and (iv)
(d) (ii) and (iv)

7. Two waves

$$y_1 = A \sin(\omega t - kx)$$

and

$$y_2 = A \sin(\omega t + kx)$$

superimpose to produce a stationary wave, then

(a) $x = 0$ is a node
(b) $x = 0$ is an antinode
(c) $x = \frac{\pi}{k}$ is a node
(d) $\pi = \frac{2\pi}{k}$ is an antinode

Comprehension Based Questions

Passage

Incident wave $y = A \sin\left(ax + bt + \frac{\pi}{2}\right)$ *is reflected by an obstacle at* $x = 0$ *which reduces intensity of reflected wave by 36%. Due to superposition, the resulting wave consists of a standing wave and a travelling wave given by*

$$y = -1.6 \sin ax \sin bt + cA \cos(bt + ax)$$

where A, a, b *and* c *are positive constants.*

1. Amplitude of reflected wave is

(a) $0.6\,A$
(b) $0.8\,A$
(c) $0.4\,A$
(d) $0.2\,A$

2. Value of c is

(a) 0.2
(b) 0.4
(c) 0.6
(d) 0.3

3. Position of second antinode is

(a) $x = \frac{\pi}{3a}$
(b) $x = \frac{3\pi}{a}$
(c) $x = \frac{3\pi}{2a}$
(d) $x = \frac{2\pi}{3a}$

Match the Columns

1. In the figure shown, mass per unit length of string-2 is nine times that of string-1. Tension in both the strings is same. A transverse wave is incident at the boundary as shown. Part of wave is reflected in medium-1 and part is transmitted to medium-2. Match the following two columns.

Column I	Column II
(a) $\lvert A_1/A_2 \rvert$	(p) 9
(b) v_1/v_2	(q) 1
(c) I_1/I_2	(r) 3
(d) P_2/P_1	(s) data insufficient

Here A is amplitude, v the speed of wave, I the intensity and P the power. Abbreviation 1 is used for reflected wave and 2 for transmitted wave.

2. Transverse waves are produced in a stretched wire. Both ends of the string are fixed. Let us compare between second overtone mode (in numerator) and fifth harmonic mode (in denominator). Match the following two columns.

Column I	Column II
(a) Frequency ratio	(p) 2/3
(b) Number of nodes ratio	(q) 4/5
(c) Number of antinodes ratio	(r) 3/5
(d) Wavelength ratio	(s) 5/3

3. A wave travels from a denser medium to a rarer medium, then match the following two columns.

Column I	Column II
(a) speed of wave	(p) will increase
(b) wavelength of wave	(q) will decrease
(c) amplitude of wave	(r) will remain unchanged
(d) frequency of wave	(s) may increase or decrease

4. Two waves of same amplitude and same intensity interfere at one point. Phase difference between them is θ. Match the following two columns.

Column I	Column II
(a) Resultant amplitude for $\theta = 60°$	(p) 2 times
(b) Resultant amplitude for $\theta = 120°$	(q) 3 times
(c) Resultant intensity for $\theta = 90°$	(r) 4 times
(d) Resultant intensity for $\theta = 0°$	(s) None of these

5. A wire is stretched and fixed at its two ends. Its second overtone frequency is 210 Hz. Then, match the following two columns.

Column I	Column II
(a) Fundamental frequency	(p) 210 Hz
(b) Third harmonic frequency	(q) 350 Hz
(c) Third overtone frequency	(r) 280 Hz
(d) Second harmonic frequency	(s) None of these

Subjective Questions

1. Three pieces of string, each of length L, are joined together end-to-end, to make a combined string of length $3L$. The first piece of string has mass per unit length μ_1, the second piece has mass per unit length $\mu_2 = 4\mu_1$ and the third piece has mass per unit length $\mu_3 = \mu_1/4$.

(a) If the combined string is under tension F, how much time does it take a transverse wave to travel the entire length $3L$? Give your answer in terms of L, F and μ_1.

(b) Does your answer to part (a) depend on the order in which the three piece are joined together? Explain.

2. In a stationary wave that forms as a result of reflection of waves from an obstacle, the ratio of the amplitude at an antinode to the amplitude at node is 6. What percentage of energy is transmitted?

3. A standing wave $y = a \sin kx \cos \omega t$ is maintained in a homogeneous rod with cross-sectional area S and density ρ. Find the total mechanical energy confined between the sections corresponding to the adjacent nodes.

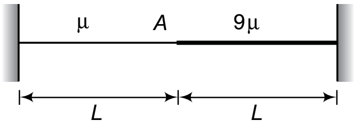
4. A string of mass per unit length μ is clamped at both ends such that one end of the string is at $x = 0$ and the other is at $x = l$. When string vibrates in fundamental mode, amplitude of the mid-point of the string is a and tension in the string is T. Find the total oscillation energy stored in the string.

5. A long wire PQR is made by joining two wires PQ and QR of equal radii. PQ has a length 4.8 m and mass 0.06 kg. QR has length 2.56 m and mass 0.2 kg. The wire PQR is under a tension of 80 N. A sinusoidal wave pulse of amplitude 3.5 cm is sent along the wire PQ from the end P. No power is dissipated during the propagation of the wave pulse. Calculate :

(a) The time taken by the wave pulse to reach the other end R.

(b) The amplitude of the reflected and transmitted wave pulse after the incident wave pulse crosses the joint Q.

6. A light string is tied at one end to fixed support and to a heavy string of equal length L at the other end as shown in figure. Mass per unit length of the strings are μ and 9μ and the tension is T. Find the possible values of frequencies such that point A is a node/antinode.

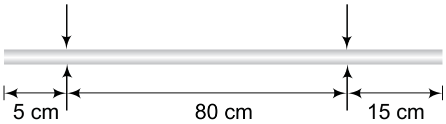


7. A string fixed at both ends is vibrating in the lowest possible mode of vibration for which a point at quarter of its length from one end is a point of maximum displacement. The frequency of vibration in this mode is 100 Hz. What will be the frequency emitted when it vibrates in the next mode such that this point is again a point of maximum displacement ?

8. Sources separated by 20 m vibrate according to the equation $y_1 = 0.06 \sin \pi t$ and $y_2 = 0.02 \sin \pi t$. They send out waves along a rod with speed 3 m/s. What is the equation of motion of a particle 12 m from the first source and 8 m from the second, y_1, y_2 are in m?

9. Three component sinusoidal waves progressing in the same direction along the same path have the same period but their amplitudes are $A, \frac{A}{2}$ and $\frac{A}{3}$. The phases of the variation at any position x on their path at time $t = 0$ are $0, -\frac{\pi}{2}$ and $-\pi$ respectively. Find the amplitude and phase of the resultant wave.

10. A metal rod of length 1 m is clamped at two points as shown in the figure. Distance of the clamp from the two ends are 5 cm and 15 cm, respectively. Find the minimum and next higher frequency of natural longitudinal oscillation of the rod. Given that Young's modulus of elasticity and density of aluminium are $Y = 1.6 \times 10^{11}\ \text{Nm}^{-2}$ and $\rho = 2500\ \text{kgm}^{-3}$, respectively.



11. $y_1 = 8 \sin(\omega t - kx)$ and $y_2 = 6 \sin(\omega t + kx)$ are two waves travelling in a string of area of cross-section s and density ρ. These two waves are superimposed to produce a standing wave.

(a) Find the energy of the standing wave between two consecutive nodes.

(b) Find the total amount of energy crossing through a node per second.

19.1 Introduction

Of all the mechanical waves that occur in nature, the most important in our everyday life are longitudinal waves in a medium, usually air, called **sound waves.** The reason is that the human ear is tremendously sensitive and can detect sound waves even of very low intensity. The human ear is sensitive to waves in the frequency range from about 20 to 20000 Hz called the **audible range**, but we also use the term sound for similar waves with frequencies above **(ultrasonic)** and below **(infrasonic)** the range of human hearing. Our main concern in this chapter is with sound waves in air, but sound can travel through any gas, liquid or solid.

In this chapter, we will discuss several important properties of sound waves, including **pressure wave** and **density wave.** We will find that superposition of two sound waves differing slightly in frequency causes a phenomenon called **beats.** When a source of sound or a listener moves through the air, the listener may hear a different frequency than the one emitted by the source. This is the **Doppler's effect.**

Note *Sound wave (rather we can call audible sound wave) is a part of longitudinal wave with frequency varying from 20 Hz to 20,000 Hz.*

19.2 Displacement Wave, Pressure Wave and Density Wave

Upto this point we have described mechanical waves primarily in terms of displacement. As we have discussed in chapter-17, a sinusoidal wave equation $y(x, t)$ travelling in positive x-direction can be written as

$$\boxed{y(x, t) = A \sin(kx - \omega t)}$$

which gives the instantaneous displacement y of a particle in the medium at position x at time t.

Note that in a longitudinal wave the displacements are parallel to the direction of motion of the wave. So, x and y are measured parallel to each other, not perpendicular as in a transverse wave. The amplitude A is the maximum displacement of a particle in a medium from its equilibrium position.

These displacements are along the direction of the motion of the wave lead to **variations in the density and pressure** of air. Hence, a sound wave can also be described in terms of variations of pressure or density at various points. The pressure fluctuations are of the order of $1\ \text{Pa}\ (=1\ \text{N/m}^2)$, whereas atmospheric pressure is about 10^5 Pa. In a sinusoidal sound wave in air, the pressure fluctuates above and below atmospheric pressure p_0 with the same frequency as the motions of the air particles. Similarly, the density of air also vibrates sinusoidally above and below its normal level. So, we can express a sound wave either in terms of $y(x, t)$ or $\Delta p(x, t)$ or $\Delta\rho(x, t)$. All the three equations are related to one another. For example, amplitude of pressure variation $(\Delta p)_m$ is related to amplitude of displacement A by the equation,

$$\Delta p_m = BAk$$

where B is the bulk modulus of the medium. Moreover, pressure or density wave is 90° out of phase with the displacement wave, i.e. when the displacement is zero, the pressure and density changes are either maximum or minimum and when the displacement is a maximum or minimum, the pressure and density changes are zero. Now, let us find the relation between them.

Relation between Displacement Wave and Pressure Wave

Figure shows a harmonic displacement wave moving through air contained in a long tube of cross-sectional area S.

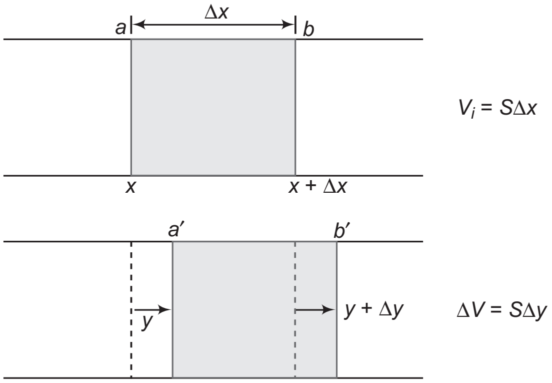

Fig. 19.1

The volume of gas that has a thickness Δx in the horizontal direction is $V_i = S\Delta x$. The change in volume ΔV is $S\,\Delta y$, where Δy is the difference between the value of y at $x + \Delta x$ and the value of y at x. From the definition of bulk modulus, the pressure variation in the gas is

$$\Delta p = -B\,\frac{\Delta V}{V_i} = -B\left(\frac{S\Delta y}{S\Delta x}\right) = -B\left(\frac{\Delta y}{\Delta x}\right)$$

As Δx approaches zero, the ratio $\frac{\Delta y}{\Delta x}$ becomes $\frac{\partial y}{\partial x}$. (The partial derivative indicates that we are interested in the variation of y with position at a fixed time).

Therefore,
$$\boxed{\Delta p = -B\,\frac{\partial y}{\partial x}} \qquad \ldots\text{(i)}$$

So, this is the equation which relates the displacement equation with the pressure equation. Suppose the displacement equation is

$$\boxed{y = A\cos(kx - \omega t)} \qquad \ldots\text{(ii)}$$

Then,
$$\frac{\partial y}{\partial x} = -kA\sin(kx - \omega t) \qquad \ldots\text{(iii)}$$

and from Eqs. (i) and (iii), we find that

$$\boxed{\begin{gathered}\Delta p = BAk\sin(kx - \omega t) = (\Delta p)_m \sin(kx - \omega t) \\ (\Delta p)_m = BAk\end{gathered}} \qquad \ldots\text{(iv)}$$

Here,

where Δp_m is the amplitude of pressure variation. From Eqs. (ii) and (iv), we see that pressure equation is 90° out of phase with displacement equation. When the displacement is zero, the pressure variation is either maximum or minimum and *vice-versa.* Fig. 19.2 (a) shows displacement from equilibrium of air molecules in a harmonic sound wave *versus* position at some instants. Points x_1 and x_3 are points of zero displacement.

Now, refer Fig. 19.2 (b) : Just to the left of x_1, the displacement

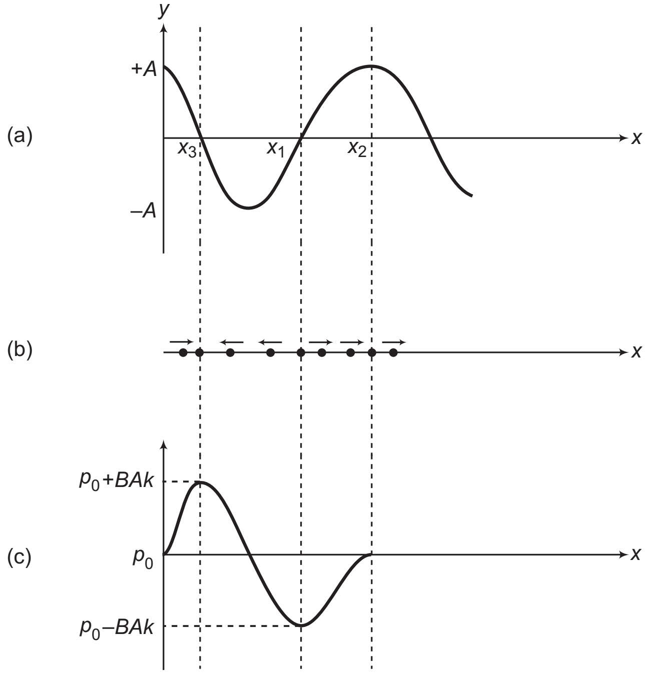

Fig. 19.2

is negative indicating that the gas molecules are displaced to left away from point x_1 at this instant. Just to the right of x_1, the displacement is positive indicating that the molecules are displaced to the right, which is again away from point x_1. So, at point x_1 the pressure of the gas is minimum. So, if p_0 is the atmospheric pressure (normal pressure), the pressure at x_1 will be

$$p(x_1) = p_0 - (\Delta p)_m = p_0 - BAk$$

At point x_3, the pressure (and hence the density also) is maximum because the molecules on both sides of that point are displaced toward point x_3. Hence,

$$p(x_3) = p_0 + (\Delta p)_m = p_0 + BAk$$

At point x_2, the pressure (and hence the density) does not change because the gas molecules on both sides of that point have equal displacements in the same direction or

$$p(x_2) = p_0$$

From Fig. 19.2 (a) and (c), we see that pressure change and displacement are 90° out of phase.

Relation between Pressure Wave and Density Wave

In this section, we will find the relation between pressure wave and density wave.

According to definition of bulk modulus (B),

$$B = \left(-\frac{dp}{dV/V} \right) \qquad \text{...(i)}$$

Further, $$\text{volume} = \frac{\text{mass}}{\text{density}} \quad \text{or} \quad V = \frac{m}{\rho}$$

or $$dV = -\frac{m}{\rho^2} \cdot d\rho = -\frac{V}{\rho} \cdot d\rho \quad \text{or} \quad \frac{dV}{V} = -\frac{d\rho}{\rho}$$

Substituting in Eq. (i), we get

$$d\rho = \frac{\rho\,(dp)}{B} = \frac{dp}{v^2} \qquad \left(v = \sqrt{\frac{B}{\rho}} \Rightarrow \frac{\rho}{B} = \frac{1}{v^2} \right)$$

Or, this can be written as

$$\boxed{\Delta\rho = \frac{\rho}{B} \cdot \Delta p = \frac{1}{v^2} \cdot \Delta p}$$

So, this relation relates the pressure equation with the density equation. For example, if

$$\Delta p = (\Delta p)_m \sin\,(kx - \omega t)$$

then $$\Delta\rho = (\Delta\rho)_m \sin\,(kx - \omega t)$$

where, $$\boxed{(\Delta\rho)_m = \frac{\rho}{B}\,(\Delta p)_m = \frac{(\Delta p)_m}{v^2}}$$

Thus, density equation is in phase with the pressure equation and this is 90° out of phase with the displacement equation.

Example 19.1 *Corresponding to displacement equation,*

$$y = A \sin(kx + \omega t)$$

of a longitudinal wave make its pressure and density wave also. Bulk modulus of the medium is B and density is ρ.

Solution Given, $y(x,\ t) = A \sin\,(kx + \omega t)$

$$\frac{\partial y}{\partial x} = kA \cos\,(kx + \omega t) \qquad \ldots\text{(i)}$$

Now, pressure equation is given by

$$\Delta p = -B\left(\frac{\partial y}{\partial x}\right)$$

Substituting the value of $\frac{\partial y}{\partial x}$ from Eq. (i), we have

$$\Delta p = -BAk \cos\,(kx + \omega t) \qquad \textbf{Ans.}$$

Similarly, density equation is given by

$$(\Delta p) = \frac{\rho}{B}\,(\Delta p) = \frac{\rho}{B}\left(-B\frac{\partial y}{\partial x}\right) = -\rho\left(\frac{\partial y}{\partial x}\right)$$

Substituting the values of $\frac{\partial y}{\partial x}$ from Eq. (i), we have,

$$\Delta\rho = -\rho Ak \cos\,(kx + \omega t) \qquad \textbf{Ans.}$$

Example 19.2 *(a) What is the displacement amplitude for a sound wave having a frequency of* 100 *Hz and a pressure amplitude of* 10 *Pa?*

(b) The displacement amplitude of a sound wave of frequency 300 *Hz is* 10^{-7} *m. What is the pressure amplitude of this wave? Speed of sound in air is* 340 *m/s and density of air is* 1.29 *kg/m*^{3}.

Solution (a) $(\Delta p)_m = BAk$

Here, $$k = \frac{\omega}{v} = \frac{2\pi f}{v}$$

and $$B = \rho v^2 \qquad \left(\text{as } v = \sqrt{\frac{B}{\rho}}\right)$$

$$\therefore \qquad (\Delta p)_m = (\rho v^2)(A)\left(\frac{2\pi f}{v}\right)$$

$$\therefore \qquad A = \frac{(\Delta p)_m}{2\pi v \rho f} \qquad \ldots\text{(i)}$$

Substituting the values, we have

$$A = \frac{(10)}{2 \times 3.14 \times 340 \times 1.29 \times 100}$$

$$= 3.63 \times 10^{-5} \text{ m} \qquad \textbf{Ans.}$$

(b) From Eq. (i) $(\Delta p)_m = 2\pi f \rho v A$

Substituting the values, we have

$$(\Delta p)_m = 2 \times 3.14 \times 300 \times 1.29 \times 340 \times 10^{-7}$$

$$= 8.26 \times 10^{-2} \text{ N/m}^2 \qquad \textbf{Ans.}$$

INTRODUCTORY EXERCISE 19.1

1. Calculate the bulk modulus of air from the following data for a sound wave of wavelength 35 cm travelling in air. The pressure at a point varies between $(10^5 \pm 14)$ Pa and the particles of the air vibrate in SHM of amplitude 5.5×10^{-6} m.

2. Find the minimum and maximum wavelengths of sound in water that is in the audible range for an average human ear. Speed of sound in water is 1450 m/s.

3. A typical loud sound wave with a frequency of 1 kHz has a pressure amplitude of about 10 Pa

(a) At $t = 0$, the pressure is a maximum at some point x_1. What is the displacement at that point at $t = 0$?

(b) What is the maximum value of the displacement at any time and place? Take the density of air to be 1.29 kg/m^3 and speed of sound in air is 340 m/s.

4. The pressure variation in a sound wave in air is given by

$$\Delta p = 12 \sin(8.18x - 2700t + \pi/4) \text{ N/m}^2$$

Find the displacement amplitude. Density of air = 1.29 kg/m^3.

19.3 Speed of a Longitudinal Wave

First we calculate the speed at which a longitudinal pulse propagates through a fluid. We will apply Newton's second law to the motion of an element of the fluid and from this we derive the wave equation.

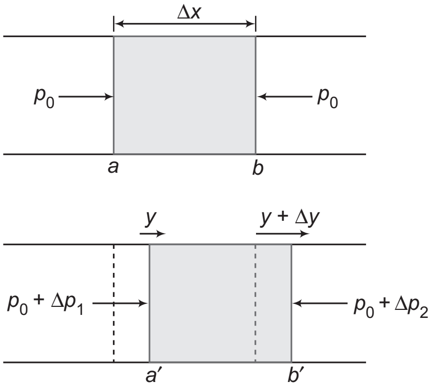

Fig. 19.3

Consider a fluid element *ab* confined to a tube of cross-sectional area *S* as shown in figure. The element has a thickness Δx. We assume that the equilibrium pressure of the fluid is p_0. Because of the disturbance, the section '*a*' of the element moves a distance *y* from its mean position and section '*b*' moves a distance $y + \Delta y$ to a new position b'. The pressure on the left side of the element becomes $p_0 + \Delta p_1$ and on the right side it becomes $p_0 + \Delta p_2$. If ρ is the equilibrium density, the mass of the element is $\rho S \Delta x$. (When the element moves its mass does not change, even though its volume and density do change).

The net force acting on the element is

$$F = (\Delta p_1 - \Delta p_2)\, S$$

and its acceleration is

$$a = \frac{\partial^2 y}{\partial t^2}$$

Thus, Newton's second law applied to the motion of the element is

$$(\Delta p_1 - \Delta p_2)\, S = ma = \rho S \Delta x \frac{\partial^2 y}{\partial t^2} \qquad \ldots\text{(i)}$$

Next we divide both sides by Δx and note that in the limit as $\Delta x \to 0$, we have $(\Delta p_1 - \Delta p_2)/\Delta x \to \partial p/\partial x$, Eq. (i) then take the form

$$-\frac{\partial p}{\partial x} = \rho \frac{\partial^2 y}{\partial t^2} \qquad \ldots\text{(ii)}$$

The excess pressure Δp may be written as

$$\Delta p = -B \frac{\partial y}{\partial x} \quad \Rightarrow \quad \frac{\partial p}{\partial x} = -B \frac{\partial^2 y}{\partial x^2}$$

When this is used in Eq. (ii), we obtain the wave equation.

$$\frac{\partial^2 y}{\partial x^2}=\frac{\rho}{B}\cdot\frac{\partial^2 y}{\partial t^2} \quad \text{or} \quad \frac{\partial^2 y}{\partial t^2}=\frac{B}{\rho}\frac{\partial^2 y}{\partial x^2}$$

Comparing this equation with the wave equation,

$$\frac{\partial^2 y}{\partial t^2}=v^2\frac{\partial^2 y}{\partial x^2}$$

We have $$\boxed{v=\sqrt{\frac{B}{\rho}}}$$ (speed of longitudinal wave in a fluid)

This is the speed of longitudinal waves within a **gas** or a **liquid.**

When a longitudinal wave propagates in a solid rod or bar, the rod expands sideways slightly when it is compressed longitudinally and the speed of a longitudinal wave in a rod is given by

$$\boxed{v=\sqrt{\frac{Y}{\rho}}}$$ (speed of a longitudinal wave in a solid rod)

19.4 Sound Waves in Gases

In the preceding section, we derived equation

$$v=\sqrt{B/\rho}$$

for the speed of longitudinal waves in a fluid of bulk modulus B and density ρ. We use this to find the speed of sound in an ideal gas. The bulk modulus of the gas, however depends on the process. When a wave travels through a gas, are the compressions and expansions adiabatic, or is there enough heat conduction between adjacent layers of gas to maintain a nearly constant temperature throughout?

Because thermal conductivities of gases are very small, it turns out that for ordinary sound frequencies (20 Hz to 20,000 Hz) propagation of sound is very nearly adiabatic. Thus, in the above equation, we use the **adiabatic bulk modulus (B_s)**, which is given by

$$B_s=\gamma p$$

Here, γ is the ratio of molar heat capacity C_p/C_V. Thus,

$$\boxed{v=\sqrt{\frac{\gamma p}{\rho}}}$$

We can get a useful alternative form of the above equation by substituting density ρ of an ideal gas

$$\rho=\frac{pM}{RT}$$

where, R is the gas constant, M the molecular mass and T is the absolute temperature combining all these equations, we can write

$$\boxed{v=\sqrt{\frac{\gamma RT}{M}}}$$ (speed of sound in an ideal gas)

Effect of Temperature, Pressure and Humidity on the Speed of Sound in Air

(i) **Effect of temperature** From the equation,

$$v = \sqrt{\frac{\gamma RT}{M}}$$

We can see that,

$$\boxed{v \propto \sqrt{T}} \quad \text{or} \quad \frac{v_1}{v_2} = \sqrt{\frac{T_1}{T_2}}$$

At STP, the temperature is 0°C or 273 K. If the speed of sound at 0°C is v_0, its value at t°C will satisfy

$$\frac{v_t}{v_0} = \sqrt{\frac{273+t}{273}} = \left(1+\frac{t}{273}\right)^{\frac{1}{2}} = 1+\frac{t}{546}$$

$$\therefore \qquad v_t = v_0\left(1+\frac{t}{546}\right)$$

If the speed of sound in air at 0°C (v_0) be taken 332 m/s, then

$$v_t = 332\left(1+\frac{t}{546}\right)$$

or

$$\boxed{v_t = 332 + 0.61t}$$

Thus, the velocity of sound in air increases roughly by 0.61 m/s per degree centigrade rise in temperature.

(ii) **Effect of pressure** From the formula for the speed of sound in a gas $v = \sqrt{\frac{\gamma p}{\rho}}$, it appears that $v \propto \sqrt{p}$. But actually it is not so. Because

$$\frac{p}{\rho} = \frac{RT}{M} = \text{constant at constant temperature.}$$

That is, at constant temperature if p changes then ρ also changes in such a way that p/ρ remains constant. Hence, in the formula $v = \sqrt{\frac{\gamma p}{\rho}}$, the value of p/ρ does not change when p changes. From this it is clear that if the temperature of the gas remains constant, then there is no effect of the pressure change on the speed of sound.

(iii) **Effect of humidity** The density of moist air (i.e. air mixed with water-vapour) is less than the density of dry air. This is because in moist air heavy dust particles settle down due to condensation. Hence, density of air gets decreased thus increasing the speed of sound. Therefore, assuming the value of γ for moist air same as for dry air (which is actually slightly less than that for dry air) it is clear from the formula $v = \sqrt{\frac{\gamma p}{\rho}}$ that the speed of sound in moist air is slightly greater than in dry air.

Example 19.3 *Calculate the speed of longitudinal waves in the following gases at* $0°C$ *and* 1 *atm* $(=10^5$ *Pa):*

(a) *oxygen for which the bulk modulus is* 1.41×10^5 *Pa and density is* 1.43 *kg/m*^{3}.
(b) *helium for which the bulk modulus is* 1.7×10^5 *Pa and the density is* 0.18 *kg/m*^{3}.

Solution (a)

$$v_{O_2} = \sqrt{\frac{B}{\rho}} = \sqrt{\frac{1.41\times10^5}{1.43}} = 314 \text{ m/s}$$ **Ans.**

(b)

$$v_{He} = \sqrt{\frac{B}{\rho}} = \sqrt{\frac{1.7\times10^5}{0.18}} = 972 \text{ m/s}$$ **Ans.**

Example 19.4 *Find speed of sound in hydrogen gas at* $27°C$. *Ratio* C_p/C_V *for* H_2 *is 1.4. Gas constant* $R = 8.31$ *J/mol-K.*

Solution $\because \quad v = \sqrt{\frac{\gamma RT}{M}}$

Here, $T = 27 + 273 = 300\text{ K}$, $\gamma = 1.4$, $R = 8.31\text{ J/mol-K}$, $M = 2\times10^{-3}\text{ kg/mol}$

$$\therefore \quad v = \sqrt{\frac{1.4\times8.31\times300}{2\times10^{-3}}} = 1321\text{ m/s}$$ **Ans.**

Note *In the above formula, put* $M = 2\times10^{-3}$ *kg/mol. Don't put it 2 kg.*

Example 19.5 *At what temperature will the speed of sound in hydrogen be the same as in oxygen at* $100°C$*? Molar masses of oxygen and hydrogen are in the ratio* $16:1$.

Solution $v = \sqrt{\frac{\gamma RT}{M}}$

$$v_{H_2} = v_{O_2}$$

$$\therefore \quad \sqrt{\frac{\gamma_{H_2} RT_{H_2}}{M_{H_2}}} = \sqrt{\frac{\gamma_{O_2} RT_{O_2}}{M_{O_2}}}$$

$$\gamma_{H_2} = \gamma_{O_2}$$ (as both are diatomic)

$$\therefore \qquad T_{H_2} = \left(\frac{M_{H_2}}{M_{O_2}}\right)(T_{O_2}) = \left(\frac{1}{16}\right)(100 + 273)$$

$$= 23.31\,\text{K}$$

$$\approx -\,249.7^\circ\,\text{C}$$

Ans.

INTRODUCTORY EXERCISE 19.2

1. Calculate the temperature at which the velocity of sound in air is double its velocity at 0°C.
2. Calculate the difference in the speeds of sound in air at -3°C, 60 cm pressure of mercury and 30°C, 75 cm pressure of mercury. The speed of sound in air at 0°C is 332 m/s.
3. In a liquid with density $900\ \text{kg/m}^3$, longitudinal waves with frequency 250 Hz are found to have wavelength 8.0 m. Calculate the bulk modulus of the liquid.
4. Calculate the speed of sound in oxygen at 273 K.

19.5 Sound Intensity

Travelling sound waves, like all other travelling waves, transfer energy from one region of space to another. We define the **intensity** of a wave (denoted by I) to be the time average rate at which energy is transported by the wave, per unit area across a surface perpendicular to the direction of propagation. We have already derived an expression for the intensity of a mechanical wave

$$\boxed{I = \frac{1}{2}\rho A^2\omega^2 v} \qquad \text{...(i)}$$

For a sound wave,

$$(\Delta p)_m = BAk = BA\left(\frac{\omega}{v}\right) \quad \text{or} \quad \omega = \frac{(\Delta p)_m v}{BA}$$

Substituting this value in Eq. (i), we have

$$I = \frac{1}{2}\rho A^2 \frac{(\Delta p)_m^2 v^2}{B^2 A^2} v \qquad (\rho v^2 = B)$$

or

$$\boxed{I = \frac{v\,(\Delta p)_m^2}{2B}} \qquad \text{...(ii)}$$

Thus, intensity of a sound wave can be calculated by either of the Eqs. (i) or (ii).

Sound Intensity in Decibels

The physiological sensation of loudness is closely related to the intensity of wave producing the sound. At a frequency of 1 kHz people are able to detect sounds with intensities as low as $10^{-12}\ \text{W/m}^2$. On the other hand, an intensity of $1\ \text{W/m}^2$ can cause pain and prolonged exposure to sound at this level will damage a person's ears. Because the range in intensities over which people hear is so large, it is convenient to use a logarithmic scale to specify intensities. This scale is defined as follows.

If the intensity of sound in watts per square metre is I, then the intensity level β in decibels (dB) is given by

$$\boxed{\beta = 10 \log \frac{I}{I_0}} \qquad \text{...(iii)}$$

where the base of the logarithm is 10, and $I_0 = 10^{-12}\ \text{W/m}^2$ (roughly the minimum intensity that can be heard).

On the decibel scale, the pain threshold of $1\ \text{W/m}^2$ is then

$$\beta = 10 \log \frac{1}{10^{-12}} = 120\ \text{dB}$$

Note *For the comparison of two different sounds in dB ; we can modify Eq. (iii) as*

$$\boxed{\beta_2 - \beta_1 = 10 \log_{10} \frac{I_2}{I_1}} \qquad \text{...(iv)}$$

Table 19.1 gives typical values for the intensity levels of some of the common sounds.

Table 19.1 Sound intensity levels in decibels

(Threshold of hearing = 0 dB; threshold of pain = 120 dB)

Source of sound	dB
Rusting leaves	10
Whisper	20
Quiet room	30
Normal level of speech (inside)	65
Street traffic (inside car)	80
Riveting tool	100
Thunder	110
Indoor rock concert	120

Example 19.6 *For a person with normal hearing, the faintest sound that can be heard at a frequency of 400 Hz has a pressure amplitude of about* 6.0×10^{-5} *Pa. Calculate the corresponding intensity in* W/m^2*. Take speed of sound in air as 344 m/s and density of air 1.2* kg/m^3.

Solution $\because \quad I = \dfrac{v(\Delta p)_m^2}{2B}$

Substituting $B = \rho v^2$, the above equation reduces to

$$I = \frac{(\Delta p)_m^2}{2\rho v} = \frac{(6.0 \times 10^{-5})^2}{2 \times 1.2 \times 344}$$

$$= 4.4 \times 10^{-12}\ \text{W/m}^2$$ **Ans.**

Example 19.7 *Find intensity of sound in dB if its intensity in Watt/m² is* 10^{-10}.

Solution Using the equation,

$$\beta = 10 \log_{10} \frac{I}{I_0}, \text{ we have}$$

$$\beta = 10 \log_{10} \left(\frac{10^{-10}}{10^{-12}} \right) = 10 \log_{10} (10^2)$$

$$= 20 \, \text{dB}$$ **Ans.**

Example 19.8 *A point source of sound emits a constant power with intensity inversely proportional to the square of the distance from the source. By how many decibels does the sound intensity level drops when you move from point* P_1 *to* P_2*? Distance of* P_2 *from the source is two times the distance of source from* P_1.

Solution We label the two points 1 and 2, and we use the equation $\beta = 10 \log \frac{I}{I_0}$ (dB) twice.

The difference in sound intensity level $\beta_2 - \beta_1$ is given by

$$\beta_2 - \beta_1 = (10 \, \text{dB}) \left(\log \frac{I_2}{I_0} - \log \frac{I_1}{I_0} \right)$$

$$= (10 \, \text{dB}) [(\log I_2 - \log I_0) - (\log I_1 - \log I_0)]$$

$$= (10 \, \text{dB}) \log \frac{I_2}{I_1}$$

Now, $$I \propto \frac{1}{r^2} \Rightarrow \therefore \frac{I_2}{I_1} = \left(\frac{r_1}{r_2} \right)^2 = \frac{1}{4} \quad \text{as} \quad r_2 = 2r_1$$

$\therefore$ $$\beta_2 - \beta_1 = (10 \, \text{dB}) \log \left(\frac{1}{4} \right) = -6.0 \, \text{dB}$$ **Ans.**

INTRODUCTORY EXERCISE 19.3

1. A sound wave in air has a frequency of 300 Hz and a displacement amplitude of 6.0×10^{-3} mm. For this sound wave calculate the
   (a) pressure amplitude (b) intensity (c) sound intensity level (in dB)
   Speed of sound = 344 m/s and density of air = 1.2 kg/m^3.
2. Most people interpret a 9.0 dB increase in sound intensity level as a doubling in loudness. By what factor must the sound intensity be increased to double the loudness?
3. A baby's mouth is 30 cm from her father's ear and 3.0 m from her mother's ear. What is the difference between the sound intensity levels heard by the father and by the mother.
4. The faintest sound that can be heard has a pressure amplitude of about 2×10^{-5} N/m^2 and the loudest that can be heard without pain has a pressure amplitude of about 28 N/m^2. Determine in each case (a) the intensity of the sound both in W/m^2 and in dB and (b) the amplitude of the oscillations if the frequency is 500 Hz. Assume an air density of 1.29 kg/m^3 and a velocity of sound is 345 m/s.

19.6 Interference in Sound Wave and Stationary Wave

In chapter 18, we have already discussed about the principle of superposition, interference and stationary wave. In the similar manner, we can make stationary waves with longitudinal (or sound) waves also.

When two identical sound waves travel in opposite directions, then by their superposition (and hence interference) longitudinal stationary waves are formed.

But, as we know that, with every longitudinal travelling wave three equations are associated $y(x, t)$, $\Delta P(x, t)$ and $\Delta\rho(x, t)$. So, with every longitudinal stationary wave three equations are associated, $y(x, t)$, $\Delta P(x, t)$ and $\Delta\rho(x, t)$.

Following three points are important with longitudinal stationary wave :

(i) If individual displacement amplitudes of constituent travelling waves are A_0 each, then displacement amplitude in stationary wave varies from 0 to $2A_0$.

(ii) If two identical (same frequency) longitudinal waves travel in opposite directions, standing waves are produced by their superposition. If the equations of the two waves are written as

$$\Delta p_1 = (\Delta p)_m \sin(kx - \omega t)$$

and
$$\Delta p_2 = (\Delta p)_m \sin(kx + \omega t)$$

then from the principle of superposition, the resultant wave is

$$\Delta p = \Delta p_1 + \Delta p_2 = 2(\Delta p)_m \sin kx \cos \omega t \qquad \ldots\text{(i)}$$

This equation is similar to the equation obtained in chapter 18 for standing waves on a string.

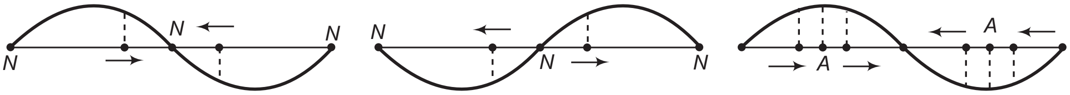
From Eq. (i), we can see that

$$\Delta p = 0 \quad \text{at } x = 0, \lambda/2, \lambda, \ldots, \text{etc.} \qquad \text{(pressure nodes)}$$

and
$$\Delta p = \text{maximum at } x = \lambda/4, 3\lambda/4, \ldots, \text{etc.} \qquad \text{(pressure antinodes)}$$

The distance between two adjacent nodes or between two adjacent antinodes is $\lambda/2$. Longitudinal standing waves can be produced in air columns trapped in tubes of cylindrical shape. Organ pipes are such vibrating air columns.

(iii) Because the pressure wave is 90° out of phase with the displacement wave. Consequently, the displacement node behaves as a pressure antinode and *vice-versa*.



(a) (b) (c)

Fig. 19.4

This can be explained by realizing that two small volume elements of fluid on opposite sides of a displacement node are vibrating in opposite phase. Hence, when they approach each other [see Fig. (a)] the pressure at this node is a maximum, and when they recede from each other, [see Fig. (b)] the pressure at this node is a minimum. Similarly, two small elements of fluid which are on opposite sides of a displacement antinode vibrate in phase and therefore give rise to no pressure variations at the antinode [see Fig. (c)].

Extra Points to Remember

- Most of the problems of interference can be solved by calculating the path difference Δx and then by putting

$$\Delta x = 0, \lambda, 2\lambda, \dots \qquad \text{(constructive interference)}$$

$$\Delta x = \frac{\lambda}{2}, \frac{3\lambda}{2} \dots \qquad \text{(destructive interference)}$$

provided the waves emitted from S_1 and S_2 are in phase.

- If the two waves emitted from S_1 and S_2 have already a phase difference of π, the conditions of maximas and minimas are interchanged, i.e. path difference

$$\Delta x = \frac{\lambda}{2}, \frac{3\lambda}{2} \dots \qquad \text{(for constructive interference)}$$

and $$\Delta x = \lambda, 2\lambda, \dots \qquad \text{(for destructive interference)}$$

Example 19.9 *Two sound sources S_1 and S_2 emit pure sinusoidal waves in phase. If the speed of sound is 350 m/s, then*

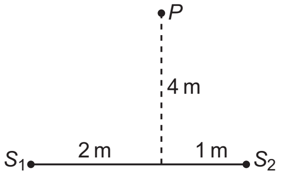


Fig. 19.5

(a) for what frequencies does constructive interference occur at P?

(b) for what frequencies does destructive interference occur at point P?

Solution Path difference, $\Delta x = S_1P - S_2P$

$$= \sqrt{(2)^2 + (4)^2} - \sqrt{(1)^2 + (4)^2}$$

$$= 4.47 - 4.12 = 0.35 \text{ m}$$

(a) Constructive interference occurs when the path difference is an integer multiple of wavelength.

or $$\Delta x = n\lambda = \frac{nv}{f} \quad \text{or} \quad f = \frac{nv}{\Delta x} \qquad \text{where, } n = 1, 2, 3, \dots$$

$$\therefore \quad f = \frac{350}{0.35}, \frac{2 \times 350}{0.35}, \frac{3 \times 350}{0.35}, \dots$$

$$f = 1000 \text{ Hz}, 2000 \text{ Hz}, 3000 \text{ Hz}, \dots, \text{etc.}$$ **Ans.**

(b) Destructive interference occurs when the path difference is a half-integer multiple of wavelengths

or $$\Delta x = (2n+1)\frac{\lambda}{2} \qquad n = 0, 1, 2, \dots$$

or $$\Delta x = (2n+1)\frac{v}{2f}$$

$$\therefore \quad f = \frac{(2n+1)\,v}{2\,\Delta x}$$

$$= \frac{350}{2 \times 0.35}, \frac{3 \times 350}{2 \times 0.35}, \frac{5 \times 350}{2 \times 0.35}, \dots$$

$$= 500 \text{ Hz}, 1500 \text{ Hz}, 2500 \text{ Hz}, \dots$$ **Ans.**

INTRODUCTORY EXERCISE 19.4

1. Two sound waves emerging from a source reach a point simultaneously along two paths. When the path difference is 12 cm or 36 cm, then there is a silence at that point. If the speed of sound in air be 330 m/s, then calculate maximum possible frequency of the source.
2. A wave of frequency 500 cycle/s has a phase velocity of 350 m/s.
   (a) How far apart are two points 60° out of phase?
   (b) What is the phase difference between two displacements at a certain point at time 10^{-3} s apart?

19.7 Standing Longitudinal Waves in Organ Pipes

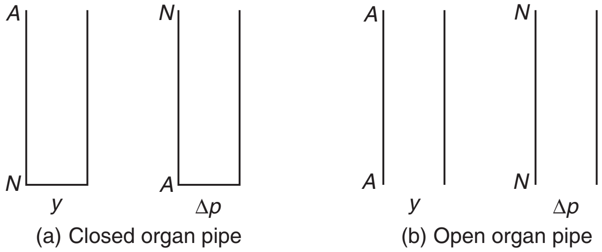
When longitudinal waves propagate in a fluid in a pipe with finite length, the waves are reflected from the ends in a same way the transverse waves on a string are reflected at its ends. The superposition of the waves travelling in opposite directions forms a longitudinal standing wave.

Transverse waves on a string, including standing waves, are usually described only in terms of the displacement of the string. But longitudinal standing waves in a fluid may be described either in terms of the displacement of the fluid or in terms of the pressure variation in the fluid. To avoid confusion we will use the terms **displacement node** and **displacement antinode** to refer to points where particles of the fluid have zero displacement and maximum displacement respectively. Similarly, **pressure node** and **pressure antinode** refer to the points where pressure and density variation in the fluid is zero or maximum, respectively.

Conditions at the Boundary of an Organ Pipe

Let us take an example of a closed organ pipe. In a closed pipe one end is closed and the other is open. When a longitudinal wave encounters the closed end of the pipe it gets reflected from this end. But the reflected wave is 180° out of phase with the incident wave, i.e. a compression is reflected as a compression and a rarefaction is reflected as a rarefaction. This is a necessary condition because the displacement of the small volume elements at the closed end must always be zero. Hence, a closed end is a displacement node.

A sound wave is also reflected from an open end. You may wonder how a sound wave can reflect from an open end, since there may not appear to be a change in the medium at this point. At the open end pressure is the same as atmospheric pressure and does not vary. Thus, there is a pressure node (or displacement antinode) at this end. A compression is therefore reflected as a rarefaction and rarefaction as a compression. Now let us see how this reflection takes place. When a rarefaction reaches an open end, the surrounding air rushes towards this region and creates a compression that travels back along the pipe. Similarly, when a compression reaches an open end, the air expands to form a rarefaction. This can be said in a different way as : at the open end of the tube, fluid elements are free to move, so there is a displacement antinode. Thus, in a nutshell we can say that closed end of an organ pipe is a displacement node or pressure antinode and open end of the pipe is displacement antinode or pressure node.



(a) Closed organ pipe (b) Open organ pipe

Fig. 19.6

Similarly, both ends of an open organ pipe (open at both ends) are displacement antinodes or pressure nodes.

Standing Waves in a Closed Organ Pipe

To get resonance in a closed organ pipe sound waves are sent in by a source (normally a tuning fork) near the open end. Resonance corresponds to a pressure antinode at the closed end and a pressure node at the open end. The standing wave patterns for the three lowest harmonics in this situation are shown in figure. Since the node-antinode separation is $\frac{\lambda}{4}$, the resonance condition for the first harmonic is, $l = \frac{\lambda_1}{4}$.

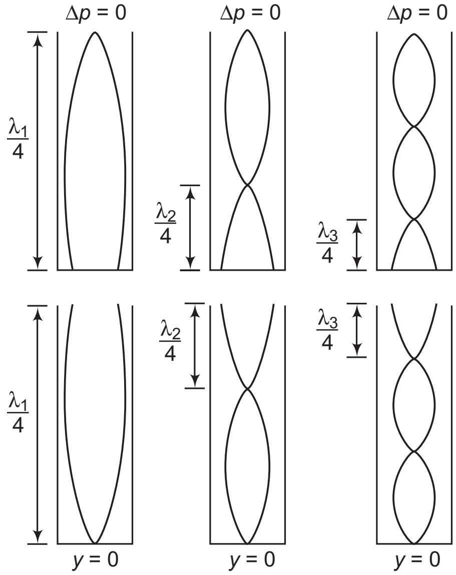


Fig. 19.7

Similarly, the resonance conditions for the higher harmonics are $l = \frac{3\lambda_2}{4}, \frac{5\lambda_3}{4}, \ldots$, etc. or, $\lambda_n = \frac{4l}{n}$ (where $n = 1, 3, 5\ldots$). The natural frequencies of oscillation of the air in the tube closed at one end and open at the other are, therefore,

$$\boxed{f_n = \frac{v}{\lambda_n} = n\frac{v}{4l} = nf_1 \qquad (n = 1, 3, 5, \dots)}$$

Here, v = speed of sound in the tube

$$f_1 = \frac{v}{4l} \qquad \text{(fundamental frequency or the first harmonic)}$$

$$f_3 = 3\frac{v}{4l} = 3f_1 \qquad \text{(first overtone or the third harmonic)}$$

and

$$f_5 = 5\frac{v}{4l} = 5f_1 \qquad \text{(second overtone or the fifth harmonic)}$$

and so on.

Thus, in a pipe closed at one end and open at the other, the natural frequencies of oscillation form a harmonic series that includes only odd integer multiples of the fundamental frequency.

Standing Waves in an Open Organ Pipe

Since both ends of the tube are open, there are pressure nodes (or displacement antinodes) at both ends. Figure shows the resulting standing waves for the three lowest resonant frequencies since the distance between pressure nodes is $\lambda/2$, the resonance condition is $l = n\left(\frac{\lambda_n}{2}\right)$ where $n = 1, 2, 3, \dots$ and l is the length of the tube. The resonant frequencies for a tube open at both ends are then :

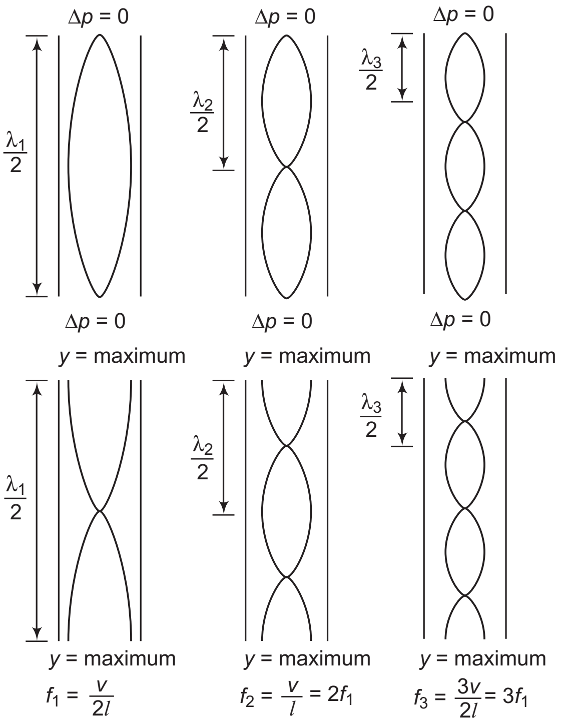

Fig. 19.8

$$\boxed{f_n = \frac{v}{\lambda_n} = n\frac{v}{2l} = nf_1 \quad (n = 1, 2, 3, \dots)}$$

Here,
$$f_1 = \frac{v}{2l}$$

(fundamental frequency or first harmonic)

$$f_2 = \frac{v}{l} = 2f_1$$

(first overtone or second harmonic)

$$f_3 = 3\left(\frac{v}{2l}\right) = 3f_1$$

(second overtone or third harmonic)

and so on.

Thus, in a pipe open at both ends, the natural frequencies of oscillation form a harmonic series that includes all integral multiples of the fundamental frequency.

✓ Extra Points to Remember

- **Laplace end correction** In practice, the pressure nodes lie slightly beyond the ends of the tube. A compression reaching an open end does not reflect until it passes beyond the end. For a thin walled tube of circular cross-section, this **end correction** is approximately 0.6 r where r is the tube's radius. Hence, the effective length of the tube is longer than the true length l.

  Therefore, Laplace correction $e = 0.6\,r$ (in closed pipe) and $2e = 1.2\,r$ (in open pipe)

  Hence, $$f = n\left[\frac{v}{2(l+1.2\,r)}\right] \quad \text{(in open pipe)}$$

  and $$f = n\left[\frac{v}{4(l+0.6\,r)}\right] \quad \text{(in closed pipe)}$$

  However, we neglect this small correction if the length of the tube is much larger than its diameter.
- If an open pipe and a closed pipe are of same lengths, then fundamental frequency of open pipe $\left(=\frac{v}{2l}\right)$ is two times the fundamental frequency of closed pipe $\left(=\frac{v}{4l}\right)$.
- In the above equations v is the speed of constituent longitudinal waves by which stationary wave is formed. This speed in air is given by

  $$v = \sqrt{\frac{\gamma RT}{M}}$$

  If temperature is increased or some light gas is filled in the pipe, then v will increase.So, this set of frequencies will also increase.
- As n increases, v remains unchanged, f increases. Therefore, $\lambda (= v/f)$ and the loop size $\left(=\frac{\lambda}{2}\right)$ decrease.

Example 19.10 *Third overtone of a closed organ pipe is in unison with fourth harmonic of an open organ pipe. Find the ratio of the lengths of the pipes.*

Solution Third overtone of closed organ pipe means seventh harmonic. Given

$$(f_7)_{\text{closed}} = (f_4)_{\text{open}}$$

$$7\left(\frac{v}{4l_c}\right) = 4\left(\frac{v}{2l_o}\right)$$

$$\therefore \quad \frac{l_c}{l_o} = \frac{7}{8} \qquad \textbf{Ans.}$$

Example 19.11 *An open organ pipe has a fundamental frequency of 300 Hz. The first overtone of a closed organ pipe has the same frequency as the first overtone of this open pipe. How long is each pipe?*
(Speed of sound in air = 330 m/s)

Solution Fundamental frequency of an open organ pipe,

$$f_1 = \frac{v}{2l_o} \Rightarrow l_o = \frac{v}{2f_1} = \frac{330}{2\times 300}$$

$$= 0.55\text{ m}$$

$$= 55\text{ cm} \qquad \textbf{Ans.}$$

Given, first overtone of closed organ pipe = first overtone of open organ pipe

Hence, $$3\left(\frac{v}{4l_c}\right) = 2\left(\frac{v}{2l_o}\right)$$

∴ $$l_c = \frac{3}{4} l_o = \left(\frac{3}{4}\right)(0.55)$$

$$= 0.4125\,\text{m}$$

$$= 41.25\,\text{cm}$$ **Ans.**

Example 19.12 *A cylindrical tube, open at both ends, has a fundamental frequency f in air. The tube is dipped vertically in water so that half of its length is in water. The fundamental frequency of the air column is now* **(JEE 1981)**

(a) $f/2$ *(b)* $3f/4$ *(c)* f *(d)* $2f$

Solution Initially, the tube was open at both ends and then it is closed.

$$f_o = \frac{v}{2l_o} \quad \text{and} \quad f_c = \frac{v}{4l_c}$$

Since, tube is half dipped in water, $l_c = \dfrac{l_o}{2}$

∴ $$f_c = \frac{v}{4\left(\dfrac{l_o}{2}\right)} = \frac{v}{2l_o} = f_o = f$$

Hence, the correct option is (c).

Example 19.13 *A closed organ pipe of length L and an open organ pipe contain gases of densities* ρ_1 *and* ρ_2*, respectively. The compressibility of gases are equal in both the pipes. Both the pipes are vibrating in their first overtone with same frequency. The length of the open organ pipe is* **(JEE 2004)**

(a) $\dfrac{L}{3}$ *(b)* $\dfrac{4L}{3}$ *(c)* $\dfrac{4L}{3}\sqrt{\dfrac{\rho_1}{\rho_2}}$ *(d)* $\dfrac{4L}{3}\sqrt{\dfrac{\rho_2}{\rho_1}}$

Solution. $f_c = f_o$ (both first overtone)

or $$3\left(\frac{v_c}{4L}\right) = 2\left(\frac{v_o}{2l_o}\right)$$

∴ $$l_o = \frac{4}{3}\left(\frac{v_o}{v_c}\right)L = \frac{4}{3}\frac{\sqrt{B/\rho_2}}{\sqrt{B/\rho_1}}L$$

$$= \frac{4}{3}\sqrt{\frac{\rho_1}{\rho_2}}L$$

Hence, the correct option is (c).

Note *Compressibility* $= \dfrac{1}{\text{Bulk modulus}}$. *Compressibility is same. Therefore, bulk modulus is also same.*

INTRODUCTORY EXERCISE 19.5

1. An open pipe is suddenly closed at one end with the result that the frequency of third harmonic of the closed pipe is found to be higher by 100 Hz than the fundamental frequency of the open pipe. The fundamental frequency of the open pipe is **(JEE 1996)**

(a) 200 Hz (b) 300 Hz (c) 240 Hz (d) 480 Hz

2. An organ pipe P_1 closed at one end vibrating in its first harmonic and another pipe P_2 open at both ends vibrating in its third harmonic are in resonance with a given tuning fork. The ratio of the length of P_1 and P_2 is **(JEE 1988)**

(a) 8/3 (b) 3/8 (c) 1/6 (d) 1/3

3. A tube closed at one end and containing air produces, when excited the fundamental note of frequency 512 Hz. If the tube is opened at both ends, the fundamental frequency that can be excited is (in Hz) **(JEE 1986)**

(a) 1024 (b) 512 (c) 256 (d) 128

4. The fundamental frequency of a closed organ pipe is 220 Hz.

(a) Find the length of this pipe.

(b) The second overtone of this pipe has the same frequency as the third harmonic of an open pipe. Find the length of this open pipe. Take speed of sound in air 345 m/s.

5. Standing sound waves are produced in a pipe that is 0.8 m long, open at one end, and closed at the other. For the fundamental and first two overtones, where along the pipe (measured from the closed end) are

(a) the displacement antinodes

(b) the pressure antinodes.

6. An organ pipe has two successive harmonics with frequencies 400 and 560 Hz. The speed of sound in air is 344 m/s.

(a) Is this an open or a closed pipe?

(b) What two harmonics are there?

(c) What is the length of the pipe?

19.8 Beats

When two wavetrains of the same frequency travel along the same line in opposite directions, standing waves are formed in accordance with the principle of superposition. In standing waves, amplitude is a function of distance. This illustrates a type of interference that we can call **interference in space.** The same principle of superposition leads us to another type of interference, which we can call **interference in time.** It occurs when two wavetrains of slightly different frequency travel through the same region.

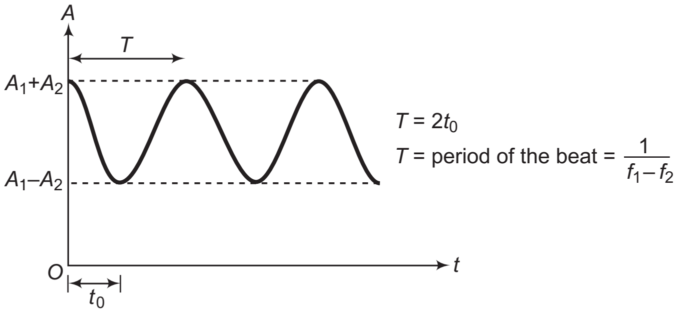

Fig. 19.9

If the waves are in phase at some time (say $t=0$) the interference will be constructive and the resultant amplitude at this moment will be A_1+A_2, where A_1 and A_2 are the amplitudes of individual wavetrains. But at some later time (say $t=t_0$), because the frequencies are different, the waves will be out of phase or the interference will be destructive and the resultant amplitude will be A_1-A_2 (if $A_1>A_2$). Later, we will see that the time t_0 is $\dfrac{1}{2(f_1-f_2)}$.

Thus, the resultant amplitude oscillates between A_1+A_2 and A_1-A_2 with a time period $T=2t_0=\dfrac{1}{f_1-f_2}$ or with a frequency $f=f_1-f_2$ known as **beat frequency.** Thus,

$$\boxed{\text{Beat frequency, } f=f_1-f_2}$$

Calculation of Beat Frequency

Suppose two waves of frequencies f_1 and f_2 $(<f_1)$ are meeting at some point in space. The corresponding periods are T_1 and T_2 $(>T_1)$. If the two waves are in phase at $t=0$, they will again be in phase when the first wave has gone through exactly one more cycle than the second. This will happen at a time $t=T$, the period of the beat. Let n be the number of cycles of the first wave in time T, then the number of cycles of the second wave in the same time is $(n-1)$. Hence,

$$T=nT_1 \qquad \ldots\text{(i)}$$

and

$$T=(n-1)\,T_2 \qquad \ldots\text{(ii)}$$

Eliminating n from these two equations, we have

$$T=\frac{T_1T_2}{T_2-T_1}=\frac{1}{\dfrac{1}{T_1}-\dfrac{1}{T_2}}=\frac{1}{f_1-f_2}$$

The reciprocal of the beat period is the beat frequency

$$f=\frac{1}{T}=f_1-f_2.$$

Alternate Method

Let the oscillations at some point in space (say $x=0$) due to two waves be

$$y_1=A_1\sin 2\pi f_1t \quad\text{and}\quad y_2=A_2\sin 2\pi f_2t \qquad (\omega=2\pi f)$$

If they are in phase at some time t, then

$$2\pi f_1t=2\pi f_2t \quad\text{or}\quad f_1t=f_2t \qquad \ldots\text{(i)}$$

They will be again in phase at time $(t+T)$ if,

$$2\pi f_1(t+T)=2\pi f_2(t+T)+2\pi$$

or

$$f_1(t+T)=f_2(t+T)+1 \qquad \ldots\text{(ii)}$$

Solving Eqs. (i) and (ii), we get $T=\dfrac{1}{f_1-f_2}$

Note *If a tuning fork is loaded with wax, its frequency decreases. On the other hand, when tuning fork is filed, its frequency increases.*

Example 19.14 *Two tuning forks A and B produce* 6 *beats per second. Frequency of A is* 300 *Hz. When B is slightly loaded with wax, beat frequency decreases. Find original frequency of B.*

Solution Since, *A* and *B* produce 6 beats per second. Therefore, original frequency of *B* may be 306 Hz or 294 Hz.

When *B* is loaded with wax, its frequency will decrease (suppose it decreases by 1Hz). So, if it is 306 Hz, it will become 305 Hz. If it is 294 Hz, it will become 293 Hz.

Frequency of *A* is unchanged (= 300 Hz). If f_B becomes 305 Hz, then beat frequency will become 5 Hz. If f_B becomes 293 Hz, then it will become 7 Hz. But in the question it is given that beat frequency has decreased. So, the correct answer is 306 Hz.

Example 19.15 *The string of a violin emits a note of* 400 *Hz at its correct tension. The string is bit taut and produces* 5 *beats per second with a tuning fork of frequency* 400 *Hz. Find frequency of the note emitted by this taut string.*

Solution The frequency of vibration of a string increases with increase in the tension. Thus, the note emitted by the string will be a little more than 400 Hz. As it produces 5 beats per second with the 440 Hz tuning fork, the frequency will be 405 Hz.

Example 19.16 *Two tuning forks P and Q when set vibrating, give* 4 *beats per second. If a prong of the fork P is filed, the beats are reduced to* 2 *per second. Determine the original frequency of P, if that of Q is* 250 *Hz.*

Solution There are four beats between *P* and *Q*, therefore the possible frequencies of *P* are 246 or 254 (that is 250 ± 4) Hz.

When the prong of *P* is filed, its frequency becomes greater than the original frequency.

If we assume that the original frequency of *P* is 254, then on filing its frequency will be greater than 254. The beats between *P* and *Q* will be more than 4. But it is given that the beats are reduced to 2, therefore, 254 is not possible.

Therefore, the required frequency must be 246 Hz.

(This is true, because on filing the frequency may increase to 248, giving 2 beats with *Q* of frequency 250 Hz) **Ans.**

INTRODUCTORY EXERCISE 19.6

1. A tuning fork produces 4 beats per second with another tuning fork of frequency 256 Hz. The first one is now loaded with a little wax and the beat frequency is found to increase to 6 per second. What was the original frequency of the first tuning fork?
2. A tuning fork of unknown frequency makes three beats per second with a standard fork of frequency 384 Hz. The beat frequency decreases when a small piece of wax is put on a prong of the first fork. What is the frequency of this fork?

19.9 The Doppler's Effect

If a wave source and a receiver are moving relative to each other, the frequency observed by the receiver (f') is different from the actual source frequency (f). This phenomenon is called the **Doppler's effect**, named after the Austrian physicist Christian Johann Doppler (1803–1853), who discovered it in light waves.

Perhaps you might have noticed how the sound of a vehicle's horn changes as the vehicle moves past you. The frequency (pitch) of the sound you hear as the vehicle approaches you is higher than the frequency you hear as it moves away from you. The Doppler's effect applies to waves in general. Let us apply it to sound waves. We consider the special case in which the source and observer move along the line joining them. We will use the following symbols,

v = speed of sound, v_s = speed of source and v_o = speed of observer

and v_m = velocity of medium in which sound travels.

For example, if Doppler's effect is observed in air, it is wind velocity. If Doppler's effect is observed inside a river, then it is river velocity.

The general formula of the changed frequency is

$$\boxed{f' = \left(\frac{v \pm v_m \pm v_o}{v \pm v_m \pm v_s}\right) f}$$

Sign Convention

v_m We are talking about that sound which is travelling from source to observer (S to O). If the medium is also travelling in the same direction, then it means medium is supporting the sound. So, take positive sign both in numerator and denominator. If the medium travels in opposite direction, then take negative sign. If nothing is given in the question, then take it zero.

v_o and v_s The concept is approaching nature always increases the frequency. So, take positive sign with v_o (because it is in numerator) and negative sign with v_s (as it is in denominator). On the other hand, receding nature decreases the frequency. So, take negative sign with v_o and positive sign with v_s. Now, let us make some different cases.

Case 1

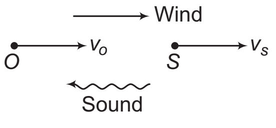

Fig. 19.10

In the given figure, sound is travelling from right to left but wind is blowing from left to right, so we will have to take negative sign with wind velocity. Observer is approaching towards source, so take positive sign with v_o. Source is receding from the observer, so take positive sign with v_s. The correct formula is given below

$$f' = \left(\frac{v - v_{\text{wind}} + v_o}{v - v_{\text{wind}} + v_s}\right) f$$

Case 2

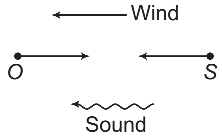

Fig. 19.11

Sound and wind both are travelling in the same direction (from S to O), so take positive sign with wind velocity. Source and observer both are approaching towards each other. So, take positive sign with v_o and negative sign with v_s. Therefore, the correct formula is

$$f' = \left(\frac{v + v_{\text{wind}} + v_o}{v + v_{\text{wind}} - v_s}\right) f$$

Now, let us derive two special cases when medium velocity is zero.

Source at Rest, Observer Moves

Suppose that the observer O moves towards the source S at speed v_o. The speed of the sound waves relative to O is $v_r = v + v_o$, but wavelength has its normal value $\lambda = \frac{v}{f}$. Thus, the frequency heard by O is

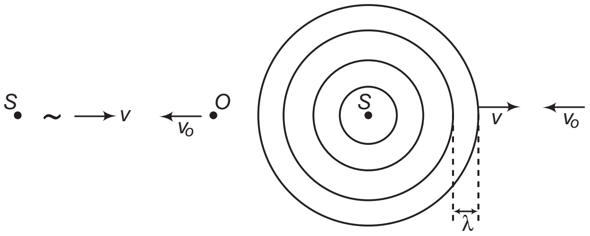

Fig. 19.12

$$f' = \frac{v_r}{\lambda} = \left(\frac{v + v_o}{v}\right) f$$

If O were moving away from S, the frequency heard by O would be

$$f' = \left(\frac{v - v_o}{v}\right) f$$

Combining these two expressions, we find

$$\boxed{f' = \left(\frac{v \pm v_o}{v}\right) f} \qquad \ldots\text{(i)}$$

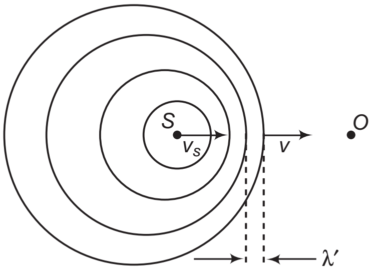
Source Moves, Observer at Rest

Fig. 19.13

Suppose that the source S moves towards O as shown in figure.

If S were at rest, the distance between two consecutive wave pulses emitted by sound would be $\lambda = \frac{v}{f} = vT$. However, in one time period S moves a distance v_sT before it emits the next pulse. As a result the wavelength is modified. Directly ahead of S the effective wavelength (for both S and O) is

$$\lambda' = vT - v_sT = (v - v_s)T = \left(\frac{v - v_s}{f}\right)$$



The wavelength in front of the source is less than the normal whereas in the rear it is larger than normal.

Fig. 19.14

The speed of sound waves relative to O is simply v. Thus, the frequency observed by O is

$$f' = \frac{v}{\lambda'} = \left(\frac{v}{v - v_s}\right)f$$

If S were moving away from O, the effective wavelength would be $\lambda' = \left(\frac{v + v_s}{f}\right)$ and the apparent frequency would be

$$f' = \left(\frac{v}{v + v_s}\right)f$$

Combining these two results, we have

$$\boxed{f' = \left(\frac{v}{v \pm v_s}\right)f} \qquad \text{...(ii)}$$

All four possibilities can be combined into one equation

$$\boxed{f' = \left(\frac{v \pm v_o}{v \mp v_s}\right)f} \qquad \text{...(iii)}$$

where the upper signs (+ numerator, – denominator) correspond to the source and observer along the line joining the two in the direction toward the other, and the lower signs in the direction away from the other.

Alternate Method

The above formulae can be derived alternately as discussed below.

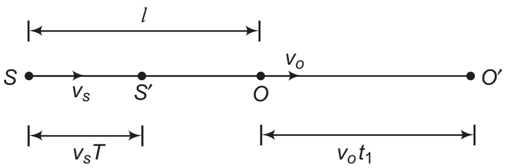


Fig. 19.15

Assume that the source and observer are moving along the same line and that the observer O is to the right of the source S. Suppose that at time $t=0$, when the source and the observer are separated by a distance $SO=l$, the source emits a wave pulse (say p_1) that reaches the observer at a later time t_1. In that time the observer has moved a distance $v_o t_1$ and the total distance travelled by p_1 in the time t_1 has been $l+v_o t_1$. If v is the speed of sound, this distance is also vt_1. Then,

$$vt_1 = l + v_0 t_1$$

or

$$t_1 = \frac{l}{v - v_0} \qquad \ldots\text{(iv)}$$

At time $t=T$, the source is at S' and the wave pulse (say p_2) emitted at this time will reach the observer at a time say t_2, measured from the same time $t=0$, as before. The total distance travelled by p_2 till it is received by the observer (measured from S') is $(l-v_sT)+v_o t_2$. The actual travel time for p_2 is (t_2-T) and the distance travelled is $v\,(t_2-T)$. Therefore,

$$v\,(t_2 - T) = (l - v_sT) + v_0 t_2$$

or

$$t_2 = \frac{l + (v - v_s)\,T}{v - v_o} \qquad \ldots\text{(v)}$$

The time interval reckoned by the observer between the two pulses emitted by the source at S and at S' is

$$T' = t_2 - t_1 = \left(\frac{v - v_s}{v - v_o}\right)T$$

This is really the changed time period as observed by the observer. Hence, the new frequency is

$$f' = \frac{1}{T'} = \left(\frac{v - v_o}{v - v_s}\right)\frac{1}{T}$$

or

$$f' = \left(\frac{v - v_o}{v - v_s}\right)f$$

This is a result which we can expect by using equation $f' = \left(\dfrac{v \pm v_o}{v \mp v_s}\right) f$ in the case when source is moving towards observer and observer is moving away from the source.

Extra Points to Remember

- We have derived equation number (iii) by assuming that v_o and v_s are along the line joining source and observer. If the motion is along some other direction, the components of velocities along the line joining source and observer are considered.

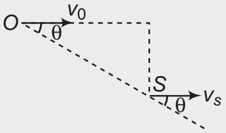

Fig. 19.16

For example in the figure shown,
$$f' = \left(\frac{v + v_o \cos\theta}{v + v_s \cos\theta}\right) f$$

- Change in frequency depends on the fact that whether the source is moving towards the observer or the observer is moving towards the source. But when the speed of source and observer are much lesser than that of sound, the change in frequency becomes independent of the fact whether the source is moving or the observer. This can be shown as under.

  Suppose a source is moving towards a stationary observer, with speed u and the speed of sound is v, then
$$f' = \left(\frac{v}{v-u}\right) f = \left(\frac{1}{1-\frac{u}{v}}\right) f = \left(1-\frac{u}{v}\right)^{-1} f$$
  Using the binomial expansion, we have
$$\left(1-\frac{u}{v}\right)^{-1} \approx 1+\frac{u}{v} \quad \text{if} \quad u << v$$
$$\therefore \qquad f' \approx \left(1+\frac{u}{v}\right) f \quad \text{if} \quad u << v$$
  On the other hand, if an observer moves towards a stationary source with same speed u, then
$$f' = \left(\frac{v+u}{v}\right) f = \left(1+\frac{u}{v}\right) f$$
  which is same as above.

- As long as v_s and v_o are along the line joining S and O, Doppler's effect (or change in frequency) does not depend on the distance between S and O. For example in the given figure,

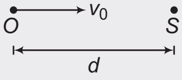

Fig. 19.17

$$f' = f\left(\frac{v+v_o}{v}\right)$$

  $f' > f$ but it is constant and independent of 'd'.

- Frequency is given by $f = \dfrac{v}{\lambda}$

  By the motion of source, λ changes, therefore frequency changes. But, from the motion of observer, relative velocity v between sound and observer changes, therefore frequency changes.

- Despite the motion of source or observer (or both), Doppler's effect is not observed (or $f' = f$) under the following four conditions.

***Condition* 1** $\mathbf{v}_s$ or $\mathbf{v}_o$ is making an angle of 90° with the line joining S and O. This is illustrated in the following figure.

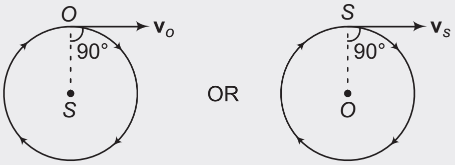

Fig. 19.18

***Condition* 2** Source and observer both are in motion but their velocities are equal or relative motion between them is zero.

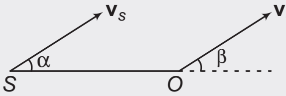

Fig. 19.19

In the figure shown, $\mathbf{v}_s = \mathbf{v}_o$ if $v_s = v_o$ and $\alpha = \beta$

Taking the components along SO, we have $f' = f\left(\dfrac{v - v_o \cos\beta}{v - v_s \cos\alpha}\right) \Rightarrow f' = f$ because $v_s = v_o$ and $\alpha = \beta$

***Condition* 3** Source and observer both are at rest. Only medium is in motion.

Fig. 19.20

In the figure shown, source and observer are at rest. Only wind is blowing in a direction from source to observer. The changed frequency is

$$f' = f\left(\frac{v + v_{\text{wind}}}{v + v_{\text{wind}}}\right) = f$$

***Condition* 4**

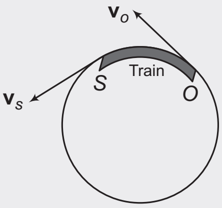

Fig. 19.21

A train is travelling on a circular track. Engine is the source of sound and guard is the observer. Although,

$$\mathbf{v}_s \neq \mathbf{v}_o$$

yet f' comes out to be f.

Exercise Derive the above result.

- **Doppler's Effect in Light**

Light waves also show Doppler's effect. If a light source is moving away from a stationary observer, then the frequency of light waves appear to be decreased and wavelength appear to be increased and *vice-versa*.

If the light source or the observer is moving with a velocity v such that the distance between them is decreasing, then the apparent frequency of the source will be given by

$$\boxed{f' = f\sqrt{\frac{1 + \frac{v}{c}}{1 - \frac{v}{c}}}}$$

If the distance between the light source and the observer is increasing, then the apparent frequency of the source is given by

$$\boxed{f' = f\sqrt{\frac{1-\frac{v}{c}}{1+\frac{v}{c}}}}$$

The change in wavelength can be determined by

$$\boxed{\Delta\lambda = \frac{v}{c}\cdot\lambda}$$

If the light source is moving away from the observer, the shift in the spectrum is towards red and if it is moving towards the observer the shift is towards the violet.

Note *The Doppler's effect in light depends only on the relative motion between the source and the observer while the Doppler's effect in sound also depends upon whether the source is moving or the observer is moving.*

Example 19.17 *A car approaching a crossing C at a speed of 20 m/s sounds a horn of frequency 500 Hz when 80 m from the crossing. Speed of sound in air is 330 m/s. What frequency is heard by an observer (at rest) 60 m from the crossing on the straight road which crosses car road at right angles?*

Solution The situation is as shown in figure.

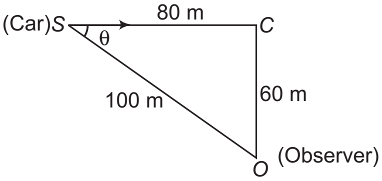

Fig. 19.22

$$\cos\theta = \frac{80}{100} = \frac{4}{5}$$

∴ Apparent frequency,

$$f_{\text{app}} = \left(\frac{v}{v - v_s\cos\theta}\right) f$$

$$= \left(\frac{330}{330 - 20\times\frac{4}{5}}\right)(500)$$

$$= 525.5\ \text{Hz}$$ **Ans.**

Example 19.18 *A siren emitting a sound of frequency 1000 Hz moves away from you towards a cliff at a speed of 10 m/s.*

(a) What is the frequency of the sound, you hear coming directly from the siren?

(b) What is the frequency of sound you hear reflected off the cliff. Speed of sound in air is 330 m/s?

Note *For reflected sound cliff can be assumed as a plane mirror.*

Solution (a) Sound heard directly

$$f_1 = f_0\left(\frac{v}{v+v_s}\right) \Rightarrow v_s = 10\ \text{m/s}$$

$$\therefore \qquad f_1 = \left(\frac{330}{330+10}\right)\times 1000$$

$$= 970.6\ \text{Hz}$$ **Ans.**

(b) The frequency of the reflected sound is given by

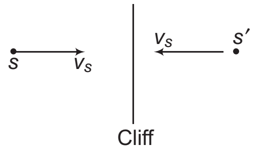

Fig. 19.23

$$f_2 = f_0\left(\frac{v}{v-v_s}\right)$$

$$f_2 = \left(\frac{330}{330-10}\right)\times 1000$$

$$= 1031.25\,\text{Hz}$$ **Ans.**

Example 19.19 *A whistle of frequency* 540 *Hz rotates in a circle of radius* 2 *m at a linear speed of* 30 *m/s. What is the lowest and highest frequency heard by an observer a long distance away at rest with respect to the centre of circle? Take speed of sound in air as* 330 *m/s. Can the apparent frequency be ever equal to actual?*

Solution Apparent frequency will be minimum when the source is at N and moving away from the observer.

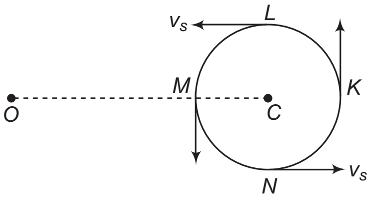

Fig. 19.24

$$f_{\min} = \left(\frac{v}{v+v_s}\right)f$$

$$= \left(\frac{330}{330+30}\right)(540) = 495\,\text{Hz}$$ **Ans.**

Frequency will be maximum when source is at L and approaching the observer.

$$f_{\max} = \left(\frac{v}{v-v_s}\right)f = \left(\frac{330}{330-30}\right)(540)$$

$$= 594\,\text{Hz}$$ **Ans.**

Further, when the source is at M and K, angle between velocity of source and line joining source and observer is 90° or $v_s \cos\theta = v_s \cos 90° = 0$. So, there will be no change in the apparent frequency.

Note *Although the source velocity v_s is not along the line joining S and O but at a long distance we can assume that it is along SO.*

Example 19.20 *Two tuning forks with natural frequencies* 340 *Hz each move relative to a stationary observer. One fork moves away from the observer while the other moves towards him at the same speed. The observer hears beats of frequency* 3 *Hz. Find the speed of the tuning fork (velocity of sound in air is* 340 *m/s).*

Note *The difference in apparent frequencies is very small (3 Hz). So, we may conclude that the speed of source (v_s) << speed of sound (v). Therefore, we can neglect the higher terms of $\frac{v_s}{v}$.*

Solution Given,

$$f_1 - f_2 = 3$$

or

$$\left(\frac{v}{v-v_s}\right)f - \left(\frac{v}{v+v_s}\right)f = 3$$

or $$\left[\frac{1}{\left(1-\frac{v_s}{v}\right)}-\frac{1}{\left(1+\frac{v_s}{v}\right)}\right]f=3$$

or $$\left[\left(1-\frac{v_s}{v}\right)^{-1}-\left(1+\frac{v_s}{v}\right)^{-1}\right]f=3$$

or $$\left[\left(1+\frac{v_s}{v}\right)-\left(1-\frac{v_s}{v}\right)\right]f=3$$

or $$\frac{2v_s f}{v}=3$$

or Speed of tuning fork, $v_s=\dfrac{3v}{2f}$

Substituting the values, we get

$$v_s=\frac{(3)(340)}{(2)(340)}=1.5\text{ m/s}$$ **Ans.**

INTRODUCTORY EXERCISE 19.7

1. A whistle giving out 450 Hz approaches a stationary observer at a speed of 33 m/s. The frequency heard by the observer (in Hz) is (Speed of sound = 330 m/s) **(JEE 2000)**

(a) 409 (b) 429

(c) 517 (d) 500

2. A train moves towards a stationary observer with speed 34 m/s. The train sounds a whistle and its frequency registered by the observer is f_1. If the train's speed is reduced to 17 m/s, the frequency registered is f_2. If the speed of sound is 340 m/s, then the ratio f_1/f_2 is **(JEE 1997)**

(a) 18/19 (b) 1/2

(c) 2 (d) 19/18

3. A siren placed at a railway platform is emitting sound of frequency 5 kHz. A passenger sitting in a moving train *A* records a frequency of 5.5 kHz, while the train approaches the siren. During his return journey in a different train *B* he records a frequency of 6.0 kHz while approaching the same siren. The ratio of the velocity of train *B* to that of train *A* is **(JEE 2002)**

(a) 242/252 (b) 2

(c) 5/6 (d) 11/6

4. A train is moving on a straight track with speed 20 ms^{-1}. It is blowing its whistle at the frequency of 1000 Hz. The percentage change in the frequency heard by a person standing near the track as the train passes him is close to (speed of sound = 320 ms^{-1}) **(JEE 2015 Main)**

(a) 12% (b) 6%

(c) 18% (d) 24%

Solved Examples

TYPED PROBLEMS

Type 1. *Based on Doppler's effect and Beats together*

Concept

(i) If there is a relative motion between source and observer, frequency changes.

(ii) Natural frequencies of a stretched wire are

$$f_n = n\left(\frac{v}{2l}\right) = n\left[\frac{\sqrt{T/\mu}}{2l}\right] \qquad \text{(where } n = 1, 2, \ldots)$$

If tension in the wire is changed, then frequency changes.

(iii) Natural frequencies of a closed pipe are

$$f_n = n\left(\frac{v}{4l}\right) \qquad \text{(where } n = 1, 3, \ldots)$$

and natural frequencies of an open pipe are

$$f_n = n\left(\frac{v}{2l}\right) \qquad \text{(where } n = 1, 2, \ldots)$$

Here, $v = \sqrt{\frac{\gamma RT}{M}}$

When temperature is increased, these sets of frequencies also increase.

(iv) Beat frequency is given by

$$f_b = f_1 - f_2 \qquad \text{(if } f_1 > f_2)$$

Example 1 *The first overtone of an open organ pipe beats with the first overtone of a closed organ pipe with a beat frequency of 2.2 Hz. The fundamental frequency of the closed organ pipe is 110 Hz. Find the lengths of the pipes. Speed of sound in air $v = 330$ m/s.*

Solution Let l_1 and l_2 be the lengths of closed and open pipes respectively.

Fundamental frequency of closed organ pipe is given by

$$f_1 = \frac{v}{4l}$$

where v is speed of sound in air and 330 m/s equal to

But, $f_1 = 110$ Hz (given)

Therefore, $\frac{v}{4l_1} = 110$ Hz

$$\therefore \quad l_1 = \frac{v}{4 \times 110} = \frac{330}{4 \times 110} \text{ m} = 0.75 \text{ m}$$

First overtone of closed organ pipe will be

$$f_3 = 3f_1 = 3\ (110)\ \text{Hz} = 330\ \text{Hz}$$

This produces a beat frequency of 2.2 Hz with first overtone of open organ pipe.

Therefore, first overtone frequency of open organ pipe is either

$$(330 + 2.2)\ \text{Hz} = 332.2\ \text{Hz}$$

or $$(330 - 2.2)\ \text{Hz} = 327.8\ \text{Hz}$$

If it is 332.2 Hz, then

$$2\left(\frac{v}{2l_2}\right) = 332.2\ \text{Hz}$$

or $$l_2 = \frac{v}{332.2} = \frac{330}{332.2}\ \text{m} = 0.99\ \text{m}$$

and if it is 327.8 Hz, then

$$2\left(\frac{v}{2l_2}\right) = 327.8\ \text{Hz}$$

or $$l_2 = \frac{v}{327.8}\ \text{m} = \frac{330}{327.8}\ \text{m} = 1.0067\ \text{m}$$

Therefore, length of the closed organ pipe is $l_1 = 0.75$ m while length of open pipe is either $l_2 = 0.99$ m or 1.0067 m. **Ans.**

Example 2 *A vibrating string of certain length l under a tension T resonates with a mode corresponding to the first overtone (third harmonic) of an air column of length 75 cm inside a tube closed at one end. The string also generates 4 beats/s with a tuning fork of frequency n. Now when the tension of the string is slightly increased the number of beats reduces to 2 per second. Assuming the velocity of sound in air to be 340 m/s, the frequency n of the tuning fork in Hz is* **(JEE 2008)**

(a) 344 *(b)* 336

(c) 117.3 *(d)* 109.3

Solution With increase in tension, frequency of vibrating string will increase. Since, number of beats are decreasing. Therefore, frequency of vibrating string or third harmonic frequency of closed pipe should be less than the frequency of tuning fork by 4.

∴ Frequency of tuning fork = third harmonic frequency of closed pipe + 4

$$= 3\left(\frac{v}{4l}\right) + 4 = 3\left(\frac{340}{4 \times 0.75}\right) + 4$$

$$= 344\ \text{Hz}$$

∴ Correct option is (a).

Example 3 *Two identical straight wires are stretched so as to produce 6 beats/s when vibrating simultaneously. On changing the tension slightly in one of them, the beat frequency remains unchanged. Denoting by T_1, T_2 the higher and the lower initial tension in the strings, then it could be said that while making the above changes in tension* **(JEE 1991)**

(a) T_2 was decreased *(b) T_2 was increased*

(c) T_1 was decreased *(d) T_1 was increased*

Solution $T_1 > T_2$

∴ $v_1 > v_2$

or $f_1 > f_2$

and $f_1 - f_2 = 6$ Hz

Now, if T_1 is increased, f_1 will increase or $f_1 - f_2$ will increase. Therefore, (d) option is wrong.

If T_1 is decreased, f_1 will decrease and it may be possible that now $f_2 - f_1$ become 6 Hz.Therefore, (c) option is correct.

Similarly, when T_2 is increased, f_2 will increase and again $f_2 - f_1$ may become equal to 6 Hz. So, (b) is also correct. But (a) is wrong.

Example 4 *A sonometer wire under tension of 64 N vibrating in its fundamental mode is in resonance with a vibrating tuning fork. The vibrating portion of the sonometer wire has a length of 10 cm and mass of 1 g. The vibrating tuning fork is now moved away from the vibrating wire with a constant speed and an observer standing near the sonometer hears one beat per second. Calculate the speed with which the tuning fork is moved, if the speed of sound in air is 300 m/s.* **(JEE 1983)**

Solution Fundamental frequency of sonometer wire,

$$f = \frac{v}{2l} = \frac{1}{2l}\sqrt{\frac{T}{\mu}}$$

$$= \frac{1}{2 \times 0.1}\sqrt{\frac{64 \times 0.1}{10^{-3}}}$$

$$= 400 \text{ Hz}$$

Given beat frequency, $f_b = f - f' = 1$ Hz

∴ $f' = 399$ Hz

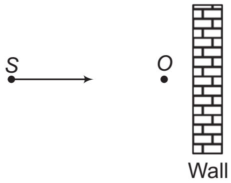
Using $$f' = f\left(\frac{v}{v + v_s}\right)$$

or $$399 = 400\left(\frac{300}{300 + v_s}\right)$$

Solving we get, $v_s = 0.75$ m/s **Ans.**

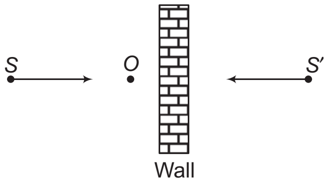
Type 2. *Reflection of a sound from a wall and beats*

Concept



A source of sound is approaching towards a wall. An observer hears two sounds. One is direct from the source and the other reflected from wall. If both frequencies are same, then the observer will hear no beats and if there is a frequency difference then beats are heard to the observer. This all depends on the position of observer. For finding the frequency of reflected sound we have the following two approaches.

Approach 1 Take wall as a plane mirror. Image of S on this plane mirror will behave like another source S' for the reflected sound.



For example, in the shown figure both direct sound source S and reflected sound source S' are approaching towards the observer.

Approach 2 First consider wall as an observer for the sound received to it from the source S. Now, consider this wall as a source for reflected sound.

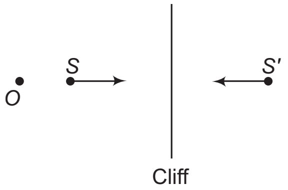
Example 5 *A siren emitting a sound of frequency* 1000 *Hz moves away from you toward a cliff at a speed of* 10 *m/s.*

(a) What is the frequency of the sound you hear coming directly from the siren?

(b) What is the frequency of the sound you hear reflected off the cliff?

(c) What beat frequency would you hear? Take the speed of sound in air as 330 *m/s.*

Solution The situation is as shown in figure.



(a) Frequency of sound reaching directly to us (by S)

$$f_1 = \left(\frac{v}{v + v_s}\right)$$

$$f = \left(\frac{330}{330 + 10}\right)(1000)$$

$$= 970.6 \text{ Hz}$$ **Ans.**

(b) Frequency of sound which is reflected from the cliff (from S')

$$f_2 = \left(\frac{v}{v - v_s}\right) f = \left(\frac{330}{330 - 10}\right)(1000)$$

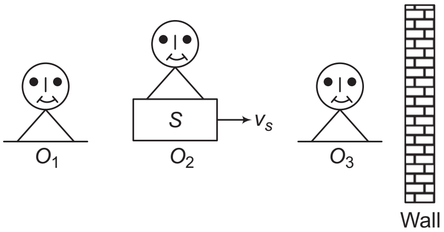
$$= 1031.3 \text{ Hz}$$ **Ans.**

(c) Beat frequency $= f_2 - f_1$

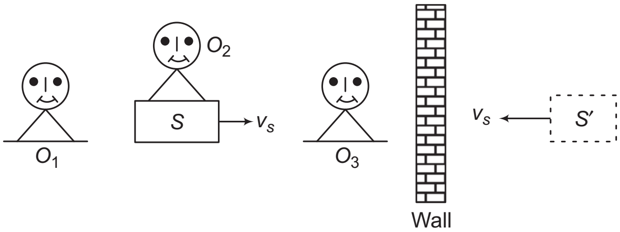
$$= 60.7 \text{ Hz}$$ **Ans.**

Note *Numerically the beat frequency comes out to be* 60.7 *Hz. But, beats between two tones can be detected by ear upto a frequency of about 7 per second. At higher frequencies beats cannot be distinguished in the sound produced. Hence, the correct answer of part (c) should be zero.*

Example 6 *A source of sound of frequency f is approaching towards a wall with speed v_s. Speed of sound is v. Three observers O_1, O_2 and O_3 are at different locations as shown. Find the beat frequency as observed by three different observers.*



Solution For reflected sound we can take wall as a plane mirror.



Observer O_1 S is receding from O_1 and S′ is approaching towards him. So,

$$f_{s'} > f_s$$

$$f_b = f_{s'} - f_s$$

$$= f\left(\frac{v}{v - v_s}\right) - f\left(\frac{v}{v + v_s}\right)$$

$$= \left(\frac{2vv_s}{v^2 - v_s^2}\right) f \qquad \textbf{Ans.}$$

Observer O_2 O_2 has no relative motion with S. Therefore, there will be no change in the frequency of direct sound from S. Further, O_2 and S′ are approaching towards each other. Therefore, the frequency of reflected sound will increase.

$$f_b = f_{s'} - f_s$$

$$= f\left(\frac{v + v_{o_2}}{v - v_s}\right) - f$$

But $v_{o_2} = v_s$

$$\therefore \qquad f_b = f\left(\frac{v + v_s}{v - v_s}\right) - f$$

$$= \left(\frac{2v_s}{v - v_s}\right) f \qquad \textbf{Ans.}$$

Observer O_3 S and S′ both are approaching towards O_3. So, both frequencies will increase. But after the increase they are equal. So, beat frequency will be zero.

$$f_s = f_{s'} = f\left(\frac{v}{v - v_s}\right)$$

$$\therefore \qquad f_b = f_s - f_{s'} = 0$$

Example 7 *A sound wave of frequency f travels horizontally to the right. It is reflected from a large vertical plane surface moving to left with a speed v. The speed of sound in medium is c* **(JEE 1995)**

(a) *The number of waves striking the surface per second is* $f\dfrac{(c+v)}{c}$

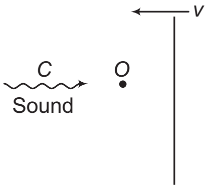
(b) *The wavelength of reflected wave is* $\dfrac{c(c-v)}{f(c+v)}$

(c) *The frequency of the reflected wave is* $f\dfrac{(c+v)}{(c-v)}$

(d) *The number of beats heard by a stationary listener to the left of the reflecting surface is* $\dfrac{vf}{c-v}$

Solution Moving plane is like a moving observer. Therefore, number of waves encountered by moving plane,

$$f_1 = f\left(\frac{v+v_0}{v}\right) = f\left(\frac{c+v}{c}\right)$$



Frequency of reflected wave, $f_2 = f_1\left(\dfrac{v}{v-v_s}\right) = f\left(\dfrac{c+v}{c-v}\right)$

Wavelength of reflected wave, $\lambda_2 = \dfrac{c}{f_2} = \dfrac{c}{f}\left(\dfrac{c-v}{c+v}\right)$

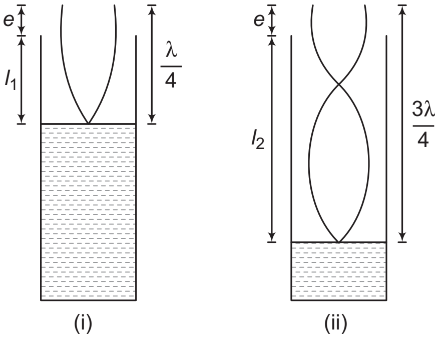
Beat frequency, $f_b = f_2 - f = f\left(\dfrac{c+v}{c-v}\right) - f = \dfrac{2fv}{c-v}$

Therefore, the correct options are (a), (b) and (c).

Type 3. *Based on the experiment of finding speed of sound using resonance tube*

Concept

(i) If a vibrating tuning fork (of known frequency) is held over the open end of a resonance tube, then resonance is obtained at some position as the level of water is lowered.



(i) (ii)

If e is the end correction of the tube and l_1 is the length from the water level to the top of the tube, then

$$l_1 + e = \frac{\lambda}{4} \qquad \ldots\text{(i)}$$

Now, the water level is further lowered until a resonance is again obtained. If l_2 is new length of the air column, then

$$l_2 + e = \frac{3\lambda}{4} \qquad \ldots\text{(ii)}$$

Subtracting Eq. (i) from Eq. (ii),
we get

$$l_2 - l_1 = \frac{\lambda}{2}$$

or $$\lambda = 2(l_2 - l_1) = \frac{v}{f} \qquad \left(\lambda = \frac{v}{f}\right)$$

$\therefore$ $$\boxed{v = 2f(l_2 - l_1)}$$

(ii) The above result is independent of the end correction e.

(iii) In the above two figures v, λ, f and loop size $\left(= \frac{\lambda}{2}\right)$ are same in both figures. Length of closed organ pipe is different. In the second figure, length is more. So, the fundamental frequency $\left(f = \frac{v}{4l}\right)$ will be less.

Suppose frequency of given tuning fork is 300 Hz. Then, fundamental frequency of first pipe is also 300Hz. But fundamental frequency of the second pipe should be 100 Hz. So, that its next higher frequency (or first overtone frequency) which is three times the fundamental $(= 3 \times 100 = 300\,\text{Hz})$ should also be in resonance with the given tuning fork.

Example 8 *A tuning fork of 512 Hz is used to produce resonance in a resonance tube experiment. The level of water at first resonance is 30.7 cm and at second resonance is 63.2 cm. The error in calculating velocity of sound is* **(JEE 2005)**

(a) 204.1 *cm/s* *(b)* 110 *cm/s*

(c) 58 *cm/s* *(d)* 280 *cm/s*

Solution Actual speed of sound in air is 330 m/s

$$\frac{\lambda}{2} = (l_2 - l_1) = (63.2 - 30.7)\,\text{cm} = 32.5\,\text{cm} = 0.325\,\text{m}$$

or $$\lambda = 0.65\,\text{m}$$

$\therefore$ Speed of sound observed, $v_0 = f\lambda = 512 \times 0.65 = 332.8\,\text{m/s}$

$\therefore$ Error in calculating velocity of sound = 2.8 m/s = 280 cm/s

$\therefore$ The correct option is (d).

Example 9 *In the experiment for the determination of the speed of sound in air using the resonance column method, the length of the air column that resonates in the fundamental mode, with a tuning fork is 0.1 m. When this length is changed to 0.35 m, the same tuning fork resonates with the first overtone. Calculate the end correction.* **(JEE 2003)**

(a) 0.012 *m* *(b)* 0.025 *m* *(c)* 0.05 *m* *(d)* 0.024 *m*

Solution Let e be the end correction.

Given that, fundamental tone for a length 0.1m = first overtone for the length 0.35 m.

$$\frac{v}{4(0.1+e)} = \frac{3v}{4(0.35+e)}$$

Solving this equation, we get $e = 0.025\,\text{m} = 2.5\,\text{cm}$.

$\therefore$ The correct option is (b).

Alternate method

$$l_2 + e = 3\lambda/4 \quad \text{and} \quad l_1 + e = \lambda/4$$

Solving these two equations, we get

$$e = \frac{l_2 - 3l_1}{2} = \frac{0.35 - 3 \times 0.1}{2} = 0.025\ \text{m}$$

Example 10 *A student is performing the experiment of resonance column. The diameter of the column tube is 4 cm. The frequency of the tuning fork is 512 Hz. The air temperature is 38° C in which the speed of sound is 336 m/s. The zero of the meter scale coincides with the top end of the resonance column tube. When the first resonance occurs, the reading of the water level in the column is* **(JEE 2012)**

(a) 14.0 *cm* *(b)* 15.2 *cm*

(c) 16.4 *cm* *(d)* 17.6 *cm*

Solution With end correction,

$$f = n\left[\frac{v}{4(l+e)}\right], \qquad \text{(where, } n = 1, 3, \ldots\text{)}$$

$$= n\left[\frac{v}{4(l+0.6r)}\right]$$

Because, $e = 0.6\,r$, where r is radius of pipe.

For first resonance, $n = 1$

$$\therefore \quad f = \frac{v}{4(l+0.6r)} \quad \text{or} \quad l = \frac{v}{4f} - 0.6r = \left[\left(\frac{336 \times 100}{4 \times 512}\right) - 0.6 \times 2\right] \text{cm}$$

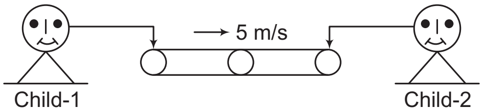
$$= 15.2\ \text{cm}$$

$\therefore$ The correct option is (b).

Type 4. *Based on a situation which is similar to Doppler's effect*

Concept

Let us take an example.



A belt shown in figure is moving with velocity 5 m/s. Child-1 is placing some coins over the belt at a regular interval of 1sec. Child -2 is receiving the coins on the other hand. Now, let us compare this situation with Doppler's effect.

Child-1 is source, child-2 is observer, velocity of belt is net velocity of sound ($= v \pm v_m$) by which sound travels from source to observer. Actually, in this case

$$v = \text{velocity of coin (similar to velocity of sound)}$$
$$= 0$$
$$v_m = \text{velocity of medium (or velocity of belt)}$$
$$= 5\,\text{m/s}$$
$$T = \text{time interval of placing two successive coins}$$
$$= 1\,\text{sec}$$
$$\therefore \quad f = \frac{1}{T} = \text{number of coins placed per second}$$

λ = distance between two coins = $v_m T = 5\,\text{m}$.

Now, let us consider the different cases.

Case 1 When source (child-1) and observer (child-2) both are at rest only belt (or medium) is in motion. In this case, distance between two coins moving towards child-2 with 5 m/s is 5m. If child-2 receives first coin at time $t_1 = 0$, then he will receive the second coin at $t_2 = \frac{5\,\text{m}}{5\,\text{m/s}} = 1\text{sec}$.

$\therefore$ T' = time interval of receival of two successive coins

$$= t_2 - t_1 = 1\text{ sec}$$
$$\therefore \quad f' = \frac{1}{T'} = 1\,\text{Hz}$$

Result By the motion of only medium, there is no change in frequency.

Case 2 If child-1 (or source) starts moving towards child-2 with 2 m/s. Then, in $T = 1$ sec, belt will move a distance of 5 m towards child-2 and child-1 will also travel a distance of 2m towards child-2 at the time of placing the second coin. Hence,

λ = new distance between two successive coins = $(5 - 2)\,\text{m} = 3\text{ m}$

Now, if child-2 receives the first coin at time $t_1 = 0$, then he will receive the second coin (at a distance of 3m from first coin) moving towards him with 5 m/s at time $t_2 = \frac{3}{5}$ sec.

$$\therefore \quad T' = t_2 - t_1 = \frac{3}{5}\text{sec} \quad \text{or} \quad f' = \frac{1}{T'} = \frac{5}{3}\text{Hz} \text{ or } f' > f$$

Result By the motion of source only wavelength changes therefore frequency changes.

Case 3 Child-1 (or source) is stationary and child-2 starts moving towards child-1 with 2 m/s. This time,

λ = distance between two successive coins is unchanged or 5 m.

But coins and child-2 are moving towards each other with 5 m/s and 2 m/s, respectively. Therefore, relative velocity between them is 7m/s. So, if child-2 receives the first coin at time $t_1 = 0$, then he will receive the second coin at time $t_2 = \frac{5}{7}$ sec

$$\therefore \quad T' = t_2 - t_1 = \frac{5}{7}\text{sec} \quad \text{or} \quad f' = \frac{1}{T'} = \frac{7}{5}\text{Hz} \text{ or } f' > f$$

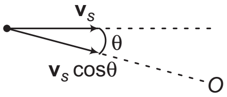
Result By the motion of observer relative velocity between sound and observer changes. Therefore, frequency changes.

Note *In case-2, $f' = \frac{5}{3}$ Hz and in case-3, $f' = \frac{7}{5}$ Hz. These two are not same, although speeds are same in both cases but change in frequency is different.*

Type 5. *When* $\mathbf{v}_s$ *or* $\mathbf{v}_o$ *are not along the line joining S and O but they are very far from each other.*

Concept

In this case, we take components of $\mathbf{v}_s$ and $\mathbf{v}_o$ along the line *SO*. For example in the figure shown below,



$$f' = f\left(\frac{v}{v - v_s\cos\theta}\right)$$

If source is very far from observer, then

$$\theta \to 0° \quad \text{or} \quad \cos\theta \to 1$$

$$\therefore \qquad f' = f\left(\frac{v}{v - v_s}\right)$$

Example 11 *A source of frequency f is moving towards the observer along the line SO with a constant velocity v_s as shown in figure. Plot f′ versus t graph. Where f′ is the changed frequency observed by the observer.*

Solution **During approach**

$$f' = f\left(\frac{v}{v - v_s}\right) = f_1 \qquad \text{(say)}$$

$$f' > f$$

but f' is constant with time.

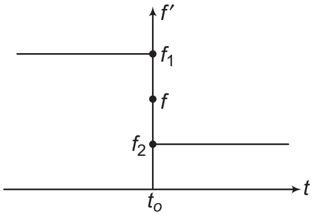
During recede

$$f' = f\left(\frac{v}{v + v_s}\right) = f_2 \ \text{(say)}$$

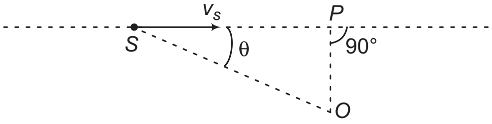
$$f' < f$$

but f' is constant with time. The correct f' *versus* t graph is as shown.

In the figure, t_o is the time when source is crossing the observer.



Example 12 *Repeat example-11 if source does not move along the line SO.*



Solution The changed frequency f' is now,

$$f' = f\left(\frac{v}{v - v_s\cos\theta}\right)$$

This time f' is not constant but it is a function of θ, which is variable. But, at a far distance, $\theta \to 0°$ or $\cos\theta \to 1$ or

$$\therefore \qquad f' = f\left(\frac{v}{v - v_s}\right)$$

and this is the maximum value of f' (say $f_{\max}$)

At point P, $\theta = 90°$

$$\therefore \qquad f' = f$$

During receding (to the right of P)

$$f' = f\left(\frac{v}{v + v_s\cos\theta}\right)$$

Again, at large distance from P,

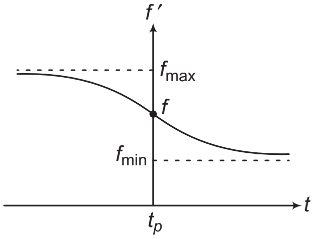
$\theta \to 0°$ or $\cos\theta \to 1$

$$\therefore \qquad f' = f\left(\frac{v}{v + v_s}\right)$$

This time, this is the minimum value of f' (say $f_{\min}$).

Hence, f' varies from $f_{\max}$ to $f_{\min}$, with $f' = f$ at the time of crossing P.

The correct f' *versus* t graph is as shown below.



Example 13 *A whistle emitting a sound of frequency 440 Hz is tied to a string of 1.5 m length and rotated with an angular velocity of 20 rad/s in the horizontal plane. Calculate the range of frequencies heard by an observer stationed at a large distance from the whistle. (Speed of sound = 330 m/s).* **(JEE 1996)**

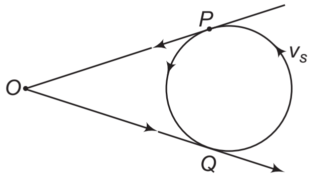
Solution v_s = Speed of source (whistle) $= R\omega = (1.5)\,(20)$ m/s, $v_s = 30$ m/s

Maximum frequency will be heard by the observer in position P and minimum in position Q.

Now,

$$f_{\max} = f\left(\frac{v}{v - v_s}\right)$$

where, v = speed of sound in air = 330 m/s



$$= (440)\left(\frac{330}{330-30}\right)\text{ Hz}$$

or $$f_{\max} = 484\text{ Hz}$$

and $$f_{\min} = f\left(\frac{v}{v + v_s}\right) = (440)\left(\frac{330}{330+30}\right)$$

$$f_{\min} = 403.33\text{ Hz}$$

Therefore, range of frequencies heard by observer is from 484 Hz to 403.33 Hz.

Miscellaneous Examples

Example 14 *The water level in a vertical glass tube* 1.0 *m long can be adjusted to any position in the tube. A tuning fork vibrating at* 660 *Hz is held just over the open top end of the tube. At what positions of the water level will there be in resonance? Speed of sound is* 330 *m/s.*

Solution Resonance corresponds to a pressure antinode at closed end and pressure node at open end. Further, the distance between a pressure node and a pressure antinode is $\frac{\lambda}{4}$, the condition of resonance would be,

Length of air column $l = n\frac{\lambda}{4} = n\left(\frac{v}{4f}\right)$

Here, $n = 1, 3, 5, \ldots$

$$l_1 = (1)\left(\frac{330}{4 \times 660}\right) = 0.125\text{ m}$$

$$l_2 = 3l_1 = 0.375\text{ m}$$

$$l_3 = 5l_1 = 0.625\text{ m}$$

$$l_4 = 7l_1 = 0.875\text{ m}$$

$$l_5 = 9l_1 = 1.125\text{ m}$$

Since, $l_5 > 1$ m (the length of tube), the length of air columns can have the values from l_1 to l_4 only.

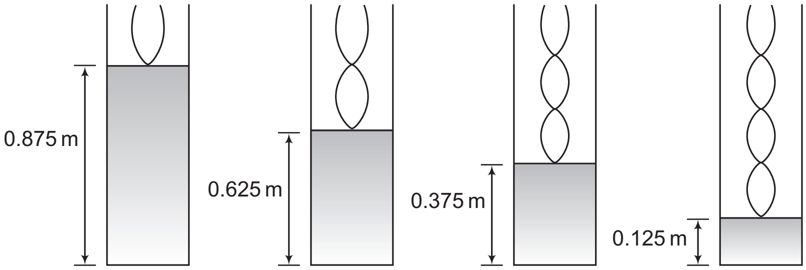
Therefore, level of water at resonance will be

$$(1.0 - 0.125)\ \text{m} = 0.875\ \text{m}$$

$$(1.0 - 0.375)\ \text{m} = 0.625\ \text{m}$$

$$(1.0 - 0.625)\ \text{m} = 0.375\ \text{m}$$

and $$(1.0 - 0.875)\ \text{m} = 0.125\ \text{m}$$ **Ans.**



In all the four cases shown in figure, the resonance frequency is 660 Hz but first one is the fundamental tone or first harmonic. Second is first overtone or third harmonic and so on.

Example 15 *A tube 1.0 m long is closed at one end. A stretched wire is placed near the open end. The wire is 0.3 m long and has a mass of 0.01 kg. It is held fixed at both ends and vibrates in its fundamental mode. It sets the air column in the tube into vibration at its fundamental frequency by resonance. Find*

(a) the frequency of oscillation of the air column and

(b) the tension in the wire.

Speed of sound in air = 330 m/s.

Solution (a) Fundamental frequency of closed pipe $= \dfrac{v}{4l}$

$$= \frac{330}{4 \times 1} = 82.5\ \text{Hz}$$ **Ans.**

(b) At resonance, given that :

fundamental frequency of stretched wire (at both ends)

= fundamental frequency of air column

$$\therefore \quad \frac{v}{2l} = 82.5\ \text{Hz}$$

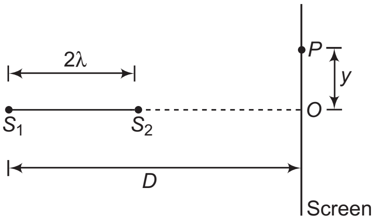
$$\therefore \quad \frac{\sqrt{T/\mu}}{2l} = 82.5$$

or $$T = \mu\ (2 \times 0.3 \times 82.5)^2$$

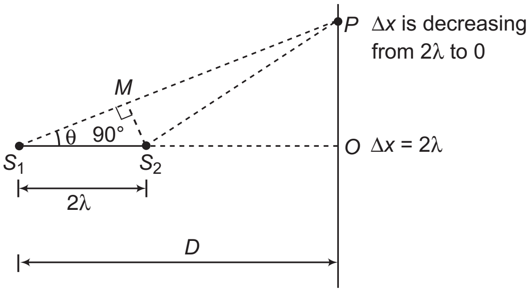
$$= \left(\frac{0.01}{0.3}\right) (2 \times 0.3 \times 82.5)^2$$

$$= 81.675\ \text{N}$$ **Ans.**

Example 16 *Two coherent narrow slits emitting sound of wavelength λ in the same phase are placed parallel to each other at a small separation of 2λ. The sound is detected by moving a detector on the screen at a distance $D (>> \lambda)$ from the slit S_1 as shown in figure. Find the distance y such that the intensity at P is equal to intensity at O.*



Solution At point O on the screen the path difference between the sound waves reaching from S_1 and S_2 is 2λ, i.e. constructive interference is obtained at O. At a very large distance from point O on the screen the path difference is zero.



Thus, we can conclude that as we move away from point O on the screen path difference decreases from 2λ to zero. At O constructive interference is obtained (where $\Delta x = 2\lambda$). So, next constructive interference will be obtained where $\Delta x = \lambda$. Hence,

$$S_1P - S_2P = \lambda$$

or
$$\sqrt{D^2 + y^2} - \sqrt{y^2 + (D - 2\lambda)^2} = \lambda$$

$\therefore$
$$\sqrt{D^2 + y^2} - \lambda = \sqrt{y^2 + (D - 2\lambda)^2}$$

On squaring both sides, we get

$$D^2 + y^2 + \lambda^2 - 2\lambda\sqrt{D^2 + y^2} = y^2 + D^2 + 4\lambda^2 - 4\lambda D$$

or
$$2\sqrt{D^2 + y^2} = 4D - 3\lambda$$

as $D >> \lambda$,
$$4D - 3\lambda \approx 4D$$

$\therefore$
$$2\sqrt{D^2 + y^2} = 4D$$

or
$$\sqrt{D^2 + y^2} = 2D$$

Again squaring both sides, we get

$$D^2 + y^2 = 4D^2$$

or
$$y = \sqrt{3}\,D$$ **Ans.**

Alternate method Let $\Delta x = \lambda$ at angle θ as shown. Path difference between the waves is $S_1M = 2\lambda\cos\theta$ because $S_2P \approx MP$

$\therefore$
$$2\lambda\cos\theta = \lambda \qquad (\Delta x = \lambda)$$

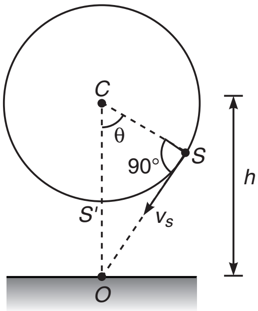
or
$$\theta = 60^\circ$$

Now,
$$PO = S_1O\tan\theta = S_1O\tan 60^\circ$$

or
$$y = \sqrt{3}\,D$$ **Ans.**

Example 17 *A fighter plane moving in a vertical loop with constant speed of radius R. The centre of the loop is at a height h directly overhead of an observer standing on the ground. The observer receives maximum frequency of the sound produced by the plane when it is nearest to him. Find the speed of the plane. Velocity of sound in air is v.*

Solution Let the speed of the plane (source) be v_s. Maximum frequency will be observed by the observer when v_s is along SO. The observer receives maximum frequency when the plane is nearest to him. That is as soon as the wave pulse reaches from S to O with speed v the plane reaches from S to S' with speed v_s. Hence,



$$t = \frac{SO}{v} = \frac{SS'}{v_s} \quad \text{or} \quad v_s = \left(\frac{SS'}{SO}\right) v$$

$$= \frac{R\theta}{\sqrt{h^2 - R^2}} v \qquad \textbf{Ans.}$$

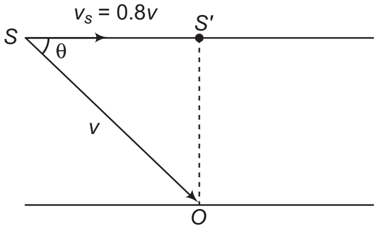
Here, $$\cos\theta = \frac{R}{h} \quad \text{or} \quad \theta = \cos^{-1}\left(\frac{R}{h}\right)$$

Example 18 *A source of sound of frequency* 1000 *Hz moves uniformly along a straight line with velocity* 0.8 *times velocity of sound. An observer is located at a distance* $l = 250$ *m from this line. Find*

(a) the frequency of the sound at the instant when the source is closest to the observer.

(b) the distance of the source when he observes no change in the frequency.

Solution (a) Suppose the pulse which is emitted when the source is at S reaches the observer O in the same time in which the source reaches from S to S', then



$$\cos\theta = \frac{SS'}{SO} = \frac{v_s t}{vt} = \frac{v_s}{v} = 0.8$$

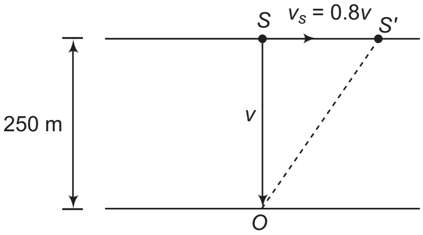
Now, $$f' = \left(\frac{v}{v - v_s \cos\theta}\right) f$$

$$= \left\{\frac{v}{v - (0.8v)(0.8)}\right\}(1000)$$

$$= \left(\frac{1}{1 - 0.64}\right)(1000)$$

$$= 2777.7 \text{ Hz}$$ **Ans.**

(b) The observer will observe no change in the frequency when the source is at S as shown in figure. In the time when the wave pulse reaches from S to O, the source will reach from S to S'. Hence,



$$t = \frac{SO}{v} = \frac{SS'}{v_s}$$

$\therefore$ $$SS' = \left(\frac{v_s}{v}\right) SO$$

$$= (0.8)(250) = 200 \text{ m}$$

Therefore, distance of observer from source at this instant is

$$S'O = \sqrt{(SO)^2 + (SS')^2}$$

$$= \sqrt{(250)^2 + (200)^2}$$

$$\approx 320 \text{ m}$$ **Ans.**

Example 19 *The air column in a pipe closed at one end is made to vibrate in its second overtone by a tuning fork of frequency 440 Hz. The speed of sound in air is 330 m/s. End corrections may be neglected. Let p_0 denotes the mean pressure at any point in the pipe, and Δp_0 the maximum amplitude of pressure variation.*

(a) Find the length L of the air column.

(b) What is the amplitude of pressure variation at the middle of the column?

(c) What are the maximum and minimum pressures at the open end of the pipe?

(d) What are the maximum and minimum pressures at the closed end of the pipe?

Solution (a) Frequency of second overtone of the closed pipe

$$= 5\left(\frac{v}{4L}\right) = 440 \text{ Hz}$$ (Given)

$\therefore$ $$L = \frac{5v}{4 \times 440} \text{ m}$$

Substituting

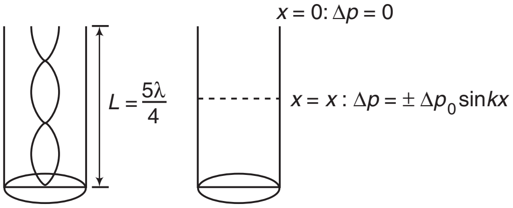
$$v = \text{speed of sound in air} = 330 \text{ m/s}$$

$$L = \frac{5 \times 330}{4 \times 440} = \frac{15}{16} \text{ m} \qquad \textbf{Ans.}$$

(b) $$\lambda = \frac{4L}{5} = \frac{4\ (15/16)}{5} = \frac{3}{4} \text{ m}$$

Open end is displacement antinode. Therefore, it would be a pressure node

or $$\text{at } x = 0; \quad \Delta p = 0$$



Pressure amplitude at $x = x$ can be written as

$$\Delta p = \pm\ \Delta p \sin kx$$

where, $$k = \frac{2\pi}{\lambda} = \frac{2\pi}{3/4} = \frac{8\pi}{3} \text{ m}^{-1}$$

Therefore, pressure amplitude at $x = \frac{L}{2} = \frac{15/16}{2}$ m or (15/32) m will be

$$\Delta p = \pm\ \Delta p_0 \sin\left(\frac{8\pi}{3}\right)\left(\frac{15}{32}\right) = \pm\ \Delta p_0 \sin\left(\frac{5\pi}{4}\right)$$

$$\Delta p = \pm\ \frac{\Delta p_0}{\sqrt{2}} \qquad \textbf{Ans.}$$

(c) Open end is a pressure node, i.e. $\Delta p = 0$

Hence, $$p_{\max} = p_{\min} = \text{Mean pressure } (p_0)$$

(d) Closed end is a displacement node or pressure antinode.

Therefore, $$p_{\max} = p_0 + \Delta p_0$$

and $$p_{\min} = p_0 - \Delta p_0$$

Example 20 *At a distance* 20 *m from a point source of sound the loudness level is* 30 *dB. Neglecting the damping, find*

(a) the loudness at 10 *m from the source*

(b) the distance from the source at which sound is not heard.

Solution (a) Intensity due to a point source varies with distance r from it as

$$I \propto \frac{1}{r^2}$$

or $$\frac{I_1}{I_2} = \left(\frac{r_2}{r_1^2}\right)^2$$

Now, $$L_1 = 10 \log \frac{I_1}{I_0}$$

and $$L_2 = 10 \log \frac{I_2}{I_0}$$

∴ $$L_1 - L_2 = 10 \left[\log \frac{I_1}{I_0} - \log \frac{I_2}{I_0} \right]$$

$$= 10 \log \frac{I_1}{I_2} = 10 \log \left(\frac{r_2}{r_1} \right)^2$$

Substituting, $L_1 = 30\,\text{dB}$, $r_1 = 20\,\text{m}$ and $r_2 = 10\,\text{m}$

we have $$30 - L_2 = 10 \log \left(\frac{10}{20} \right)^2 = -6.0$$

or $$L_2 = 36\,\text{dB}$$ **Ans.**

(b) $L_1 - L_2 = 10 \log \left(\frac{r_2}{r_1} \right)^2$

Sound is not heard at a point where $L_2 = 0$

or $$30 = 10 \log \left(\frac{r_2}{r_1} \right)^2$$

∴ $$\left(\frac{r_2}{r_1} \right)^2 = 1000 \quad \text{or} \quad \frac{r_2}{r_1} = 31.62$$

∴ $$r_2 = (31.62)(20) \approx 632\,\text{m}$$ **Ans.**

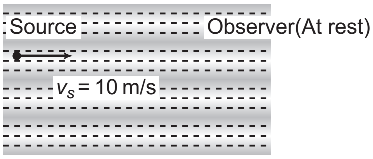
Example 21 *A boat is travelling in a river with a speed 10 m/s along the stream flowing with a speed 2 m/s. From this boat, a sound transmitter is lowered into the river through a rigid support. The wavelength of the sound emitted from the transmitter inside the water is 14.45 mm. Assume that attenuation of sound in water and air is negligible.*

(a) What will be the frequency detected by a receiver kept inside the river downstream?

(b) The transmitter and the receiver are now pulled up into air. The air is blowing with a speed 5 m/s in the direction opposite the river stream. Determine the frequency of the sound detected by the receiver.

(Temperature of the air and water = 20° C; Density of river water = 10^3 kg/m^3; Bulk modulus of the water = 2.088×10^9 Pa; Gas constant, R = 8.31 J/mol-K; Mean molecular mass of air = 28.8×10^{-3} kg/mol; C_p/C_V for air = 1.4) **(JEE 2001)**

Solution Velocity of sound in water is



$$v_w = \sqrt{\frac{B}{\rho}} = \sqrt{\frac{2.088 \times 10^9}{10^3}}$$

$$= 1445\,\text{m/s}$$

Frequency of sound in water will be

$$f_0 = \frac{v_w}{\lambda_w} = \frac{1445}{14.45 \times 10^{-3}} \text{ Hz}$$

$$f_0 = 10^5 \text{ Hz}$$

(a) Frequency of sound detected by receiver (observer) at rest would be

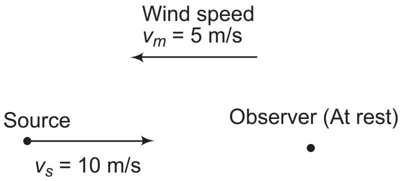
$$f_1 = f_0 \left(\frac{v_w + v_r}{v_w + v_r - v_s} \right)$$

$$= (10^5) \left(\frac{1445 + 2}{1445 + 2 - 10} \right) \text{ Hz}$$

$$f_1 = 1.0069 \times 10^5 \text{ Hz}$$ **Ans.**

(b) Velocity of sound in air is

$$v_a = \sqrt{\frac{\gamma RT}{M}}$$



$$= \sqrt{\frac{(1.4)\,(8.31)\,(20 + 273)}{28.8 \times 10^{-3}}}$$

$$= 344 \text{ m/s}$$

Frequency does not depend on the medium. Therefore, frequency in air is also $f_0 = 10^5$ Hz.

∴ Frequency of sound detected by receiver (observer) in air would be

$$f_2 = f_0 \left(\frac{v_a - v_w}{v_a - v_w - v_s} \right) = 10^5 \left[\frac{344 - 5}{344 - 5 - 10} \right] \text{Hz}$$

$$f_2 = 1.0304 \times 10^5 \text{ Hz}$$ **Ans.**

Example 22 *Three sound sources A, B and C have frequencies* 400, 401 *and* 402 *Hz, respectively. Calculate the number of beats noted per second.*

Solution Let us make the following table.

Group	Beat frequency $(f_1 - f_2)$ Hz	Beat time period $\left(\frac{1}{f_1 - f_2}\right)$ second
A and *B*	1	1
B and *C*	1	1
A and *C*	2	0.5

Beat time period for *A* and *B* is 1 s. It implies that if *A* and *B* are in phase at time $t = 0$, they are again in phase after 1 s. Same is the case with *B* and *C*. But beat time period for *A* and *C* is 0.5 s.

Therefore, beat time period for all together *A*, *B* and *C* will be 1 s. Because if, at $t = 0$, *A*, *B* and *C* all are in phase then after 1 s. (*A* and *B*) and (*B* and *C*) will again be in phase for the first time while (A and C) will be in phase for the second time. Or we can say that all A, B and C are again in phase after 1 s.

$\therefore$ Beat time period, $T_b = 1\text{ s}$

or Beat frequency, $f_b = \dfrac{1}{T_b} = 1\text{ Hz}$ **Ans.**

Alternate method Suppose at time t, the equations of waves are

$$y_1 = A_1 \sin 2\pi f_A t \qquad (\omega = 2\pi f)$$

$$y_2 = A_2 \sin 2\pi f_B t$$

and $$y_3 = A_3 \sin 2\pi f_C t$$

If they are in phase at some given instant of time t, then

$$2\pi f_A t = 2\pi f_B t = 2\pi f_C t \qquad \text{...(i)}$$

Let T_b be the beat time period, i.e. after time T_b they all are again in phase. As $f_C > f_B > f_A$, so

$$2\pi f_C\,(t + T_b) = 2\pi f_A\,(t + T_b) + 2m\pi \qquad \text{...(ii)}$$

and $$2\pi f_B\,(t + T_b) = 2\pi f_A\,(t + T_b) + 2n\pi \qquad \text{...(iii)}$$

Here, m and n ($< m$) are positive integers.

From Eqs. (i) and (ii),

$$(f_C - f_A)\,T_b = m \qquad \text{...(iv)}$$

Similarly, from Eqs. (i) and (iii)

$$(f_B - f_A)\,T_b = n \qquad \text{...(v)}$$

Dividing Eq. (iv) by Eq. (v),

$$\frac{m}{n} = \frac{f_C - f_A}{f_B - f_A} = \frac{402 - 400}{401 - 400} = \frac{2}{1}$$

Thus, letting $m = 2$ and $n = 1$

$$T_b = \frac{m}{f_C - f_A} \qquad \text{[from Eq. (iv)]}$$

$$= \frac{2}{2} = 1\text{ Hz}$$

$\therefore$ Beat frequency, $f_b = \dfrac{1}{T_b} = 1\text{ Hz}$ **Ans.**

Exercises

LEVEL 1

Assertion and Reason

Directions : *Choose the correct option.*

(*a*) *If both **Assertion** and **Reason** are true and the **Reason** is correct explanation of the **Assertion.***

(*b*) *If both **Assertion** and **Reason** are true but **Reason** is not the correct explanation of **Assertion.***

(*c*) *If **Assertion** is true, but the **Reason** is false.*

(*d*) *If **Assertion** is false but the **Reason** is true.*

1. Assertion : A closed pipe and an open organ pipe are of same length. Then, neither of their frequencies can be same.

Reason : In the above case fundamental frequency of closed organ pipe will be two times the fundamental frequency of open organ pipe.

2. Assertion : A sound source is approaching towards a stationary observer along the line joining them. Then, apparent frequency to the observer will go on increasing.

Reason : If there is no relative motion between source and observer, apparent frequency is equal to the actual frequency.

3. Assertion : In longitudinal wave pressure is maximum at a point where displacement is zero.

Reason : There is a phase difference of $\frac{\pi}{2}$ between $y(x, t)$ and $\Delta P(x, t)$ equation in case of longitudinal wave.

4. Assertion : A train is approaching towards a hill. The driver of the train will hear beats.

Reason : Apparent frequency of reflected sound observed by driver will be more than the frequency of direct sound observed by him.

5. Assertion : Sound level increases linearly with intensity of sound.

Reason : If intensity of sound is doubled, sound level increases approximately 3 dB.

6. Assertion : Speed of sound in gases is independent of pressure of gas.

Reason : With increase in temperature of gas speed of sound will increase.

7. Assertion : Beat frequency between two tuning forks A and B is 4 Hz. Frequency of A is greater than the frequency of B. When A is loaded with wax, beat frequency may increase or decrease.

Reason : When a tuning fork is loaded with wax, its frequency decreases.

8. Assertion : Two successive frequencies of an organ pipe are 450 Hz and 750 Hz. Then, this pipe is a closed pipe.

Reason : Fundamental frequency of this pipe is 150 Hz.

9. **Assertion :** Fundamental frequency of a narrow pipe is more.

   Reason : According to Laplace end correction if radius of pipe is less, frequency should be more.

10. **Assertion :** In the experiment of finding speed of sound by resonance tube method, as the level of water is lowered, wavelength increases.

    Reason : By lowering the water level number of loops increases.

Objective Questions

1. Velocity of sound in vacuum is

(a) equal to 330 m/s
(b) greater than 330 m/s
(c) less than 330 m/s
(d) None of these

2. Longitudinal waves are possible in

(a) solids
(b) liquids
(c) gases
(d) All of these

3. If the fundamental frequency of a pipe closed at one end is 512 Hz. The frequency of a pipe of the same dimension but open at both ends will be

(a) 1024 Hz
(b) 512 Hz
(c) 256 Hz
(d) 128 Hz

4. The temperature at which the velocity of sound in oxygen will be the same as that of nitrogen at 15°C is

(a) 112°C
(b) 72°C
(c) 56°C
(d) 17°C

5. A closed organ pipe is excited to vibrate in the third overtone. It is observed that there are

(a) three nodes and three antinodes
(b) three nodes and four antinodes
(c) four nodes and three antinodes
(d) four nodes and four antinodes

6. When temperature is increased, the frequency of organ pipe

(a) increases
(b) decreases
(c) remains same
(d) Nothing can be said

7. When a sound wave travels from water to air, it

(a) bends towards normal
(b) bends away from normal
(c) may bend in any direction
(d) data insufficient

8. A closed organ pipe and an open organ pipe are tuned to the same fundamental frequency. The ratio of their lengths is

(a) 1 : 2
(b) 2 : 1
(c) 1 : 4
(d) 4 : 1

9. A sonometer wire under a tension of 10 kg weight is in unison with a tuning fork of frequency 320 Hz. To make the wire vibrate in unison with a tuning fork of frequency 256 Hz, the tension should be altered by

(a) 3.6 kg decreased
(b) 3.6 kg increased
(c) 6.4 kg decreased
(d) 6.4 kg increased

10. A tuning fork of frequency 256 Hz is moving towards a wall with a velocity of 5 m/s. If the speed of sound is 330 m/s, then the number of beats heard per second by a stationary observer lying between tuning fork and the wall is

(a) 2 (b) 4 (c) zero (d) 8

11. Two sound waves of wavelength 1 m and 1.01 m in a gas produce 10 beats in 3 s. The velocity of sound in the gas is

(a) 330 m/s (b) 337 m/s (c) 360 m/s (d) 300 m/s

12. When a source is going away from a stationary observer with the velocity equal to that of sound in air, then the frequency heard by observer is n times the original frequency. The value of n is

(a) 0.5 (b) 0.25
(c) 1.0 (d) No sound is heard

13. When interference is produced by two progressive waves of equal frequencies, then the maximum intensity of the resulting sound are N times the intensity of each of the component waves. The value of N is

(a) 1 (b) 2
(c) 4 (d) 8

14. A tuning fork of frequency 500 Hz is sounded on a resonance tube. The first and second resonances are obtained at 17 cm and 52 cm. The velocity of sound is

(a) 170 m/s (b) 350 m/s
(c) 520 m/s (d) 850 m/s

15. A vehicle, with a horn of frequency n is moving with a velocity of 30 m/s in a direction perpendicular to the straight line joining the observer and the vehicle. The observer perceives the sound to have a frequency $(n + n_1)$. If the sound velocity in air is 300 m/s, then

(a) $n_1 = 10\,n$ (b) $n_1 = 0$
(c) $n_1 = 0.1\,n$ (d) $n_1 = -0.1\,n$

16. How many frequencies below 1 kHz of natural oscillations of air column will be produced if a pipe of length 1 m is closed at one end? [velocity of sound in air is 340 m/s]

(a) 3 (b) 6
(c) 4 (d) 8

17. A sound source emits frequency of 180 Hz when moving towards a rigid wall with speed 5 m/s and an observer is moving away from wall with speed 5 m/s. Both source and observer moves on a straight line which is perpendicular to the wall. The number of beats per second heard by the observer will be [speed of sound = 355 m/s]

(a) 5 beats/s (b) 10 beats/s
(c) 6 beats/s (d) 8 beats/s

18. Two sound waves of wavelengths λ_1 and λ_2 $(\lambda_2 > \lambda_1)$ produce n beats/s, the speed of sound is

(a) $\dfrac{n\lambda_1\lambda_2}{\lambda_2 - \lambda_1}$ (b) $n\left(\dfrac{1}{\lambda_1} - \dfrac{1}{\lambda_2}\right)$
(c) $n(\lambda_2 - \lambda_1)$ (d) $n(\lambda_2 + \lambda_1)$

19. A, B and C are three tuning forks. Frequency of A is 350 Hz. Beats produced by A and B are 5/s and by B and C are 4/s. When a wax is put on A beat frequency between A and B is 2 Hz and between A and C is 6 Hz. Then, frequency of B and C respectively, are

(a) 355 Hz, 349 Hz (b) 345 Hz, 341 Hz
(c) 355 Hz, 341 Hz (d) 345 Hz, 349 Hz

20. The first resonance length of a resonance tube is 40 cm and the second resonance length is 122 cm. The third resonance length of the tube will be

(a) 200 cm (b) 202 cm (c) 203 cm (d) 204 cm

21. Two identical wires are stretched by the same tension of 100 N and each emits a note of frequency 200 Hz. If the tension in one wire is increased by 1 N, then the beat frequency is

(a) 2 Hz
(b) $\frac{1}{2}$ Hz
(c) 1 Hz
(d) None of these

22. A tuning fork of frequency 340 Hz is sounded above an organ pipe of length 120 cm. Water is now slowly poured in it. The minimum height of water column required for resonance is (speed of sound in air = 340 m/s)

(a) 25 cm
(b) 95 cm
(c) 75 cm
(d) 45 cm

23. In a closed end pipe of length 105 cm, standing waves are set up corresponding to the third overtone. What distance from the closed end, amongst the following is a pressure node?

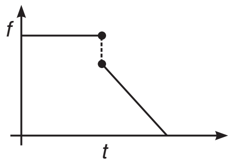
(a) 20 cm
(b) 60 cm
(c) 85 cm
(d) 45 cm

24. Oxygen is 16 times heavier than hydrogen. At NTP equal volume of hydrogen and oxygen are mixed. The ratio of speed of sound in the mixture to that in hydrogen is

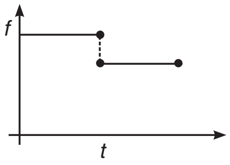
(a) $\sqrt{8}$
(b) $\sqrt{\frac{1}{8}}$
(c) $\sqrt{\frac{2}{17}}$
(d) $\sqrt{\frac{32}{17}}$

25. A train is moving towards a stationary observer. Which of the following curve best represents the frequency received by observer f as a function of time?

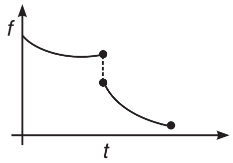
(a)



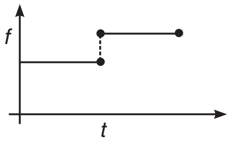
(b)



(c)



(d)



26. A closed organ pipe and an open organ pipe of same length produce 4 beats when they are set into vibrations simultaneously. If the length of each of them were twice their initial lengths, the number of beats produced will be

(a) 2
(b) 4
(c) 1
(d) 8

27. One train is approaching an observer at rest and another train is receding from him with the same velocity 4 m/s. Both trains blow whistles of same frequency of 243 Hz. The beat frequency in Hz as heard by the observer is (speed of sound in air = 320 m/ s)

(a) 10
(b) 6
(c) 4
(d) 1

28. Speed of sound in air is 320 m/s. A pipe closed at one end has a length of 1 m and there is another pipe open at both ends having a length of 1.6 m. Neglecting end corrections, both the air columns in the pipes can resonate for sound of frequency

(a) 80 Hz (b) 240 Hz (c) 320 Hz (d) 400 Hz

29. Four sources of sound each of sound level 10 dB are sounded together in phase, the resultant intensity level will be ($\log_{10} 2 = 0.3$)

(a) 40 dB (b) 26 dB (c) 22 dB (d) 13 dB

30. A longitudinal sound wave given by $p = 2.5 \sin \frac{\pi}{2}(x - 600\,t)$ (p is in N/m^2, x is in metre and t is in second) is sent down a closed organ pipe. If the pipe vibrates in its second overtone, the length of the pipe is

(a) 6 m (b) 8 m (c) 5 m (d) 10 m

31. Sound waves of frequency 600 Hz fall normally on perfectly reflecting wall. The distance from the wall at which the air particles have the maximum amplitude of vibration is

(speed of sound in air = 330 m/s)

(a) 13.75 cm (b) 40.25 cm (c) 70.5 cm (d) 60.75 cm

32. The wavelength of two sound waves are 49 cm and 50 cm, respectively. If the room temperature is 30°C, then the number of beats produced by them is approximately
(velocity of sound in air at 30°C = 332 m/s)

(a) 6 (b) 10 (c) 13 (d) 18

33. Two persons A and B, each carrying a source of frequency 300 Hz, are standing a few metre apart. A starts moving towards B with velocity 30 m/s. If the speed of sound is 300 m/s, which of the following is true?

(a) Number of beats heard by A is higher than that heard by B
(b) The number of beats heard by B are 30 Hz
(c) Both (a) and (b) are correct
(d) Both (a) and (b) are wrong

34. A fixed source of sound emitting a certain frequency appears as f_a when the observer is approaching the source with speed v_0 and f_r when the observer recedes from the source with the same speed. The frequency of the source is

(a) $\frac{f_r + f_a}{2}$ (b) $\frac{f_r - f_a}{2}$ (c) $\sqrt{f_a f_r}$ (d) $\frac{2 f_r f_a}{f_r + f_a}$

Subjective Questions

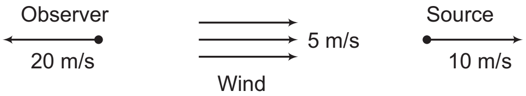
1. Determine the speed of sound waves in water, and find the wavelength of a wave having a frequency of 242 Hz. Take $B_{\text{water}} = 2 \times 10^9$ Pa.

2. If the source and receiver are at rest relative to each other but the wave medium is moving relative to them, will the receiver detect any wavelength or frequency shift.

3. Using the fact that hydrogen gas consists of diatomic molecules with $M = 2$ kg/K-mol. Find the speed of sound in hydrogen at 27° C.

4. About how many times more intense will the normal ear perceive a sound of 10^{-6} W/m^2 than one of 10^{-9} W/m^2?

5. A 300 Hz source, an observer and a wind are moving as shown in the figure with respect to the ground. What frequency is heard by the observer? Take speed of sound in air = 340 m/s.



6. A person standing between two parallel hills fires a gun. He hears the first echo after $\frac{3}{2}$ s, and a second echo after $\frac{5}{5}$ s. If speed of sound is 332 m/s, calculate the distance between the hills. When will he hear the third echo?

7. Helium is a monoatomic gas that has a density of 0.179 kg/m^3 at a pressure of 76 cm of mercury and a temperature of 0° C. Find the speed of compressional waves (sound) in helium at this temperature and pressure.

8. (a) In a liquid with density 1300 kg/m^3, longitudinal waves with frequency 400 Hz are found to have wavelength 8.00 m. Calculate the bulk modulus of the liquid.

(b) A metal bar with a length of 1.50 m has density 6400 kg/m^3. Longitudinal sound waves take 3.90×10^{-4} s to travel from one end of the bar to the other. What is Young's modulus for this metal?

9. What must be the stress (F/A) in a stretched wire of a material whose Young's modulus is Y for the speed of longitudinal waves equal to 30 times the speed of transverse waves?

10. A gas is a mixture of two parts by volume of hydrogen and one part by volume of nitrogen at STP. If the velocity of sound in hydrogen at 0° C is 1300 m/s. Find the velocity of sound in the gaseous mixture at 27° C.

11. The explosion of a fire cracker in the air at a height of 40 m produces a 100 dB sound level at ground below. What is the instantaneous total radiated power? Assuming that it radiates as a point source.

12. (a) What is the intensity of a 60 dB sound?

(b) If the sound level is 60 dB close to a speaker that has an area of 120 cm^2. What is the acoustic power output of the speaker?

13. (a) By what factor must the sound intensity be increased to increase the sound intensity level by 13.0 dB?

(b) Explain why you do not need to know the original sound intensity?

14. The speed of a certain compressional wave in air at standard temperature and pressure is 330 m/s. A point source of frequency 300 Hz radiates energy uniformly in all directions at the rate of 5 Watt.

(a) What is the intensity of the wave at a distance of 20 m from the source?

(b) What is the amplitude of the wave there? [Density of air at STP = 1.29 kg/m^3]

15. What is the amplitude of motion for the air in the path of a 60 dB, 800 Hz sound wave? Assume that $\rho_{\text{air}} = 1.29 \text{ kg/m}^3$ and $v = 330$ m/s.

16. A rock band gives rise to an average sound level of 102 dB at a distance of 20 m from the centre of the band. As an approximation, assume that the band radiates sound equally into a sphere. What is the sound power output of the band?

17. If it were possible to generate a sinusoidal 300 Hz sound wave in air that has a displacement amplitude of 0.200 mm. What would be the sound level of the wave? (Assume $v = 330$ m/s and $\rho_{\text{air}} = 1.29\ \text{kg/m}^3$)

18. (a) A longitudinal wave propagating in a water-filled pipe has intensity $3.00 \times 10^{-6}\ \text{W/m}^2$ and frequency 3400 Hz. Find the amplitude A and wavelength λ of the wave. Water has density $1000\ \text{kg/m}^3$ and bulk modulus 2.18×10^9 Pa.

(b) If the pipe is filled with air at pressure 1.00×10^5 Pa and density $1.20\ \text{kg/m}^3$, what will be the amplitude A and wavelength λ of a longitudinal wave with the same intensity and frequency as in part (a)?

(c) In which fluid is the amplitude larger, water or air?
What is the ratio of the two amplitudes? Why is this ratio so different from one? Consider air as diatomic.

19. For a person with normal hearing, the faintest sound that can be heard at a frequency of 400 Hz has a pressure amplitude of about 6.0×10^{-5} Pa. Calculate the corresponding intensity and sound intensity level at 20° C. (Assume $v = 330$ m/s and $\rho_{\text{air}} = 1.29\ \text{kg/m}^3$).

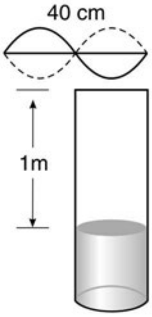
20. Find the fundamental frequency and the frequency of the first two overtones of a pipe 45.0 cm long. (a) If the pipe is open at both ends. (b) If the pipe is closed at one end. Use $v = 344$ m/s.

21. A uniform tube of length 60 cm stands vertically with its lower end dipping into water. First two air column lengths above water are 15 cm and 45 cm, when the tube responds to a vibrating fork of frequency 500 Hz. Find the lowest frequency to which the tube will respond when it is open at both ends.

22. Write the equation for the fundamental standing sound waves in a tube that is open at both ends. If the tube is 80 cm long and speed of the wave is 330 m/s. Represent the amplitude of the wave at an antinode by A.

23. A long glass tube is held vertically, dipping into water, while a tuning fork of frequency 512 Hz is repeatedly struck and held over the open end. Strong resonance is obtained, when the length of the tube above the surface of water is 50 cm and again 84 cm, but not at any intermediate point. Find the speed of sound in air and next length of the air column for resonance.

24. A wire of length 40 cm which has a mass of 4 g oscillates in its second harmonic and sets the air column in the tube to vibrations in its fundamental mode as shown in figure. Assuming the speed of sound in air as 340 m/s, find the tension in the wire.



25. In a resonance tube experiment to determine the speed of sound in air, a pipe of diameter 5 cm is used. The column in pipe resonates with a tuning fork of frequency 480 Hz when the minimum length of the air column is 16 cm. Find the speed of sound in air column at room temperature.

26. On a day when the speed of sound is 345 m/s, the fundamental frequency of a closed organ pipe is 220 Hz. (a) How long is this closed pipe? (b) The second overtone of this pipe has the same wavelength as the third harmonic of an open pipe. How long is the open pipe?

27. A closed organ pipe is sounded near a guitar, causing one of the strings to vibrate with large amplitude. We vary the tension of the string until we find the maximum amplitude. The string is 80% as long as the closed pipe. If both the pipe and the string vibrate at their fundamental frequency, calculate the ratio of the wave speed on the string to the speed of sound in air.

28. A police siren emits a sinusoidal wave with frequency $f_S = 300\,\text{Hz}$. The speed of sound is 340 m/s. (a) Find the wavelength of the waves if the siren is at rest in the air. (b) If the siren is moving at 30 m/s, find the wavelength of the waves ahead of and behind the source.

29. Two identical violin strings, when in tune and stretched with the same tension, have a fundamental frequency of 440.0 Hz. One of the string is retuned by adjusting its tension. When this is done, 1.5 beats per second are heard when both strings are plucked simultaneously. (a) What are the possible fundamental frequencies of the retuned string? (b) By what fractional amount was the string tension changed if it was (i) increased (ii) decreased?

30. A swimming duck paddles the water with its feet once every 1.6 s, producing surface waves with this period. The duck is moving at constant speed in a pond where the speed of surface waves is 0.32 m/s, and the crests of the waves ahead of the duck are spaced 0.12 m apart. (a) What is the duck's speed? (b) How far apart are the crests behind the duck?

31. A railroad train is travelling at 30.0 m/s in still air. The frequency of the note emitted by the train whistle is 262 Hz. What frequency is heard by a passenger on a train moving in the opposite direction to the first at 18.0 m/s and (a) approaching the first? (b) receding from the first? Speed of sound in air = 340 m/s.

32. A boy is walking away from a wall at a speed of 1.0 m/s in a direction at right angles to the wall. As he walks, he blows a whistle steadily. An observer towards whom the boy is walking hears 4.0 beats per second. If the speed of sound is 340 m/s, what is the frequency of the whistle?

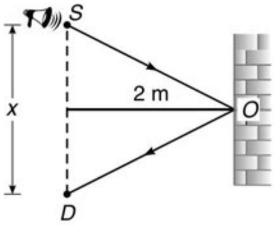
33. A tuning fork P of unknown frequency gives 7 beats in 2 seconds with another tuning fork Q. When Q runs towards a wall with a speed of 5 m/s it gives 5 beats per second with its echo. On loading P with wax, it gives 5 beats per second with Q. What is the frequency of P? Assume speed of sound = 332 m/s.

34. A stationary observer receives sonic oscillations from two tuning forks one of which approaches and the other recedes with the same velocity. As this takes place, the observer hears the beats of frequency $f = 2.0\,\text{Hz}$. Find the velocity of each tuning fork if their oscillation frequency is $f_0 = 680\,\text{Hz}$ and the velocity of sound in air is $v = 340$ m/s.

35. Sound waves from a tuning fork A reach a point P by two separate paths ABP and ACP. When ACP is greater than ABP by 11.5 cm, there is silence at P. When the difference is 23 cm the sound becomes loudest at P and when 34.5 cm there is silence again and so on. Calculate the minimum frequency of the fork if the velocity of sound is taken to be 331.2 m/s.

36. Two loudspeakers S_1 and S_2 each emit sounds of frequency 220 Hz uniformly in all directions. S_1 has an acoustic output of 1.2×10^{-3} W and S_2 has 1.8×10^{-3} W. S_1 and S_2 vibrate in phase. Consider a point P such that $S_1P = 0.75$ m and $S_2P = 3$ m. How are the phases arriving at P related? What is the intensity at P when both S_1 and S_2 are on? Speed of sound in air is 330 m/s.

37. A source of sound emitting waves at 360 Hz is placed in front of a vertical wall, at a distance 2 m from it. A detector is also placed in front of the wall at the same distance from it. Find the minimum distance between the source and the detector for which the detector detects a maximum of sound. Take speed of sound in air = 360 m/s. Assume that there is no phase change in reflected wave.



38. The atomic mass of iodine is 127 g/mol. A standing wave in iodine vapour at 400 K has nodes that are 6.77 cm apart when the frequency is 1000 Hz. At this temperature, is iodine vapour monoatomic or diatomic.

39. A tuning fork whose natural frequency is 440 Hz is placed just above the open end of a tube that contains water. The water is slowly drained from the tube while the tuning fork remains in place and is kept vibrating. The sound is found to be enhanced when the air column is 60 cm long and when it is 100 cm long. Find the speed of sound in air.

40. A piano wire *A* vibrates at a fundamental frequency of 600 Hz. A second identical wire *B* produces 6 beats per second with it when the tension in *A* is slightly increased. Find the ratio of the tension in *A* to the tension in *B*.

41. A tuning fork of frequency 256 Hz produces 4 beats per second with a wire of length 25 cm vibrating in its fundamental mode. The beat frequency decreases when the length is slightly shortened. What could be the minimum length by which the wire be shortened so that it produces no beats with the tuning fork?

42. Show that when the speed of the source and the observer are small compared to the speed of sound in the medium, the change in frequency becomes independent of the fact whether the source is moving or the observer.

43. A sound source moves with a speed of 80 m/s relative to still air toward a stationary listener. The frequency of sound is 200 Hz and speed of sound in air is 340 m/s.

(a) Find the wavelength of the sound between the source and the listener.

(b) Find the frequency heard by the listener.

44. A railroad train is travelling at 30 m/s in still air. The frequency of the note emitted by the locomotive whistle is 500 Hz. What is the wavelength of the sound waves :

(a) in front of the locomotive? (b) behind the locomotive?

What is the frequency of the sound heard by a stationary listener

(c) in front of the locomotive? (d) behind the locomotive?

Speed of sound in air is 344 m/s.

45. For a certain organ pipe, three successive resonance frequencies are observed at 425, 595 and 765 Hz respectively. Taking the speed of sound in air to be 340 m/s,

(a) explain whether the pipe is closed at one end or open at both ends.

(b) determine the fundamental frequency and length of the pipe.

46. Two tuning forks *A* and *B* sounded together give 8 beats per second. With an air resonance tube closed at one end, the two forks give resonances when the two air columns are 32 cm and 33 cm respectively. Calculate the frequencies of forks.

LEVEL 2

Single Correct Option

1. A plane wave of sound travelling in air is incident upon a plane water surface. The angle of incidence is 60°. If velocity of sound in air and water are 330 m/s and 1400 m/s, then the wave undergoes

(a) refraction only

(b) reflection only

(c) Both reflection and refraction

(d) neither reflection nor refraction

2. An organ pipe of $(3.9\,\pi)$ m long, open at both ends is driven to third harmonic standing wave. If the amplitude of pressure oscillation is 1% of mean atmospheric pressure $[p_0 = 10^5 \text{ N/m}^2]$. The maximum displacement of particle from mean position will be

[Given, velocity of sound = 200 m/s and density of air = 1.3 kg/m^3]

(a) 2.5 cm (b) 5 cm

(c) 1 cm (d) 2 cm

3. A plane sound wave passes from medium 1 into medium 2. The speed of sound in medium 1 is 200 m/s and in medium 2 is 100 m/s. The ratio of amplitude of the transmitted wave to that of incident wave is

(a) $\frac{3}{4}$ (b) $\frac{4}{5}$

(c) $\frac{5}{6}$ (d) $\frac{2}{3}$

4. Two sources of sound are moving in opposite directions with velocities v_1 and v_2 $(v_1 > v_2)$. Both are moving away from a stationary observer. The frequency of both the sources is 1700 Hz. What is the value of $(v_1 - v_2)$ so that the beat frequency observed by the observer is 10 Hz? $v_{\text{sound}} = 340$ m/s and assume that v_1 and v_2 both are very much less than v_{sound}.

(a) 1 m/s (b) 2 m/s

(c) 3 m/s (d) 4 m/s

5. A sounding body emitting a frequency of 150 Hz is dropped from a height. During its fall under gravity it crosses a balloon moving upwards with a constant velocity of 2 m/s one second after it started to fall. The difference in the frequency observed by the man in balloon just before and just after crossing the body will be (velocity of sound = 300 m/s, $g = 10$ m/s^2)

(a) 12 (b) 6

(c) 8 (d) 4

6. A closed organ pipe has length L. The air in it is vibrating in third overtone with maximum amplitude a. The amplitude at distance $\frac{L}{7}$ from closed end of the pipe is

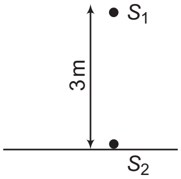
(a) 0

(b) a

(c) $\frac{a}{2}$

(d) Data insufficient

7. S_1 and S_2 are two coherent sources of sound having no initial phase difference. The velocity of sound is 330 m/s. No maxima will be formed on the line passing through S_2 and perpendicular to the line joining S_1 and S_2. If the frequency of both the sources is



(a) 330 Hz (b) 120 Hz (c) 100 Hz (d) 220 Hz

8. A source is moving with constant speed $v_s = 20$ m/s towards a stationary observer due east of the source. Wind is blowing at the speed of 20 m/s at 60° north of east. The source has frequency 500 Hz. Speed of sound = 300 m/s. The frequency registered by the observer is approximately

(a) 541 Hz (b) 552 Hz
(c) 534 Hz (d) 517 Hz

9. A car travelling towards a hill at 10 m/s sounds its horn which has a frequency 500 Hz. This is heard in a second car travelling behind the first car in the same direction with speed 20 m/s. The sound can also be heard in the second car by reflection of sound from the hill. The beat frequency heard by the driver of the second car will be (speed of sound in air = 340 m/s)

(a) 31 Hz (b) 24 Hz
(c) 21 Hz (d) 34 Hz

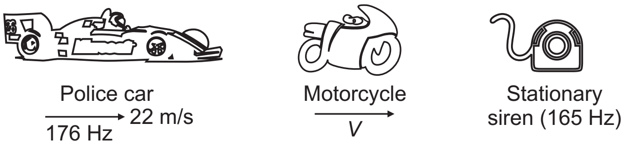
10. Two sounding bodies are producing progressive waves given by $y_1 = 2\sin(400\pi t)$ and $y_2 = \sin(404\pi t)$ where t is in second, which superpose near the ears of a person. The person will hear

(a) 2 beats/s with intensity ratio 9/4 between maxima and minima
(b) 2 beats/s with intensity ratio 9 between maxima and minima
(c) 4 beats/s with intensity ratio 16 between maxima and minima
(d) 4 beats/s with intensity ratio 16/9 between maxima and minima

11. The air in a closed tube 34 cm long is vibrating with two nodes and two antinodes and its temperature is 51°C. What is the wavelength of the waves produced in air outside the tube, when the temperature of air is 16°C?

(a) 42.8 cm (b) 68 cm (c) 17 cm (d) 102 cm

12. A police car moving at 22 m/s, chase a motorcyclist. The police man sounds his horn at 176 Hz, while both of them move towards a stationary siren of frequency 165 Hz. Calculate the speed of the motorcyclist, if he does not observe any beats. (velocity of sound in air = 330 m/s) **(JEE 2003)**

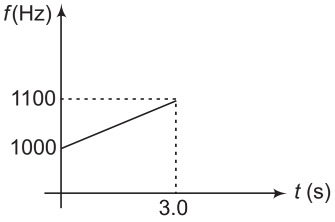


(a) 33 m/s (b) 22 m/s (c) zero (d) 11 m/s

13. A closed organ pipe resonates in its fundamental mode at a frequency of 200 Hz with O_2 in the pipe at a certain temperature. If the pipe now contains 2 moles of O_2 and 3 moles of ozone, then what will be the fundamental frequency of same pipe at same temperature?

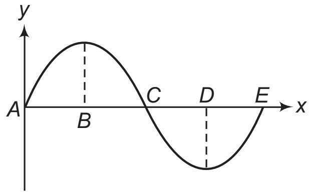
(a) 268.23 Hz (b) 175.4 Hz (c) 149.45 Hz (d) None of these

14. A detector is released from rest over a source of sound of frequency $f_0 = 10^3$ Hz. The frequency observed by the detector at time t is plotted in the graph. The speed of sound in air is ($g = 10\ \text{m/s}^2$)



(a) 330 m/s (b) 350 m/s (c) 300 m/s (d) 310 m/s

15. Sound waves are travelling along positive x-direction. Displacement of particle at any time t is as shown in figure. Select the wrong statement.



(a) Particle located at E has its velocity in negative x-direction
(b) Particle located at D has zero velocity
(c) Both (a) and (b) are correct
(d) Both (a) and (b) are wrong

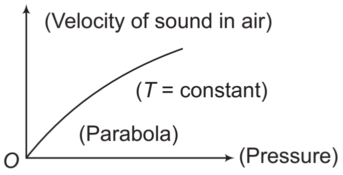
More than One Correct Options

1. An air column in a pipe, which is closed at one end, is in resonance with a vibrating tuning fork of frequency 264 Hz. If $v = 330$ m/s, the length of the column in cm is (are)

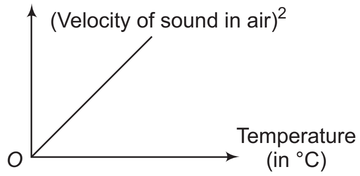
(a) 31.25 (b) 62.50
(c) 93.75 (d) 125

2. Which of the following is/are correct?

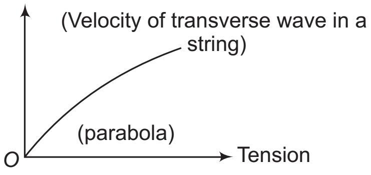
(a)



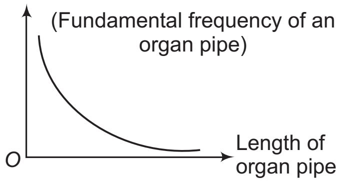
(b)



(c)



(d)



3. Choose the correct options for longitudinal wave

(a) maximum pressure variation is BAk
(b) maximum density variation is ρAk
(c) pressure equation and density equation are in phase
(d) pressure equation and displacement equation are out of phase

4. Second overtone frequency of a closed pipe and fourth harmonic frequency of an open pipe are same. Then, choose the correct options.

(a) Fundamental frequency of closed pipe is more than the fundamental frequency of open pipe
(b) First overtone frequency of closed pipe is more than the first overtone frequency of open pipe
(c) Fifteenth harmonic frequency of closed pipe is equal to twelfth harmonic frequency of open pipe
(d) Tenth harmonic frequency of closed pipe is equal to eighth harmonic frequency of open pipe

5. For fundamental frequency f of a closed pipe, choose the correct options.

(a) If radius of pipe is increased, f will decrease
(b) If temperature is increased, f will increase
(c) If molecular mass of the gas filled in the pipe is increased, f will decrease.
(d) If pressure of gas (filled in the pipe) is increased without change in temperature, f will remain unchanged

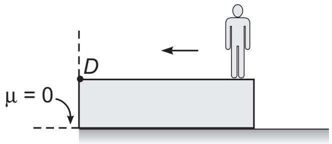
6. A source is approaching towards an observer with constant speed along the line joining them. After crossing the observer, source recedes from observer with same speed. Let f is apparent frequency heard by observer. Then,

(a) f will keep on increasing during approaching
(b) f will keep on decreasing during receding
(c) f will remain constant during approaching
(d) f will remain constant during receding

Comprehension Based Questions

Passage

A man of mass 50 *kg is running on a plank of mass* 150 *kg with speed of* 8 *m/s relative to plank as shown in the figure (both were initially at rest and the velocity of man with respect to ground any how remains constant). Plank is placed on smooth horizontal surface. The man, while running, whistles with frequency* f_0. *A detector* (D) *placed on plank detects frequency. The man jumps off with same velocity (w.r.t. to ground) from point D and slides on the smooth horizontal surface [Assume coefficient of friction between man and horizontal is zero]. The speed of sound in still medium is* 330 *m/s. Answer the following questions on the basis of above situations.*



1. The frequency of sound detected by detector D, before man jumps off the plank is

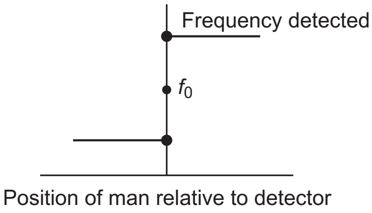
(a) $\frac{332}{324} f_0$ (b) $\frac{330}{322} f_0$
(c) $\frac{328}{336} f_0$ (d) $\frac{330}{338} f_0$

2. The frequency of sound detected by detector D, after man jumps off the plank is

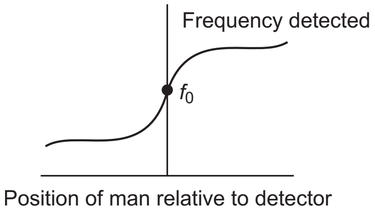
(a) $\frac{332}{324} f_0$ (b) $\frac{330}{322} f_0$
(c) $\frac{328}{336} f_0$ (d) $\frac{330}{338} f_0$

3. Choose the correct plot between the frequency detected by detector *versus* position of the man relative to detector.

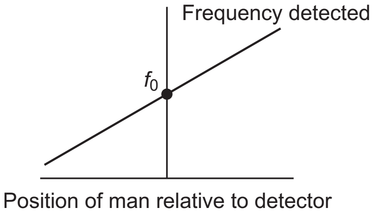
(a)



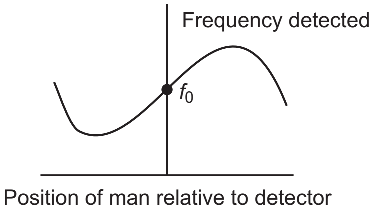
(b)



(c)



(d)

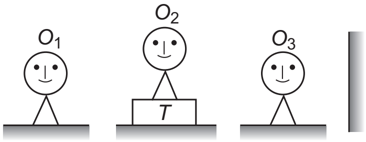


Match the Columns

1. Fundamental frequency of an open organ pipe is f. Match the following two columns for a closed pipe of double the length.

Column I	Column II
(a) Fundamental frequency	(p) $1.25\,f$
(b) Second overtone frequency	(q) f
(c) Third harmonic frequency	(r) $0.75\,f$
(d) First overtone frequency	(s) None of these

2. A train T horns a sound of frequency f. It is moving towards a wall with speed $\frac{1}{4}$th the speed of sound. There are three observers O_1, O_2 and O_3 as shown. Match the following two columns.



Column I	Column II
(a) Beat frequency observed to O_1	(p) $\frac{2}{3}f$
(b) Beat frequency observed to O_2	(q) $\frac{8}{15}f$
(c) Beat frequency observed to O_3	(r) None of these
(d) If train moves in opposite direction with same speed, then beat frequency observed to O_3	(s) Zero

3. A tuning fork is placed near a vibrating stretched wire. A boy standing near the two hears a beat frequency f. It is known that frequency of tuning fork is greater than frequency of stretched wire. Match the following two columns.

Column I	Column II
(a) If tuning fork is loaded with wax,	(p) beat frequency must increase.
(b) If prongs of tuning fork are filed,	(q) beat frequency must decrease.
(c) If tension in stretched wire is increased,	(r) beat frequency may increase.
(d) If tension in stretched wire is decreased,	(s) beat frequency may decrease.

4. I represents intensity of sound wave, A the amplitude and r the distance from the source. Then, match the following two columns.

Column I	Column II
(a) Intensity due to a point source.	(p) proportional to $r^{-1/2}$
(b) Amplitude due to a point source.	(q) proportional to r^{-1}
(c) Intensity due to a line source.	(r) proportional to r^{-2}
(d) Amplitude due to a line source.	(s) proportional to r^{-4}

5. The equation of longitudinal stationary wave in second overtone mode in a closed organ pipe is

$$y = (4 \text{ mm}) \sin \pi x \cos \pi t$$

Here, x is in metre and t in second. Then, match the following two columns.

Column I	Column II
(a) Length of pipe	(p) 1 m
(b) Wavelength	(q) 1.5 m
(c) Distance of displacement node from the closed end	(r) 2.0 m
(d) Distance of pressure node from the closed end	(s) None of these

Subjective Questions

1. A window whose area is $2\, m^2$ opens on a street where the street noise results at the window an intensity level of 60 dB. How much acoustic power enters the window through sound waves? Now, if a sound absorber is fitted at the window, how much energy from the street will it collect in a day?

2. A point A is located at a distance $r = 1.5$ m from a point source of sound of frequency 600 Hz. The power of the source is 0.8 W. Speed of sound in air is 340 m/s and density of air is 1.29 kg/m^3. Find at the point A,

(a) the pressure oscillation amplitude $(\Delta p)_m$

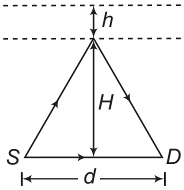
(b) the displacement oscillation amplitude A.

3. A flute which we treat as a pipe open at both ends is 60 cm long.

(a) What is the fundamental frequency when all the holes are covered?

(b) How far from the mouthpiece should a hole be uncovered for the fundamental frequency to be 330 Hz? Take speed of sound in air as 340 m/s.

4. A source S and a detector D of high frequency waves are a distance d apart on the ground. The direct wave from S is found to be in phase at D with the wave from S that is reflected from a horizontal layer at an altitude H. The incident and reflected rays make the same angle with the reflecting layer. When the layer rises a distance h, no signal is detected at D. Neglect absorption in the atmosphere and find the relation between d, h, H and the wavelength λ of the waves.



5. Two sound speakers are driven in phase by an audio amplifier at frequency 600 Hz. The speed of sound is 340 m/s. The speakers are on the y-axis, one at $y = +1.0$ m and the other at $y = -1.0$ m. A listener begins at $y = 0$ and walks along a line parallel to the y-axis at a very large distance x away.

(a) At what angle θ (between the line from the origin to the listener at the x-axis) will she first hear a minimum sound intensity?

(b) At what angle will she first hear a maximum (after $\theta = 0°$) sound intensity?

(c) How many maxima can she possibly hear if she keeps walking in the same direction?

6. Two speakers separated by some distance emit sound of the same frequency. At some point P the intensity due to each speaker separately is I_0. The path difference from P to one of the speakers is $\frac{1}{2}\lambda$ greater than that from P to the other speaker. What is the intensity at P if

(a) the speakers are coherent and in phase;

(b) the speakers are incoherent; and

(c) the speakers are coherent but have a phase difference of 180°?

7. Two loudspeakers radiate in phase at 170 Hz. An observer sits at 8 m from one speaker and 11m from the other. The intensity level from either speaker acting alone is 60 dB. The speed of sound is 340 m/ s.

(a) Find the observed intensity when both speakers are on together.

(b) Find the observed intensity level when both speakers are on together but one has its leads reversed so that the speakers are 180° out of phase.

(c) Find the observed intensity level when both speakers are on and in phase but the frequency is 85 Hz.

8. Two identical speakers emit sound waves of frequency 680 Hz uniformly in all directions with a total audio output of 1 mW each. The speed of sound in air is 340 m/s. A point P is a distance 2.00 m from one speaker and 3.00 m from the other.

(a) Find the intensities I_1 and I_2 from each speaker at point P separately.

(b) If the speakers are driven coherently and in phase, what is the intensity at point P?

(c) If they are driven coherently but out of phase by 180°, what is the intensity at point P?

(d) If the speakers are incoherent, what is the intensity at point P?

9. A train of length l is moving with a constant speed v along a circular track of radius R. The engine of the train emits a sound of frequency f. Find the frequency heard by a guard at the rear end of the train.

10. A 3 m long organ pipe open at both ends is driven to third harmonic standing wave. If the amplitude of pressure oscillations is 1 per cent of mean atmospheric pressure ($p_0 = 10^5$ Nm^2). Find the amplitude of particle displacement and density oscillations. Speed of sound $v = 332$ m / s and density of air $\rho = 1.03$ kg / m^3.

11. A siren creates a sound level of 60 dB at a location 500 m from the speaker. The siren is powered by a battery that delivers a total energy of 1.0 kJ. Assuming that the efficiency of siren is 30%, determine the total time the siren can sound.

12. A cylinder of length 1 m is divided by a thin perfectly flexible diaphragm in the middle. It is closed by similar flexible diaphragms at the ends. The two chambers into which it is divided contain hydrogen and oxygen. The two diaphragms are set in vibrations of same frequency. What is the minimum frequency of these diaphragms for which the middle diaphragm will be motionless? Velocity of sound in hydrogen is 1100 m/ s and that in oxygen is 300 m/ s.

13. A conveyor belt moves to the right with speed $v = 300$ m/ min. A very fast pieman puts pies on the belt at a rate of 20 per minute and they are received at the other end by a pieeater.

(a) If the pieman is stationary find the spacing x between the pies and the frequency with which they are received by the stationary pieeater.

(b) The pieman now walks with speed 30 m/min towards the receiver while continuing to put pies on the belt at 20 per minute. Find the spacing of the pies and the frequency with which they are received by the stationary pieeater.

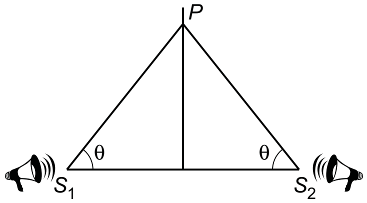
14. A point sound source is situated in a medium of bulk modulus 1.6×10^5 N/ m^2. An observer standing at a distance 10 m from the source writes down the equation for the wave as $y = A \sin (15\pi x - 6000\,\pi t)$. Here y and x are in metres and t is in second. The maximum pressure amplitude received to the observer's ear is (24π) Pa, then find.

(a) the density of the medium,

(b) the displacement amplitude A of the waves received by the observer and

(c) the power of the sound source.

15. Two sources of sound S_1 and S_2 vibrate at the same frequency and are in phase. The intensity of sound detected at a point P (as shown in figure) is I_0.



(a) If $\theta = 45°$ what will be the intensity of sound detected at this point if one of the sources is switched off ?

(b) What will be intensity of sound detected at P if $\theta = 60°$ and both the sources are now switched on?

16. Two narrow cylindrical pipes A and B have the same length. Pipe A is open at both ends and is filled with a monoatomic gas of molar mass M_A. Pipe B is open at one end and closed at the other end and is filled with a diatomic gas of molar mass M_B. Both gases are at the same temperature. **(JEE 2002)**

(a) If the frequency of the second harmonic of the fundamental mode in pipe A is equal to the frequency of the third harmonic of the fundamental mode in pipe B, determine the value of $\frac{M_A}{M_B}$.

(b) Now, the open end of pipe B is also closed (so that the pipe is closed at both ends.) Find the ratio of the fundamental frequency in pipe A to that in pipe B.

17. A boat is travelling in a river with a speed 10 m/s along the stream flowing with a speed 2 m/s. From this boat a sound transmitter is lowered into the river through a rigid support. The wavelength of the sound emitted from the transmitter inside the water is 14.45 mm. Assume that attenuation of sound in water and air is negligible.

(a) What will be the frequency detected by a receiver kept inside the river downstream?

(b) The transmitter and the receiver are now pulled up into the air. The air is blowing with a speed 5 m/s in the direction opposite to the river stream. Determine the frequency of the sound detected by the receiver.

(Temperature of the air and water = 20° C; Density of river water = 10^3 kg/m^3; bulk modulus the water = 2.088×10^9 Pa; Gas constant $R = 8.31$ J/mol-K; Mean molecular mass of air = 28.8×10^{-3} kg per mol and C_p/C_V for air = 1.4)

18. A string 25 cm long and having a mass of 2.5 g is under tension. A pipe closed at one end is 40 cm long. When the string is set vibrating in its first overtone and the air in the pipe in its fundamental frequency, 8 beats per second are heard. It is observed that decreasing the tension in the string decrease the beat frequency. If the speed of sound in air is 320 m/s, find the tension in the string.

19. A source emits sound waves of frequency 1000 Hz. The source moves to the right with a speed of 32 m/s relative to ground. On the right a reflecting surface moves towards left with a speed of 64 m/s relative to the ground. The speed of sound in air is 332 m/s. Find

(a) the wavelength of sound in ahead of the source,

(b) the number of waves arriving per second which meets the reflecting surface,

(c) the speed of reflected waves and

(d) the wavelength of reflected waves.

20.1 Thermometers and The Celsius Temperature Scale

Thermometers are devices that are used to measure temperatures. All thermometers are based on the principle that some physical properties of a system change as the system's temperature changes. Some physical properties that change with temperature are

1. the volume of a liquid
2. the length of a solid
3. the pressure of a gas at constant volume
4. the volume of a gas at constant pressure and
5. the electric resistance of a conductor.

A common thermometer in everyday use consists of a mass of liquid, usually mercury or alcohol that expands in a glass capillary tube when heated. In this case, the physical property is the **change in volume of the liquid**. Any temperature change is proportional to the change in length of the liquid column. The thermometer can be calibrated accordingly. On the celsius temperature scale, a thermometer is usually calibrated between 0°C (called the ice point of water) and 100°C (called the steam point of water). Once the liquid levels in the thermometer have been established at these two points, the distance between the two points is divided into 100 equal segments to create the celsius scale.

Thus, each segment denotes a change in temperature of one celsius degree (1°C). A practical problem in this type of thermometer is that readings may vary for two different liquids. When one thermometer reads a temperature, for example 40°C the other may indicate a slightly different value. This discrepancies between thermometers are especially large at temperatures far from the calibration points. To surmount this problem we need a universal thermometer whose readings are independent of the substance used in it. The gas thermometer used in the next article meets this requirement.

20.2 The Constant Volume Gas Thermometer and The Absolute Temperature Scale

The physical property used by the constant volume gas thermometer is the **change in pressure of a gas at constant volume**.

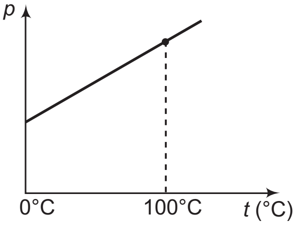

Fig. 20.1

The pressure *versus* temperature graph for a typical gas taken with a constant volume is shown in figure. The two dots represent the two reference temperatures namely, the ice and steam points of water. The line connecting them serves as a calibration curve for unknown temperatures. Experiments show that the thermometer readings are nearly independent of the type of gas used as long as the gas pressure is low and the temperature is well above the point at which the gas liquefies.

If you extend the curves shown in figure toward negative temperatures, you find, in every case, that the pressure is zero when the temperature is –273.15° C. This significant temperature is used as the basis for the **absolute temperature scale**, which sets –273.15° C as its zero point.

This temperature is often referred to as **absolute zero**. The size of a degree on the absolute temperature scale is identical to the size of a degree on the celsius scale. Thus, the conversion between these temperatures is

$$\boxed{T_C = T - 273.15} \qquad \ldots\text{(i)}$$

In 1954, by the International committee on weights and measures, the **triple point of water** was chosen as the reference temperature for this new scale. The triple point of water is the single combination of temperature and pressure at which liquid water, gaseous water and ice (solid water) coexist in equilibrium. This triple point occurs at a temperature of approximately 0.01° C and a pressure of 4.58 mm of mercury. On the new scale, which uses the unit **kelvin**, the temperature of water at the triple point was set at 273.16 kelvin, abbreviated as 273.16 K. (No degree sign is used with the unit kelvin).

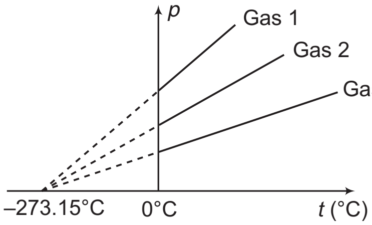

Fig. 20.2

This new absolute temperature scale (also called the kelvin scale) employs the SI unit of absolute temperature, the kelvin which is defined to be "$\frac{1}{273.16}$ of the difference between absolute zero and the temperature of the triple point of water".

The Celsius, Fahrenheit and Kelvin Temperature Scales

Eq. (i) shows the relation between the temperatures in celsius scales and kelvin scale. Because the size of a degree is the same on the two scales, a temperature difference of 10°C is equal to a temperature difference of 10 K. The two scales differ only in the choice of the zero point. The ice point temperature on the kelvin scale, 273.15 K, corresponds to 0.00°C and the kelvin steam point 373.15 K, is equivalent to 100.00°C.

A common temperature scale in everyday use in US is the **Fahrenheit scale**. The ice point in this scale is 32°F and the steam point is 212°F. The distance between these two points are divided in 180 equal parts. The relation between celsius scale and Fahrenheit scale is as derived below.

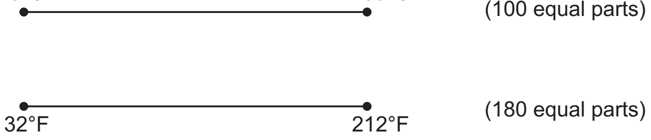

Fig. 20.3

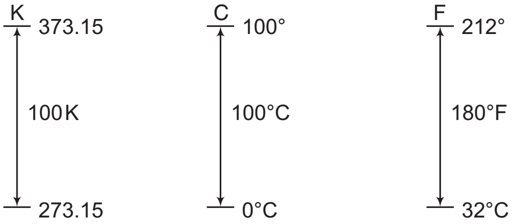
$$100 \text{ parts of celsius scale} = 180 \text{ parts of Fahrenheit scale}$$

$$\therefore \quad 1 \text{ part of celsius scale} = \frac{9}{5} \text{ parts of Fahrenheit scale}$$



Relation among Kelvin, Celsius and Fahrenheit temperature scales

Fig. 20.4

Hence, $$T_F = 32 + \frac{9}{5} T_C \qquad \text{...(ii)}$$

Further, $$\Delta T_C = \Delta T = \frac{5}{9} \Delta T_F \qquad \text{...(iii)}$$

✓ Extra Points to Remember

- **Different Thermometers**

  Thermometric property It is the property that can be used to measure the temperature. It is represented by any physical quantity such as length, volume, pressure and resistance etc., which varies linearly with a certain range of temperature. Let X denotes the thermometric physical quantity and X_0, X_{100} and X_t be its values at 0°C, 100°C and t °C respectively. Then,

$$\boxed{t = \left(\frac{X_t - X_0}{X_{100} - X_0}\right) \times 100°\text{C}}$$

  (i) Constant volume gas thermometer The pressure of a gas at constant volume is the thermometric property. Therefore,

$$\boxed{t = \left(\frac{p_t - p_0}{p_{100} - p_0}\right) \times 100°\text{C}}$$

  (ii) Platinum resistance thermometer The resistance of a platinum wire is the thermometric property. Hence,

$$\boxed{t = \left(\frac{R_t - R_0}{R_{100} - R_0}\right) \times 100°\text{C}}$$

  (iii) Mercury thermometer In this thermometer, the length of a mercury column from some fixed point is taken as thermometric property. Thus,

$$\boxed{t = \left(\frac{l_t - l_0}{l_{100} - l_0}\right) \times 100°\text{C}}$$

- Two other thermometers, commonly used are **thermocouple thermometer** and **total radiation pyrometer.**

- **Total radiation pyrometer** is used to measure very high temperatures. When a body is at a high temperature, it glows brightly and the radiation emitted per second from unit area of the surface of the body is proportional to the fourth power of the absolute temperature of the body. If this radiation is measured by some device, the temperature of the body is calculated. This is the principle of a total radiation pyrometer. The main advantage of this thermometer is that the experimental body is not kept in contact with it. Hence, there is no definite higher limit of its temperature range. It can measure temperature from 800°C to 3000°C–4000°C. However, it cannot be used to measure temperatures below 800°C because at low temperatures the emission of radiation is so poor that it cannot be measured directly.
- **Ranges of different thermometers**

Table 20.1

Thermometer	Lower limit	Upper limit
Mercury thermometer	–30°C	300°C
Gas thermometer	–268°C	1500°C
Platinum resistance thermometer	–200°C	1200°C
Thermocouple thermometer	–200°C	1600°C
Radiation thermometer	800°C	No limit

- **Reaumur's scale** Other than Celsius, Fahrenheit and Kelvin temperature scales **Reaumur's scale** was designed by Reaumur in 1730. The lower fixed point is 0°R representing melting point of ice. The upper fixed point is 80°R, which represents boiling point of water. The distance between the two fixed points is divided into 80 equal parts. Each part represents 1°R. If T_C, T_F and T_R are temperature values of a body on Celsius scale, Fahrenheit scale and Reaumur scale respectively, then

$$\boxed{\frac{T_C - 0}{100} = \frac{T_F - 32}{180} = \frac{T_R - 0}{80}}$$

- A substance is found to exist in three states solid, liquid and gas. For each substance, there is a set of temperature and pressure at which all the three states may coexist. This is called **triple point** of that substance. For water, the values of pressure and temperature corresponding to triple point are 4.58 mm of Hg and 273.16°K.

Example 20.1 *Express a temperature of 60°F in degrees Celsius and in Kelvin.*

Solution Substituting $T_F = 60°$ F in Eq. (ii),

$$T_C = \frac{5}{9}(T_F - 32) = \frac{5}{9}(60° - 32°)$$

$$= 15.55° \text{ C}$$ **Ans.**

From Eq. (i),

$$T = T_C + 273.15 = 15.55° \text{ C} + 273.15$$

$$= 288.7 \text{ K}$$ **Ans.**

Example 20.2 *The temperature of an iron piece is heated from 30°C to 90°C. What is the change in its temperature on the Fahrenheit scale and on the kelvin scale?*

Solution $\Delta T_C = 90°\text{ C} - 30°\text{ C} = 60°\text{ C}$

Using Eq. (iii),

$$\Delta T_F = \frac{9}{5}\Delta T_C = \frac{9}{5}(60°\text{ C})$$

$$= 108°\text{ F}$$ **Ans.**

and $$\Delta T = \Delta T_C = 60\text{ K}$$ **Ans.**

INTRODUCTORY EXERCISE 20.1

1. What is the value of
   (a) 0°F in Celsius scale?
   (b) 0 K on Fahrenheit scale?
2. At what temperature is the Fahrenheit scale reading equal to
   (a) twice (b) half of Celsius?
3. A faulty thermometer reads 5°C in melting ice and 99°C in steam. Find the correct temperature in °F when this faulty thermometer reads 52°C.
4. At what temperature the Fahrenheit and Kelvin scales of temperature give the same reading?
5. At what temperature the Fahrenheit and Celsius scales of temperature give the same reading?

20.3 Heat and Temperature

The word heat is always used during transfer of thermal energy from hot body to cold body (due to temperature difference between them). Following are given some statements. Some of them are right and some are wrong. From those statements, you will be able to find the difference between heat and temperature.

Wrong Statements

(i) This body has large quantity of heat.
(ii) Temperature transfer is taking place from body A to body B.

Correct Statements

(i) Temperature of body A is more than temperature of body B.
(ii) Heat transfer is taking place from body A to body B because A is at higher temperature than body B.

Note *One calorie* (1 *cal*) *is defined as the amount of heat required to raise the temperature of one gram of water from* 14.5° *C to* 15.5° *C.*

Experiments have shown that

$$1\ cal = 4.186\ J$$

Similarly, $$1\ kcal = 1000\ cal = 4186\ J$$

The calorie is not a fundamental SI unit.

20.4 Thermal Expansion

Most substances expand when they are heated. Thermal expansion is a consequence of the change in average separation between the constituent atoms of an object. Atoms of an object can be imagined to be connected to one another by stiff springs as shown in Fig. 20.5. At ordinary temperatures, the atoms in a solid oscillate about their equilibrium positions with an amplitude of approximately 10^{-11} m. The average spacing between the atoms is about 10^{-10} m. As the temperature of solid increases, the atoms oscillate with greater amplitudes, as a result the average separation between them increases, consequently the object expands.

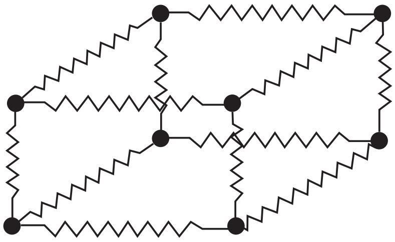


Fig. 20.5

More precisely, thermal expansion arises from the asymmetrical nature of the potential energy curve.

At the atomic level, thermal expansion may be understood by considering how the potential energy of the atoms varies with distance. The equilibrium position of an atom will be at the minimum of the potential energy well if the well is symmetric. At a given temperature, each atom vibrates about its equilibrium position and its average position remains at the minimum point. If the shape of the well is not symmetrical, as shown in figure, the average position of an atom will not be at the minimum point. When the temperature is raised the amplitude of the vibrations increases and the average position is located at a greater interatomic separation. This increased separation is manifested as expansion of the material.

Linear Expansion

Suppose that the temperature of a thin rod of length l is changed from T to $T+\Delta T$. It is found experimentally that, if ΔT is not too large, the corresponding change in length Δl of the rod is directly proportional to ΔT and l. Thus,

$$\Delta l \propto \Delta T$$

and $$\Delta l \propto l$$

Introducing a proportionality constant α (which is different for different materials) we may write Δl as

$$\Delta l = l\alpha\Delta T \qquad \text{...(i)}$$

Here, the constant α is called the **coefficient of linear expansion** of the material of the rod and its units are K^{-1} or $[(^\circ C)^{-1}]$. Remember that $\Delta T = \Delta T_C$.

Actually, α does depend slightly on the temperature, but its variation is usually small enough to be negligible, even over a temperature range of 100°C. We will always assume that α is a constant.

Volume Expansion

Because the linear dimensions of an object change with temperature, it follows that surface area and volume change as well. Just as with linear expansion, experiments show that if the temperature change ΔT is not too great (less than 100°C or so), the increase in volume ΔV is proportional to both, the temperature change ΔT and the initial volume V. Thus,

$$\Delta V \propto \Delta T$$

and

$$\Delta V \propto V$$

Introducing a proportionality constant γ, we may write ΔV as

$$\Delta V = V \times \gamma \times \Delta T \qquad \dots \text{(ii)}$$

Here, γ is called the **coefficient of volume expansion**. The units of γ are K^{-1} or $({}^\circ C)^{-1}$.

Relation Between γ and α

For an isotropic solid (which has the same value of α in all directions) $\gamma = 3\alpha$. To see that $\gamma = 3\alpha$ for a solid, consider a cube of length l and volume $V = l^3$.

When the temperature of the cube is increased by dT, the side length increases by dl and the volume increases by an amount dV given by

$$dV = \left(\frac{dV}{dl}\right) \cdot dl = 3l^2 \cdot dl$$

Now, $$dl = l\alpha dT$$

$\therefore$ $$dV = 3l^3 \alpha dT = (3\alpha) V dT$$

This is consistent with Eq. (ii),

$$dV = \gamma V dT, \text{ only if}$$

$$\gamma = 3\alpha \qquad \dots\text{(iii)}$$

Average values of α and γ for some materials are listed in Table 20.2. You can check the relation $\gamma = 3\alpha$, for the materials given in the table.

Table 20.2

Material	α [K^{-1} or $({}^\circ C)^{-1}$]	γ [K^{-1} or $({}^\circ C)^{-1}$]
Steel	1.2×10^{-5}	3.6×10^{-5}
Copper	1.7×10^{-5}	5.1×10^{-5}
Brass	2.0×10^{-5}	6.0×10^{-5}
Aluminium	2.4×10^{-5}	7.2×10^{-5}

The Anomalous Expansion of Water

Most liquids also expand when their temperatures increase. Their expansion can also be described by Eq. (ii). The volume expansion coefficients for liquids are about 100 times larger than those for solids.

Some substances contract when heated over a certain temperature range. The most common example is water.

Figure shows how the volume of 1 g of water varies with temperature at atmospheric pressure. The volume decreases as the temperature is raised from 0°C to about 4°C, at 4°C the volume is a minimum and the density is a maximum (1000 kg/m^3). Above 4° C, water expands with increasing temperature like most substances.

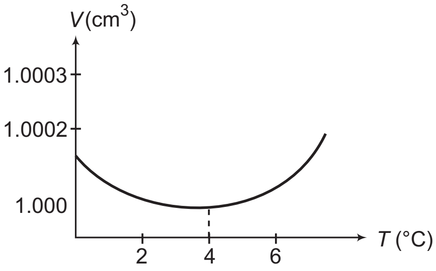

Fig. 20.6

This anomalous behaviour of water causes ice to form first at the surface of a lake in cold weather. As winter approaches, the water temperature decreases initially at the surface. The water there sinks because of its increased density. Consequently, the surface reaches 0°C first and the lake becomes covered with ice. Now ice is bad conductor of heat so water at the bottom remains at 4°C, the highest density of water. Aquatic life is able to survive the cold winter as the bottom of the lake remains unfrozen at a temperature of about 4°C.

✓ Extra Points to Remember

- If a solid object has a hole in it, what happens to the size of the hole, when the temperature of the object increases? A common misconception is that if the object expands, the hole will shrink because material expands into the hole. But the truth is that if the object expands, the hole will expand too, because every linear dimension of an object changes in the same way when the temperature changes.

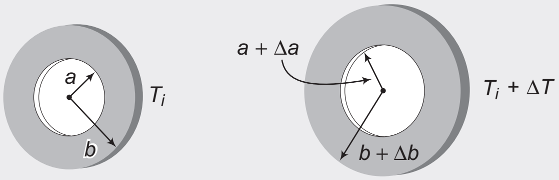

Fig. 20.7

- **Expansion of a bimetallic strip** As Table 20.2 indicates, each substance has its own characteristic average coefficient of expansion.

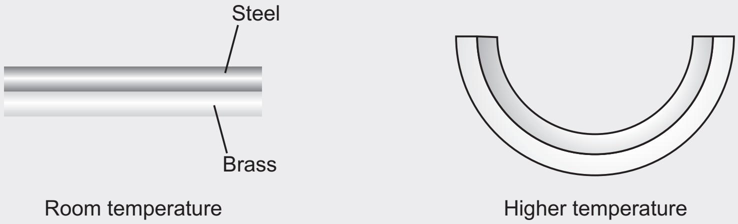

Fig. 20.8

For example, when the temperatures of a brass rod and a steel rod of equal length are raised by the same amount from some common initial value, the brass rod expands more than the steel rod because brass has a greater average coefficient of expansion than steel. Such type of bimetallic strip is found in practical devices such as **thermostats** to break or make electrical contact.

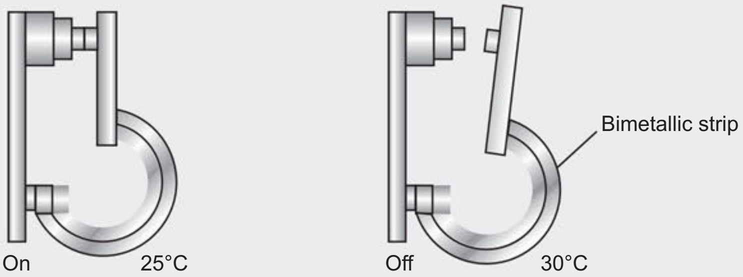

Fig. 20.9

- **Variation of density with temperature** Most substances expand when they are heated, i.e. volume of a given mass of a substance increases on heating, so the density should decrease $\left(\text{as } \rho \propto \frac{1}{V}\right)$. Let us see how the density (ρ) varies with increase in temperature.

$$\rho = \frac{m}{V}$$

or $$\rho \propto \frac{1}{V} \qquad \text{(for a given mass)}$$

∴ $$\frac{\rho'}{\rho} = \frac{V}{V'} = \frac{V}{V + \Delta V} = \frac{V}{V + \gamma V \Delta T} = \frac{1}{1 + \gamma \Delta T}$$

∴ $$\boxed{\rho' = \frac{\rho}{1 + \gamma \Delta T}}$$

This expression can also be written as

$$\rho' = \rho (1 + \gamma \Delta T)^{-1}$$

If γ is very small, $$(1 + \gamma \Delta T)^{-1} \approx 1 - \gamma \Delta T$$

∴ $$\boxed{\rho' \approx \rho (1 - \gamma \Delta T)}$$

- **Effect of temperature on apparent weight when immersed in a liquid** When a solid body is completely immersed in a liquid, its apparent weight gets decreased due to an upthrust acting on it by the liquid. The apparent weight is given by

$$w_{\text{app}} = w - F$$

Here, F = upthrust = $V_S \rho_L g$

where, V_S = volume of solid and ρ_L = density of liquid

Now, as the temperature is increased V_S increases while ρ_L decreases. So, F may increase or decrease (or may remain constant also) depending upon the condition that which factor dominates on the other. We can write

$$F \propto V_S \rho_L$$

or $$\frac{F'}{F} = \frac{V_S'}{V_S} \cdot \frac{\rho_L'}{\rho_L} = \frac{(V_S + \Delta V_S)}{V_S} \cdot \left(\frac{1}{1 + \gamma_L \Delta T}\right)$$

$$= \left(\frac{V_S + \gamma_S V_S \Delta T}{V_S}\right)\left(\frac{1}{1 + \gamma_L \Delta T}\right)$$

or $$F' = F\left(\frac{1+\gamma_S \Delta T}{1+\gamma_L \Delta T}\right)$$

Now, if $\gamma_S > \gamma_L, F' > F$

or $w'_{\text{app}} < w_{\text{app}}$ and *vice-versa*.

And if $\gamma_S = \gamma_L, \quad F' = F$

or $w'_{\text{app}} = w_{\text{app}}$

- **Effect of temperature on immersed fraction of a solid in floating condition**

When a solid, whose density is less than the density of liquid is floating in it, then

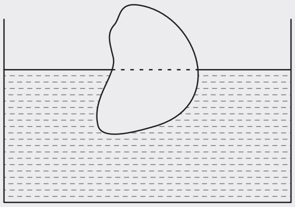

Fig. 20.10

Weight of the solid = Upthrust on solid from liquid

$$\therefore \quad V\rho_s g = V_i \rho_l g \qquad \text{...(i)}$$

Here,

ρ_s = density of solid

ρ_l = density of liquid

V_i = immersed volume of solid and

V = total volume of solid

From Eq. (i),

$$\frac{V_i}{V} = \frac{\rho_s}{\rho_l} = f \qquad \text{...(ii)}$$

where, f = immersed fraction of solid.

With increase in temperature, ρ_s and ρ_l both will decrease. Therefore, this fraction may increase, decrease or remain constant. At some higher temperature,

$$f' = \frac{\rho_s'}{\rho_l'} \qquad \text{...(iii)}$$

From Eqs. (ii) and (iii), we have

$$\frac{f'}{f} = \left(\frac{\rho_s'}{\rho_s}\right)\left(\frac{\rho_l}{\rho_l'}\right)$$

$$= \left(\frac{1}{1+\gamma_s \Delta\theta}\right)(1+\gamma_l \Delta\theta)$$

or $$\frac{f'}{f} = \left(\frac{1+\gamma_l \Delta\theta}{1+\gamma_s \Delta\theta}\right)$$

Now, if $\gamma_l > \gamma_s$, $f' > f$ or immersed fraction will increase.

If $\gamma_l = \gamma_s$, $f' = f$ or immersed fraction will remain unchanged and if,

$\gamma_l < \gamma_s$, then $f' < f$ or immersed fraction will decrease.

- **Effect of temperature on the time period of a pendulum** The time period of a simple pendulum is given by

$$T = 2\pi\sqrt{\frac{l}{g}}$$

or $$T \propto \sqrt{l}$$

As the temperature is increased, length of the pendulum and hence, time period gets increased or a pendulum clock becomes slow and it loses the time.

$$\frac{T'}{T} = \sqrt{\frac{l'}{l}} = \sqrt{\frac{l + \Delta l}{l}}$$

Here, we put $\Delta l = l\alpha\Delta\theta$ in place of $l\alpha\Delta T$ so as to avoid the confusion with change in time period. Thus,

$$\frac{T'}{T} = \sqrt{\frac{l + l\alpha\Delta\theta}{l}} = (1 + \alpha\Delta\theta)^{1/2}$$

or $$T' \approx T\left(1 + \frac{1}{2}\alpha\Delta\theta\right) \qquad (\text{if } \alpha\Delta\theta << 1)$$

or $$\boxed{\Delta T = T' - T = \frac{1}{2}T\alpha\Delta\theta}$$

Time lost in time t (by a pendulum clock whose actual time period is T and the changed time period at some higher temperature is T') is

$$\Delta t = \left(\frac{\Delta T}{T'}\right)t$$

- At some higher temperature a scale will expand and scale reading will be lesser than true value. However, at lower temperatures scale reading will be more or true value will be less.
- When a rod whose ends are rigidly fixed such as to prevent from expansion or contraction undergoes a change in temperature, thermal stresses are developed in the rod. This is because, if the temperature is increased, the rod has a tendency to expand but since it is fixed at two ends it is not allowed to expand. So, the rod exerts a force on supports to expand.

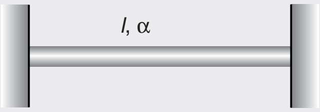

Fig. 20.11

Thermal strain $= \frac{\Delta l}{l} = \alpha\Delta T$

So thermal stress = (Y) (termal strain) = $Y\alpha\Delta T$

or force on supports $F = A$ (stress) = $YA\alpha\Delta T$

Here, Y = Young's modulus of elasticity of the rod.

$$\boxed{F = YA\alpha\Delta T}$$

- **Expansion of liquids** For heating a liquid it has to be put in some container. When the liquid is heated, the container will also expand. We define coefficient of apparent expansion of a liquid as the apparent increase in volume per unit original volume per °C rise in temperature. It is represented by γ_a. Thus,

$$\gamma_a = \gamma_r - \gamma_g$$

Here, γ_r = coefficient of volume expansion of liquid

and γ_g = coefficient of volume expansion of the container

Example 20.3 *A steel ruler exactly 20 cm long is graduated to give correct measurements at 20°C.*

(a) Will it give readings that are too long or too short at lower temperatures?

(b) What will be the actual length of the ruler when it is used in the desert at a temperature of 40° C ? $\alpha_{steel} = 1.2 \times 10^{-5}\ (°C)^{-1}$.

Solution (a) If the temperature decreases, the length of the ruler also decreases through thermal contraction. Below 20°C, each centimetre division is actually somewhat shorter than 1.0 cm, so the steel ruler gives readings that are too long.

(b) At 40°C, the increase in length of the ruler is

$$\Delta l = l\alpha\Delta T$$

$$= (20)(1.2 \times 10^{-5})(40° - 20°)$$

$$= 0.48 \times 10^{-2}\ \text{cm}$$

∴ The actual length of the ruler is

$$l' = l + \Delta l$$

$$= 20.0048\ \text{cm}$$ **Ans.**

Example 20.4 *The scale on a steel meter stick is calibrated at 15°C. What is the error in the reading of 60 cm at 27°C?* $\alpha_{steel} = 1.2 \times 10^{-5}\ (°C)^{-1}$.

Solution The error in the reading will be

$$\Delta l = (\text{scale reading})(\alpha)(\Delta T)$$

$$= (60)(1.2 \times 10^{-5})(27° - 15°)$$

$$= 0.00864\ \text{cm}$$ **Ans.**

Example 20.5 *A second's pendulum clock has a steel wire. The clock is calibrated at 20°C. How much time does the clock lose or gain in one week when the temperature is increased to 30°C?* $\alpha_{steel} = 1.2 \times 10^{-5} (°C)^{-1}$.

Solution The time period of second's pendulum is 2 second. As the temperature increases length and hence, time period increases. Clock becomes slow and it loses the time. The change in time period is

$$\Delta T = \frac{1}{2} T\alpha\Delta\theta$$

$$= \left(\frac{1}{2}\right)(2)(1.2 \times 10^{-5})(30° - 20°)$$

$$= 1.2 \times 10^{-4}\ \text{s}$$

∴ New time period is

$$T' = T + \Delta T = (2 + 1.2 \times 10^{-4})$$

$$= 2.00012\ \text{s}$$

∴ Time lost in one week

$$\Delta t = \left(\frac{\Delta T}{T'}\right) t$$

$$= \frac{(1.2 \times 10^{-4})}{(2.00012)} (7 \times 24 \times 3600)$$

$$= 36.28 \text{ s}$$ **Ans.**

Example 20.6 *A sphere of diameter 7 cm and mass 266.5 g floats in a bath of liquid. As the temperature is raised, the sphere just sinks at a temperature of $35° C$. If the density of the liquid at $0° C$ is 1.527 g/cm^3, find the coefficient of cubical expansion of the liquid. Ignore expansion of sphere.*

Solution The sphere will sink in the liquid at 35°C, when its density becomes equal to the density of liquid at 35° C.

The density of sphere,

$$\rho_{35} = \frac{266.5}{\frac{4}{3} \times \left(\frac{22}{7}\right) \times \left(\frac{7}{2}\right)^3}$$

$$= 1.483 \text{ g/cm}^3$$

Now,

$$\rho_0 = \rho_{35} \, [1 + \gamma \Delta T)$$

$$1.527 = 1.483 [1 + \gamma \times 35]$$

$$1.029 = 1 + \gamma \times 35$$

$$\gamma = \frac{1.029 - 1}{35}$$

$$= 0.00083/° \text{ C}$$ **Ans.**

Example 20.7 *A glass beaker holds exactly 1 L at 0°C*

(a) What is its volume at 50°C?

(b) If the beaker is filled with mercury at 0°C, what volume of mercury overflows when the temperature is 50°C ? $\alpha_g = 8.3 \times 10^{-6}$ per ° C and $\gamma_{Hg} = 1.82 \times 10^{-4}$ per ° C.

Solution (a) The volume of beaker after the temperature change is

$$V_{\text{beaker}} = V_0 \, (1 + 3\alpha_g \Delta\theta)$$

$$= (1) [1 + 3 \times 8.3 \times 10^{-6} \times 50]$$

$$= 1.001 \text{ L}$$ **Ans.**

(b) Volume of mercury at 50°C is

$$V_{\text{mercury}} = V_0 \, (1 + \gamma_{Hg} \Delta\theta)$$

$$= (1) [1 + 1.82 \times 10^{-4} \times 50]$$

$$= 1.009 \text{ L}$$

The overflow is thus $1.009 - 1.001 = 0.008$ L or 8 mL **Ans.**

INTRODUCTORY EXERCISE 20.2

Take the values of α from Table 20.2.

1. A pendulum clock of time period 2 s gives the correct time at 30°C. The pendulum is made of iron. How many seconds will it lose or gain per day when the temperature falls to 0°C? $\alpha_{Fe} = 1.2 \times 10^{-5} \, (^\circ\text{C})^{-1}$.
2. A block of wood is floating in water at 0°C. The temperature of water is slowly raised from 0°C to 10°C. How will the percentage of volume of block above water level change with rise in temperature?
3. A piece of metal floats on mercury. The coefficient of volume expansion of metal and mercury are γ_1 and γ_2, respectively. If the temperature of both mercury and metal are increased by an amount ΔT, by what factor does the fraction of the volume of the metal submerged in mercury changes?
4. A brass disc fits snugly in a hole in a steel plate. Should you heat or cool the system to losen the disc from the hole? Given that $\alpha_B > \alpha_{Fe}$.
5. An iron ball has a diameter of 6 cm and is 0.010 mm too large to pass through a hole in a brass plate when the ball and plate are at a temperature of 30° C. At what temperature, the same for ball and plate, will the ball just pass through the hole?
   Take the values of α from Table 20.2.
6. (a) An aluminium measuring rod which is correct at 5° C, measures a certain distance as 88.42 cm at 35 ° C. Determine the error in measuring the distance due to the expansion of the rod. (b) If this aluminium rod measures a length of steel as 88.42 cm at 35° C, what is the correct length of the steel at 35° C?
7. A steel tape is calibrated at 20° C . On a cold day when the temperature is –15° C, what will be the percentage error in the tape?

20.5 Behaviour of Gases

Gases are the most diffused form of matter. In a gas, the molecules are highly energetic and they can be widely separated from each other. The behaviour of gases and their properties derive from these facts.

Sometimes the term vapour is used to describe a gas. Strictly speaking, a gas is a substance at a temperature above its boiling point. A vapour is the gaseous phase of a substance that under ordinary conditions, exists as a liquid or solid.

One of the more obvious characteristics of gases is their ability to expand and fill any volume they are placed in. This contrasts with the behaviour exhibited by solids (fixed shape and volume) and liquids (fixed volume but indeterminate shape).

Ideal and Real Gas Laws

Gases, unlike solids and liquids have indefinite shape and indefinite volume. As a result, they are subjected to pressure changes, volume changes and temperature changes. Real gas behaviour is simpler. By understanding ideal gas behaviour, real gas behaviour becomes more tangible.

Ideal Gases

How do we describe an ideal gas? An ideal gas has the following properties :

1. An ideal gas is considered to be a "point mass". A point mass is a particle so small, its volume is very nearly zero. This means an ideal gas particle has virtually no volume.
2. Collisions between ideal gases are "elastic". This means that no attractive or repulsive forces are involved during collisions. Also, the kinetic energy of the gas molecules remains constant since these intermolecular forces are lacking.

   Volume and temperature are by now familiar concepts. Pressure, however, may need some explanation. Pressure is defined as a force per unit area. When gas molecules collide with the sides of a exert, they exert a force over that area of the container. This gives rise to the pressure inside the container.

Gas Laws

Assuming permanent (or real) gases to be ideal, through experiments, it was established that gases irrespective of their nature obey the following laws :

Boyle's Law

According to this law, for a given mass of a gas, the volume of a gas at constant temperature (called **isothermal process**) is inversely proportional to its pressure, i.e.

$$V \propto \frac{1}{p} \qquad (T = \text{constant})$$

or

$$pV = \text{constant}$$

or

$$p_i V_i = p_f V_f$$

Thus, p-V graph in an isothermal process is a rectangular hyperbola. Or pV *versus* p or V graph is a straight line parallel to p or V axis.

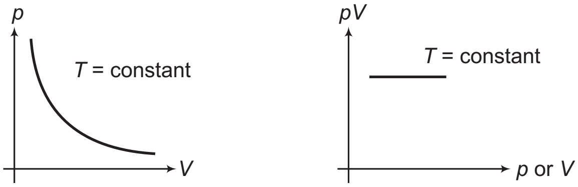

Fig. 20.12

Charles' Law

According to this law, for a given mass of a gas the volume of a gas at constant pressure (called **isobaric** process) is directly proportional to its absolute temperature, i.e.

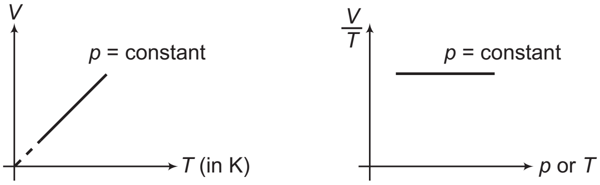

Fig. 20.13

$$V \propto T \qquad (p = \text{constant})$$

or $$\frac{V}{T} = \text{constant} \quad \text{or} \quad \frac{V_i}{T_i} = \frac{V_f}{T_f}$$

Thus, V-T graph in an isobaric process is a straight line passing through origin. Or V/T *versus* V or T graph is a straight line parallel to V or T axis.

Gay Lussac's Law or Pressure Law

According to this law, for a given mass of a gas the pressure of a gas at constant volume (called **isochoric process**) is directly proportional to its absolute temperature, i.e.

$$p \propto T \quad (V = \text{constant}) \quad \text{or} \quad \frac{p}{T} = \text{constant} \quad \text{or} \quad \frac{p_i}{T_i} = \frac{p_f}{T_f}$$

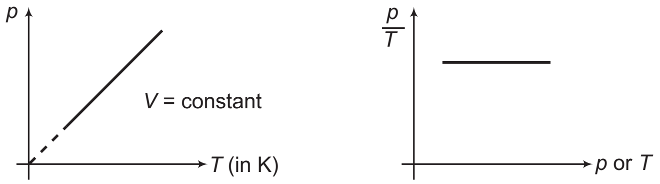

Fig. 20.14

Thus, p - T graph in an isochoric process is a straight line passing through origin or p/T *versus* p or T graph is a straight line parallel to p or T axis.

Ideal Gas Equation

All the above four laws can be written in one single equation known as ideal gas equation. According to this equation.

$$\boxed{pV = nRT = \frac{m}{M} RT}$$

In this equation, n = number of moles of the gas

$$= \frac{m}{M}$$

m = total mass of the gas

M = molecular mass of the gas

and R = universal gas constant

$= 8.31$ J/mol-K

$= 2.0$ cal/mol-K

The above three laws can be derived from this single equation. For example, for a given mass of a gas (m = constant)

$$pV = \text{constant at constant temperature} \qquad \text{(Boyle's law)}$$

$$\frac{p}{T} = \text{constant at constant volume} \qquad \text{(Pressure law)}$$

$$\frac{V}{T} = \text{constant at constant pressure} \qquad \text{(Charles' law)}$$

Avogadro's Law

The next empirical gas law, we will look at, is called Avogadro's law. This law deals with the relationship between the volume and moles of a gas at constant pressure and temperature. According to this law, at same temperature and pressure equal volumes of all gases contain equal number of molecules. Let's derive this law from the ideal gas law. Give the moles and volume subscripts, since their conditions will change.

$$pV_1 = n_1RT \quad \text{and} \quad pV_2 = n_2RT$$

Collect terms. Divide each equation by pressure, p and divide each equation by their respective mole term

$$\frac{n_1}{V_1} = \frac{n_2}{V_2} = \frac{p}{RT}$$

Thus, the number of molecules per unit volume is same for all gases at a fixed temperature and pressure. The number in 22.4 litres of any gas is 6.02×10^{23}. This is known as Avogadro number and is denoted by N_A. The mass of 22.4 litres of any gas is equal to its molecular weight in grams at S.T.P. (standard temperature 273 K and pressure 1 atm). This amount of substance is called a mole.

Note *$k = \frac{R}{N_A}$ is called **Boltzmann constant**. Its value in SI unit is* 1.38×10^{-23} *J/K.*

Extra Points to Remember

- In our previous discussion, we have discussed Charles' law and pressure law in absolute temperature scale. In centigrade scale, these laws are as under :

Charles' law When a given mass of a gas is heated at constant pressure then for each 1°C rise in temperature the volume of the gas increases by a fraction α of its volume at 0°C. Thus, if the volume of a given mass of a gas at 0°C is V_0, then on heating at constant pressure to t°C its volume will increase by $V_0\alpha t$. Therefore, if its volume at t°C be V_t, then

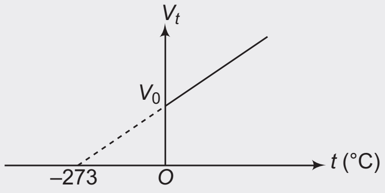

Fig. 20.15

$$V_t = V_0 + V_0\alpha t \quad \text{or} \quad V_t = V_0(1 + \alpha t)$$

Here, α is called the 'volume coefficient' of the gas. For all gases, the experimental value of α is nearly $\frac{1}{273}$ per °C.

$$\therefore \qquad V_t = V_0\left(1 + \frac{t}{273}\right)$$

Thus, V_t *versus* t graph is a straight line with slope $\frac{V_0}{273}$ and positive intercept V_0. Further $V_t = 0$ at

$$t = -273°\text{C}.$$

Pressure law According to this law, when a given mass of a gas is heated at constant volume then for each 1°C rise in temperature, the pressure of the gas increases by a fraction β of its pressure at 0°C. Thus, if the pressure of a given mass of a gas at 0°C be p_0, then on heating at constant volume to t°C, its pressure will increase by $p_0\beta t$. Therefore, if its pressure at t°C be p_t, then

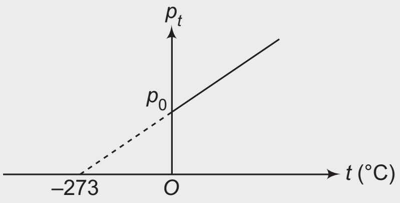

Fig. 20.16

$$p_t = p_0 + p_0\beta t \quad \text{or} \quad p_t = p_0(1 + \beta t)$$

Here, β is called the 'pressure coefficient' of the gas. For all gases the experimental value of β is also

$$\frac{1}{273} \text{ per } ^\circ\text{C} \quad \Rightarrow \quad p_t = p_0 \left(1 + \frac{t}{273}\right)$$

p_t *versus* t graph is as shown in Fig 20.16.

- The above forms of Charles' law and pressure law can be simply expressed in terms of absolute temperature.

  Let at constant pressure, the volume of a given mass of a gas at 0°C, t_1°C and t_2°C be V_0, V_1 and V_2 respectively. Then,

$$V_1 = V_0 \left(1 + \frac{t_1}{273}\right) = V_0 \left(\frac{273 + t_1}{273}\right)$$

$$V_2 = V_0 \left(1 + \frac{t_2}{273}\right) = V_0 \left(\frac{273 + t_2}{273}\right)$$

$$\therefore \quad \frac{V_1}{V_2} = \frac{273 + t_1}{273 + t_2} = \frac{T_1}{T_2}$$

  where, T_1 and T_2 are the absolute temperatures corresponding to t_1°C and t_2°C . Hence,

$$\frac{V_1}{T_1} = \frac{V_2}{T_2} \quad \text{or} \quad \frac{V}{T} = \text{constant} \quad \text{or} \quad V \propto T$$

  This is the form of Charles' law which we have already studied in article 20.5. In the similar manner, we can prove the pressure law.

- Under isobaric conditions (p = constant), V-T graph is a straight line passing through origin (where, T is in kelvin). The slope of this line is $\left(\frac{nR}{p}\right)$ as $V = \left(\frac{nR}{p}\right) T$ or slope of the line is directly proportional to $\frac{n}{p}$.

$$\text{slope} = \frac{nR}{p} \quad \text{or} \quad \text{slope} \propto \frac{n}{p}$$

  Similarly, under isochoric conditions (V = constant), p-T graph is a straight line passing through origin whose slope is $\frac{nR}{V}$ or slope is directly proportional to $\frac{n}{V}$.

- **Density of a gas** The ideal gas equation is

$$pV = nRT = \frac{m}{M} RT$$

$$\therefore \quad \frac{m}{V} = \rho = \frac{pM}{RT} \qquad (\rho = \text{density})$$

$$\therefore \quad \rho = \frac{pM}{RT}$$

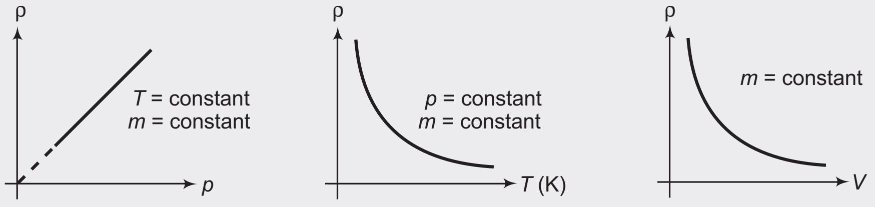

Fig. 20.17

From this equation, we can see that ρ-p graph is straight line passing through origin at constant temperature $(\rho \propto p)$ and ρ-T graph is a rectangular hyperbola at constant pressure $\left(\rho \propto \frac{1}{T}\right)$. Similarly, for a given mass of a gas ρ-V graph is a rectangular hyperbola $\left(\rho \propto \frac{1}{V}\right)$.

Example 20.8 *p-V diagrams of same mass of a gas are drawn at two different temperatures T_1 and T_2. Explain whether $T_1 > T_2$ or $T_2 > T_1$.*

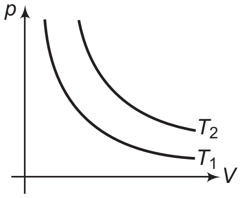

Fig. 20.18

Solution The ideal gas equation is

$$pV = nRT \quad \text{or} \quad T = \frac{pV}{nR}$$

$T \propto pV$ if number of moles of the gas are kept constant. Here, mass of the gas is constant, which implies that number of moles are constant, i.e. $T \propto pV$. In the given diagram, product of p and V for T_2 is more than T_1 at all points (keeping either p or V same for both graphs). Hence,

$$T_2 > T_1$$ **Ans.**

Example 20.9 *The p-V diagram of two different masses m_1 and m_2 are drawn (as shown) at constant temperature T. State whether $m_1 > m_2$ or $m_2 > m_1$.*

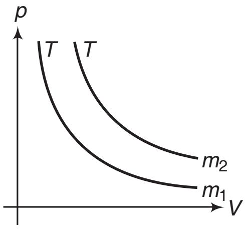

Fig. 20.19

Solution

$$pV = nRT = \frac{m}{M} RT$$

$$\therefore \quad m = (pV)\left(\frac{M}{RT}\right) \quad \text{or} \quad m \propto pV \text{ if } T = \text{constant}$$

From the graph, we can see that $p_2V_2 > p_1V_1$ (for same p or V). Therefore,

$$m_2 > m_1$$ **Ans.**

Example 20.10 *The p-T graph for the given mass of an ideal gas is shown in figure. What inference can be drawn regarding the change in volume (whether it is constant, increasing or decreasing)?*

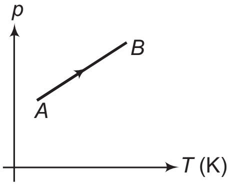

Fig. 20.20

How to Proceed *Definitely, it is not constant. Because when volume of the gas is constant p-T graph is a straight line passing through origin. The given line does not pass through origin, hence volume is not constant.*

$$V = (nR)\left(\frac{T}{p}\right)$$

Now, to see the volume of the gas we will have to see whether $\frac{T}{p}$ *is increasing or decreasing.*

Solution From the given graph, we can write the *p*-*T* equation as

$$p = aT + b \qquad (y = mx + c)$$

Here, a and b are positive constants. Further,

$$\frac{p}{T} = a + \frac{b}{T}$$

Now, $$T_B > T_A$$

$\therefore$ $$\frac{b}{T_B} < \frac{b}{T_A} \quad \text{or} \quad \left(\frac{p}{T}\right)_B < \left(\frac{p}{T}\right)_A$$

or $$\left(\frac{T}{p}\right)_B > \left(\frac{p}{T}\right)_A$$

or $$V_B > V_A$$ **Ans.**

Thus, as we move from A to B, volume of the gas is increasing.

Example 20.11 *A gas at* $27°\,C$ *in a cylinder has a volume of* 4 *litre and pressure* 100 Nm^{-2}.

(i) *Gas is first compressed at constant temperature so that the pressure is* 150 Nm^{-2}. *Calculate the change in volume.*

(ii) *It is then heated at constant volume so that temperature becomes* $127°\,C$. *Calculate the new pressure.*

Solution (i) Using Boyle's law for constant temperature,

$$p_1V_1 = p_2V_2$$

$\therefore$ $$V_2 = \frac{p_1V_1}{p_2} = \frac{100\times 4}{150} = 2.667\ \text{L}$$

$\therefore$ $$\text{Change in volume} = V_2 - V_1 = 2.667 - 4$$
$$= -1.333\ \text{L}$$

(ii) Using Gay Lussac's law for constant volume,

$$\frac{p_2}{p_1} = \frac{T_2}{T_1} \quad \text{or} \quad p_2 = \frac{T_2}{T_1}\times p_1 = \frac{(127+273)\times 150}{(27+273)}$$
$$= 200\ \text{Nm}^{-2}$$

Example 20.12 *A balloon partially filled with helium has a volume of* $30\ m^3$, *at the earth's surface, where pressure is* 76 *cm of Hg and temperature is* $27°\,C$. *What will be the increase in volume of gas if balloon rises to a height, where pressure is* 7.6 *cm of Hg and temperature is* $-54°\,C$?

Solution As $\dfrac{p_1V_1}{T_1} = \dfrac{p_2V_2}{T_2}$

$$\therefore \qquad V_2 = \frac{p_1V_1T_2}{T_1 p_2}$$

$$= \frac{76 \times 30 \times (-54 + 273)}{(27 + 273) \times 7.6}$$

$$= 219 \text{ m}^3$$

$\therefore$ Increase in volume of gas

$$= V_2 - V_1 = 219 - 30$$

$$= 189 \text{ m}^3$$

INTRODUCTORY EXERCISE 20.3

1. From the graph for an ideal gas, state whether m_1 or m_2 is greater.

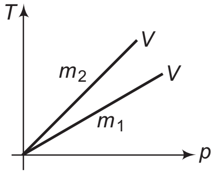

Fig. 20.21

2. A vessel is filled with an ideal gas at a pressure of 20 atm and is at a temperature of 27°C. One-half of the mass is removed from the vessel and the temperature of the remaining gas is increased to 87°C. At this temperature, find the pressure of the gas.
3. A vessel contains a mixture of 7 g of nitrogen and 11 g of carbon dioxide at temperature $T = 290$ K. If pressure of the mixture is 1 atm $(= 1.01 \times 10^5 \text{ N/m}^2)$, calculate its density $(R = 8.31 \text{J/mol-K})$.
4. An electric bulb of volume 250 cm^3 was sealed off during manufacture at a pressure of 10^{-3} mm of mercury at 27°C. Compute the number of air molecules contained in the bulb. Given that $R = 8.31 \text{J/mol-K}$ and $N_A = 6.02 \times 10^{23}$ per mol.
5. State whether $p_1 > p_2$ or $p_2 > p_1$ for given mass of a gas?

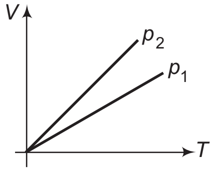

Fig. 20.22

6. For a given mass of a gas what is the shape of p *versus* $\dfrac{1}{V}$ graph at constant temperature?
7. For a given mass of a gas, what is the shape of pV *versus* T graph in isothermal process?

20.6 Degree of Freedom (f)

The minimum number of ways in which motion of a body (or a system) can be described completely is called its degree of freedom.

For example In Fig. (a), block has one degree of freedom, because it is confined to move in a straight line and has only one translational degree of freedom.

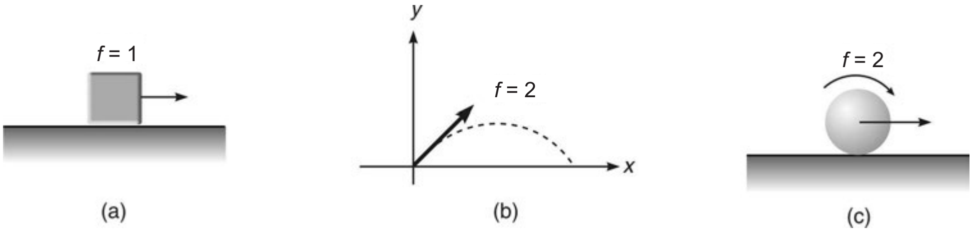

Fig. 20.23

In Fig. (b), the particle has two degrees of freedom because it is confined to move in a plane and so it has two translational degrees of freedom.

In Fig. (c), the sphere has two degrees of freedom one rotational and another translational.

Similarly, a particle free to move in space will have three translational degrees of freedom.

Degree of Freedom of Gas Molecules

A gas molecule can have, the following types of energies

(i) translational kinetic energy
(ii) rotational kinetic energy
(iii) vibrational energy (potential + kinetic)

Vibrational Energy

The forces between different atoms of a gas molecule (interatomic force) may be visualized by imagining every atom as being connected to its neighbours by springs. Each atom can vibrate along the line joining the atoms. Energy associated with this is called vibrational energy.

Degree of Freedom of Monoatomic Gas

A monoatomic gas molecule (like He) consists of a single atom. It can have translational motion in any direction in space. Thus, it has 3 translational degrees of freedom.

$$f = 3 \quad \text{(all translational)}$$

It can also rotate but due to its small moment of inertia, rotational kinetic energy is neglected.

Degree of Freedom of a Diatomic and Linear Polyatomic Gas

The molecules of a diatomic and linear polyatomic gas (like O_2, CO_2 and H_2) cannot only move bodily but also rotate about anyone of the three coordinate axes as shown in figure. However, its moment of inertia about the axis joining the two atoms (x-axis) is negligible. Hence, it can have only two rotational degrees of freedom. Thus, a diatomic molecule has 5 degrees of freedom : 3 translational and 2 rotational. At sufficiently high temperatures, it has vibrational energy as well providing it two more degrees of freedom (one vibrational kinetic energy and another vibrational potential energy). Thus, at high temperatures a diatomic molecule has 7 degrees of freedom, 3 translational, 2 rotational and 2 vibrational. Thus,

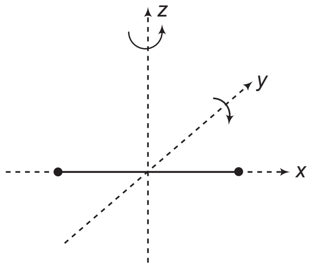

Fig. 20.24

$f = 5$ (3 translational + 2 rotational) at room temperatures and

$f = 7$ (3 translational + 2 rotational + 2 vibrational) at high temperatures.

Degree of Freedom of Non-linear Polyatomic Gas

A non-linear polyatomic molecule (such as NH_3) can rotate about any of three coordinate axes. Hence, it has 6 degrees of freedom 3 translational and 3 rotational. At room temperatures, a polyatomic gas molecule has insignificant vibrational energy. But at high enough temperatures it is also significant. So, it has 8 degrees of freedom 3 rotational, 3 translational and 2 vibrational. Thus,

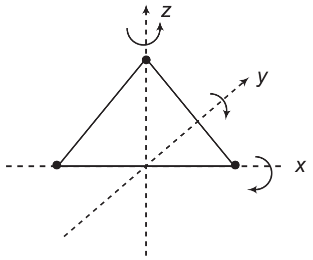

Fig. 20.25

$f = 6$ (3 translational + 3 rotational) at room temperatures and

$f = 8$ (3 translational + 3 rotational + 2 vibrational) at high temperatures.

Degree of Freedom of a Solid

An atom in a solid has no degrees of freedom for translational and rotational motion. At high temperatures, due to vibration along 3 axes it has $3 \times 2 = 6$ degrees of freedom.

$f = 6$ (all vibrational) at high temperatures

Note *(i) Degrees of freedom of a diatomic and polyatomic gas depends on temperature and since there is no clear cut demarcation line above which vibrational energy become significant. Moreover, this temperature varies from gas to gas. On the other hand, for a monoatomic gas there is no such confusion. Degree of freedom here is 3 at all temperatures. Unless and until stated in the question you can take $f = 3$ for monoatomic gas, $f = 5$ for a diatomic gas and $f = 6$ for a non-linear polyatomic gas.*

(ii) When a diatomic or polyatomic gas dissociates into atoms it behaves as a monoatomic gas. Whose degrees of freedom are changed accordingly.

20.7 Internal Energy of an Ideal Gas

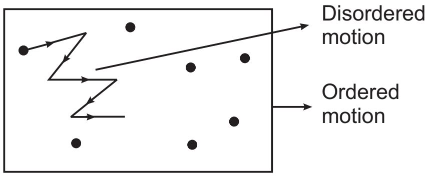

Fig. 20.26

Suppose a gas is contained in a closed vessel as shown in figure. If the container as a whole is moving with some speed, then this motion is called the **ordered motion** of the gas. Source of this motion is some external force. The *zig-zag* motion of gas molecules within the vessel is known as the **disordered motion**. This motion is directly related to the temperature of the gas. As the temperature is increased, the disordered motion of the gas molecules gets fast. The internal energy (U) of the gas is concerned only with its disordered motion. It is in no way concerned with its ordered motion. When the temperature of the gas is increased, its disordered motion and hence its internal energy is increased.

Intermolecular forces in an ideal gas is zero. Thus, PE due to intermolecular forces of an ideal gas is zero. A monoatomic gas is having a single atom. Hence, its vibrational energy is zero. For dia and polyatomic gases vibrational energy is significant only at high temperatures. So, they also have only translational and rotational KE. We may thus conclude that at room temperature the internal energy of an ideal gas (whether it is mono, dia or poly) consists of only translational and rotational KE. Thus,

U (of an ideal gas) $= K_T + K_R$ at room temperatures.

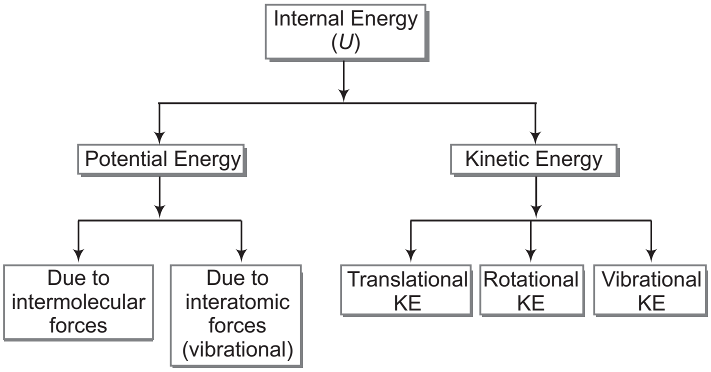

Fig. 20.27

Later in the next article, we will see that K_T (translational KE) and K_R (rotational KE) depends on T only. They are directly proportional to the absolute temperature of the gas. Thus, **internal energy of an ideal gas depends only on its absolute temperature (*T*) and is directly proportional to *T*.**

$$\boxed{U \propto T}$$

20.8 Law of Equipartition of Energy

An ideal gas is just like an ideal father. An ideal father distributes whole of its properties and assets equally among his children. Same is the case with an ideal gas. It distributes its internal energy equally in all degrees of freedom. In each degree of freedom energy of one mole of an ideal gas is

$\frac{1}{2}RT$, where T is the absolute temperature of the gas. Thus, if f be the number of degrees of freedom, the internal energy of 1 mole of the gas will be $\frac{f}{2}RT$ or internal energy of n moles of the gas will be $\frac{n}{2}fRT$. Thus,

$$\boxed{U = \frac{n}{2} fRT} \qquad \ldots\text{(i)}$$

For a monoatomic gas, $f = 3$.

Therefore, $$U = \frac{3}{2}RT \qquad \text{(for 1 mole of a monoatomic gas)}$$

For a dia and linear polyatomic gas at low temperatures, $f = 5$, so,

$$U = \frac{5}{2}RT \qquad \text{(for 1 mole)}$$

and for non-linear polyatomic gas at low temperatures, $f = 6$, so

$$U = \frac{6}{2}RT = 3RT \qquad \text{(for 1 mole)}$$

Note *(i) For one molecule, R (the gas constant) is replaced by k (the Boltzmann constant). For example, internal energy of one molecule in one degree of freedom will be* $\frac{1}{2}kT$.

(ii) Ignoring the vibrational effects we can summarise the above results in tabular form as below.

Table 20.3

Nature of gas	Degree of freedom			Internal energy of 1 mole			Internal energy of 1 molecule		
	Total	Translational	Rotational	Total	Translational	Rotational	Total	Translational	Rotational
Monoatomic	3	3	0	$\frac{3}{2}RT$	$\frac{3}{2}RT$	0	$\frac{3}{2}kT$	$\frac{3}{2}kT$	0
Dia or linear polyatomic	5	3	2	$\frac{5}{2}RT$	$\frac{3}{2}RT$	RT	$\frac{5}{2}kT$	$\frac{3}{2}kT$	kT
Non-linear polyatomic	6	3	3	$3RT$	$\frac{3}{2}RT$	$\frac{3}{2}RT$	$3kT$	$\frac{3}{2}kT$	$\frac{3}{2}kT$

(iii) From the above table, we can see that translational kinetic energy of all types of gases is same. The difference is in rotational kinetic energy.

Example 20.13 *Find total internal energy of 3 moles of hydrogen gas at temperature T.*

Solution Using the relation, $$U = \frac{nf}{2}RT$$

we have, $n = 3$, $f = 5$ for diatomic H_2 gas.

$$\therefore \qquad U = \frac{3 \times 5}{2}RT = 7.5\,RT$$ **Ans.**

Example 20.14 *Ten moles of O_2 gas are kept at temperature T. At some higher temperature 2T, forty percent of molecular oxygen breaks into atomic oxygen. Find change in internal energy of the gas.*

Solution **Initial energy** Using the relation, $U = \frac{nf}{2} RT$

we have, $n = 10$, $f = 5$ for diatomic O_2 gas

$$U_i = \frac{10 \times 5}{2} (RT) = 25\,RT$$

Final energy Forty percent means 4 moles O_2 breaks into O. So, it will become 8 moles of monoatomic gas O. Remaining 6 moles are of diatomic gas O_2. But now the new temperature is $2T$.

$$\therefore \qquad U_f = \frac{8 \times 3}{2} (R)(2T) + \frac{6 \times 5}{2} (R)(2T) = 54\,RT$$

So, change in internal energy, $\Delta U = U_f - U_i = 29\,RT$ **Ans.**

Example 20.15 *At a given temperature internal energy of a monoatomic, diatomic and non-linear polyatomic gas is U_0 each. Find their translational and rotational kinetic energies separately.*

Solution **Monoatomic gas** Translational degree of freedom of monoatomic gas is 3 and rotational degree of freedom is zero. Therefore, whole internal energy is in the form of translational kinetic energy.

$$\therefore \qquad K_T = U_0 \quad \text{and} \quad K_R = 0$$

Diatomic gas Translational degree of freedom of diatomic gas is 3 and rotational degree of freedom is 2. Hence, ratio of translational and rotational kinetic energy will be 3 : 2

$$\therefore \qquad K_T = \frac{3}{5} U_0 \quad \text{and} \quad K_R = \frac{2}{5} U_0$$

Non-linear polyatomic gas In non-linear polyatomic gas translational and rotational both degrees of freedom are 3 each. So, translational and rotational kinetic energy are equal. Hence,

$$K_T = K_R = \frac{U_0}{2}$$

INTRODUCTORY EXERCISE 20.4

1. A gas mixture consists of 2 moles of oxygen and 4 moles of argon at temperature T. Neglecting all vibrational modes, the total internal energy of the system is **(JEE 1999)**

   (a) $4\,RT$ (b) $15\,RT$ (c) $9\,RT$ (d) $11RT$

2. The average translational kinetic energy of O_2 (molar mass 32) molecules at a particular temperature is 0.048 eV. The translational kinetic energy of N_2 (molar mass 28) molecules in eV at the same temperature is **(JEE 1997)**

   (a) 0.0015 (b) 0.003 (c) 0.048 (d) 0.768

3. At a given temperature, rotational kinetic energy of diatomic gas is K_0. Find its translational and total kinetic energy.

20.9 Molar Heat Capacity

"Molar heat capacity C is the heat required to raise the temperature of 1 mole of a gas by 1°C (or 1 K)." Thus,

$$\boxed{C = \frac{\Delta Q}{n\Delta T} \quad \text{or} \quad \Delta Q = nC\Delta T}$$

For a gas, the value of C depends on the process through which its temperature is raised.

For example, in an isothermal process $\Delta T` = 0$ or $C_{\text{iso}} = \infty$. In an adiabatic process, (we will discuss it later) $\Delta Q = 0$. Hence, $C_{\text{adi}} = 0$. Thus, molar heat capacity of a gas varies from 0 to ∞ depending on the process. In general, experiments are made either at constant volume or at constant pressure. In case of solids and liquids, due to small thermal expansion, the difference in measured values of molar heat capacities is very small and is usually neglected. However, in case of gases molar heat capacity at constant volume C_V is quite different from that at constant pressure $C_{p.}$ Later in the next chapter, we will derive the following relations, (for an ideal gas)

$$\boxed{\begin{aligned} C_V &= \frac{dU}{dT} = \frac{f}{2}R = \frac{R}{\gamma - 1} \\ C_p &= C_V + R \\ \gamma &= \frac{C_p}{C_V} = 1 + \frac{2}{f} \end{aligned}}$$

Here, U is the internal energy of one mole of the gas. The most general expression for C in the process $pV^x =$ constant is

$$\boxed{C = \frac{R}{\gamma - 1} + \frac{R}{1 - x}} \qquad \text{(we will derive it later)}$$

For example : For isobaric process $p =$ constant or $x = 0$ and

$$C = C_p = \frac{R}{\gamma - 1} + R = C_V + R$$

For an isothermal process, $pV =$ constant or $x = 1$

∴ $C = \infty$ and

For an adiabatic process $pV^{\gamma} =$ constant or $x = \gamma$

∴ $C = 0$

Values of f, U, C_V, C_p and γ for different gases are given in Table 20.4.

Table 20.4

Nature of gas	f	$U = \frac{f}{2}RT$	$C_V = dU/dT = \frac{f}{2}R$	$C_p = C_V + R$	$\gamma = \frac{C_p}{C_V} = 1 + \frac{2}{f}$
Monoatomic	3	$\frac{3}{2}RT$	$\frac{3}{2}R$	$\frac{5}{2}R$	$\frac{5}{3} = 1.67$
Dia and linear polyatomic	5	$\frac{5}{2}RT$	$\frac{5}{2}R$	$\frac{7}{2}R$	$\frac{7}{5} = 1.4$
Non-linear polyatomic	6	$3RT$	$3R$	$4R$	$\frac{4}{3} = 1.33$

Extra Points to Remember

- Mixture of non-reactive gases

(a) $n = n_1 + n_2$

(b) $p = p_1 + p_2$

(c) $U = U_1 + U_2$

(d) $\Delta U = \Delta U_1 + \Delta U_2$

(e) $C_V = \dfrac{n_1 C_{V_1} + n_2 C_{V_2}}{n_1 + n_2}$

(f) $C_p = \dfrac{n_1 C_{p_1} + n_2 C_{p_2}}{n_1 + n_2} = C_V + R$

(g) $\gamma = \dfrac{C_p}{C_V}$ or $\dfrac{n}{\gamma - 1} \Rightarrow \dfrac{n_1 + n_2}{\gamma - 1} = \dfrac{n_1}{\gamma_1 - 1} + \dfrac{n_2}{\gamma_2 - 1}$

(h) $M = \dfrac{n_1 M_1 + n_2 M_2}{n_1 + n_2}$

Example 20.16 *Two moles of helium (He) are mixed with four moles of hydrogen* (H_2)*. Find*

(a) C_V *of the mixture*

(b) C_p *of the mixture and*

(c) γ *of the mixture.*

Solution Helium is a monoatomic gas.

$$\therefore \qquad C_V = \frac{3}{2}R,\ C_P = \frac{5}{2}R \text{ and } \gamma = \frac{5}{3}$$

Hydrogen is a diatomic gas.

$$\therefore \qquad C_V = \frac{5}{2}R \text{ and } C_V = \frac{7}{2}R \text{ and } \gamma = \frac{7}{5}$$

(a) **C_V of the mixture**

$$C_V = \frac{n_1 C_{V_1} + n_2 C_{V_2}}{n_1 + n_2} = \frac{(2)\left(\frac{3}{2}R\right) + 4\left(\frac{5}{2}R\right)}{2+4}$$

$$= \frac{13}{6}R \qquad \textbf{Ans.}$$

(b) **C_p of the mixture**

$$C_p = C_V + R = \frac{13}{6}R + R$$

$$= \frac{19}{6}R \qquad \textbf{Ans.}$$

Alternate method

$$C_p = \frac{n_1 C_{p_1} + n_2 C_{p_2}}{n_1 + n_2}$$

$$= \frac{(2)\left(\frac{5}{2}R\right) + (4)\left(\frac{7}{2}R\right)}{2+4}$$

$$= \frac{19}{6}R \qquad \textbf{Ans.}$$

(c) **γ of the mixture**

$$\gamma = \frac{C_p}{C_V} = \frac{(19/6)R}{(13/6)R}$$

$$= \frac{19}{13}$$ **Ans.**

Alternate method

$$\frac{n_1 + n_2}{\gamma - 1} = \frac{n_1}{\gamma_1 - 1} + \frac{n_2}{\gamma_2 - 1}$$

$\therefore$ $$\frac{2+4}{\gamma - 1} = \frac{2}{\frac{5}{3} - 1} + \frac{4}{\frac{7}{5} - 1}$$

Solving this equation, we get

$$\gamma = \frac{19}{13}$$

Example 20.17 *Temperature of two moles of a monoatomic gas is increased by 300 K in the process $p \propto V$. Find*

(a) molar heat capacity of the gas in the given process

(b) heat required in the given process.

Solution (a) Molar heat capacity C is given by

$$C = C_V + \frac{R}{1-x} \qquad \text{...(i)}$$

in the process $pV^x =$ constant.

Now, $C_V = \frac{3}{2}R$ for monoatomic gas.

Further, the given process can be written as

$$PV^{-1} = \text{constant}$$

$\therefore$ $$x = -1$$

Substituting the values in Eq. (i), we have

$$C = \frac{3}{2}R + \frac{R}{1+1} = 2R$$ **Ans.**

(b) Q or $\Delta Q = nC\Delta T$

Substituting the values, we have

$$\Delta Q = (2)(2R)(300)$$

$$= 1200R$$ **Ans.**

20.10 Kinetic Theory of Gases

We have studied the mechanics of single particles. When we approach the mechanics associated with the many particles in systems such as gases, liquids and solids, we are faced with analyzing the dynamics of a huge number of particles. The dynamics of such many particle systems is called statistical mechanics.

The game involved in studying a system with a large number of particles is similar to what happens after every physics test. Of course we are interested in our individual marks, but we also want to know the class average.

The kinetic theory that we study in this article is a special aspect of the statistical mechanics of large number of particles. We begin with the simplest model for a monatomic ideal gas, a dilute gas whose particles are single atoms rather than molecules.

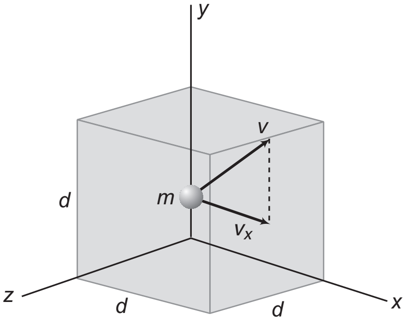
Macroscopic variables of a gas are pressure, volume and temperature and microscopic properties are speed of gas molecules, momentum of molecules, etc. Kinetic theory of gases relates the microscopic properties to macroscopic properties. Furthermore, the kinetic theory provides us with a physical basis for our understanding of the concept of pressure and temperature.

The Ideal Gas Approximation

We make the following assumptions while describing an ideal gas :

1. The number of particles in the gas is very large.
2. The volume V containing the gas is much larger than the total volume actually occupied by the gas particles themselves.
3. The dynamics of the particles is governed by Newton's laws of motion.
4. The particles are equally likely to be moving in any direction.
5. The gas particles interact with each other and with the walls of the container only *via* elastic collisions.
6. The particles of the gas are identical and indistinguishable.

The Pressure of an Ideal Gas



A cubical box with sides of length *d* containing an ideal gas. The molecule shown moves with velocity *v*.

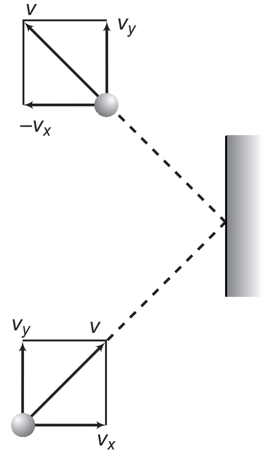
Fig. 20.28

Consider an ideal gas consisting of N molecules in a container of volume V. The container is a cube with edges of length d. Consider the collision of one molecule moving with a velocity **v** toward the right hand face of the cube. The molecule has velocity components v_x, v_y and v_z. Previously, we used m to represent the mass of a sample, but in this article we shall use m to represent the mass of one molecule. As the molecule collides with the wall elastically its x-component of velocity is reversed, while its y and z-components of velocity remain unaltered. Because the x-component of the momentum of the molecule is mv_x before the collision and $-mv_x$ after the collision, the change in momentum of the molecule is

$$\Delta p_x = -mv_x - (mv_x) = -2mv_x$$

Applying impulse = change in momentum to the molecule

$$F\Delta t = \Delta p_x = -2mv_x$$



A molecule makes an elastic collision with the wall of the container. Its *x*-component of momentum is reversed, while its *y*-component remains unchanged. In this construction, we assume that the molecule moves in the *x*-*y* plane.

Fig. 20.29

where, F is the magnitude of the average force exerted by the wall on the molecule in time Δt. For the molecules to collide second time with the same wall, it must travel a distance $2d$ in the x-direction. Therefore, the time interval between two collisions with the same wall is $\Delta t = \dfrac{2d}{v_x}$. Over a time interval that is long compared with Δt, the average force exerted on the molecules for each collision is

$$F = \frac{-2mv_x}{\Delta t} = \frac{-2mv_x}{2d/v_x} = \frac{-mv_x^2}{d}$$

According to Newton's third law, the average force exerted by the molecule on the wall is, $\dfrac{mv_x^2}{d}$.

Each molecule of the gas exerts a force on the wall. We find the total force exerted by all the molecules on the wall by adding the forces exerted by the individual molecules.

$$\therefore \qquad F_{\text{wall}} = \frac{m}{d}(v_{x_1}^2 + v_{x_2}^2 + \ldots + v_{x_N}^2)$$

$$= \frac{mN}{d}\left(\frac{v_{x_1}^2 + v_{x_2}^2 + \ldots + v_{x_N}^2}{N}\right)$$

This can also be written as

$$F_{\text{wall}} = \frac{Nm}{d}\bar{v}_x^2$$

where,
$$\bar{v}_x^2 = \frac{v_{x_1}^2 + v_{x_2}^2 + \ldots + v_{x_N}^2}{N}$$

Since, the velocity has three components v_x, v_y and v_z, we can have

$$\bar{v}^2 = \bar{v}_x^2 + \bar{v}_y^2 + \bar{v}_z^2 \qquad (\text{as } v^2 = v_x^2 + v_y^2 + v_z^2)$$

Because the motion is completely random, the average values $\bar{v}_x^2$, $\bar{v}_y^2$ and $\bar{v}_z^2$ are equal to each other. So,

$$\bar{v}^2 = 3\bar{v}_x^2 \quad \text{or} \quad \bar{v}_x^2 = \frac{1}{3}\bar{v}^2$$

Therefore,
$$F_{\text{wall}} = \frac{N}{3}\left(\frac{m\bar{v}^2}{d}\right)$$

$\therefore$ Pressure on the wall

$$p = \frac{F_{\text{wall}}}{A} = \frac{F_{\text{wall}}}{d^2} = \frac{1}{3}\left(\frac{N}{d^3}m\bar{v}^2\right)$$

$$= \frac{1}{3}\left(\frac{N}{V}\right)m\bar{v}^2 = \frac{2}{3}\left(\frac{N}{V}\right)\left(\frac{1}{2}m\bar{v}^2\right)$$

$$\therefore \qquad p = \frac{1}{3}\frac{mN}{V}\bar{v}^2 = \frac{2}{3}\left(\frac{N}{V}\right)\left(\frac{1}{2}m\bar{v}^2\right) \qquad \ldots\text{(i)}$$

This result indicates that the pressure is proportional to the number of molecules per unit volume (N/V) and to the average translational kinetic energy of the molecules $\frac{1}{2}m\bar{v}^2$. This result relates the large scale quantity (macroscopic) of pressure to an atomic quantity (microscopic)—the average value of the square of the molecular speed. The above equation verifies some features of pressure with which you are probably familiar. One way to increase the pressure inside a container is to increase the number of molecules per unit volume in the container.

The Meaning of the Absolute Temperature

Rewriting Eq. (i) in the more familiar form

$$pV = \frac{2}{3}N\left(\frac{1}{2}m\bar{v}^2\right)$$

Let us now compare it with the ideal gas equation

$$pV = nRT$$

$$nRT = \frac{2}{3} N \left(\frac{1}{2} m\bar{v}^2 \right)$$

Here, $$n = \frac{N}{N_A} \qquad (N_A = \text{Avogadro number})$$

$\therefore$ $$T = \frac{2}{3} \left(\frac{N_A}{R} \right) \left(\frac{1}{2} m\bar{v}^2 \right)$$

or $$T = \frac{2}{3k} \left(\frac{1}{2} m\bar{v}^2 \right) \qquad \text{...(ii)}$$

where, k is **Boltzmann's constant** which has the value

$$k = \frac{R}{N_A} = 1.38 \times 10^{-23} \text{ J/K}$$

By rearranging Eq. (ii) we can relate the translational molecular kinetic energy to the temperature

$$\frac{1}{2} mv^2 = \frac{3}{2} kT$$

That is, the average translational kinetic energy per molecule is $\frac{3}{2} kT$. Further,

$$\bar{v}_x^2 = \frac{1}{3} \bar{v}^2, \quad \text{it follows that}$$

$$\frac{1}{2} m\bar{v}_x^2 = \frac{1}{2} kT$$

In the similar manner, it follows that

$$\frac{1}{2} m\bar{v}_y^2 = \frac{1}{2} kT$$

and $$\frac{1}{2} m\bar{v}_z^2 = \frac{1}{2} kT$$

Thus, in each translational degree of freedom one gas molecule has an energy $\frac{1}{2} kT$. One mole of a gas has N_A number of molecules. Thus, one mole of the gas has an energy $\frac{1}{2} (kN_A) T = \frac{1}{2} RT$ in each degree of freedom. Which is nothing but the law of equipartition of energy. The total translational kinetic energy of one mole of an ideal gas is therefore, $\frac{3}{2} RT$.

$$\boxed{(\text{KE})_{\text{Trans}} = \frac{3}{2} RT \quad \text{(of one mole)}}$$

Root Mean Square Speed

The square root of $\overline{\mathbf{v}}^2$ is called the root mean square (rms) speed of the molecules. From Eq. (ii), we obtain, for the rms speed

$$v_{\text{rms}} = \sqrt{\overline{v}^2} = \sqrt{\frac{3kT}{m}}$$

Using $$k = \frac{R}{N_A}, \qquad mN_A = M$$

and $$\frac{RT}{M} = \frac{p}{\rho}$$

we can write,

$$\boxed{v_{\text{rms}} = \sqrt{\frac{3kT}{m}} = \sqrt{\frac{3RT}{M}} = \sqrt{\frac{3p}{\rho}}}$$

Mean Speed or Average Speed

The particles of a gas have a range of speeds. The average speed is found by taking the average of the speeds of all the particles at a given instant. Remember that the speed is a positive scalar since it is the magnitude of the velocity.

$$v_{\text{av}} = \frac{v_1 + v_2 + \ldots + v_N}{N}$$

From Maxwellian speed distribution law, we can show that

$$\boxed{v_{\text{av}} = \sqrt{\frac{8kT}{\pi m}} = \sqrt{\frac{8RT}{\pi M}} = \sqrt{\frac{8p}{\pi\rho}}}$$

Most Probable Speed

This is defined as the speed which is possessed by maximum fraction of total number of molecules of the gas. For example, if speeds of 10 molecules of a gas are, 1, 2, 2, 3, 3, 3, 4, 5, 6, 6 km/s, then the most probable speed is 3 km/s, as maximum fraction of total molecules possess this speed. Again from Maxwellian speed distribution law :

$$\boxed{v_{\text{mp}} = \sqrt{\frac{2kT}{m}} = \sqrt{\frac{2RT}{M}} = \sqrt{\frac{2p}{\rho}}}$$

Note 1. *In the above expressions of v_{rms}, v_{av} and v_{mp}, M is the molar mass in kilogram per mole. For example, molar mass of hydrogen is 2×10^{-3} kg/mol.*

2. $v_{rms} > v_{av} > v_{mp}$ *(RAM)*

3. $v_{rms} : v_{av} : v_{mp} = \sqrt{3} : \sqrt{\frac{8}{\pi}} : \sqrt{2}$

and since, $\frac{8}{\pi} \approx 2.5$, *we have* $v_{rms} : v_{av} : v_{mp} = \sqrt{3} : \sqrt{2.5} : \sqrt{2}$

Extra Points to Remember

- Pressure exerted by an ideal gas is numerically equal to two-third of the mean kinetic energy of translation per unit volume of (E) the gas. Thus,

$$\boxed{p = \frac{2}{3}E = \frac{1}{3}\frac{mN}{V}v_{\text{rms}}^2}$$

Here, m = mass of one gas molecule

N = total number of molecules

- **Mean Free Path** Every gas consists of a very large number of molecules. These molecules are in a state of continuous rapid and random motion. They undergo perfectly elastic collisions against one another. Therefore, path of a single gas molecule consists of a series of short *zig-zag* paths of different lengths. The mean free path of a gas molecule is the average distance between two successive collisions. It is represented by λ.

$$\boxed{\lambda = \frac{kT}{\sqrt{2}\pi\sigma^2 p}}$$

Here, σ = diameter of the molecule

k = Boltzmann's constant

- **Avogadro's Hypothesis** At constant temperature and pressure equal volumes of different gases contain equal number of molecules. In 1 g-mole of any gas there are 6.02×10^{23} molecules of that gas. This is called Avogadro's number. Thus,

$$\boxed{N = 6.02 \times 10^{23} \text{ per g-mole}}$$

Therefore, the number of molecules in mass m of the substance

$$\boxed{\text{Number of molecules} = nN = \frac{m}{M} \times N}$$

- **Dalton' Law of Partial Pressure** According to this law if the gases filled in a vessel do not react chemically, then the combined pressure of all the gases is due to the partial pressure of the molecules of the individual gases. If $p_1, p_2, \ldots$ represent the partial pressures of the different gases, then the total pressure is,

$$p = p_1 + p_2 \ldots$$

Example 20.18 *Find the rms speed of hydrogen molecules at room temperature (= 300 K).*

Solution Mass of 1 mole of hydrogen gas

$$= 2\text{g} = 2 \times 10^{-3} \text{ kg}$$

$$\Rightarrow \qquad v_{\text{rms}} = \sqrt{\frac{3RT}{M}}$$

$$= \sqrt{\frac{3 \times 8.31 \times 300}{2 \times 10^{-3}}}$$

$$= 1.93 \times 10^3 \text{ m/s}$$

Ans.

Example 20.19 *A tank used for filling helium balloons has a volume of 0.3 m^3 and contains 2.0 mol of helium gas at 20.0°C. Assuming that the helium behaves like an ideal gas.*

(a) What is the total translational kinetic energy of the molecules of the gas?

(b) What is the average kinetic energy per molecule?

Solution (a) Using $(\text{KE})_{\text{Trans}} = \frac{3}{2} nRT$

with $n = 2.0$ mol and $T = 273 + 20 = 293$ K, we find that

$$(\text{KE})_{\text{Trans}} = \frac{3}{2}(2.0)(8.31)(293)$$

$$= 7.3 \times 10^3 \text{ J}$$ **Ans.**

(b) The average kinetic energy per molecule is $\frac{3}{2} kT$.

or $$\frac{1}{2} m\bar{v}^2 = \frac{1}{2} m\bar{v}^2_{\text{rms}} = \frac{3}{2} kT$$

$$= \frac{3}{2}(1.38 \times 10^{-23})(293)$$

$$= 6.07 \times 10^{-21} \text{ J}$$ **Ans.**

Example 20.20 *Consider an 1100 particles gas system with speeds distribution as follows :*

1000 particles each with speed 100 m/s

2000 particles each with speed 200 m/s

4000 particles each with speed 300 m/s

3000 particles each with speed 400 m/s and 1000 particles each with speed 500 m/s

Find the average speed, and rms speed.

Solution The average speed is

$$v_{\text{av}} = \frac{(1000)(100) + (2000)(200) + (4000)(300) + (3000)(400) + (1000)(500)}{1100}$$

$$= 309 \text{ m/s}$$ **Ans.**

The rms speed is

$$v_{\text{rms}} = \sqrt{\frac{(1000)(100)^2 + (2000)(200)^2 + (4000)(300)^2 + (3000)(400)^2 + (1000)(500)^2}{1100}}$$

$$= 328 \text{ m/s}$$ **Ans.**

Note *Here,* $\frac{v_{rms}}{v_{av}} \neq \sqrt{\frac{3}{8/\pi}}$ *as values and gas molecules are arbitrarily taken.*

Example 20.21 *Calculate the change in internal energy of 3.0 mol of helium gas when its temperature is increased by 2.0 K.*

Solution Helium is a monatomic gas. Internal energy of n moles of the gas is

$$U = \frac{3}{2} nRT$$

$$\therefore \qquad \Delta U = \frac{3}{2} nR(\Delta T)$$

Substituting the values,

$$\Delta U = \left(\frac{3}{2}\right)(3)(8.31)(2.0)$$

$$= 74.8 \text{ J}$$ **Ans.**

Example 20.22 *In a crude model of a rotating diatomic molecule of chlorine (Cl_2), the two Cl atoms are 2.0×10^{-10} m apart and rotate about their centre of mass with angular speed $\omega = 2.0 \times 10^{12}$ rad/s. What is the rotational kinetic energy of one molecule of Cl_2, which has a molar mass of 70.0 g/mol?*

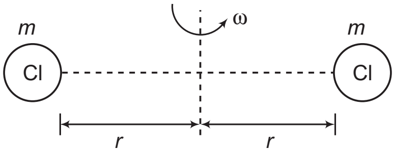


Fig. 20.30

Solution Moment of inertia,

$$I = 2(mr^2) = 2mr^2$$

Here,

$$m = \frac{70 \times 10^{-3}}{2 \times 6.02 \times 10^{23}}$$

$$= 5.81 \times 10^{-26} \text{ kg}$$

and

$$r = \frac{2.0 \times 10^{-10}}{2}$$

$$= 1.0 \times 10^{-10} \text{ m}$$

$$\therefore \qquad I = 2(5.81 \times 10^{-26})(1.0 \times 10^{-10})^2$$

$$= 1.16 \times 10^{-45} \text{ kg-m}^2$$

$$\therefore \qquad K_R = \frac{1}{2} I\omega^2$$

$$= \frac{1}{2} \times (1.16 \times 10^{-45}) \times (2.0 \times 10^{12})^2$$

$$= 2.32 \times 10^{-21} \text{ J}$$ **Ans.**

Example 20.23 *Prove that the pressure of an ideal gas is numerically equal to two third of the mean translational kinetic energy per unit volume of the gas.*

Solution Translational KE per unit volume

$$E = \frac{1}{2}(\text{mass per unit volume})(\overline{v}^2)$$

$$= \frac{1}{2}(\rho)\left(\frac{3p}{\rho}\right) = \frac{3}{2}p$$

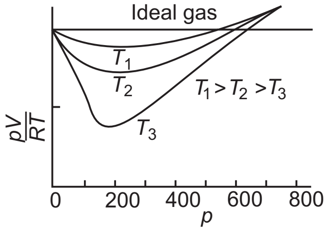
or $$p = \frac{2}{3}E$$ **Hence Proved**.

INTRODUCTORY EXERCISE 20.5

1. Calculate the root mean square speed of hydrogen molecules at 373.15 K.
2. Five gas molecules chosen at random are found to have speed of 500, 600, 700, 800 and 900 m/s. Find the rms speed. Is it the same as the average speed?
3. The average speed of all the molecules in a gas at a given instant is not zero, whereas the average velocity of all the molecules is zero. Explain why?
4. A sample of helium gas is at a temperature of 300 K and a pressure of 0.5 atm. What is the average kinetic energy of a molecule of a gas?
5. A sample of helium and neon gases has a temperature of 300 K and pressure of 1.0 atm. The molar mass of helium is 4.0 g/mol and that of neon is 20.2 g/mol.
   (a) Find the rms speed of the helium atoms and of the neon atoms.
   (b) What is the average kinetic energy per atom of each gas?
6. At what temperature will the particles in a sample of helium gas have an rms speed of 1.0 km/s?
7. For any distribution of speeds $v_{\text{rms}} \geq v_{\text{av}}$. Is this statement true or false?

Final Touch Points

1. **Departures from ideal gas behaviour for a real gas** An ideal gas is a simple theoretical model of a gas. No real gas is truly ideal. Figure shows departures from ideal gas behaviour for a real gas at three different temperatures. Notice that all curves approach the ideal gas behaviour for low pressures and high temperatures.



At low pressures or high temperatures the molecules are far apart and molecular interactions are negligible. Without interactions, the gas behaves like an ideal one .

2. **van der Waal's Equation** Experiments have proved that real gases deviate largely from ideal behaviour. The reason of this deviation is two wrong assumptions in the kinetic theory of gases.
   (i) The size of the molecules is much smaller in comparison to the volume of the gas, hence, it may be neglected.
   (ii) Molecules do not exert intermolecular force on each other.
   van der Waal made corrections for these assumptions and gave a new equation. This equation is known as van der Waal's equation for real gases.
   (a) **Correction for the finite size of molecules:** Molecules occupy some volume. Therefore, the volume in which they perform thermal motion is less than the observed volume of the gas. It is represented by $(V - b)$. Here, b is a constant which depends on the effective size and number of molecules of the gas. Therefore, we should use $(V - b)$ in place of V in gas equation.
   (b) **Correction for intermolecular attraction:** Due to the intermolecular force between gas molecules the molecules which are very near to the wall experiences a net inward force. Due to this inward force there is a decrease in momentum of the particles of a gas. Thus, the pressure exerted by real gas molecules is less than the pressure exerted by the molecules of an ideal gas. So, we use $\left(p + \frac{a}{V^2}\right)$ in place of p in gas equation. Here, again a is a constant.

   van der Waal's equation of state for real gases thus becomes,

$$\left(p + \frac{a}{V^2}\right)(V - b) = RT$$

3. **Critical Temperature, Pressure and Volume :** Gases can't be liquified above a temperature called critical temperature (T_C) however large the pressure may be. The pressure required to liquify the gas at critical temperature is called critical pressure (p_C) and the volume of the gas at critical temperature and pressure is called critical volume (V_C). Value of critical constants in terms of van der Waal's constants a and b are as under :

$$V_C = 3b, \qquad p_C = \frac{a}{27b^2} \qquad \text{and} \qquad T_C = \frac{8a}{27Rb}$$

Further, $\frac{RT_C}{p_C V_C} = \frac{8}{3}$ is called critical coefficient and is same for all gases.

4. Detailed Discussion on Molar Heat Capacity

For monatomic gases value of C_V is $\frac{3}{2}R$. No variation is observed in this. So, value of $C_V, C_p, C_p - C_V$ and γ comes out to be same for different monatomic gases (Table 20.5).

Table 20.5

Gas	C_p	C_V	$C_p - C_V$	$\gamma = C_p/C_V$
Monoatomic Gases				
He	20.8	12.5	8.33	1.67
Ar	20.8	12.5	8.33	1.67
Diatomic Gases				
H_2	28.8	20.4	8.33	1.41
N_2	29.1	20.8	8.33	1.40
O_2	29.4	21.1	8.33	1.40
CO_2	29.3	21.0	8.33	1.40
Cl_2	34.7	25.7	8.96	1.35
Polyatomic Gases				
CO_2	37.0	28.5	8.50	1.30
SO_2	40.4	31.4	9.00	1.29
H_2O	35.4	27.0	8.37	1.30
CH_2	35.5	27.1	8.41	1.31

*All values except that for water were obtained at 300 K. SI units are used for C_p and C_V.

For dia and polyatomic gases these values are not equal for different gases. These values vary from gas to gas. Even for one gas values are different at different temperatures.

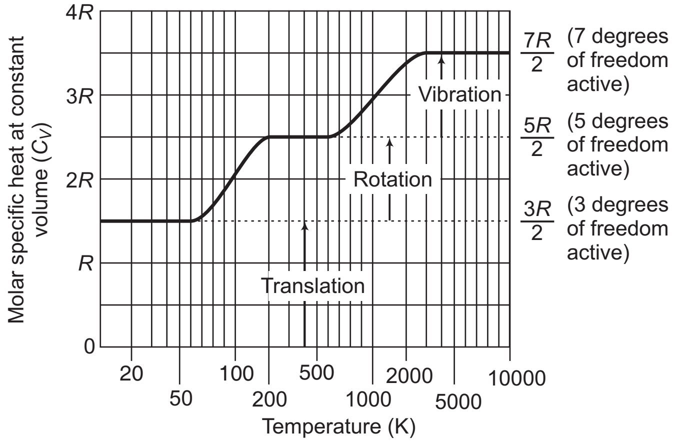


Figure illustrates the variation in the molar specific heat (at constant volume) for H_2 over a wide range in temperatures. (Note that T is drawn on a logarithmic scale). Below about 100 K, C_V is $\frac{3R}{2}$ which is characteristic of three translational degrees of freedom. At room temperature (300 K) it is $\frac{5R}{2}$ which includes the two rotational degrees of freedom. It seems, therefore, that at low temperatures, rotation is not allowed. At high temperatures, C_V starts to rise toward the value $\frac{7R}{2}$. Thus, the vibrational degrees of freedom contribute only at these high temperatures. In Table 20.4 the large values of C_V for some polyatomic molecules show the contributions of vibrational energy. In addition, a molecule with three or more atoms that are not in a straight line has three, not two, rotational degrees of freedom.

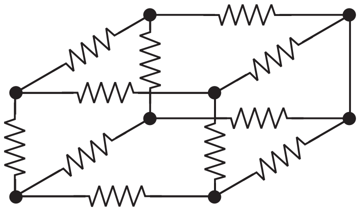
From this discussion, we expect heat capacities to be temperature-dependent, generally increasing with increasing temperature.

5. **Solids** In crystalline solids (monoatomic), the atoms are arranged in a three dimensional array, called a lattice. Each atom in a lattice can vibrate along three mutually perpendicular directions, each of which has two degrees of freedom. One corresponding to vibrations KE and the other vibrational PE. Thus, each atom has a total of six degrees of freedom. The volume of a solid does not change significantly with temperature, and so there is little difference between C_V and C_p for a solid. The molar heat capacity is expected to be

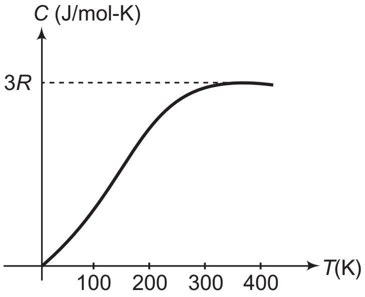


$$C = \frac{f}{2}R = \frac{6}{2}R$$

or $$C = 3R \qquad \text{(ideal monatomic solid)}$$

Its numerical value is $C \approx 25$ J/mol-K ≈ 6 cal/mol-K. This result was first found experimentally by **Dulong and Petit**.

Figure shows that the Dulong and Petit's law is obeyed quite well at high (> 250 K) temperatures. At low temperatures, the heat capacities decreases.



Solved Examples

TYPED PROBLEMS

Type 1. *Conversion of graph*

Concept

(i) In heat, we normally find the following graphs:

S.No	Equation type	Nature of graph
1.	$y \propto x$	Straight line passing through origin
2.	$y \propto \frac{1}{x}$	Rectangular hyperbola
3.	$y =$ constant	Straight line parallel to x-axis
4.	$x =$ constant	Straight line parallel to y-axis
5.	$x =$ constant and $y =$ constant	Dot

(ii) Density of any substance is given by

$$\rho = \frac{m}{V}$$

For given mass of any substance, density only depends on V. It varies with V as

$$\rho \propto \frac{1}{V}$$

If V increases, ρ decreases and *vice-versa*.

(iii) For an ideal gas, density is also given as

$$\rho = \frac{pM}{RT}$$

For a given gas,

$$\rho \propto \frac{p}{T}$$

(iv) For an ideal gas,

$$pV = nRT$$

and

$$U = \frac{nf}{2}RT$$

For given moles of the gas,

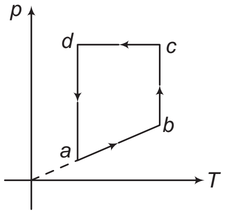
$$U \propto T \quad \text{and} \quad T \propto pV$$

If product of p and V is increasing, it means temperature is increasing. So, U is increasing.

For example, in isothermal process, T is constant.

Therefore, U is constant. Hence, U *versus* T graph is a dot.

Example 1



Corresponding to p-T graph as shown in figure, draw

(a) p-V graph *(b) V-T graph*

(c) ρ-T graph and *(d) U-T graph*

Solution ***ab*** **process** From the given graph, we can see that

$$p \propto T$$

$$\Rightarrow \quad V = \text{constant} \qquad \text{(isochoric)}$$

$$\text{or} \quad \rho = \text{constant} \qquad \left(\text{as } \rho \propto \frac{1}{V}\right)$$

p and T both are increasing.

Therefore, U is also increasing (as $U \propto T$)

Now,

(i) p-V graph is straight line parallel to p-axis as V is constant.

(ii) V-T graph is a straight line parallel to T-axis as V is constant.

(iii) ρ-T graph is a straight line parallel to T-axis as ρ is constant.

(iv) U-T graph is a straight line passing through origin as $U \propto T$.

bc **process** From the given graph, we can see that

$$T = \text{constant} \qquad \text{(isothermal)}$$

$$\Rightarrow \quad U = \text{constant}$$

$$\Rightarrow \quad pV = \text{constant}$$

$$\text{or} \quad p \propto \frac{1}{V}$$

p is increasing. Therefore, V will decrease.

Hence, ρ will increase.

Now,

(i) p-V graph is a rectangular hyperbola $\left(\text{as } P \propto \frac{1}{V}\right)$.

(ii) V-T graph is a straight line parallel to V-axis, as T = constant

(iii) ρ-T graph is a straight line parallel to ρ-axis, as T = constant

(iv) U-T graph is a dot, as U and T both are constants.

cd **process** From the given graph, we can see that

$$p = \text{constant} \qquad \text{(isobaric)}$$

$$\Rightarrow \quad V \propto T$$

Temperature is decreasing. So, volume will also decrease. But density will increase.

Now,

(i) p - V graph is a straight line parallel to V-axis because p is constant.

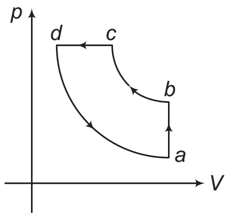
(ii) V - T graph is a straight line passing through origin, as $V \propto T$.

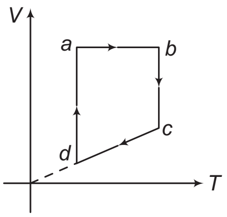
(iii) $\rho = \dfrac{pM}{RT} \Rightarrow \rho \propto \dfrac{1}{T}$ as p, M and R all are constants. Hence, ρ - T graph is rectangular hyperbola.

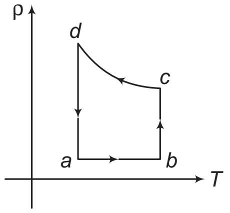
(iv) U - T graph is a straight line passing through origin as $U \propto T$.

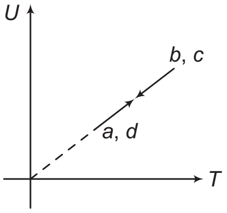
***da* process** This process is just inverse of *bc* process. So, this process will complete the cycle following the steps discussed in process *bc*.

The four graphs are as shown below.









Type 2. *When ordered motion of a gas converts into disordered motion*

Concept

In article 20.7, we have seen that if a container filled with a gas is in motion, then the gas molecules have some ordered motion also. When the container is suddenly stopped, this ordered motion of gas molecules converts into disordered motion. Therefore, internal energy (and hence the temperature) of the gas will increase. In such situation, we can apply the equation,

$$\frac{1}{2}mv^2 = \Delta U$$

where,

$$U = \frac{nf}{2}RT$$

$\therefore$

$$\Delta U = \frac{nf}{2}R\Delta T$$

where,

$$n = \frac{m}{M}$$

Example 2 *An insulated box containing a monoatomic gas of molar mass M moving with a speed v_0 is suddenly stopped. Find the increment in gas temperature as a result of stopping the box.* **(JEE 2003)**

Solution Decrease in kinetic energy = increase in internal energy of the gas

$$\therefore \qquad \frac{1}{2}mv_0^2 = \frac{nf}{2}R\Delta T = \left(\frac{m}{M}\right)\left(\frac{3}{2}R\right)\Delta T$$

$$\therefore \qquad \Delta T = \frac{Mv_0^2}{3R}$$

Type 3. *Based on the concept of pressure exerted by gas molecules striking elastically with walls of a container.*

Concept

(i) Gas molecules are assumed to be moving with v_{rms}.

(ii) They strike with the wall elastically. So, in each collision change in linear momentum is $2mv_{\text{rms}}$.

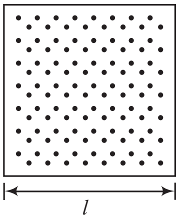
(iii) Time interval between two successive collisions is $\frac{2L}{v_{\text{rms}}}$ if we have a cubical box of side L and,

(iv) $F = \frac{\Delta p}{\Delta t}$, Pressure $= \frac{F}{A}$

Example 3 *A cubical box of side 1 m contains helium gas (atomic weight 4) at a pressure of $100\ N/m^2$. During an observation time of 1 second, an atom travelling with the root-mean-square speed parallel to one of the edges of the cube, was found to make 500 hits with a particular wall, without any collision with other atoms. Take $R = \frac{25}{3}$ J/mol-K and $k = 1.38 \times 10^{-23}$ J/K.*

(a) Evaluate the temperature of the gas.
(b) Evaluate the average kinetic energy per atom.
(c) Evaluate the total mass of helium gas in the box.

Solution Volume of the box = 1 m^3, pressure of the gas = 100 N/m^2. Let T be the temperature of the gas.



(a) Time between two consecutive collisions with one wall $= \frac{1}{500}$ s.

This time should be equal to $\frac{2l}{v_{\text{rms}}}$, where l is the side of the cube.

$$\frac{2l}{v_{\text{rms}}} = \frac{1}{500}$$

$$\text{or} \qquad v_{\text{rms}} = 1000 \text{ m/s} \qquad (\text{as } l = 1 \text{ m})$$

$$\therefore \qquad \sqrt{\frac{3RT}{M}} = 1000$$

or $$T = \frac{(1000)^2 M}{3R} = \frac{(10^6)\,(4 \times 10^{-3})}{3\left(\frac{25}{3}\right)}$$

$$= 160 \text{ K}$$ **Ans.**

(b) Average kinetic energy per atom $= \frac{3}{2} kT$

$$= \frac{3}{2}(1.38 \times 10^{-23})\,(160) \text{ J}$$

$$= 3.312 \times 10^{-21} \text{ J}$$ **Ans.**

(c) From $pV = nRT = \frac{m}{M} RT$

We get mass of helium gas in the box,

$$m = \frac{pVM}{RT}$$

Substituting the values, we get

$$m = \frac{(100)\,(1)\,(4 \times 10^{-3})}{\left(\frac{25}{3}\right)(160)}$$

$$= 3.0 \times 10^{-4} \text{ kg}$$ **Ans.**

Example 4 *1 g mole of oxygen at 27°C and 1 atmospheric pressure is enclosed in a vessel.*

(a) Assuming the molecules to be moving with v_{rms}, find the number of collisions per second which the molecules make with one square metre area of the vessel wall.

(b) The vessel is next thermally insulated and moved with a constant speed v_0. It is then suddenly stopped. The process results in a rise of temperature of the gas by 1°C. Calculate the speed v_0. $[k = 1.38 \times 10^{-23}\ J/K$ and $N_A = 6.02 \times 10^{23}/mol]$ **(JEE 2002)**

Solution (a) Mass of one oxygen molecule,

$$m = \frac{M}{N_A}$$

$$= \frac{32}{6.02 \times 10^{23}} \text{ g}$$

$$= 5.316 \times 10^{-23} \text{ g}$$

$$= 5.316 \times 10^{-26} \text{ kg}$$

$$v_{\text{rms}} = \sqrt{\frac{3kT}{m}}$$

$$= \sqrt{\frac{3 \times 1.38 \times 10^{-23} \times 300}{5.316 \times 10^{-26}}}$$

$$= 483.35 \text{ m/s}$$

Change in momentum per collision,

$$\Delta p = mv_{\text{rms}} - (-mv_{\text{rms}}) = 2mv_{\text{rms}}$$

$$= (2)\,(5.316 \times 10^{-26})\,(483.35)$$

$$= 5.14 \times 10^{-23} \text{ kg-m/s}$$

Now, suppose n particles strike per second

$$F = n\Delta p = (n)\,(5.14\times 10^{-23})\ \text{N} \qquad \left(F_{\text{ext}} = \frac{dp}{dt}\right)$$

Now, as $p = \dfrac{F}{A}$, for unit area $F = p$

$\therefore \qquad (n)\,(5.14\times 10^{-23}) = 1.01\times 10^{5}$

or $\qquad n = 1.965\times 10^{27}$ per second **Ans.**

(b) When the vessel is stopped, the ordered motion of the vessel converts into disordered motion and temperature of the gas is increased.

$$\therefore \qquad \frac{1}{2} m v_0^2 = \Delta U \qquad \text{...(i)}$$

$$U = \frac{5}{2} RT \qquad \text{(for 1 g mole of } O_2\text{)}$$

$$\therefore \qquad \Delta U = \frac{5}{2} R\Delta T$$

Here, m is not the mass of one gas molecule but it is the mass of the whole gas.

$$m = \text{ mass of 1 mol} = 32\times 10^{-3}\ \text{kg}$$

Substituting these values in Eq. (i), we get

$$v_0 = \sqrt{\frac{5R\Delta T}{m}} = \sqrt{\frac{5\times 8.31\times 1}{32\times 10^{-3}}} = 36\ \text{m/s}$$ **Ans.**

Miscellaneous Examples

Example 5 *An ideal diatomic gas with $C_V = \dfrac{5R}{2}$ occupies a volume V_i at a pressure p_i. The gas undergoes a process in which the pressure is proportional to the volume. At the end of the process, it is found that the rms speed of the gas molecules has doubled from its initial value. Determine the amount of energy transferred to the gas by heat.*

Solution Given that, $p \propto V$ or $pV^{-1} = \text{constant}$

As we know, molar heat capacity in the process $pV^x = \text{constant}$ is

$$C = \frac{R}{\gamma - 1} + \frac{R}{1-x} = C_V + \frac{R}{1-x}$$

In the given problem,

$$C_V = \frac{5R}{2} \quad \text{and} \quad x = -1$$

$$\therefore \qquad C = \frac{5R}{2} + \frac{R}{2} = 3R \qquad \text{...(i)}$$

At the end of the process rms speed is doubled, i.e. temperature has become four times ($v_{\text{rms}} \propto \sqrt{T}$).

Now,
$$\begin{aligned}\Delta Q &= nC\Delta T\\ &= nC\,(T_f - T_i)\\ &= nC\,(4T_i - T_i)\\ &= 3T_i nC\\ &= (3T_i)\,(n)\,(3R)\\ &= 9\,(nRT_i)\end{aligned}$$

or
$$\Delta Q = 9P_iV_i$$ **Ans.**

Example 6 *Given, Avogadro's number $N = 6.02 \times 10^{23}$ and Boltzmann's constant $k = 1.38 \times 10^{-23}$ J/K.*

(a) Calculate the average kinetic energy of translation of the molecules of an ideal gas at 0°C and at 100°C.

(b) Also calculate the corresponding energies per mole of the gas.

Solution (a) According to the kinetic theory, the average kinetic energy of translation per molecule of an ideal gas at kelvin temperature T is $\left(\frac{3}{2}\right)kT$, where k is Boltzmann's constant.

At 0° C ($T = 273$ K), the kinetic energy of translation $= \frac{3}{2}kT$

$$= \frac{3}{2} \times (1.38 \times 10^{-23}) \times 273 = 5.65 \times 10^{-21} \text{ J/mole}$$

At 100° C ($T = 373$ K), the energy is

$$\frac{3}{2} \times (1.38 \times 10^{-23}) \times 373 = 7.72 \times 10^{-21} \text{ J/mole}$$

(b) 1 mole of gas contains N ($= 6.02 \times 10^{23}$) molecules. Therefore, at 0° C, the kinetic energy of translation of 1 mole of the gas is

$$= (5.65 \times 10^{-21})\,(6.02 \times 10^{23}) \approx 3401 \text{ J/mol}$$

and at 100° C

kinetic energy of translation of 1 mole of gas is

$$= (7.72 \times 10^{-21})\,(6.02 \times 10^{23}) \approx 4647 \text{ J/mol}$$

Example 7 *An air bubble starts rising from the bottom of a lake. Its diameter is 3.6 mm at the bottom and 4 mm at the surface. The depth of the lake is 250 cm and the temperature at the surface is 40°C. What is the temperature at the bottom of the lake? Given atmospheric pressure = 76 cm of Hg and $g = 980$ cm/s^2.*

Solution At the bottom of the lake, volume of the bubble

$$V_1 = \frac{4}{3}\pi r_1^3 = \frac{4}{3}\pi(0.18)^3 \text{ cm}^3$$

Pressure on the bubble p_1 = Atmospheric pressure + Pressure due to a column of 250 cm of water

$$\begin{aligned}&= 76 \times 13.6 \times 980 + 250 \times 1 \times 980\\ &= (76 \times 13.6 + 250)\,980 \text{ dyne/cm}^2\end{aligned}$$

At the surface of the lake, volume of the bubble

$$V_2 = \frac{4}{3}\pi r_2^3 = \frac{4}{3}\pi\ (0.2)^3\ \text{cm}^3$$

Pressure on the bubble, p_2 = atmospheric pressure

$$= (76 \times 13.6 \times 980)\ \text{dyne/cm}^2$$

$$T_2 = 273 + 40°\,\text{C}$$
$$= 313°\ \text{K}$$

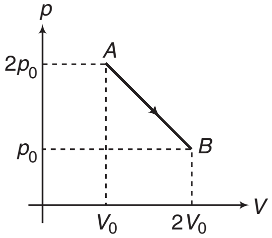
Now
$$\frac{p_1V_1}{T_1} = \frac{p_2V_2}{T_2}$$

or
$$\frac{(76 \times 13.6 + 250)\,980 \times \left(\frac{4}{3}\right)\pi\,(0.18)^3}{T_1} = \frac{(76 \times 13.6) \times 980 \left(\frac{4}{3}\right)\pi\,(0.2)^3}{313}$$

or
$$T_1 = 283.37\ \text{K}$$

∴
$$T_1 = 283.37 - 273$$
$$= 10.37°\,\text{C}$$

Example 8 *p-V diagram of n moles of an ideal gas is as shown in figure. Find the maximum temperature between A and B.*



How to Proceed For given number of moles of a gas,

$$T \propto pV \qquad (pV = nRT)$$

Although $(pV)_A = (pV)_B = 2p_0V_0$ or $T_A = T_B$, yet it is not an isothermal process. Because in isothermal process *p-V* graph is a rectangular hyperbola while it is a straight line. So, to see the behaviour of temperature, first we will find either *T-V* equation or *T-p* equation and from that equation we can judge how the temperature varies. From the graph, first we will write *p-V* equation, then we will convert it either in *T-V* equation or in *T-p* equation with the help of equation, $pV = nRT$.

Solution From the graph the *p-V* equation can be written as

$$p = -\left(\frac{p_0}{V_0}\right)V + 3p_0 \qquad (y = -mx + c)$$

or
$$pV = -\left(\frac{p_0}{V_0}\right)V^2 + 3p_0V$$

or
$$nRT = 3p_0V - \left(\frac{p_0}{V_0}\right)V^2 \qquad (\text{as } pV = nRT)$$

or
$$T = \frac{1}{nR}\left[3p_0V - \left(\frac{p_0}{V_0}\right)V^2\right]$$

This is the required T-V equation. This is quadratic in V. Hence, T-V graph is a parabola. Now, to find maximum or minimum value of T, we can substitute.

$$\frac{dT}{dV}=0$$

or
$$3p_0-\left(\frac{2p_0}{V_0}\right)V=0 \quad \text{or} \quad V=\frac{3}{2}V_0$$

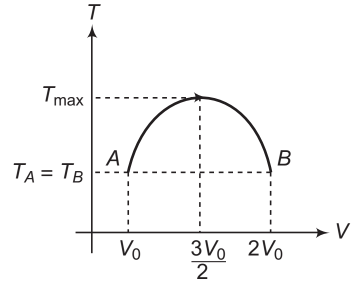
Further $\frac{d^2T}{dV^2}$ is negative at $V=\frac{3}{2}V_0$.

Hence, T is maximum at $V=\frac{3}{2}V_0$ and this maximum value is

$$T_{\max}=\frac{1}{nR}\left[(3p_0)\left(\frac{3V_0}{2}\right)-\left(\frac{p_0}{V_0}\right)\left(\frac{3V_0}{2}\right)^2\right]$$

or
$$T_{\max}=\frac{9p_0V_0}{4nR}$$ **Ans.**

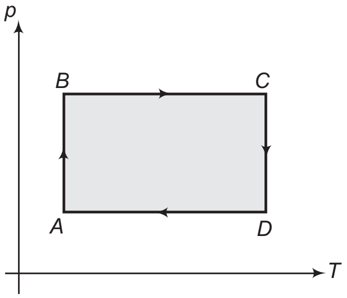
Thus, T-V graph is as shown in figure.



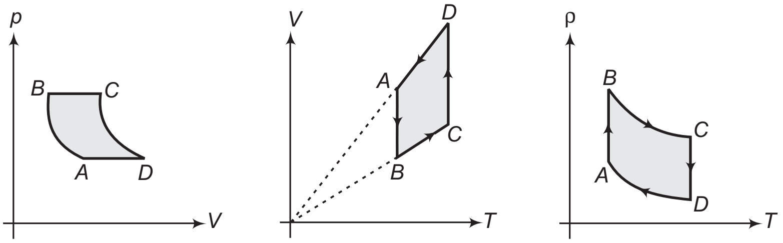
$$T_A=T_B=\frac{2p_0V_0}{nR} \quad \text{and} \quad T_{\max}=\frac{9p_0V_0}{4nR}$$
$$=2.25\,\frac{p_0V_0}{nR}$$

Note *Most of the problems of $T_{\max}$, $p_{\max}$ and $V_{\max}$ are solved by differentiation. Sometimes graph will be given and sometimes direct equation will be given. For $p_{\max}$ you will require either p-V or p-T equation.*

Example 9 *Plot p-V, V-T and ρ-T graph corresponding to the p-T graph for an ideal gas shown in figure.*



Solution ***Process AB*** *is an isothermal process with* T = constant *and* $p_B > p_A$.



***p-V* graph :** $p \propto \frac{1}{V}$ i.e. p-V graph is a rectangular hyperbola with $p_B > p_A$

and $$V_B < V_A.$$

***V-T* graph :** T = constant. Therefore, V-T graph is a straight line parallel to V-axis with $V_B < V_A$.

ρ-*T* graph : $$\rho = \frac{pM}{RT}$$

or $$\rho \propto p$$

As T is constant. Therefore, ρ-T graph is a straight line parallel to ρ-axis with $\rho_B > \rho_A$ as $p_B > p_A$.

Process *BC* is an isobaric process with P = constant

and $$T_C > T_B.$$

***p-V* graph :** As p is constant. Therefore, p-V graph is a straight line parallel to V-axis with $V_C > V_B$ (because $V \propto T$ in an isobaric process)

***V-T* graph :** In isobaric process $V \propto T$, i.e. V-T graph is a straight line passing through origin, with $T_C > T_B$

and $$V_C > V_B.$$

ρ-*T* graph : $\rho \propto \frac{1}{T}$ (when P = constant), i.e. ρ-T graph is a hyperbola with $T_C > T_B$

and $$\rho_C < \rho_B$$

There is no need of discussing C-D and D-A processes. As they are opposite to AB and BC respectively. The corresponding three graphs are shown above.

Exercises

LEVEL 1

Assertion and Reason

Directions : *Choose the correct option.*

(*a*) *If both **Assertion** and **Reason** are true and the **Reason** is correct explanation of the **Assertion.***

(*b*) *If both **Assertion** and **Reason** are true but **Reason** is not the correct explanation of **Assertion.***

(*c*) *If **Assertion** is true, but the **Reason** is false.*

(*d*) *If **Assertion** is false but the **Reason** is true.*

1. **Assertion :** Straight line on p-T graph for an ideal gas represents isochoric process.

   Reason : If $p \propto T, V =$ constant.

2. **Assertion :** Vibrational kinetic energy is insignificant at low temperatures.

   Reason : Interatomic forces are responsible for vibrational kinetic energy.

3. **Assertion :** In the formula $p = \frac{2}{3}E$, the term E represents translational kinetic energy per unit volume of gas.

   Reason : In case of monoatomic gas, translational kinetic energy and total kinetic energy are equal.

4. **Assertion :** If a gas container is placed in a moving train, the temperature of gas will increase.

   Reason : Kinetic energy of gas molecules will increase.

5. **Assertion :** According to the law of equipartition of energy, internal energy of an ideal gas at a given temperature, is equally distributed in translational and rotational kinetic energies.

   Reason : Rotational kinetic energy of a monoatomic gas is zero

6. **Assertion :** Real gases behave as ideal gases most closely at low pressure and high temperature.

   Reason : Intermolecular force between ideal gas molecules is assumed to be zero.

7. **Assertion :** A glass of water is filled at 4°C. Water will overflow, if temperature is increased or decreased. (Ignore expansion of glass).

   Reason : Density of water is minimum at 4°C.

8. **Assertion :** If pressure of an ideal gas is doubled and volume is halved, then its internal energy will remain unchanged.

   Reason : Internal energy of an ideal gas is a function of only temperature.

9. **Assertion :** In equation $p = \frac{1}{3}\alpha\, v_{\text{rms}}^2$, the term α represents density of gas.

   Reason : $v_{\text{rms}} = \sqrt{\frac{3RT}{M}}$.

10. Assertion : In isobaric process, V-T graph is a straight line passing through origin. Slope of this line is directly proportional to mass of the gas. V is taken on y-axis.

Reason : $V = \left(\frac{nR}{p}\right)T$

$\therefore$ slope $\propto n$

or slope $\propto m$

Objective Questions

1. The average velocity of molecules of a gas of molecular weight M at temperature T is

(a) $\sqrt{\frac{3RT}{M}}$ (b) $\sqrt{\frac{8RT}{\pi M}}$

(c) $\sqrt{\frac{2RT}{M}}$ (d) zero

2. Four particles have velocities 1, 0, 2 and 3 m/s. The root mean square velocity of the particles (definition wise) is

(a) 3.5 m/s (b) $\sqrt{3.5}$ m/s

(c) 1.5 m/s (d) $\sqrt{\frac{14}{3}}$ m/s

3. The temperature of an ideal gas is increased from 27°C to 927°C. The rms speed of its molecules becomes

(a) twice (b) half

(c) four times (d) one-fourth

4. In case of hydrogen and oxygen at NTP, which of the following is the same for both?

(a) Average linear momentum per molecule (b) Average KE per molecule

(c) KE per unit volume (d) KE per unit mass

5. The average kinetic energy of the molecules of an ideal gas at 10°C has the value E. The temperature at which the kinetic energy of the same gas becomes $2E$ is

(a) 5°C (b) 10°C

(c) 40°C (d) None of these

6. A polyatomic gas with n degrees of freedom has a mean energy per molecule given by

(a) $\frac{n}{2}RT$ (b) $\frac{1}{2}RT$

(c) $\frac{n}{2}kT$ (d) $\frac{1}{2}kT$

7. In a process, the pressure of a gas remains constant. If the temperature is doubled, then the change in the volume will be

(a) 100% (b) 200%

(c) 50% (d) 25%

8. A steel rod of length 1 m is heated from 25° to 75°C keeping its length constant. The longitudinal strain developed in the rod is (Given, coefficient of linear expansion of steel $= 12 \times 10^{-6}/{}^\circ\text{C}$)

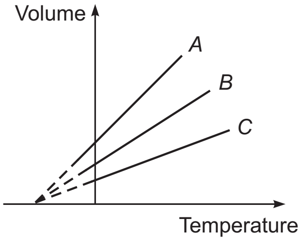
(a) 6×10^{-4} (b) -6×10^{-5}

(c) -6×10^{-4} (d) zero

9. The coefficient of linear expansion of steel and brass are $11 \times 10^{-6}/°C$ and $19 \times 10^{-6}/°C$, respectively. If their difference in lengths at all temperatures has to kept constant at 30 cm, their lengths at 0°C should be

(a) 71.25 cm and 41.25 cm	(b) 82 cm and 52 cm
(c) 92 cm and 62 cm	(d) 62.25 cm and 32.25 cm

10. The expansion of an ideal gas of mass m at a constant pressure p is given by the straight line B. Then, the expansion of the same ideal gas of mass $2m$ at a pressure $2p$ is given by the straight line



(a) C	(b) A
(c) B	(d) data insufficient

Subjective Questions

1. Change each of the given temperatures to the Celsius and Kelvin scales: 68° F, 5° F and 176° F.

2. Change each of the given temperatures to the Fahrenheit and Reaumur scales: 30° C, 5° C and −20° C.

3. At what temperature do the Celsius and Fahrenheit readings have the same numerical value?

4. You work in a materials testing lab and your boss tells you to increase the temperature of a sample by 40.0° C. The only thermometer you can find at your workbench reads in °F. If the initial temperature of the sample is 68.2 °F. What is its temperature in °F, when the desired temperature increase has been achieved?

5. The steam point and the ice point of a mercury thermometer are marked as 80° and 20°. What will be the temperature in centigrade mercury scale when this thermometer reads 32°?

6. A platinum resistance thermometer reads 0° C when its resistance is 80 Ω and 100° C when its resistance is 90 Ω. Find the temperature at which the resistance is 86 Ω.

7. The steam point and the ice point of a mercury thermometer are marked as 80° and 10°. At what temperature on centigrade scale the reading of this thermometer will be 59°?

8. Find the temperature at which oxygen molecules would have the same rms speed as of hydrogen molecules at 300 K.

9. Find the mass (in kilogram) of an ammonia molecule NH_3.

10. Three moles of an ideal gas having $\gamma = 1.67$ are mixed with 2 moles of another ideal gas having $\gamma = 1.4$. Find the equivalent value of γ for the mixture.

11. How many degrees of freedom have the gas molecules, if under standard conditions the gas density is $\rho = 1.3 \text{ kg/m}^3$ and velocity of sound propagation on it is $v = 330$ m/s?

12. 4 g hydrogen is mixed with 11.2 litre of He at STP in a container of volume 20 litre. If the final temperature is 300 K, find the pressure.

13. One mole of an ideal monoatomic gas is taken at a temperature of 300 K. Its volume is doubled keeping its pressure constant. Find the change in internal energy.

14. Two perfect monoatomic gases at absolute temperatures T_1 and T_2 are mixed. There is no loss of energy. Find the temperature of the mixture if the number of moles in the gases are n_1 and n_2.

15. If the water molecules in 1.0 g of water were distributed uniformly over the surface of earth, how many such molecules would there be in 1.0 cm^2 of earth's surface?

16. If the kinetic energy of the molecules in 5 litres of helium at 2 atm is E. What is the kinetic energy of molecules in 15 litres of oxygen at 3 atm in terms of E ?

17. At what temperature is the "effective" speed of gaseous hydrogen molecules (molecular weight = 2) equal to that of oxygen molecules (molecular weight = 32) at 47° C ?

18. At what temperature is v_{rms} of H_2 molecules equal to the escape speed from earth's surface. What is the corresponding temperature for escape of hydrogen from moon's surface? Given $g_m = 1.6 \text{ m/s}^2$, $R_e = 6367$ km and $R_m = 1750$ km.

19. The pressure of the gas in a constant volume gas thermometer is 80 cm of mercury in melting ice. When the bulb is placed in a liquid, the pressure becomes 160 cm of mercury. Find the temperature of the liquid.

20. The resistances of a platinum resistance thermometer at the ice point, the steam point and the boiling point of sulphur are 2.50, 3.50 and 6.50 Ω respectively. Find the boiling point of sulphur on the platinum scale. The ice point and the steam point measure 0° and 100°, respectively.

21. In a constant volume gas thermometer, the pressure of the working gas is measured by the difference in the levels of mercury in the two arms of a *U*-tube connected to the gas at one end . When the bulb is placed at the room temperature 27.0 °C, the mercury column in the arm open to atmosphere stands 5.00 cm above the level of mercury in the other arm. When the bulb is placed in a hot liquid, the difference of mercury levels becomes 45.0 cm. Calculate the temperature of the liquid.(Atmospheric pressure = 75.0 cm of mercury.)

22. A steel wire of 2.0 mm^2cross-section is held straight (but under no tension) by attaching it firmly to two points a distance 1.50 m apart at 30 ° C. If the temperature now decreases to –10° C and if the two points remain fixed, what will be the tension in the wire? For steel, Y = 20,0000 MPa.

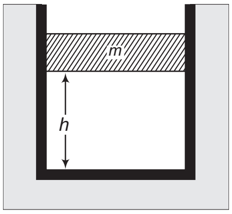
23. A metallic bob weighs 50 g in air. If it is immersed in a liquid at a temperature of 25° C, it weighs 45 g. When the temperature of the liquid is raised to 100° C, it weighs 45.1 g. Calculate the coefficient of cubical expansion of the liquid. Given that coefficient of cubical expansion of the metal is $12 \times 10^{-6}\ ^\circ C^{-1}$.

24. An ideal gas exerts a pressure of 1.52 MPa when its temperature is 298.15 K and its volume is $10^{-2} m^3$. (a) How many moles of gas are there? (b) What is the mass density if the gas is molecular hydrogen? (c) What is the mass density if the gas is oxygen?

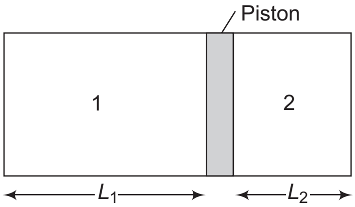
25. A compressor pumps 70 L of air into a 6 L tank with the temperature remaining unchanged. If all the air is originally at 1 atm. What is the final absolute pressure of the air in the tank?

26. A partially inflated balloon contains 500 m^3 of helium at 27° C and 1 atm pressure. What is the volume of the helium at an altitude of 18000 ft, where the pressure is 0.5 atm and the temperature is –3° C?

27. A cylinder whose inside diameter is 4.00 cm contains air compressed by a piston of mass m = 13.0 kg which can slide freely in the cylinder. The entire arrangement is immersed in a water bath whose temperature can be controlled. The system is initially in equilibrium at temperature $t_i = 20°$ C. The initial height of the piston above the bottom of the cylinder is $h_i = 4.00$ cm. The temperature of the water bath is gradually increased to a final temperature $t_f = 100°$ C. Calculate the final height h_f of the piston.



28. The closed cylinder shown in figure has a freely moving piston separating chambers 1 and 2. Chamber 1 contains 25 mg of N_2 gas and chamber 2 contains 40 mg of helium gas. When equilibrium is established what will be the ratio L_1 / L_2? What is the ratio of the number of moles of N_2 to the number of moles of He? (Molecular weights of N_2 and He are 28 and 4).



29. Two gases occupy two containers A and B. The gas in A of volume 0.11 m^3 exerts a pressure of 1.38 MPa. The gas in B of volume 0.16 m^3 exerts a pressure of 0.69 MPa. Two containers are united by a tube of negligible volume and the gases are allowed to intermingle. What is the final pressure in the container if the temperature remains constant ?

30. A glass bulb of volume 400 cm^3 is connected to another of volume 20 cm^3 by means of a tube of negligible volume. The bulbs contain dry air and are both at a common temperature and pressure of 20°C and 1.00 atm. The larger bulb is immersed in steam at 100°C and the smaller in melting ice at 0°C. Find the final common pressure.

31. The condition called standard temperature and pressure (STP) for a gas is defined as temperature of $0°\text{ C} = 273.15$ K and a pressure of $1 \text{ atm} = 1.013 \times 10^5$ Pa. If you want to keep a mole of an ideal gas in your room at STP, how big a container do you need?

32. A large cylindrical tank contains 0.750 m^3 of nitrogen gas at 27° C and 1.50×10^5 Pa (absolute pressure). The tank has a tightfitting piston that allows the volume to be changed. What will be the pressure if the volume is decreased to 0.480 m^3 and the temperature is increased to 157°C.

33. A vessel of volume 5 litres contains 1.4 g of N_2 and 0.4 g of He at 1500 K. If 30% of the nitrogen molecules are dissociated into atoms then find the gas pressure.

34. Temperature of diatomic gas is 300 K. If moment of inertia of its molecules is 8.28×10^{-38} g-cm^2. Calculate their root mean square angular velocity.

35. Find the number of degrees of freedom of molecules in a gas. Whose molar heat capacity

(a) at constant pressure $C_p = 29 \text{ J mol}^{-1}\text{K}^{-1}$

(b) $C = 29 \text{ J mol}^{-1}\text{K}^{-1}$ in the process pT = constant.

36. In a certain gas $\frac{2}{5}$th of the energy of molecules is associated with the rotation of molecules and the rest of it is associated with the motion of the centre of mass.

(a) What is the average translational energy of one such molecule when the temperature is 27°C?

(b) How much energy must be supplied to one mole of this gas at constant volume to raise the temperature by 1°C?

37. A mixture contains 1 mole of helium ($C_p = 2.5\,R, C_V = 1.5\,R$) and 1 mole of hydrogen ($C_p = 3.5R, C_V = 2.5\,R$). Calculate the values of C_p, C_V and γ for the mixture.

38. An ideal gas $(C_p / C_V = \gamma)$ is taken through a process in which the pressure and the volume vary as $P = aV^b$. Find the value of b for which the specific heat capacity in the process is zero.

39. An ideal gas is taken through a process in which the pressure and the volume are changed according to the equation $p = kV$. Show that the molar heat capacity of the gas for the process is given by $C = C_V + \frac{R}{2}$.

40. The pressure of a gas in a 100 mL container is 200 kPa and the average translational kinetic energy of each gas particle is 6×10^{-21} J. Find the number of gas particles in the container. How many moles are there in the container?

41. One gram mole NO_2 at 57° C and 2 atm pressure is kept in a vessel. Assuming the molecules to be moving with rms velocity. Find the number of collisions per second which the molecules make with one square metre area of the vessel wall.

42. A 2.00 mL volume container contains 50 mg of gas at a pressure of 100 kPa. The mass of each gas particle is 8.0×10^{-26} kg. Find the average translational kinetic energy of each particle.

43. Call the rms speed of the molecules in an ideal gas v_0 at temperature T_0 and pressure p_0. Find the speed if (a) the temperature is raised from $T_0 = 293$ K to 573 K (b) the pressure is doubled and $T = T_0$ (c) the molecular weight of each of the gas molecules is tripled.

44. (a) What is the average translational kinetic energy of a molecule of an ideal gas at temperature of 27° C?

(b) What is the total random translational kinetic energy of the molecules in one mole of this gas?

(c) What is the rms speed of oxygen molecules at this temperature?

45. At 0°C and 1.0 atm $(= 1.01 \times 10^5\ \text{N/m}^2)$ pressure the densities of air, oxygen and nitrogen are $1.284\ \text{kg/m}^3$, $1.429\ \text{kg/m}^3$ and $1.251\ \text{kg/m}^3$ respectively. Calculate the percentage of nitrogen in the air from these data, assuming only these two gases to be present.

46. An air bubble of $20\ \text{cm}^3$ volume is at the bottom of a lake 40 m deep where the temperature is 4°C. The bubble rises to the surface which is at a temperature of 20°C. Take the temperature to be the same as that of the surrounding water and find its volume just before it reaches the surface.

47. For a certain gas the heat capacity at constant pressure is greater than that at constant volume by 29.1 J/K.

(a) How many moles of the gas are there?

(b) If the gas is monatomic, what are heat capacities at constant volume and pressure?

(c) If the gas molecules are diatomic which rotate but do not vibrate, what are heat capacities at constant volume and at constant pressure?

48. The heat capacity at constant volume of a sample of a monatomic gas is 35 J/K. Find

(a) the number of moles

(b) the internal energy at 0°C

(c) the molar heat capacity at constant pressure.

LEVEL 2

Single Correct Option

1. Two thermally insulated vessels 1 and 2 are filled with air at temperatures (T_1, T_2), volumes (V_1, V_2) and pressures (p_1, p_2) respectively. If the valve joining the two vessels is opened, the temperature inside the vessel at equilibrium will be (P = common pressure)

(a) $T_1 + T_2$

(b) $(T_1 + T_2)/2$

(c) $\dfrac{T_1T_2p(V_1 + V_2)}{p_1V_1T_2 + p_2V_2T_1}$

(d) $\dfrac{T_1T_2(p_1V_1 + p_2V_2)}{p_1V_1T_2 + p_2V_2T_1}$

2. Two marks on a glass rod 10 cm apart are found to increase their distance by 0.08 mm when the rod is heated from 0°C to 100°C. A flask made of the same glass as that of rod measures a volume of 100 cc at 0°C. The volume it measures at 100°C in cc is

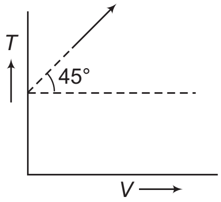
(a) 100.24

(b) 100.12

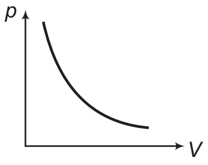
(c) 100.36

(d) 100.48

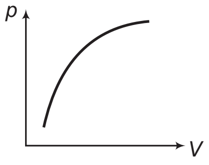
3. The given curve represents the variation of temperature as a function of volume for one mole of an ideal gas. Which of the following curves best represents the variation of pressure as a function of volume?



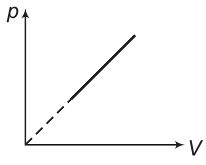
(a)



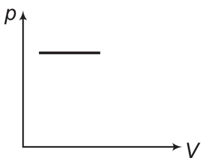
(b)



(c)



(d)



4. A gas is found to be obeyed the law p^2V = constant. The initial temperature and volume are T_0 and V_0. If the gas expands to a volume $3V_0$, then the final temperature becomes

(a) $\sqrt{3}\, T_0$

(b) $\sqrt{2}\, T_0$

(c) $\dfrac{T_0}{\sqrt{3}}$

(d) $\dfrac{T_0}{\sqrt{2}}$

5. Air fills a room in winter at 7°C and in summer at 37°C. If the pressure is the same in winter and summer, the ratio of the weight of the air filled in winter and that in summer is

(a) 2.2

(b) 1.75

(c) 1.1

(d) 3.3

6. Three closed vessels A, B and C are at the same temperature T and contain gases which obey Maxwell distribution law of velocities. Vessel A contains O_2, B only N_2 and C mixture of equal quantities of O_2 and N_2. If the average speed of the O_2 molecules in vessel A is v_1 that of N_2 molecules in vessel B is v_2, then the average speed of the O_2 molecules in vessel C is

(a) $\frac{(v_1 + v_2)}{2}$ (b) v_1

(c) $\sqrt{v_1 v_2}$ (d) None of these

7. In a very good vacuum system in the laboratory, the vacuum attained was 10^{-13} atm. If the temperature of the system was 300 K, the number of molecules present in a volume of 1 cm^3 is

(a) 2.4×10^6 (b) 24

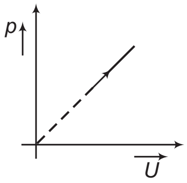
(c) 2.4×10^9 (d) zero

8. If nitrogen gas molecule goes straight up with its rms speed at 0°C from the surface of the earth and there are no collisions with other molecules, then it will rise to an approximate height of

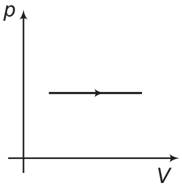
(a) 8 km (b) 12 km

(c) 12 m (d) 8 m

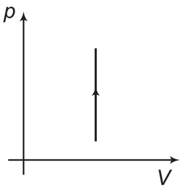
9. The given p-U graph shows the variation of internal energy of an ideal gas with increase in pressure. Which of the following pressure-volume graph is equivalent to this graph?



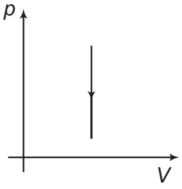
(a)



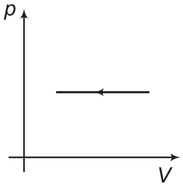
(b)



(c)



(d)



10. 28 g of N_2 gas is contained in a flask at a pressure of 10 atm and at a temperature of 57°C. It is found that due to leakage in the flask, the pressure is reduced to half and the temperature to 27°C. The quantity of N_2 gas that leaked out is

(a) 11/20 g (b) 20/11 g

(c) 5/63 g (d) 63/5 g

11. A mixture of 4 g of hydrogen and 8 g of helium at NTP has a density about

(a) 0.22 kg/m^3 (b) 0.62 kg/m^3

(c) 1.12 kg/m^3 (d) 0.13 kg/m^3

12. The pressure (p) and the density (ρ) of given mass of a gas expressed by Boyle's law, $p = K\rho$ holds true

(a) for any gas under any condition

(b) for same gas under any condition

(c) only if the temperature is kept constant

(d) None of the above

More than One Correct Options

1. During an experiment, an ideal gas is found to obey a condition $\frac{p^2}{\rho}$ = constant. (ρ = density of the gas). The gas is initially at temperature T, pressure p and density ρ. The gas expands such that density changes to $\rho/2$.

(a) The pressure of the gas changes to $\sqrt{2}\ p$
(b) The temperature of the gas changes to $\sqrt{2}\ T$
(c) The graph of the above process on p-T diagram is parabola
(d) The graph of the above process on p-T diagram is hyperbola

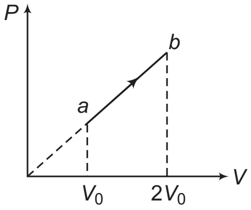
2. During an experiment, an ideal gas is found to obey a condition Vp^2 = constant. The gas is initially at a temperature T, pressure p and volume V. The gas expands to volume $4V$.

(a) The pressure of gas changes to $\frac{p}{2}$
(b) The temperature of gas changes to $4T$
(c) The graph of the above process on p-T diagram is parabola
(d) The graph of the above process on p-T diagram is hyperbola

3. Find the correct options.

(a) Ice point in Fahrenheit scale is 32°F
(b) Ice point in Fahrenheit scale is 98.8°F
(c) Steam point in Fahrenheit scale is 212°F
(d) Steam point in Fahrenheit scale is 252°F

4. In the P-V diagram shown in figure, choose the correct options for the process a-b :

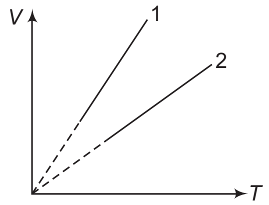


(a) density of gas has reduced to half
(b) temperature of gas has increased to two times
(c) internal energy of gas has increased to four times
(d) T-V graph is a parabola passing through origin

5. Choose the **wrong** options

(a) Translational kinetic energy of all ideal gases at same temperature is same
(b) In one degree of freedom all ideal gases has internal energy = $\frac{1}{2}RT$
(c) Translational degree of freedom of all ideal gases is three
(d) Translational kinetic energy of one mole of all ideal gases is $\frac{3}{2}RT$

6. Along the line-1, mass of gas is m_1 and pressure is p_1. Along the line-2 mass of same gas is m_2 and pressure is p_2. Choose the correct options.



(a) m_1 may be less than m_2
(b) m_2 may be less than m_1
(c) p_1 may be less than p_2
(d) p_2 may be less than p_1

7. Choose the correct options.

(a) In $p = \frac{m}{M} RT$, m is mass of gas per unit volume

(b) In $pV = \frac{m}{M} RT$, m is mass of one molecule of gas

(c) In $p = \frac{1}{3} \frac{mN}{V} v_{\text{rms}}^2$, m is total mass of gas.

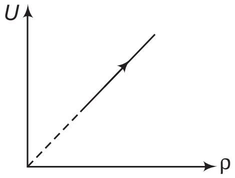
(d) In $v_{\text{rms}} = \sqrt{\frac{3kT}{m}}$, m is mass of one molecule of gas

Match the Columns

1. Match the following two columns for 2 moles of an ideal diatomic gas at room temperature T.

Column I	Column II
(a) Translational kinetic energy	(p) $2RT$
(b) Rotational kinetic energy	(q) $4RT$
(c) Potential energy	(r) $3RT$
(d) Total internal energy	(s) None of these

2. In the graph shown, U is the internal energy of gas and ρ the density. Corresponding to given graph, match the following two columns.



Column I	Column II
(a) Pressure	(p) is constant
(b) Volume	(q) is increasing
(c) Temperature	(r) is decreasing
(d) Ratio T/V	(s) data insufficient

3. At a given temperature T,

$v_1 = \sqrt{\frac{x_1 RT}{M}}$ = rms speed of gas molecules, $v_2 = \sqrt{\frac{x_2 RT}{M}}$ = average speed of gas molecules

$v_3 = \sqrt{\frac{x_3 RT}{M}}$ = most probable speed of gas molecules, $v_4 = \sqrt{\frac{x_4 RT}{M}}$ = speed of sound

Column I	Column II
(a) x_1	(p) 1.5
(b) x_2	(q) 2.0
(c) x_3	(r) 3.0
(d) x_4	(s) data insufficient

4. With increase in temperature, match the following two columns.

Column I	Column II
(a) Density of water	(p) will increase
(b) Fraction of a solid floating in a liquid	(q) will decrease
(c) Apparent weight of a solid immersed in water	(r) will remain unchanged
(d) Time period of pendulum	(s) may increase or decrease

5. Corresponding to isobaric process, match the following two columns.

Column I	Column II
(a) p-T graph	(p) (b) U-ρ graph	(q) (c) T-V graph	(r) (d) T-ρ graph	(s) 
Note *First physical quantity is along y-axis.*

Subjective Questions

1. Show that the volume thermal expansion coefficient for an ideal gas at constant pressure is $\frac{1}{T}$.

2. The volume of a diatomic gas ($\gamma = 7/5$) is increased two times in a polytropic process with molar heat capacity $C = R$. How many times will the rate of collision of molecules against the wall of the vessel be reduced as a result of this process?

3. A perfectly conducting vessel of volume $V = 0.4\ \text{m}^3$ contains an ideal gas at constant temperature $T = 273\ \text{K}$. A portion of the gas is let out and the pressure of the gas falls by $\Delta p = 0.24$ atm. (Density of the gas at STP is $\rho = 1.2\ \text{kg/m}^3$). Find the mass of the gas which escapes from the vessel.

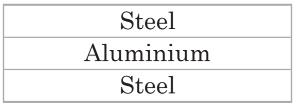
4. A thin-walled cylinder of mass m, height h and cross-sectional area A is filled with a gas and floats on the surface of water. As a result of leakage from the lower part of the cylinder, the depth of its submergence has increased by Δh. Find the initial pressure p_1 of the gas in the cylinder if the atmospheric pressure is p_0 and the temperature remains constant.

5. Find the minimum attainable pressure of an ideal gas in the process $T = T_0 + \alpha V^2$, where T_0 and α are positive constants and V is the volume of one mole of gas.

6. A solid body floats in a liquid at a temperature $t = 50° \text{C}$ being completely submerged in it. What percentage of the volume of the body is submerged in the liquid after it is cooled to $t_0 = 0° \text{C}$, if the coefficient of cubic expansion for the solid is $\gamma_s = 0.3 \times 10^{-5}\ °\text{C}^{-1}$ and of the liquid $\gamma_l = 8 \times 10^{-5}\ °\text{C}^{-1}$.

7. Two vessels connected by a pipe with a sliding plug contain mercury. In one vessel, the height of mercury column is 39.2 cm and its temperature is 0° C, while in the other, the height of mercury column is 40 cm and its temperature is 100° C. Find the coefficient of cubical expansion for mercury. The volume of the connecting pipe should be neglected.

8. Two steel rods and an aluminium rod of equal length l_0 and equal cross-section are joined rigidly at their ends as shown in the figure below. All the rods are in a state of zero tension at 0° C.



Find the length of the system when the temperature is raised to θ. Coefficient of linear expansion of aluminium and steel are α_a and α_s, respectively. Young's modulus of aluminium is Y_a and of steel is Y_s.

9. A metal rod A of 25 cm length expands by 0.050 cm when its temperature is raised from 0° C to 100° C. Another rod B of a different metal of length 40 cm expands by 0.040 cm for the same rise in temperature. A third rod C of 50 cm length is made up of pieces of rods A and B placed end to end expands by 0.03 cm on heating from 0° C to 50° C. Find the lengths of each portion of the composite rod.

21.5 Refrigerator

21.6 Zeroth Law of Thermodynamics

21.7 Second Law of Thermodynamics

21.1 The First Law of Thermodynamics

The first law of thermodynamics is basically law of conservation of energy. This law can be applied for any type of system like solid, liquid and gas. But, in most of the cases the system will be an ideal gas. A process in which there are changes in the state of a thermodynamic system (like p, V, T, U and ρ etc.) is called a **thermodynamic process.**

We now come to the first law

Suppose Q heat is given to a system, then part of it is used by the system in doing work W against the surroundings (like atmosphere) and part is used by the system in increasing its internal energy ΔU. Thus,

$$\boxed{Q = W + \Delta U} \qquad \ldots\text{(i)}$$

Let us take a real life situation similar to first law.

Consider a person X. Suppose his monthly income is Rs. 50,000 (Q). He spends Rs. 30,000 (W) as his monthly expenditure. Then, obviously the remaining Rs. 20,000 goes to his savings (ΔU). In some month it is also possible that he spends more than his income. In that case he will withdraw it from his bank and his savings will get reduced ($\Delta U < 0$). In the similar manner, other combinations can be made.

Sign Convention

(i) ***Q*** If heat is given to the system, then Q is positive and if heat is taken from the system, then it is negative.

(ii) ***W*** Work done used in Eq. (i) is the work done by the system (not work done on the system). This work done is positive if volume of the system increases. Sign of work done in different situations is given in tabular form as below

Table 21.1

S.No	Volume of the system	Work done by the system used in Eq. (i)	Work done on the system
1.	is increasing	positive	negative
2.	is decreasing	negative	positive
3.	is constant	zero	zero

(iii) Δ***U*** Internal energy of a system is due to disordered motion of its constituent particles. It mainly depends on state (solid, liquid and gas) and temperature. For example, two different states at same temperature will have different internal energy. Ice at 0°C and water at 0°C have different energies. Similarly, same state at different temperatures will have different energies. For example, internal energy of an ideal gas is given by

$$U = \frac{nf}{2} RT$$

or

$$U \propto T$$

If temperature increases, internal energy also increases and $\Delta U = U_f - U_i$ will be positive.

Extra Points to Remember

- If a thermodynamic system changes from an initial equilibrium state A to final equilibrium state B through three different paths 1, 2 and 3, then Q and W will be different along these three paths. But $Q - W$ or ΔU will be same along all three paths. This is because, Q and W are path functions. But U is a state function. Thus,

$$\boxed{Q_1 - W_1 = Q_2 - W_2 = Q_3 - W_3 = \Delta U}$$

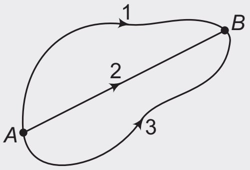

Fig. 21.1

In a closed path, $\Delta U = 0$

Example 21.1 *When a system goes from state A to state B, it is supplied with 400 J of heat and it does 100 J of work.*

(a) For this transition, what is the system's change in internal energy?

(b) If the system moves from B to A, what is the change in internal energy?

(c) If in moving from A to B along a different path in which $W'_{AB} = 400$ J *of work is done on the system, how much heat does it absorb?*

Solution (a) From the first law,

$$\Delta U_{AB} = Q_{AB} - W_{AB} = (400 - 100)\text{ J} = 300\text{ J}$$

(b) Consider a closed path that passes through the state A and B. Internal energy is a state function so ΔU is zero for a closed path.

Thus, $\Delta U = \Delta U_{AB} + \Delta U_{BA} = 0$ or $\Delta U_{BA} = - \Delta U_{AB} = - 300$ J

(c) The change in internal energy is the same for any path, so

$$\Delta U_{AB} = \Delta U'_{AB} = Q'_{AB} - W'_{AB}$$

$$300\text{ J} = Q'_{AB} - (-400\text{ J})$$

and the heat exchanged is $Q'_{AB} = - 100$ J

The negative sign indicates that the system loses heat in this transition.

INTRODUCTORY EXERCISE 21.1

1. The quantities in the following table represent four different paths for the same initial and final states. Find *a, b, c, d, e, f* and *g.*

Table 21.2

Q(J)	W(J)	ΔU(J)
–80	–120	*d*
90	*c*	*e*
a	40	*f*
b	–40	*g*

2. In a certain chemical process, a lab technician supplies 254 J of heat to a system. At the same time, 73 J of work are done on the system by its surroundings. What is the increase in the internal energy of the system?

21.2 Further Explanation of Three Terms Used in First Law

First law of thermodynamics basically revolves round the three terms $Q, \Delta U$ and W. If you substitute these three terms correctly with proper signs in the equation $Q = \Delta U + W$, then you are able to solve most of the problems of first law. Let us take each term one by one. Here, we are taking the system an ideal gas.

(i) **Heat Transfer (Q or ΔQ)** There are two methods of finding Q or ΔQ.

***Method* 1.**
$$\boxed{Q = nC\Delta T}$$

or
$$\boxed{\Delta Q = nC\Delta T}$$

where, C is the molar heat capacity of the gas and n is the number of moles of the gas. Always take,

$$\boxed{\Delta T = T_f - T_i}$$

where, T_f is the final temperature and T_i the initial temperature of the gas. Further, we have discussed in chapter 20, that molar heat capacity of an ideal gas in the process $pV^x =$ constant is

$$\boxed{C = \frac{R}{\gamma - 1} + \frac{R}{1-x} = C_V + \frac{R}{1-x}}$$

$C = C_V = \dfrac{R}{\gamma - 1}$ in isochoric process and

$C = C_p = C_V + R$ in isobaric process

Mostly C_p and C_V are used.

Note *For finding C, nature of gas and process should be known. Nature of gas will give us C_V and process the value of x.*

***Method* 2.** We can also find Q by finding ΔU and W by the equation

$$Q = W + \Delta U$$

(ii) **Change in internal energy (ΔU)** There are two methods of finding ΔU.

***Method* 1.** For change in internal energy of the gas

$$\Delta U = nC_V \Delta T$$

Students are often confused that the result $\Delta U = nC_V \Delta T$ can be applied only in case of an isochoric process (as C_V is here used). However, it is not so. It can be applied in any process, whether it is isobaric, isothermal, adiabatic or else.

Note *In the above expression, value of C_V depends on the nature of gas.*

***Method* 2.** We can also find ΔU from the basic equation of first law of thermodynamics,

$$\Delta U = Q - W$$

(iii) **Work done (W)** This is the most important of the three.

Work Done During Volume Changes

A gas in a cylinder with a movable piston is a simple example of a thermodynamic system.

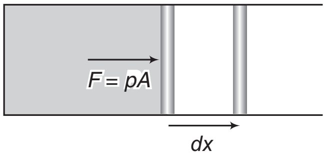

Fig. 21.2

Figure shows a gas confined to a cylinder that has a movable piston at one end. If the gas expands against the piston, it exerts a force and does work on the piston. If the piston compresses the gas as it is moved inward, work is done on the gas. The work associated with such volume changes can be determined as follows.

Let the gas pressure on the piston face be p. Then, the force on the piston due to the gas is pA, where A is the area of the face.

When the piston is pushed outward an infinitesimal distance dx, the work done by the gas is

$$dW = Fdx = pA\,dx$$

which, since the change in volume of the gas is $dV = Adx$, becomes

$$\boxed{dW = pdV}$$

For a finite change in volume from V_i to V_f, this equation is then integrated between V_i to V_f to find the net work

$$\boxed{W = \int dW = \int_{V_i}^{V_f} pdV}$$

Now, there are five methods of finding work done by a gas.

***Method* 1.** This is used when p - V equation is known to us. Suppose p as a function of V is known to us.

$$p = f(V)$$

then work done can be found by

$$W = \int_{V_i}^{V_f} f(V)\,dV$$

***Method* 2.** The work done by a gas is also equal to the area under p - V graph. Following different cases are possible :

Case 1 When volume is constant

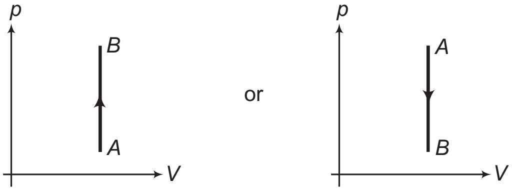

Fig. 21.3

$$V = \text{constant}$$

$$\therefore \qquad W_{AB} = 0$$

Case 2 When volume is increasing

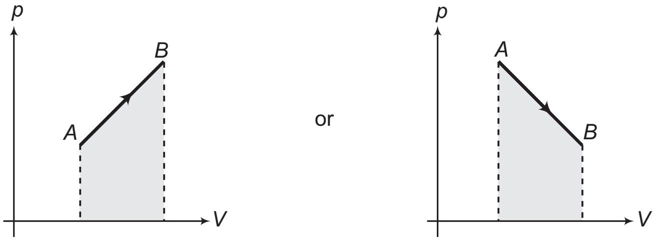

Fig. 21.4

$$V \text{ is increasing}$$

$$\therefore \qquad W_{AB} > 0$$

$$W_{AB} = \text{Shaded area}$$

Case 3 When volume is decreasing

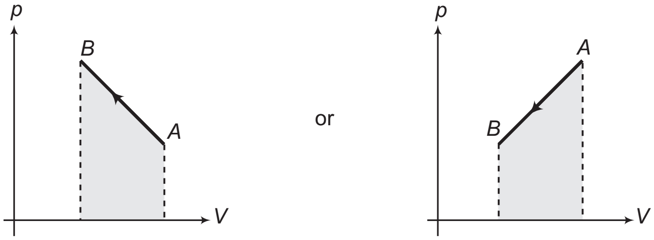

Fig. 21.5

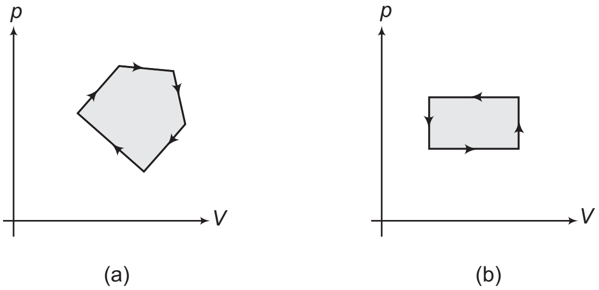
$$V \text{ is decreasing}$$

$$\therefore \qquad W_{AB} < 0$$

$$W_{AB} = -\text{ Shaded area}$$

Case 4 Cyclic process



(a) (b)

Fig. 21.6

$$W_{\text{clockwise cycle}} = +\text{Shaded area} \qquad \text{[in figure (a)]}$$

$$W_{\text{anticlockwise cycle}} = -\text{ Shaded area} \qquad \text{[in figure (b)]}$$

Case 5 Incomplete cycle

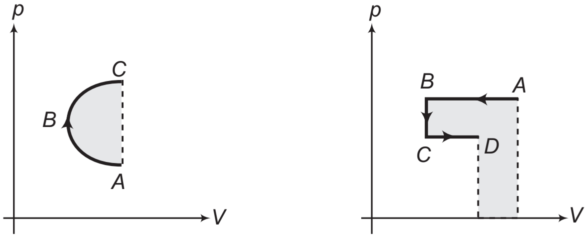


Fig. 21.7

$$W_{ABC} = +\text{Shaded area}$$
$$W_{ABCD} = -\text{Shaded area.}$$

***Method* 3.** Sometimes work done by the gas is also obtained by finding the forces against which work is done by the gas.

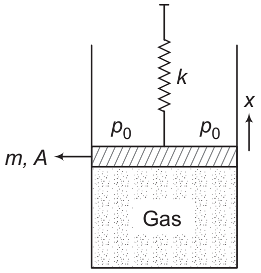

Fig. 21.8

For example, in the figure shown, work is done by the gas against the following forces (when the piston is displaced upwards)

(i) Against gravity force mg. Since, mg is a constant force.

$\therefore \quad W_1 = \text{Force} \times \text{displacement} = mgx$

(ii) Against the force $p_0 A$. Further, this is also a constant force.

$\therefore \quad W_2 = \text{Force} \times \text{displacement} = p_0 Ax$

But, $\quad Ax = \Delta V$

$\therefore \quad W_2 = p_0 \Delta V$

(iii) Against spring force kx. This is a variable force.

Hence,

$$W_3 = \int_0^x (kx)\,dx = \frac{1}{2}kx^2$$

Note *While calculating W_3, we have assumed that initially spring is in its natural length.*

***Method* 4.** In some cases, one process and limits of temperature (or temperature change) is given. In those cases, with the help of given process and the standard ideal gas equation $pV = nRT$, first we convert pdV into $f(T)dT$ and then integrate this expression with the limits of temperature. Thus,

$$W = \int pdV = \int_{T_i}^{T_f} f(T)\,dT$$

***Method* 5.** The last method of finding work done is from the fundamental equation of first law.

or
$$W = Q - \Delta U$$

Now, let us take example of each one of them.

Example 21.2 *Method 1 of Q*

Temperature of two moles of a monoatomic gas is increased by 300 K in the process $p \propto V$.

(a) Find molar heat capacity of the gas in the given process.

(b) Find heat given to the gas in that.

Solution (a) $p \propto V \quad \Rightarrow \quad pV^{-1} = \text{constant}$

If we compare with pV^x = constant, then

$$x = -1$$

Now,

$$C = C_V + \frac{R}{1-x}$$

$$C_V = \frac{3}{2}R \text{ for a monoatomic gas}$$

$$\therefore \qquad C = \frac{3}{2}R + \frac{R}{1-(-1)} = 2R$$ **Ans.**

(b) $Q = nC\Delta T$

Substituting the values, we get

$$Q = (2)(2R)(300)$$
$$= 1200R$$ **Ans.**

Example 21.3 *Method 2 of Q*

In a given process work done on a gas is 40 J and increase in its internal energy is 10 J. Find heat given or taken to/from the gas in this process.

Solution Given, $\Delta U = +10$ J

Work done on the gas is 40 J. Therefore, work done by the gas used in the equation, $Q = W + \Delta U$ will be –40 J. Now, putting the values in the equation,

$$Q = W + \Delta U$$

We have,

$$Q = -40 + 10$$
$$= -30 \text{ J}$$ **Ans.**

Here, negative sign indicates that heat is taken out from the gas.

Example 21.4 *Method 1 of ΔU*

Temperature of two moles of a monoatomic gas is increased by 600 K in a given process. Find change in internal energy of the gas.

Solution Using the equation,

$$\Delta U = nC_V \Delta T \qquad \text{for change in internal energy}$$

$$C_V = \frac{3}{2}R \qquad \text{for monoatomic gas}$$

$$\therefore \quad \Delta U = (2)\left(\frac{3}{2}R\right)(600)$$

$$= 1800\,R$$ **Ans.**

Example 21.5 *Method 2 of ΔU*

Work done by a gas in a given process is –20 J. Heat given to the gas is 60 J. Find change in internal energy of the gas.

Solution $\Delta U = Q - W$

Substituting the values we have,

$$\Delta U = 60 - (-20)$$

$$= 80\text{ J}$$ **Ans.**

ΔU is positive. Hence, internal energy of the gas is increasing.

Example 21.6 *Method 1 of W*

By integration, make expressions of work done by gas in

(a) Isobaric process (p = constant)

(b) Isothermal process (pV = constant)

(c) Adiabatic process (pV^{γ} = constant)

Solution (a) **Isobaric process**

$$W = \int_{V_i}^{V_f} p\,dV = p\int_{V_i}^{V_f} dV \qquad (\text{as } p = \text{constant})$$

$$= p\,[V]_{V_i}^{V_f} = p\,(V_f - V_i)$$

$$= p\Delta V$$ **Ans.**

Note *Any process freely taking place in atmosphere is considered isobaric. For example, melting of ice, boiling of water etc. Here, the constant pressure is p_0. Therefore,*

$$W = p_0\Delta V = p_0(V_f - V_i)$$

(b) **Isothermal process**

$$W = \int_{V_i}^{V_f} p\,dV = \int_{V_i}^{V_f}\left(\frac{nRT}{V}\right)dV \qquad \left(\text{as } p = \frac{nRT}{V}\right)$$

$$= nRT\int_{V_i}^{V_f}\frac{dV}{V} \qquad (\text{as } T = \text{constant})$$

$$= nRT\ln\left(\frac{V_f}{V_i}\right) = nRT\ln\left(\frac{p_i}{p_f}\right) \qquad \left(\text{as } p_iV_i = p_fV_f \text{ So, } \frac{V_f}{V_i} = \frac{p_i}{p_f}\right)$$

(c) **Adiabatic process**

$$pV^{\gamma} = \text{constant} = k \text{ (say)} = p_iV_i^{\gamma} = p_fV_f^{\gamma}$$

Further,
$$p = \frac{k}{V^{\gamma}} = kV^{-\gamma}$$

$$W = \int_{V_i}^{V_f} p\,dV = \int_{V_i}^{V_f} kV^{-\gamma}\,dV = \left[\frac{kV^{-\gamma+1}}{-\gamma+1}\right]_{V_i}^{V_f}$$

$$= \frac{kV_f^{-\gamma+1} - kV_i^{-\gamma+1}}{-\gamma+1} = \frac{p_fV_f^{\gamma}V_f^{-\gamma+1} - p_iV_i^{\gamma}V_i^{-\gamma+1}}{1-\gamma}$$

$$= \frac{p_fV_f - p_iV_i}{1-\gamma} = \frac{nRT_f - nRT_i}{1-\gamma} = \frac{nR\Delta T}{1-\gamma}$$

Example 21.7 Method 2 of W

In the given p-V diagram, find

(a) pressures at c and d

(b) work done in different processes separately

(c) work done in complete cycle abcd.

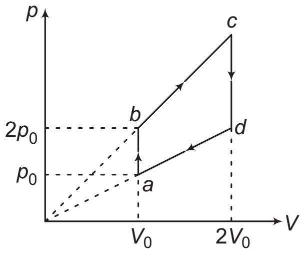

Fig. 21.9

Solution (a) Line bc is passing through origin. Hence,

$$p \propto V$$

From b to c, volume is doubled. Hence, pressure is also doubled.

$\therefore$
$$p_c = 2p_b = 4p_0$$ **Ans.**

Similarly, line ad is also passing through origin.

$\therefore$
$$p_d = 2p_a = 2p_0$$ **Ans.**

(b) ab and cd processes are isochoric ($V =$ constant). Hence,

$$W_{ab} = W_{cd} = 0$$

$$W_{bc} = \text{area under the line } bc$$
$$= \text{area of trapezium}$$
$$= \frac{1}{2}(p_b + p_c)(2V_0 - V_0)$$
$$= \frac{1}{2}(2p_0 + 4p_0)(V_0)$$
$$= 3\,p_0V_0$$ **Ans.**

Since, volume is increasing. Therefore, W_{bc} is positive.

$$W_{da} = -\text{area under the line } da$$
$$= -\text{area of trapezium}$$
$$= -\frac{1}{2}(p_a + p_d)(2V_0 - V_0)$$

$$= -\frac{1}{2}(p_0 + 2p_0)(V_0)$$

$$= -1.5\, p_0 V_0$$ **Ans.**

Volume is decreasing. Therefore, work done is negative.

(d) Work done in complete cycle

$$W_{\text{net}} = W_{ab} + W_{bc} + W_{cd} + W_{da}$$
$$= 0 + 3\, p_0 V_0 + 0 - 1.5\, p_0 V_0$$
$$= 1.5\, p_0 V_0$$ **Ans.**

Note *Net work done is also equal to the area between the cycle. Since, cycle is clockwise. Hence, net work done is positive.*

Example 21.8 *Method 3 of W*

Mass of a piston shown in Fig. 21.10 is m and area of cross-section is A. Initially spring is in its natural length. Find work done by the gas.

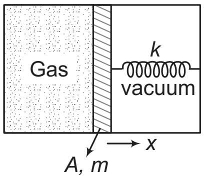

Fig. 21.10

Solution In the given condition, work is done by the gas only against spring force kx. This force is a variable force. Hence,

$$W = \int_0^x (kx)\, dx = \frac{1}{2}kx^2$$

Example 21.9 *Method 4 of W*

The temperature of n-moles of an ideal gas is increased from T_0 to $2T_0$ through a process $p = \frac{\alpha}{T}$. Find work done in this process.

Solution $$pV = nRT \quad \text{(ideal gas equation)} \qquad \text{...(i)}$$

and $$p = \frac{\alpha}{T} \qquad \text{...(ii)}$$

Dividing Eq. (i) by Eq. (ii), we get

$$V = \frac{nRT^2}{\alpha} \quad \text{or} \quad dV = \frac{2nRT}{\alpha}\, dT$$

$$\therefore \quad W = \int_{V_i}^{V_f} p\, dV = \int_{T_0}^{2T_0} \left(\frac{\alpha}{T}\right)\left(\frac{2nRT}{\alpha}\right) dT$$

$$= 2nRT_0$$ **Ans.**

Example 21.10 *Method 5 of W*

Heat taken from a gas in a process is 80 J and increase in internal energy of the gas is 20 J. Find work done by the gas in the given process.

Solution Heat is taken from the gas.

Therefore, Q is negative. Or, $Q = -80$ J

Internal energy of the gas is increasing.

Therefore, ΔU is positive. Or $\qquad \Delta U = +20\text{ J}$

Using the first law equation,

$$Q = W + \Delta U \quad \text{or} \quad W = Q - \Delta U = -80 - 20 = -100\text{ J}$$ **Ans.**

Here, negative sign indicates that volume of the gas is decreasing and work is done on the gas.

INTRODUCTORY EXERCISE 21.2

1. A gas in a cylinder is held at a constant pressure of 1.7×10^5 Pa and is cooled and compressed from 1.20 m^3 to 0.8 m^3. The internal energy of the gas decreases by 1.1×10^5 J.
  (a) Find the work done by the gas.
  (b) Find the magnitude of the heat flow into or out of the gas and state the direction of heat flow.
  (c) Does it matter whether or not the gas is ideal?

2. A thermodynamic system undergoes a cyclic process as shown in figure.

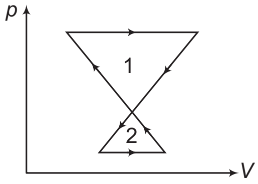

Fig. 21.12

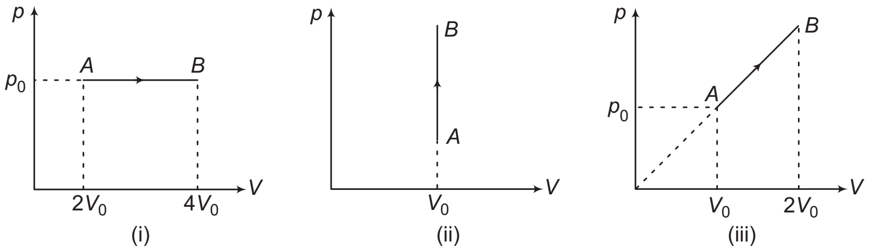
  (a) over one complete cycle, does the system do positive or negative work.
  (b) over one complete cycle, does heat flow into or out of the system.
  (c) In each of the loops 1 and 2, does heat flow into or out of the system.

3. How many moles of helium at temperature 300 K and 1.00 atm pressure are needed to make the internal energy of the gas 100 J?

4. Temperature of four moles of a monoatomic gas is increased by 300 K in isochoric process. Find W, Q and ΔU.

5. Find work done by the gas in the process AB shown in the following figures.



(i) (ii) (iii)

Fig. 21.12

6. Temperature of two moles of an ideal gas is increased by 300 K in a process $V = \frac{a}{T}$, where a is positive constant. Find work done by the gas in the given process.

7. Pressure and volume of a gas changes from (p_0, V_0) to $\left(\frac{p_0}{4}, 2V_0\right)$ in a process $pV^2 =$ constant. Find work done by the gas in the given process.

21.3 Different Thermodynamic Processes

Different thermodynamic processes and their important points are given below in tabular form.

Table 21.3

S.No	Name of the process	Important points in the process	$Q = nC\Delta T = W + \Delta U$	$\Delta U = nC_V\Delta T$	W
1.	Isothermal	$T,\ pV,\ U = \text{constant}$ $\Delta T = \Delta(pV) = \Delta U = 0$ $p_1V_1 = p_2V_2$ or $p \propto \frac{1}{V}$	$Q = W$	0	$nRT\ln\left(\frac{V_f}{V_i}\right) = nRT\ln\left(\frac{p_i}{p_f}\right)$
2.	Isochoric	$V,\ \rho,\ \frac{p}{T} = \text{constant}$ $\Delta V = \Delta\rho = \Delta\left(\frac{p}{T}\right) = 0$ $\frac{p_1}{T_1} = \frac{p_2}{T_2}$ or $p \propto T$	$C = C_V$ $\therefore\ Q = nC_V\Delta T$	$nC_V\Delta T$	0
3.	Isobaric	$p,\ \frac{V}{T} = \text{constant}$ $\Delta p = \Delta\left(\frac{V}{T}\right) = 0$ $\frac{V_1}{T_1} = \frac{V_2}{T_2}$ or $V \propto T$	$C = C_P$ $\therefore\ Q = nC_P\Delta T$	$nC_V\Delta T$	$p\Delta V \rightarrow$ For any system $Q - \Delta U = n(C_P - C_V)\Delta T$ $= nR\Delta T \rightarrow$ for an ideal gas
4.	Adiabatic process	$pV^{\gamma} = \text{constant}$ $TV^{\gamma-1} = \text{constant}$ $T^{\gamma}p^{1-\gamma} = \text{constant}$	0	$nC_V\Delta T$	$W = -\Delta U$ $\therefore\ W = -nC_V\Delta T$ $= -n\left(\frac{R}{\gamma-1}\right)(T_f - T_i)$ $= \frac{p_iV_i - p_fV_f}{\gamma-1}$
5.	Cyclic process	$(p_i, V_i, T_i) = (p_f, V_f, T_f)$ Since $T_i = T_f$ $\Rightarrow\ U_i = U_f$ or $\Delta T = \Delta U = 0$	$Q_{\text{net}} = W_{\text{net}}$	0	W_{net} = area between cycle on p-V diagram
6.	Polytropic process $pV^X = \text{constant}$	$C = \frac{R}{\gamma-1} + \frac{R}{1-x}$ $= C_V + \frac{R}{1-x}$	$nC\Delta T$	$nC_V\Delta T$	$Q - \Delta U = \frac{nR\Delta T}{1-x}$ $= \frac{nR(T_i - T_f)}{1-x}$ $= \frac{(p_iV_i - p_fV_f)}{1-x}$
7.	Free expansion in vacuum	$\Delta U = 0$ $\Rightarrow\ U, T$ and $pV = \text{constant}$ or $p \propto \frac{1}{V}$	0	0	0

Important Points in the Above Table

In isobaric process In isobaric process, neither of the three terms (Q, ΔU and W) is zero but they have a constant ratio which depends on nature of gas (like monoatomic or diatomic etc.)

$$Q : \Delta U : W = nC_p \Delta T : nC_V \Delta T : nR\Delta T = C_p : C_V : R$$

So, this ratio is $C_p : C_V : R$. For example, $C_p = \frac{5}{2}R$ and $C_V = \frac{3}{2}R$ for a monoatomic gas. Therefore, for a monoatomic gas this ratio is $\frac{5}{2}R : \frac{3}{2}R : R$ or $5 : 3 : 2$. If Q is 50 J, then ΔU will be 30 J and W is 20 J.

In adiabatic process (i) In a thermodynamic process, there are three variables p, V and T. If relation between any two (p-V, V-T or p-T) are known, then other relations can be obtained using the ideal gas equation

$$pV = nRT$$

or $$pV \propto T \qquad \text{(For given value of } n\text{)}$$

or $$p \propto \frac{T}{V}$$

and $$V \propto \frac{T}{p}$$

For example, p-V equation $pV^{\gamma} = \text{constant}$ can be converted into p-T or V-T equation.

***p*-*T* equation** Replace V with $\frac{T}{p}$

$$\therefore \qquad p\left(\frac{T}{p}\right)^{\gamma} = \text{constant} \quad \text{or} \quad p^{1-\gamma}T^{\gamma} = \text{constant}$$

***V*-*T* equation** Replace p with $\frac{T}{V}$

$$\therefore \qquad \left(\frac{T}{V}\right)V^{\gamma} = \text{constant} \quad \text{or} \quad TV^{\gamma-1} = \text{constant}$$

(ii) An adiabatic process is defined as one with no heat transfer into or out of a system : $Q = 0$. We can prevent heat flow either by surrounding the system with thermally insulating material or by carrying out the process so **quickly** that there is not enough time for appreciable heat flow. From the first law, we find that for every adiabatic process,

$$W = -\Delta U \qquad (\text{as } Q = 0)$$

Therefore, if the work done by a gas is positive (i.e. volume of the gas is increasing), then ΔU will be negative. Hence, U and therefore T will decrease. The cooling of air can be experienced practically during bursting of a tyre. The process is so fast that it can be assumed as adiabatic. As the gas expands. Therefore, it cools. On the other hand, the compression stroke in an internal combustion engine is an approximately adiabatic process. The temperature rises as the air fuel mixture in the cylinder is compressed.

Note *Contrary to adiabatic process which is very fast an isothermal process is very slow. Because the system needs sufficient time to interact with surroundings to keep its temperature constant.*

In cyclic process In a cyclic process, initial and final points are same.

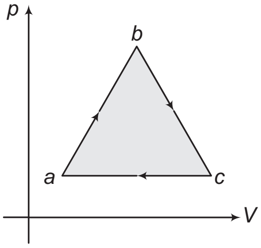


Fig. 21.13

Therefore,

$$(p_i, V_i, T_i) = (p_f, V_f, T_f)$$

Internal energy is a state function which only depends on temperature (in case of an ideal gas).

$$T_i = T_f$$

$\Rightarrow$ $$U_i = U_f$$

or $$\Delta U_{\text{net}} = 0$$

If there are three processes in a cycle *abc*, then

$$\Delta U_{ab} + \Delta U_{bc} + \Delta U_{ca} = 0$$

From first law of thermodynamics,

$$Q = W + \Delta U, \text{ if } \Delta U_{\text{net}} = 0, \text{ then}$$

$$Q_{\text{net}} = W_{\text{net}}$$

or $$Q_{ab} + Q_{bc} + Q_{ca} = W_{ab} + W_{bc} + W_{ca}$$

Further, W_{net} = area under p-V diagram. For example, W_{net} = + area of triangle '*abc*' in the shown diagram. Cycle is clockwise. So, work done will be positive.

Free expansion in vacuum A gas in a closed adiabatic chamber is taken to vacuum and then chamber is opened. So, the gas expands. Since, there is no external force which opposes this expansion. So, work done by gas

$$W = 0$$

Further no heat is supplied or taken from the gas. Therefore, heat exchange is also zero. Or

$$Q = 0$$

From first law of thermodynamics, $Q = W + \Delta U$ change in internal energy is also zero. Or

$$\Delta U = 0$$

or $$U = \text{constant}$$

$\Rightarrow$ $$T \text{ or } pV \text{ is also constant}$$

or $$p \propto \frac{1}{V}$$

This behaviour is similar to an isothermal process. The only difference is, in this process all three terms Q, ΔU and W are zero. But in isothermal process, only ΔU is zero.

✓ *Extra Points to Remember*

- **Slope of p-V diagram** In a general polytropic process,

$$pV^x = \text{constant}$$

or differentiating, we get

$$p(xV^{x-1})\,dV + V^x(dp) = 0 \quad \Rightarrow \quad \frac{dp}{dV} = -x\frac{p}{V}$$

or slope of p-V graph $= -x\dfrac{p}{V}$

In isobaric process $p =$ constant $\Rightarrow x = 0$, therefore slope $= 0$

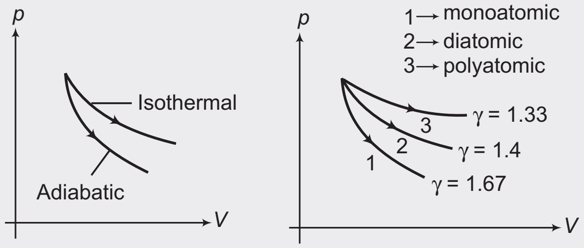
In isothermal process $pV =$ constant $\Rightarrow x = 1$, therefore slope $= -\dfrac{p}{V}$

In adiabatic process $pV^\gamma =$ constant $\Rightarrow x = \gamma$, therefore slope $= -\gamma\dfrac{p}{V}$

Thus, slope of an adiabatic graph is γ times slope of isothermal graph at that point.

Because $\gamma > 1$, the isothermal curve is not as steep as that for the adiabatic expansion.

Adiabatic and isothermal expansion of an ideal gas



Adiabatic expansion of mono,dia and polyatomic gases.

Fig. 21.14

p - V diagram of different processes is shown in one graph as below.

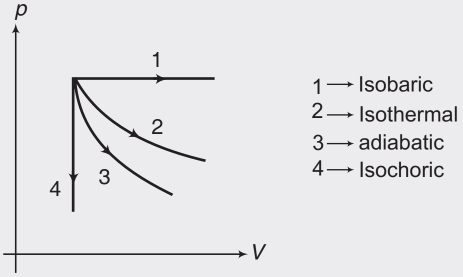


Fig. 21.15

Example 21.11 *p-V plots for two gases during adiabatic processes are shown in the figure. Plots 1 and 2 should correspond respectively to* **(JEE 2001)**

(a) He *and* O_2

(b) O_2 *and* He

(c) He *and* Ar

(d) O_2 *and* N_2

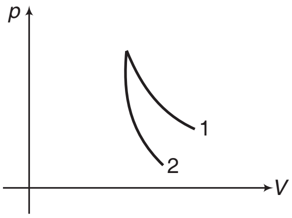

Fig. 21.16

Solution In adiabatic process :

slope of p-V graph, $$\frac{dp}{dV} = -\gamma \frac{p}{V}$$

$$\text{slope} \propto \gamma \qquad \text{(with negative sign)}$$

From the given graph,

$$(\text{slope})_2 > (\text{slope})_1$$

$$\therefore \qquad \gamma_2 > \gamma_1$$

Therefore, 1 should correspond to O_2 $(\gamma = 1.4)$ and 2 should correspond to He $(\gamma = 1.67)$.

Hence, the correct option is (b).

Example 21.12 *Starting with the same initial conditions, an ideal gas expands from volume V_1 to V_2 in three different ways, the work done by the gas is W_1 if the process is purely isothermal, W_2 if purely isobaric and W_3 if purely adiabatic, then* **(JEE 2000)**

(a) $W_2 > W_1 > W_3$

(b) $W_2 > W_3 > W_1$

(c) $W_1 > W_2 > W_3$

(d) $W_1 > W_3 > W_2$

Solution The corresponding p-V graphs (also called indicator diagram) in three different processes will be as shown below.

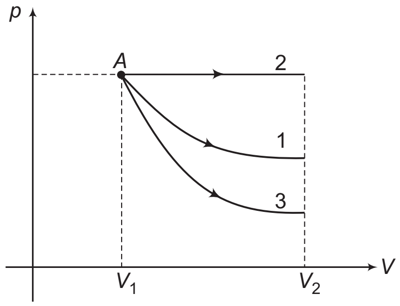

Fig. 21.17

Area under the graph gives the work done by the gas.

$$(\text{Area})_2 > (\text{Area})_1 > (\text{Area})_3 \quad \Rightarrow \quad W_2 > W_1 > W_3$$

Therefore, the correct option is (a).

Example 21.13 *When an ideal diatomic gas is heated at constant pressure, the fraction of the heat energy supplied, which increases the internal energy of the gas, is* **(JEE 1990)**

(a) $\frac{2}{5}$ (b) $\frac{3}{5}$ (c) $\frac{3}{7}$ (d) $\frac{5}{7}$

Solution The desired fraction is

$$f = \frac{\Delta U}{\Delta Q} = \frac{nC_V \Delta T}{nC_p \Delta T} = \frac{C_V}{C_p} = \frac{1}{\gamma} \quad \text{or} \quad f = \frac{5}{7} \qquad \left(\text{as } \gamma = \frac{7}{5}\right) \qquad \textbf{Ans.}$$

Therefore, the correct option is (d).

Example 21.14 *What is the heat input needed to raise the temperature of 2 moles of helium gas from 0°C to 100°C*

(a) at constant volume,

(b) at constant pressure?

(c) What is the work done by the gas in part (b)?

Give your answer in terms of R.

Solution Helium is monoatomic gas. Therefore,

$$C_V = \frac{3R}{2} \quad \text{and} \quad C_p = \frac{5R}{2}$$

(a) At constant volume,

$$\begin{aligned} Q &= nC_V \Delta T \\ &= (2)\left(\frac{3R}{2}\right)(100) \\ &= 300R \end{aligned}$$

(b) At constant pressure,

$$\begin{aligned} Q &= nC_p \Delta T \\ &= (2)\left(\frac{5R}{2}\right)(100) \\ &= 500R \end{aligned}$$

(c) At constant pressure,

$$\begin{aligned} W &= Q - \Delta U \\ &= nC_p \Delta T - nC_V \Delta T \\ &= nR\Delta T = (2)(R)(100) \\ &= 200R \end{aligned}$$

Example 21.15 *An ideal monoatomic gas at 300K expands adiabatically to twice its volume. What is the final temperature?*

Solution For an ideal monoatomic gas,

$$\gamma = \frac{5}{3}$$

In an adiabatic process, $TV^{\gamma - 1} = \text{constant}$

$\therefore$ $T_f V_f^{\gamma - 1} = T_i V_i^{\gamma - 1}$

or

$$\begin{aligned} T_f &= T_i \left(\frac{V_i}{V_f}\right)^{\gamma - 1} \\ &= (300)\left(\frac{1}{2}\right)^{\frac{5}{3} - 1} = 189\ \text{K} \end{aligned}$$

Example 21.16 *p-T graph of 2 moles of an ideal monoatomic gas* $\left(C_V = \frac{3}{2}R \text{ and } C_p = \frac{5}{2}R\right)$ *is as shown below. Find Q, W and ΔU for each of the four processes separately and then show that,*

$$\Delta U_{net} = 0$$

and

$$Q_{net} = W_{net}$$

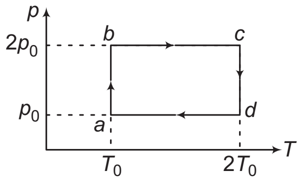

Fig. 21.18

Solution

Table 21.4

Process	Name of process	Q	ΔU	W
ab	Isothermal (as T = constant)	$Q = W = -2RT_0\ln(2)$	0	$nRT\ln\left(\frac{p_i}{p_f}\right)$ $= 2RT_0\ln\left(\frac{p_0}{2p_0}\right)$ $= -2RT_0\ln(2)$
bc	Isobaric (as p = constant)	$Q = nC_p\Delta T$ $= 2\left(\frac{5}{2}R\right)(2T_0 - T_0)$ $= 5RT_0$	$\Delta U = nC_V\Delta T$ $= 2\left(\frac{3}{2}R\right)(2T_0 - T_0)$ $= 3RT_0$	$Q - \Delta U$ or $nR\Delta T$ $= 2RT_0$
cd	Isothermal (as T = constant)	$Q = W = 4RT_0\ln(2)$	0	$nRT\ln\left(\frac{p_i}{p_f}\right)$ $= 2R(2T_0)\ln\left(\frac{2p_0}{p_0}\right)$ $= 4RT_0\ln(2)$
da	Isobaric (as p = constant)	$Q = nC_p\Delta T$ $= 2\left(\frac{5}{2}R\right)(T_0 - 2T_0)$ $= -5RT_0$	$\Delta U = nC_V\Delta T$ $= 2\left(\frac{3}{2}R\right)(T_0 - 2T_0)$ $= -3RT_0$	$Q - \Delta U$ or $nR\Delta T$ $= -2RT_0$
	Net values	$2RT_0\ln(2)$	0	$2RT_0\ln(2)$

In the given table, we can see that

$$\Delta U_{\text{net}} = 0$$

and

$$Q_{\text{net}} = W_{\text{net}}$$

INTRODUCTORY EXERCISE 21.3

1. One mole of an ideal monoatomic gas is initially at 300 K. Find the final temperature if 200 J of heat are added as follows :

   (a) at constant volume (b) at constant pressure.

2. An ideal gas expands while the pressure is kept constant. During this process, does heat flow into the gas or out of the gas? Justify your answer.

3. Consider the cyclic process depicted in figure. If Q is negative for the process BC and if ΔU is negative for the process CA, what are the signs of Q, W and ΔU that are associated with each process?

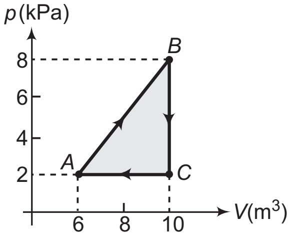

Fig. 21.19

4. A well insulated box contains a partition dividing the box into two equal volumes as shown in figure. Initially, the left hand side contains an ideal monoatomic gas and the other half is a vacuum. The partition is suddenly removed so that the gas expands throughout the entire box.

   (a) Does the temperature of the gas change?

   (b) Does the internal energy of the system change?

   (c) Does the gas work?

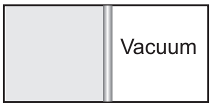

Fig. 21.20

5. Find the ratio of $\frac{\Delta Q}{\Delta U}$ and $\frac{\Delta Q}{\Delta W}$ in an isobaric process. The ratio of molar heat capacities $\frac{C_p}{C_V} = \gamma$.

6. A certain amount of an ideal gas passes from state A to B first by means of process 1, then by means of process 2. In which of the process is the amount of heat absorbed by the gas greater?

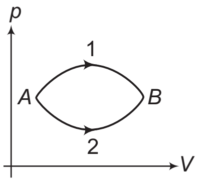

Fig. 21.21

7. A sample of ideal gas is expanded to twice its original volume of 1.00 m^3 in a quasi-static process for which $p = \alpha V^2$, with $\alpha = 5.00$ atm/m^6, as shown in Fig 21.22. How much work is done by the expanding gas?

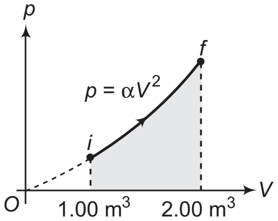

Fig. 21.22

8. As a result of the isobaric heating by $\Delta T = 72$ K, one mole of a certain ideal gas obtains an amount of heat $Q = 1.6$ kJ. Find the work performed by the gas, the increment of its internal energy and γ.

21.4 Heat Engine and its Efficiency

A heat engine is a device which converts heat energy into mechanical energy. In every heat engine, there are the following three components :

(i) Working substance (which is normally a gas in a cylinder)
(ii) Source (at temperature T_1)
(iii) Sink (at temperature T_2), $T_2 < T_1$ and sink is normally atmosphere.

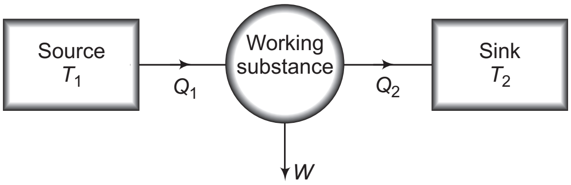

Fig. 21.23

The working substance absorbs some heat (Q_1) from the source, converts a part of it into work (W) and the rest (Q_2) is rejected to the sink.

From conservation of energy,

$$Q_1 = W + Q_2$$

Now, the above work done is used by us for different purposes.

It is just like a shopkeeper. He takes some money from you. (Suppose he takes Rs. 100/- from you). So, you are source. In lieu of this he provides services to you (suppose he provides services of worth Rs. 80/-). This is work done. The remaining Rs. 20/- is his profit which goes to his account and this is basically sink. Then, the efficiency of the shopkeeper is 80%. There can't be a shopkeeper whose efficiency is 100%.

Similarly, efficiency of a heat engine is defined as the ratio of net work done per cycle by the engine to the total amount of heat absorbed per cycle by the working substance from the source. It is denoted by η. Thus,

$$\boxed{\eta = \frac{W}{Q_1} = \frac{Q_1 - Q_2}{Q_1} = 1 - \frac{Q_2}{Q_1}}$$

Work is done by the working substance in a cyclic process. In the above expression of efficiency, W is net work done in the complete cycle which should be positive. So, cycle should be clockwise on p-V diagram. Q_1 is the total heat given to the working substance or the total positive heat. Q_2 is total heat rejected by the working substance or it is the magnitude of total negative heat.

Thus, efficiency (η) of a cycle can also be defined as

$$\eta = \left(\frac{\text{Work done by the working substance (an ideal gas in our case) during a cycle}}{\text{Heat supplied to the gas during the cycle}} \right) \times 100$$

$$= \frac{W_{\text{Total}}}{|Q_{+\text{ve}}|} \times 100$$

$$= \frac{|Q_{+\text{ve}}| - |Q_{-\text{ve}}|}{|Q_{+\text{ve}}|} \times 100 = \left\{1 - \left|\frac{Q_{-\text{ve}}}{Q_{+\text{ve}}}\right|\right\} \times 100$$

Thus,
$$\eta = \frac{W_{\text{Total}}}{|Q_{+\text{ve}}|} \times 100 = \left\{1 - \left|\frac{Q_{-\text{ve}}}{Q_{+\text{ve}}}\right|\right\} \times 100$$

Depending on the number of processes in a cycle, it may be called a two-stroke engine or four-stroke engine.

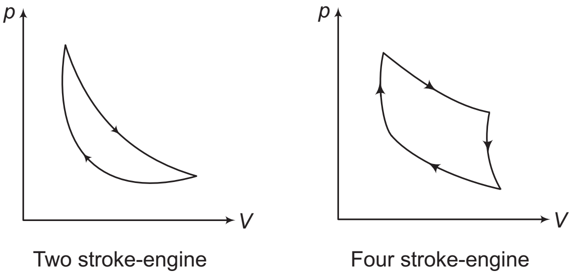

Fig. 21.24

Note *There cannot be a heat engine whose efficiency is* 100%. *It is always less than* 100%. *Thus,*

$$\eta \neq 100\%$$

or $W \neq Q_1$ *or* $W_{net} \neq Q_{+ve}$

or $Q_2 \neq 0$ *or* $|Q_{-ve}| \neq 0$

Efficiency of a Cycle

By the similar method discussed above, we can also find efficiency of a cycle provided net work done in the whole cycle comes out to be positive or it is clockwise cycle on p-V diagram. But always remember that, in a cyclic process,

$$\Delta U_{\text{net}} = 0$$

and
$$Q_{\text{net}} = W_{\text{net}}$$

If there are four processes in the cycle, then

$$\Delta U_1 + \Delta U_2 + \Delta U_3 + \Delta U_4 = 0 \text{ and}$$
$$Q_1 + Q_2 + Q_3 + Q_4 = W_1 + W_2 + W_3 + W_4$$

Carnot Engine

Carnot cycle consists of the following four processes :

(i) Isothermal expansion (process *AB*)
(ii) Adiabatic expansion (process *BC*)
(iii) Isothermal compression (process *CD*) and
(iv) Adiabatic compression (process *DA*)

The p-V diagram of the cycle is shown in the figure.

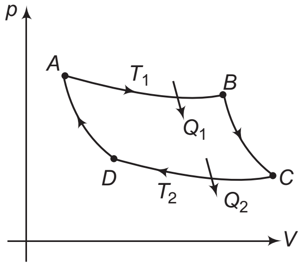

Fig. 21.25

Table 21.5

Process	Name of the process	Q	ΔU	W
AB	Isothermal expansion T_1 = constant	$Q = W$ = positive $= Q_1$	0	positive
BC	Adiabatic expansion	0	negative	positive
CD	Isothermal compression T_2 = constant	$Q = W$ = negative $= Q_2$	0	negative
DA	Adiabatic compression	0	positive	negative

In process AB, heat Q_1 is taken by the working substance at constant temperature T_1 and in process CD heat Q_2 is rejected from the working substance at constant temperature T_2. The net work done is area of graph $ABCD$.

Note *(i) In the whole cycle only Q_1 is the positive heat and Q_2 the negative heat. Thus,*

$$Q_{+ve} = Q_1$$

and

$$|Q_{-ve}| = Q_2$$

$$\therefore \quad \eta = \left(1 - \frac{Q_2}{Q_1}\right) \times 100$$

Specially for Carnot cycle, $\frac{Q_2}{Q_1}$ also comes out to be $\frac{T_2}{T_1}$.

$$\therefore \quad \eta = \left(1 - \frac{T_2}{T_1}\right) \times 100$$

(ii) Efficiency of Carnot engine is maximum (not 100%) for given temperatures T_1 and T_2. But still Carnot engine is not a practical engine because many ideal situations have been assumed while designing this engine which can practically not be obtained.

21.5 Refrigerator

Refrigerator is an apparatus which takes heat from a cold body, work is done on it and the work done together with the heat absorbed is rejected to the source.

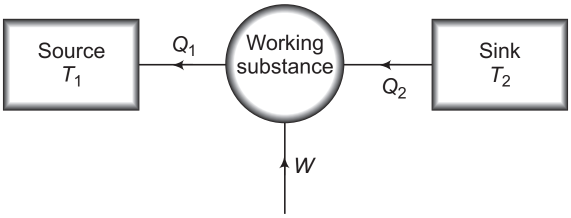

Fig. 21.26

An ideal refrigerator can be regarded as Carnot ideal heat engine working in the reverse direction.

Coefficient of Performance

Coefficient of performance (β) of a refrigerator is defined as the ratio of quantity of heat removed per cycle (Q_2) to the work done on the working substance per cycle to remove this heat. Thus,

$$\beta = \frac{Q_2}{W} = \frac{Q_2}{Q_1 - Q_2}$$

We can also show that

$$\beta = \frac{T_2}{T_1 - T_2} = \frac{1 - \eta}{\eta}$$

Here, η is the efficiency of Carnot cycle.

Example 21.17 *An ideal gas is taken through a cyclic thermodynamic process through four steps. The amounts of heat involved in these steps are $Q_1 = 5960\,J$, $Q_2 = -5585\,J$, $Q_3 = -2980\,J$ and $Q_4 = 3645\,J$ respectively. The corresponding quantities of work involved are $W_1 = 2200\,J$, $W_2 = -825\,J$, $W_3 = -1100\,J$ and W_4 respectively.* **(JEE 1994)**

(a) Find the value of W_4.

(b) What is the efficiency of the cycle?

Solution (a) In a cyclic process, $\Delta U = 0$

Therefore, $$Q_{\text{net}} = W_{\text{net}}$$

or $$Q_1 + Q_2 + Q_3 + Q_4 = W_1 + W_2 + W_3 + W_4$$

Hence, $$W_4 = (Q_1 + Q_2 + Q_3 + Q_4) - (W_1 + W_2 + W_3)$$
$$= \{(5960 - 5585 - 2980 + 3645) - (2200 - 825 - 1100)\}$$

or $$W_4 = 765\text{ J}$$ **Ans.**

(b) Efficiency,

$$\eta = \frac{\text{Total work done in the cycle}}{\text{Heat absorbed (positive heat) by the gas during the cycle}} \times 100$$

$$= \left(\frac{W_1 + W_2 + W_3 + W_4}{Q_1 + Q_4}\right) \times 100$$

$$= \left\{\frac{(2200 - 825 - 1100 + 765)}{5960 + 3645}\right\} \times 100$$

$$= \frac{1040}{9605} \times 100$$

$$\eta = 10.82\%$$ **Ans.**

Note *From energy conservation,*

$$W_{\text{net}} = Q_{+\text{ve}} - Q_{-\text{ve}} \qquad \textit{(in a cycle)}$$

$$\therefore \quad \eta = \frac{W_{\text{net}}}{Q_{+\text{ve}}} \times 100 = \frac{(Q_{+\text{ve}} - Q_{-\text{ve}})}{Q_{+\text{ve}}} \times 100$$

$$= \left(1 - \frac{Q_{-\text{ve}}}{Q_{+\text{ve}}}\right) \times 100$$

In the above question,

$$Q_{-\text{ve}} = |Q_2| + |Q_3| = (5585 + 2980)\text{ J} = 8565\text{ J}$$

and $$Q_{+\text{ve}} = Q_1 + Q_4 = (5960 + 3645)\ \text{J} = 9605\ \text{J}$$

$\therefore$ $$\eta = \left(1 - \frac{8565}{9605}\right) \times 100$$

$$\eta = 10.82\%$$

Example 21.18 *The density versus pressure graph of one mole of an ideal monatomic gas undergoing a cyclic process is shown in figure. The molecular mass of the gas is M.*

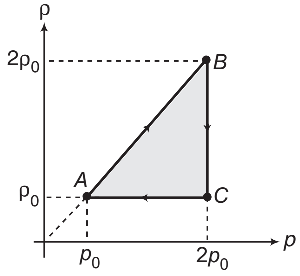

Fig. 21.27

(a) Find the work done in each process.
(b) Find heat rejected by gas in one complete cycle.
(c) Find the efficiency of the cycle.

Solution (a) Given, $n = 1$ $\therefore$ $m = M$

Process *AB* $\rho \propto p$, i.e. It is an isothermal process (T = constant), because $\rho = \dfrac{pM}{RT}$.

$\therefore$ $$W_{AB} = RT_A \ln\left(\frac{p_A}{p_B}\right) = RT_A \ln\left(\frac{1}{2}\right)$$

$$= -\frac{p_0 M}{\rho_0} \ln(2)$$

$$\Delta U_{AB} = 0$$

and $$Q_{AB} = W_{AB} = -\frac{p_0 M}{\rho_0} \ln(2)$$

Process *BC* is an isobaric process (p = constant)

$$W_{BC} = p_B (V_C - V_B) = 2p_0 \left(\frac{M}{\rho_C} - \frac{M}{\rho_B}\right) = 2p_0 \left(\frac{M}{\rho_0} - \frac{M}{2\rho_0}\right) = \frac{p_0 M}{\rho_0}$$

$$\Delta U_{BC} = C_V \Delta T$$

$$= \left(\frac{3}{2}R\right)\left[\frac{2p_0 M}{\rho_0 R} - \frac{2p_0 M}{2\rho_0 R}\right] = \frac{3p_0 M}{2\rho_0}$$

$$Q_{BC} = W_{BC} + \Delta U_{BC} = \frac{5p_0 M}{2\rho_0}$$

Process *CA* As $\rho =$ constant

$$\therefore \qquad V = \text{constant}$$

So, it is an isochoric process.

$$W_{CA} = 0$$

$$\Delta U_{CA} = C_V \Delta T$$

$$= \left(\frac{3}{2}R\right)(T_A - T_C)$$

$$= \left(\frac{3}{2}R\right)\left[\frac{p_0 M}{\rho_0 R} - \frac{2p_0 M}{\rho_0 R}\right]$$

$$= -\frac{3p_0 M}{2\rho_0}$$

$$Q_{CA} = \Delta U_{CA} = -\frac{3p_0 M}{2\rho_0}$$

(b) Heat rejected by gas $= |Q_{AB}| + |Q_{CA}|$

$$= \frac{p_0 M}{\rho_0}\left[\frac{3}{2} + \ln(2)\right]$$ **Ans.**

(c) Efficiency of the cycle (in fraction)

$$\eta = \frac{\text{Total work done}}{\text{Heat supplied}} = \frac{W_{\text{Total}}}{Q_{+\text{ve}}}$$

$$= \frac{\frac{p_0 M}{\rho_0}[1 - \ln(2)]}{\frac{5}{2}\left(\frac{p_0 M}{\rho_0}\right)}$$

$$= \frac{2}{5}[1 - \ln(2)]$$ **Ans.**

Example 21.19 *Carnot engine takes one thousand kilo calories of heat from a reservoir at 827°C and exhausts it to a sink at 27°C. How, much work does it perform? What is the efficiency of the engine?*

Solution Given, $Q_1 = 10^6$ cal

$$T_1 = (827 + 273) = 1100\text{ K}$$

and $$T_2 = (27 + 273) = 300\text{ K}$$

as, $$\frac{Q_2}{Q_1} = \frac{T_2}{T_1} \Rightarrow Q_2 = \frac{T_2}{T_1}\cdot Q_1 = \left(\frac{300}{1100}\right)(10^6)$$

$$= 2.72 \times 10^5 \text{ cal}$$

$$W = Q_1 - Q_2 = 7.28 \times 10^5 \text{ cal}$$ **Ans.**

Efficiency of the cycle,

$$\eta = \left(1 - \frac{T_2}{T_1}\right) \times 100 \quad \text{or} \quad \eta = \left(1 - \frac{300}{1100}\right) \times 100$$

$$= 72.72\%$$ **Ans.**

Example 21.20 *In a refrigerator, heat from inside at 277 K is transferred to a room at 300 K. How many joules of heat shall be delivered to the room for each joule of electrical energy consumed ideally?*

Solution Coefficient of performance of a refrigerator,

$$\beta = \frac{Q_2}{W} = \frac{T_2}{T_1 - T_2}$$

$\therefore$
$$Q_2 = W \frac{T_2}{T_1 - T_2}$$

But W = Energy consumed by the refrigerator = 1 J, $T_1 = 300$ K, $T_2 = 277$ K

$\therefore$
$$Q_2 = 1 \times \frac{277}{300 - 277} = \frac{277}{23} = 12 \text{ J}$$

Heat rejected by the refrigerator,

$$Q_1 = W + Q_2 = 1 + 12$$
$$= 13 \text{ J}$$ **Ans.**

Example 21.21 *Calculate the least amount of work that must be done to freeze one gram of water at 0°C by means of a refrigerator. Temperature of surroundings is 27°C. How much heat is passed on the surroundings in this process? Latent heat of fusion L = 80 cal/g.*

Solution $Q_2 = mL = 1 \times 80 = 80 \text{ cal}$

$$T_2 = 0° \text{ C} = 273 \text{ K}$$

and
$$T_1 = 27° \text{ C} = 300 \text{ K}$$

Least amount of work will be needed for carnot's type of cycle.

$$\frac{Q_2}{W} = \frac{T_2}{T_1 - T_2}$$

$\therefore$
$$W = \frac{Q_2 (T_1 - T_2)}{T_2}$$
$$= \frac{80 (300 - 273)}{273}$$
$$= 7.91 \text{ cal}$$ **Ans.**

$$Q_1 = Q_2 + W$$
$$= (80 + 7.91)$$
$$= 87.91 \text{ cal}$$ **Ans.**

INTRODUCTORY EXERCISE 21.4

1. Carnot engine takes 1000 K cal of heat from a reservoir at 827°*C* and exhausts it to a sink at 27°*C*. How much heat is rejected to the sink? What is the efficiency of the engine?
2. One of the most efficient engines ever developed operated between 2100 K and 700 K. Its actual efficiency is 40%. What percentage of its maximum possible efficiency is this?
3. In a heat engine, the temperature of the source and sink are 500 K and 375 K. If the engine consumes 25×10^5 J per cycle, find (a) the efficiency of the engine, (b) work done per cycle, and (c) heat rejected to the sink per cycle.
4. A Carnot engine takes 3×10^6 cal of heat from a reservoir at 627 °C and gives it to a sink at 27 °C. Find the work done by the engine.
5. The efficiency of a Carnot cycle is 1/6. If on reducing the temperature of the sink by 65 °C, the efficiency becomes 1/3, find the source and sink temperatures between which the cycle is working.
6. Refrigerator *A* works between −10 °C and 27 °C, while refrigerator *B* works between −27 °C and 17 °C, both removing heat equal to 2000 J from the freezer. Which of the two is the better refrigerator?
7. A refrigerator has to transfer an average of 263 J of heat per second from temperature −10 °C to 25 °C. Calculate the average power consumed, assuming no energy losses in the process.
8. *n* moles of a monoatomic gas are taken around in a cyclic process consisting of four processes along *ABCDA* as shown. All the lines on the *p*-*V* diagram have slope of magnitude p_0 / V_0. The pressure at *A* and *C* is p_0 and the volumes at *A* and *C* are $V_0/2$ and $3V_0/2$, respectively. Calculate the percentage efficiency of the cycle.

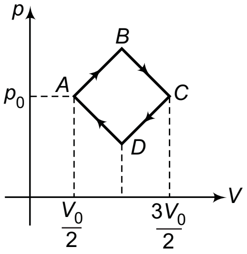

Fig. 21.28

21.6 Zeroth Law of Thermodynamics

The zeroth law of thermodynamics states that if two system *A* and *B* are in thermal equilibrium with a third system *C*, then *A* and *B* are also in thermal equilibrium with each other. It is analogous to the transitive property in math (if $A = C$ and $B = C$, then $A = B$). Another way of stating the zeroth law is that every object has a certain temperature, and when two objects are in thermal equilibrium, their temperatures are equal. It is called the zeroth law because it came to light after the first and second laws of thermodynamics had already been established and named, but was considered more fundamental and thus was given a lower number zero.

21.7 Second Law of Thermodynamics

The first law of thermodynamics is the principle of conservation of energy. Common experience shows that there are many conceivable processes that are perfectly allowed by the first law and yet are never observed. For example, nobody has ever seen a book lying on a table jumping to a height by itself. But such a thing would be possible if the principle of conservation of energy were the only restriction.

Thus, the second law of thermodynamics is a general principle which places constraints upon the direction of and the attainable efficiency of or coefficient of performance. It also imposes restrictions on entropy.

Second law of thermodynamics can be better understood by the following three statements

In Terms of Entropy

The second law can be expressed in several ways, the simplest being that heat will naturally flow from a hotter to a colder body. As its heat is a property of thermodynamic systems called entropy represented by "S" — in loose terms, a measure of the amount of disorder within a system. This can be represented in many ways, for example in the arrangement of the molecules — water molecules in an ice cube are more ordered than the same molecules after they have been heated into a gas. The entropy of the ice cube is, therefore, lower than that of the gas. Similarly, the entropy of a plate is higher when it is in pieces on the floor compared with when it is in one piece in the sink.

The second equation is a way to express the second law of thermodynamics in terms of entropy. The formula says that the entropy of an isolated natural system will always tend to stay the same or increase — in other words, the energy in the universe is gradually moving towards disorder.

Kelvin Planck's Statement

Kelvin-Planck's statement is based on the fact that the efficiency of the heat engine cycle is never 100%. This means that in the heat engine cycle some heat is always rejected to the low temperature reservoir. The heat engine cycle always operates between two heat reservoirs and produces work.

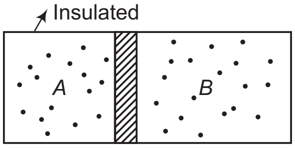
Clausius Statement

As we know from the previous statement, the natural tendency of the heat is to flow from high temperature reservoir to the low temperature reservoir.

The Clausius statement says that, to transfer the heat from low temperature to high temperature reservoir some external work should be done on the cycle. This statement has been the basis for the working for all refrigerators, heat pumps and air-conditioners. This work cannot be zero or coefficient of performance of a refrigerator cannot be infinite.

Final Touch Points

1. Adiabatic and Diathermic Wall

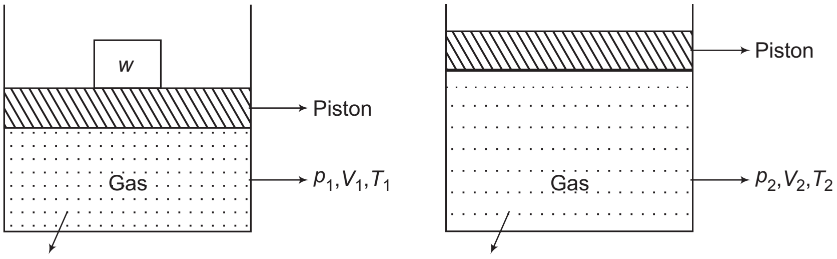


Adiabatic wall An insulating wall (can be movable also) that does not allow flow of energy (heat) from one chamber to another is called an adiabatic wall. If two thermodynamic systems *A* and *B* are separated by an adiabatic wall then the thermodynamic state of *A* will be independent of the state of *B* and *vice-versa* if wall is fixed otherwise if wall is movable, only pressure will be same on both sides.

Diathermic wall A conducting wall that allows energy flow (heat) from one chamber to another is called a diathermic wall. If two thermodynamic systems *A* and *B* are separated by a diathermic wall then thermal equilibrium is attained in due course of time (if wall is fixed). If wall is movable, then temperature and pressure on both sides will become same.

Note *In the above two cases, thermodynamic systems A and B are insulated from the external surroundings.*

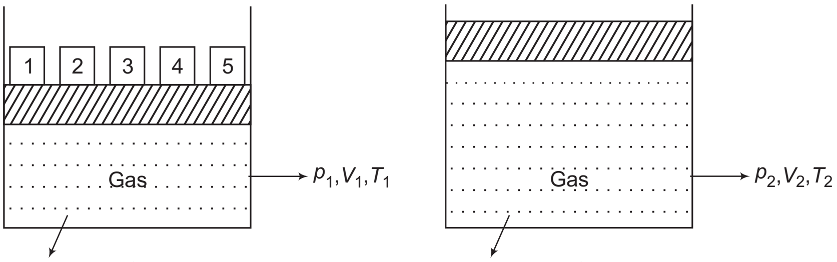
2. Quasi-Static Process Quasi means almost or near to.Quasi-static process means very nearly static process. Let us consider a system of gas contained in cylinder. The gas is held by a moving piston. A weight w is placed over the piston. Due to the weight , the gas in cylinder is compressed. After the gas reaches equilibrium, the properties of gas are denoted by p_1, V_1 and T_1. The weight placed over the piston is balanced by upward force exerted by the gas. If the weight is suddenly removed, then there will be an unbalanced force between the system and the surroundings. The gas under pressure will expand and push the piston upwards. The properties at this state after reaching equilibrium are P_2, V_2 and T_2. But the intermediate states passed through, by the system are non-equilibrium states which cannot be described by thermodynamic coordinates. In this case, we only have initial and final states and do not have a path connecting them.



Initial state of gas

Final state of gas

Sudden expansion of gas

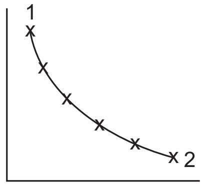


Initial state of gas

Final state of gas

Quasi-static expansion of gas

Suppose, the weight is made of large numbers of small weights. And one by one each of these small weights are removed and allowed the system to reach an equilibrium state. Then, we have intermediate equilibrium states and the path described by these states will not deviate much from the thermodynamic equilibrium state. Such a process, which is the locus of all the intermediate points passed by the system is known as quasi-static process. It means, this process is almost near to the thermodynamically equilibrium process. Infinite slowness is the characteristic feature of quasi-static process.

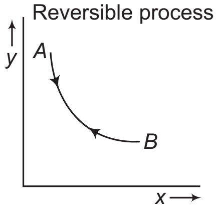


A quasi-static process

A quasi-static process is obviously a hypothetical concept. In practice, processes that are sufficiently slow and do not involve accelerated motion of the piston are reasonably approximation to an ideal quasi-static process. We shall from now onwards deal with quasi-static processes only, except when stated otherwise.

3. Reversible and Irreversible Process

Reversible process The process in which the system and surroundings can be restored to the initial state from the final state without producing any changes in the thermodynamic properties of the universe is called a reversible process. In the figure below, let us suppose that the system has undergone a change from state *A* to state *B*. If the system can be restored from state *B* to state *A*, and there is no change in the universe, then the process is said to be a reversible process. The reversible process can be reversed completely and there is no trace left to show that the system had undergone thermodynamic change.



For the system to undergo reversible change, it should occur infinitely slowly or it should be quasi-static process. During reversible process, all the changes in state that occur in the system are in thermodynamic equilibrium with each other.

Thus, there are two important conditions for the reversible process to occur. Firstly, the process should occur very slowly and secondly all of the initial and final states of the system should be in equilibrium with each other.

For example, a quasi-static isothermal expansion of an ideal gas in a cylinder fitted with a frictionless movable piston is a reversible process.

In actual practice, the reversible process never occurs, thus it is an ideal or hypothetical process.

Irreversible process The process is said to be an irreversible process if it cannot return the system and the surroundings to their original conditions when the process is reversed. The irreversible process is not at equilibrium throughout the process. Several examples can be cited. For examples,

(i) When we are driving the car uphill, it consumes a lot of fuel and this fuel is not returned when we are driving down the hill.

(ii) The base of a vessel on an oven is hotter than its other parts. When the vessel is removed, heat is transferred from the base to the other parts, bringing the vessel to a uniform temperature (which in due course cools to the temperature of the surroundings). The process cannot be reversed; a part of the vessel will not get cooler spontaneously and warm up the base. It will violate the second law of thermodynamics, if it did.

(iii) The free expansion of a gas is irreversible.

(iv) Cooking gas leaking from a gas cylinder in the kitchen diffuses to the entire room. The diffusion process will not spontaneously reverse and bring the gas back to the cylinder.

Many factors contribute in making any process irreversible. The most common of these are: friction, viscosity and other dissipative effects.

The irreversible process is also called the natural process because all the processes occurring in nature are irreversible processes.

4. $\boldsymbol{C_V = \frac{dU}{dT}}$ Let us derive the relation $C_V = \frac{dU}{dT}$, where U = internal energy of 1 mole of the gas.

Consider 1 mole ($n = 1$) of an ideal monoatomic gas which undergoes an isochoric process (V = constant).

From the first law of thermodynamics.

$$dQ = dW + dU \qquad \ldots\text{(i)}$$

Here, $dW = 0$ as V = constant

$$dQ = CdT = C_V dT \qquad (\text{In } dQ = nC_V dT,\ n = 1 \text{ and } C = C_V)$$

Substituting in Eq. (i), we have

$$C_V dT = dU$$

or $$C_V = \frac{dU}{dT}$$ **Hence proved.**

5. $\boldsymbol{C_p - C_V = R}$ To prove this relation (also known as **Mayor's formula**) let us consider 1 mole of an ideal gas which undergoes an isobaric (p = constant) process.

From first law of thermodynamics, $$dQ = dW + dU \qquad \ldots\text{(ii)}$$

Here, $$dQ = C_p dT \qquad (\text{as } n = 1 \text{ and } C = C_p)$$

$$dU = C_V dT$$

and $$dW = pdV = pd\left(\frac{RT}{p}\right) \qquad \left(\text{as } V = \frac{RT}{P}\right)$$

$$= d(RT) \qquad (\text{as } P = \text{constant})$$

$$= RdT$$

Substituting these values in Eq. (ii)

We have $$C_p dT = RdT + C_V dT \quad \text{or} \quad C_p - C_V = R$$ **Hence proved.**

6. $\boldsymbol{C_V = \frac{R}{\gamma - 1}}$ We have already derived,

$$C_p - C_V = R$$

Dividing this equation by C_V, we have

$$\frac{C_p}{C_V} - 1 = \frac{R}{C_V} \quad \text{or} \quad \gamma - 1 = \frac{R}{C_V} \qquad \left(\text{as } \frac{C_P}{C_V} = \gamma\right)$$

$\therefore$ $$C_V = \frac{R}{\gamma - 1}$$ **Hence proved.**

7. **Polytropic process** When p and V bear the relation pV^x = constant, where $x \neq 1$ or γ the process is called a polytropic one. In this process the molar heat capacity is,

$$C = C_V + \frac{R}{1-x} = \frac{R}{\gamma - 1} + \frac{R}{1-x}$$

Let us now derive this relation. The molar heat capacity is defined as

$$C = \frac{\Delta Q}{\Delta T} \quad \text{for 1 mole}$$

$$= \frac{\Delta U + \Delta W}{\Delta T}$$

$$= \frac{\Delta U}{\Delta T} + \frac{\Delta W}{\Delta T} \qquad \left(\frac{\Delta U}{\Delta T} = C_V\right)$$

$$\therefore \quad C = C_V + \frac{\Delta W}{\Delta T} \qquad \text{...(iii)}$$

Here,

$$\Delta W = \int_{V_i}^{V_f} p dV = \int_{V_i}^{V_f} kV^{-x} dV = \left[\frac{kV^{-x+1}}{-x+1}\right]_{V_i}^{V_f}$$

$$= \frac{kV_f^{-x+1} - kV_i^{-x+1}}{-x+1}$$

$$= \frac{p_f V_f^x V_f^{-x+1} - p_i V_i^x V_i^{-x+1}}{1-x}$$

$$= \frac{p_f V_f - p_i V_i}{1-x} = \frac{RT_f - RT_i}{1-x}$$

$$= \frac{R\Delta T}{1-x}$$

$$\therefore \quad \frac{\Delta W}{\Delta T} = \frac{R}{1-x}$$

Substituting in Eq. (iii), we get the result i.e.

$$\therefore \quad C = C_V + \frac{R}{1-x} = \frac{R}{\gamma - 1} + \frac{R}{1-x}$$

Solved Examples

TYPED PROBLEMS

Type 1. *Based on first law of thermodynamics applied to a general system*

Concept

First law of thermodynamics is simply law of conservation of energy which can be applied for any system.

Example 1 ***Boiling water :*** *Suppose 1.0 g of water vaporizes isobarically at atmospheric pressure* $(1.01 \times 10^5\ Pa)$. *Its volume in the liquid state is* $V_i = V_{liquid} = 1.0\ cm^3$ *and its volume in vapour state is* $V_f = V_{vapour} = 1671\ cm^3$. *Find the work done in the expansion and the change in internal energy of the system. Ignore any mixing of the steam and the surrounding air. Take latent heat of vaporization* $L_v = 2.26 \times 10^6\ J/kg$.

Solution Because the expansion takes place at constant pressure, the work done is

$$W = \int_{V_i}^{V_f} p_0 dV = p_0 \int_{V_i}^{V_f} dV = p_0\ (V_f - V_i)$$

$$= (1.01 \times 10^5)\ (1671 \times 10^{-6} - 1.0 \times 10^{-6})$$

$$= 169\ \text{J}$$ **Ans.**

$$Q = mL_v = (1.0 \times 10^{-3})\ (2.26 \times 10^6)$$

$$= 2260\ \text{J}$$ **Ans.**

Hence, from the first law, the change in internal energy

$$\Delta U = Q - W = 2260 - 169$$

$$= 2091\ \text{J}$$ **Ans.**

Note *The positive value of ΔU indicates that the internal energy of the system increases. We see that most* $\left(\frac{2091\ J}{2260\ J} = 93\%\right)$ *of the energy transferred to the liquid goes into increasing the internal energy of the system only* $\frac{169\ J}{2260\ J} = 7\%$ *leaves the system by work done by the steam on the surrounding atmosphere.*

Example 2 *A metal of mass 1 kg at constant atmospheric pressure and at initial temperature 20°C is given a heat of 20000 J. Find the following* **(JEE 2005)**

(a) change in temperature,

(b) work done and

(c) change in internal energy.

(Given, specific heat = 400 J/kg-°C, coefficient of cubical expansion, $\gamma = 9 \times 10^{-5}/°C$, *density* $\rho = 9000\ kg/m^3$, *atmospheric pressure* $= 10^5\ N/m^2$*)*

Solution (a) From $\Delta Q = ms\Delta T$

$$\Delta T = \frac{\Delta Q}{ms} = \frac{20000}{1 \times 400} = 50°\text{C}$$

(b)

$$\Delta V = V\gamma \Delta T = \left(\frac{1}{9000}\right)(9 \times 10^{-5})(50)$$

$$= 5 \times 10^{-7} \text{ m}^3$$

$\therefore$

$$W = p_0 \cdot \Delta V = (10^5)(5 \times 10^{-7}) = 0.05 \text{ J}$$

(c)

$$\Delta U = \Delta Q - W = (20000 - 0.05) \text{ J}$$

$$= 19999.95 \text{ J}$$

Type 2. *To make p-V, V-T or p-T equation corresponding to a given process*

Concept

Suppose we wish to make p-V equation for a given process then with the help of equation of first law of thermodynamics and $pV = nRT$, first make an equation of type

$$f(p)\,dp + f(V)\,dV = 0$$

Now, integrating this equation we will get the desired p-V equation.

Example 3 *Make p-V equation for an adiabatic process.*

Solution In adiabatic process, $dQ = 0$

and

$$dW = -\,dU$$

$\therefore$

$$pdV = -\,C_V dT \qquad \text{(for } n = 1\text{)}$$

$\therefore$

$$dT = -\frac{pdV}{C_V} \qquad \text{...(i)}$$

Also, for 1 mole of an ideal gas,

$$d\,(pV) = d\,(RT)$$

or

$$pdV + Vdp = RdT$$

or

$$dT = \frac{pdV + Vdp}{R} \qquad \text{...(ii)}$$

From Eqs. (i) and (ii), we get

$$C_V Vdp + (C_V + R)\,pdV = 0$$

or

$$C_V Vdp + C_p pdV = 0$$

Dividing this equation by PV, we are left with

$$C_V \frac{dp}{p} + C_p \frac{dV}{V} = 0$$

or

$$\frac{dp}{p} + \gamma \frac{dV}{V} = 0$$

or

$$\int \frac{dp}{p} + \gamma \int \frac{dV}{V} = 0$$

or

$$\ln(p) + \gamma \ln(V) = \text{constant}$$

We can write this in the form

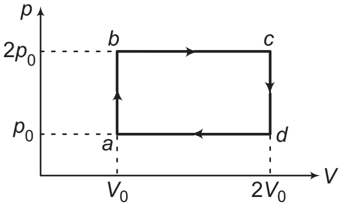
$$\boxed{pV^{\gamma} = \text{constant}}$$

Type 3. *To find values of all three terms of first law of thermodynamics from a p-V diagram provided nature of gas is given.*

Concept

Use the equation $nRT = pV$

Example 4 *A cyclic process abcd is given for a monoatomic gas* $\left(C_V = \frac{3}{2}R \text{ and } C_p = \frac{5}{2}R\right)$ *as shown in figure. Find Q, W and ΔU in each of the four processes separately. Also find the efficiency of cycle.*



Solution **Process ab**

$$V = \text{constant} \qquad (\because \text{ Isochoric process})$$

$$W_{ab} = 0$$

$$\therefore \quad Q_{ab} = \Delta U_{ab} = nC_V\Delta T$$

$$= n\left(\frac{3}{2}R\right)(T_b - T_a)$$

$$= \frac{3}{2}(nRT_b - nRT_a)$$

$$= \frac{3}{2}(p_bV_b - p_aV_a)$$

$$= \frac{3}{2}(2p_0V_0 - p_0V_0)$$

$$= 1.5\ p_0V_0$$

Process bc

$$p = \text{constant} \qquad (\because \text{ Isobaric process})$$

$$Q_{bc} = nC_p\Delta T$$

$$= n\left(\frac{5}{2}R\right)(T_c - T_b)$$

$$= \frac{5}{2}(nRT_c - nRT_b)$$

$$= \frac{5}{2}(p_cV_c - p_bV_b)$$

$$= \frac{5}{2}(4p_0V_0 - 2p_0V_0)$$

$$= 5\ p_0V_0$$

$$\begin{aligned}\Delta U_{bc} &= nC_V\Delta T\\ &= n\left(\frac{3}{2}R\right)(T_c - T_b)\\ &= \frac{3}{2}(nRT_c - nRT_b)\\ &= \frac{3}{2}(p_cV_c - p_bV_b)\\ &= \frac{3}{2}(4p_0V_0 - 2p_0V_0)\\ &= 3p_0V_0\\ W_{bc} &= Q_{bc} - \Delta U_{bc} = 2p_0V_0\end{aligned}$$

Process *cd*

Again an isochoric process.

$\therefore$

$$\begin{aligned}W_{cd} &= 0\\ Q_{cd} &= \Delta U_{cd} = nC_V\Delta T\\ &= n\left(\frac{3}{2}R\right)(T_d - T_c)\\ &= \frac{3}{2}(nRT_d - nRT_c)\\ &= \frac{3}{2}(p_dV_d - p_cV_c)\\ &= \frac{3}{2}(2p_0V_0 - 4p_0V_0)\\ &= -3p_0V_0\end{aligned}$$

Process *da*

This is an isobaric process.

$\therefore$

$$\begin{aligned}Q_{da} &= nC_p\Delta T\\ &= n\left(\frac{5}{2}R\right)(T_a - T_d)\\ &= \frac{5}{2}(nRT_a - nRT_d)\\ &= \frac{5}{2}(p_aV_a - p_dV_d)\\ &= \frac{5}{2}(p_0V_0 - 2p_0V_0)\\ &= -2.5\ p_0V_0\\ \Delta U_{da} &= nC_V\Delta T\\ &= n\left(\frac{3}{2}R\right)(T_a - T_d)\\ &= \frac{3}{2}(nRT_a - nRT_d)\\ &= \frac{3}{2}(p_aV_a - p_dV_d)\end{aligned}$$

$$= \frac{3}{2}(p_0V_0 - 2p_0V_0)$$
$$= -1.5\ p_0V_0$$
$$W_{da} = Q_{da} - \Delta U_{da}$$
$$= -\ p_0V_0$$

Efficiency of cycle

In the complete cycle,

$$W_{\text{net}} = W_{ab} + W_{bc} + W_{cd} + W_{da}$$
$$= 0 + 2p_0V_0 + 0 - p_0V_0$$
$$= p_0V_0$$

Note *This W_{net} is also equal to area under the cycle.*

$$\Sigma Q_{+\text{ve}} = Q_{ab} + Q_{bc}$$
$$= 1.5p_0V_0 + 5p_0V_0$$
$$= 6.5p_0V_0$$

$$\therefore \qquad \eta = \frac{W_{\text{net}}}{\Sigma Q_{+\text{ve}}} \times 100$$
$$= \left(\frac{p_0V_0}{6.5p_0V_0}\right) \times 100$$
$$= 15.38\ \%$$

Ans.

Miscellaneous Examples

Example 5 *For a Carnot cycle (or engine) discussed in article 21.4, prove that efficiency of cycle is given by*

$$\eta = \left(1 - \frac{T_2}{T_1}\right)$$

Solution Efficiency $= \dfrac{\text{net work done by gas}}{\text{heat absorbed by gas}} = \dfrac{|W_1| + |W_2| - |W_3| - |W_4|}{|Q_1|}$ ...(i)

Process 1 On this isothermal expansion process, the constant temperature is T_1 so work done by the gas

$$W_1 = nRT_1 \ln\left(\frac{V_b}{V_a}\right) \qquad \text{...(ii)}$$

Remember that $V_b > V_a$, so this quantity is positive, as expected. (In process 1, the gas does work by lifting something)

In isothermal process,

$$Q = W$$
$$\therefore \qquad |Q_1| = |W_1| \qquad \text{...(iii)}$$

Process 2 On this adiabatic expansion process, the temperature and volume are related through

$$TV^{\gamma-1} = \text{constant}$$

∴ $$T_1V_b^{\gamma-1} = T_2V_c^{\gamma-1}$$

or $$\frac{T_1}{T_2} = \left(\frac{V_c}{V_b}\right)^{\gamma-1} \qquad \text{...(iv)}$$

Work done by the gas in this adiabatic process is

$$W_2 = \frac{p_cV_c - p_bV_b}{1-\gamma} = \frac{nRT_c - nRT_b}{1-\gamma}$$

$$= \left(\frac{T_2-T_1}{1-\gamma}\right) nR = \left(\frac{T_1-T_2}{\gamma-1}\right) nR \qquad \text{...(v)}$$

Once again, as expected, this quantity is positive.

Process 3 In the isothermal compression process, the work done by the gas is

$$W_3 = nRT_2 \ln \frac{V_d}{V_c} \qquad \text{...(vi)}$$

Because $V_d < V_c$, the work done by the gas is negative. The work done on the gas is

$$|W_3| = -nRT_2 \ln \frac{V_d}{V_c} = nRT_2 \ln \frac{V_c}{V_d} \qquad \text{...(vii)}$$

Furthermore, just as in process 1,

$$|Q_3| = |W_3| \qquad \text{...(viii)}$$

Process 4 In the adiabatic compression process, the calculations are exactly the same as they were in process 2 but of course with different variables. Therefore,

$$\frac{T_2}{T_1} = \left(\frac{V_a}{V_d}\right)^{\gamma-1} \qquad \text{...(ix)}$$

and $$W_4 = \frac{nR}{\gamma-1}(T_2-T_1) \qquad \text{...(x)}$$

As expected, this quantity is negative and

$$|W_4| = -W_4 = \frac{nR}{\gamma-1}(T_1-T_2) \qquad \text{...(xi)}$$

We can now calculate the efficiency.

$$\text{Efficiency} = \frac{|W_1| + |W_2| - |W_3| - |W_4|}{|Q_1|}$$

$$= 1 + \frac{|W_2| - |W_3| - |W_4|}{|Q_1|} \qquad (\text{as } |W_1| = |Q_1|)$$

But our calculations show that $|W_2| = |W_4|$.

$$\text{Efficiency} = 1 - \frac{|W_3|}{|Q_1|} = 1 - \frac{nRT_2 \ln (V_c/V_d)}{nRT_1 \ln (V_b/V_a)} = 1 - \frac{T_2 \ln (V_c/V_d)}{T_1 \ln (V_b/V_a)} \qquad \text{...(xii)}$$

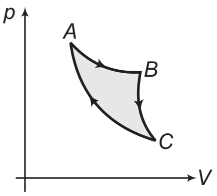
We have seen that

$$\frac{T_1}{T_2} = \left(\frac{V_c}{V_b}\right)^{\gamma-1} = \left(\frac{V_d}{V_a}\right)^{\gamma-1} \quad \text{or} \quad \frac{V_c}{V_b} = \frac{V_d}{V_a} \quad \text{or} \quad \frac{V_c}{V_d} = \frac{V_b}{V_a}$$

Substituting in Eq. (xii), we get

$$\boxed{\text{Efficiency} = 1 - \frac{T_2}{T_1}}$$

Example 6 *An ideal gas expands isothermally along AB and does 700 J of work.*



(a) *How much heat does the gas exchange along AB?*

(b) *The gas then expands adiabatically along BC and does 400 J of work. When the gas returns to A along CA, it exhausts 100 J of heat to its surroundings. How much work is done on the gas along this path?*

Solution (a) AB is an isothermal process. Hence,

$$\Delta U_{AB} = 0$$

and $$Q_{AB} = W_{AB} = 700 \text{ J}$$ **Ans.**

(b) BC is an adiabatic process. Hence,

$$Q_{BC} = 0$$

$$W_{BC} = 400 \text{ J}$$

$$\therefore \quad \Delta U_{BC} = -W_{BC} = -400 \text{ J}$$

ABC is a cyclic process and internal energy is a state function. Therefore,

$$(\Delta U)_{\text{whole cycle}} = 0 = \Delta U_{AB} + \Delta U_{BC} + \Delta U_{CA}$$

and from first law of thermodynamics,

$$Q_{AB} + Q_{BC} + Q_{CA} = W_{AB} + W_{BC} + W_{CA}$$

Substituting the values,

$$700 + 0 - 100 = 700 + 400 + \Delta W_{CA}$$

$$\therefore \quad \Delta W_{CA} = -500 \text{ J}$$ **Ans.**

Negative sign implies that work is done on the gas.

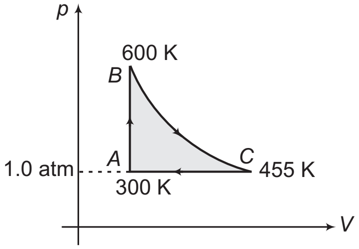
Table below shows different values in different processes.

Table 21.6

Process	Q (J)	W(J)	ΔU(J)
AB	700	700	0
BC	0	400	–400
CA	–100	–500	400
For complete cycle	600	600	0

Note *Total work done is 600 J, which implies that area of the closed curve is also 600 J.*

Example 7 *The p-V diagram of 0.2 mol of a diatomic ideal gas is shown in figure. Process BC is adiabatic. The value of γ for this gas is 1.4.*



(a) *Find the pressure and volume at points A, B and C.*

(b) *Calculate $\Delta Q, \Delta W$ and ΔU for each of the three processes.*

(c) *Find the thermal efficiency of the cycle.*

Take $1 \, atm = 1.0 \times 10^5 \, N/m^2$.

Solution (a) $p_A = p_C = 1 \text{ atm} = 1.01 \times 10^5 \text{ N/m}^2$

Process AB is an isochoric process.

$$\therefore \quad p \propto T \quad \text{or} \quad \frac{p_B}{p_A} = \frac{T_B}{T_A}$$

$$\therefore \quad p_B = \left(\frac{T_B}{T_A}\right) p_A = \left(\frac{600}{300}\right)(1 \text{ atm}) = 2 \text{ atm}$$

$$= 2.02 \times 10^5 \text{ N/m}^2$$

From ideal gas equation $$V = \frac{nRT}{p}$$

$$\therefore \quad V_A = V_B = \frac{nRT_A}{p_A}$$

$$= \frac{(0.2)(8.31)(300)}{(1.01 \times 10^5)} \approx 5.0 \times 10^{-3} \text{ m}^3$$

$$= 5 \text{ L}$$

and $$V_C = \frac{nRT_C}{p_C} = \frac{(0.2)(8.31)(455)}{(1.01 \times 10^5)}$$

$$= 7.5 \times 10^{-3} \text{ m}^3$$

$$\approx 7.5 \text{ L}$$

Table 21.7

State	p	V
A	1 atm	5 L
B	2 atm	5 L
C	1 atm	7.5 L

(b) **Process *AB*** is an isochoric process. Hence,

$$\Delta W_{AB} = 0$$

$$\Delta Q_{AB} = \Delta U_{AB} = nC_V \Delta T = n\left(\frac{5}{2}R\right)(T_B - T_A)$$

$$= (0.2)\left(\frac{5}{2}\right)(8.31)(600 - 300)$$

$$\approx 1246 \text{ J}$$

Process *BC* is an adiabatic process. Hence,

$$\Delta Q_{BC} = 0$$

$$\therefore \quad \Delta W_{BC} = -\Delta U_{BC}$$

$$\Delta U_{BC} = nC_V \Delta T = nC_V (T_C - T_B)$$

$$= (0.2)\left(\frac{5}{2}R\right)(455 - 600)$$

$$= (0.2)\left(\frac{5}{2}\right)(8.31)(-145) \text{ J}$$

$$\approx -602 \text{ J}$$

$$\therefore \quad \Delta W_{BC} = -\Delta U_{BC} = 602 \text{ J}$$

Process *CA* is an isobaric process. Hence,

$$\Delta Q_{CA} = nC_p\Delta T = n\left(\frac{7}{2}R\right)(T_A - T_C)$$

$$= (0.2)\left(\frac{7}{2}\right)(8.31)(300 - 455)$$

$$\approx -902 \text{ J}$$

$$\Delta U_{CA} = nC_V\Delta T$$

$$= \frac{\Delta Q_{CA}}{\gamma} \qquad \left(\text{as } \gamma = \frac{C_p}{C_V}\right)$$

$$= -\frac{902}{1.4} \approx -644 \text{ J}$$

$$\therefore \qquad \Delta W_{CA} = \Delta Q_{CA} - \Delta U_{CA}$$

$$= -258 \text{ J}$$

Table 21.8

Process	ΔQ (in J)	ΔW (in J)	ΔU (in J)
AB	1246	0	1246
BC	0	602	– 602
CA	– 902	– 258	– 644
Total	344	344	0

(c) Efficiency of the cycle

$$\eta = \frac{W_{\text{Total}}}{|Q_{+\text{ve}}|} \times 100 = \frac{344}{1246} \times 100$$

$$= 27.6\%$$

Example 8 *Find the molar specific heat of the process* $p = \frac{a}{T}$ *for a monoatomic gas, a being constant.*

Solution We know that

$$dQ = dU + dW$$

Specific heat,

$$C = \frac{dQ}{dT} = \frac{dU}{dT} + \frac{dW}{dT} \qquad \ldots\text{(i)}$$

Since,

$$dU = C_V dT \qquad \ldots\text{(ii)}$$

$$C = C_V + \frac{dW}{dT}$$

$$= C_V + \frac{pdV}{dT}$$

$$pV = RT$$

∴ For the given process,

$$V = \frac{RT}{p} = \frac{RT^2}{a}$$

$$\frac{dV}{dT} = \frac{2RT}{a}$$

$$\therefore \qquad C = C_V + p\left(\frac{2RT}{a}\right)$$

$$= C_V + 2R$$

$$= \frac{3}{2}R + 2R = \frac{7}{2}R$$

Example 9 *At 27° C two moles of an ideal monatomic gas occupy a volume V. The gas expands adiabatically to a volume $2V$. Calculate*

(a) final temperature of the gas

(b) change in its internal energy and

(c) the work done by the gas during the process.

[$R = 8.31$ *J/mol-K*]

Solution (a) In case of adiabatic change

$$TV^{\gamma-1} = \text{constant}$$

So that $$T_1V_1^{\gamma-1} = T_2V_2^{\gamma-1} \text{ with } \gamma = \left(\frac{5}{3}\right)$$

i.e. $$300 \times V^{2/3} = T(2V)^{2/3}$$

or $$T = \frac{300}{(2)^{2/3}} = 189 \text{ K}$$

(b) As $$\Delta U = nC_V\Delta T = n\left(\frac{3}{2}R\right)\Delta T$$

So, $$\Delta U = 2 \times \left(\frac{3}{2}\right) \times 8.31\ (189 - 300)$$

$$= -2767.23 \text{ J}$$

Negative sign means internal energy will decrease.

(c) According to first law of thermodynamics

$$Q = \Delta U + \Delta W$$

And as for adiabatic change $\Delta Q = 0$,

$$\Delta W = -\Delta U = 2767.23 \text{ J}$$

Example 10 *Two moles of a diatomic ideal gas is taken through pT = constant. Its temperature is increased from T to $2T$. Find the work done by the system?*

Solution pT = constant

$$\therefore \qquad p(pV) = \text{constant} \qquad (\text{as } T \propto pV)$$

or $$pV^{1/2} = \text{constant}$$

Comparing with $$pV^x = \text{constant}$$

We have, $$x = \frac{1}{2}$$

$$W = \frac{nR\Delta T}{1-x} = \frac{2R(2T-T)}{1-\frac{1}{2}}$$

$$= 4RT$$

Example 11 *An ideal monatomic gas at temperature* $27°C$ *and pressure* $10^6\ N/m^2$ *occupies* 10 *L volume.* 10,000 *cal of heat is added to the system without changing the volume. Calculate the change in temperature of the gas. Given :* $R = 8.31$ *J/mol-K and* $J = 4.18$ *J/cal.*

Solution For n moles of gas, we have $pV = nRT$

Here, $p = 10^6\ \text{N/m}^2$, $V = 10\ L = 10^{-2}\,\text{m}^3$ and $T = 27°\text{C} = 300\ \text{K}$

$$\therefore \qquad n = \frac{pV}{RT} = \frac{10^6 \times 10^{-2}}{8.31 \times 300} = 4.0$$

For monatomic gas, $C_V = \frac{3}{2}R$

$$\text{Thus,} \qquad C_V = \frac{3}{2} \times 8.31\ \text{J/mol-K}$$

$$= \frac{3}{2} \times \frac{8.31}{4.18} \approx 3\ \text{cal/mol-K}$$

Let ΔT be the rise in temperature when n moles of the gas is given Q cal of heat at constant volume. Then,

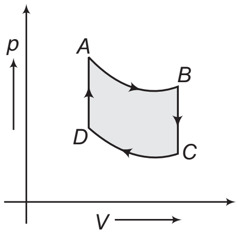
$$Q = nC_V\Delta T \quad \text{or} \quad \Delta T = \frac{Q}{nC_V}$$

$$= \frac{10000\ \text{cal}}{4.0\ \text{mole} \times 3\ \text{cal/mol-K}}$$

$$= 833\ \text{K}$$

Example 12 *One mole of a monoatomic ideal gas is taken through the cycle shown in figure.*

$A \to B$ Adiabatic expansion
$B \to C$ Cooling at constant volume
$C \to D$ Adiabatic compression.
$D \to A$ Heating at constant volume



The pressure and temperature at A, B etc., are denoted by p_A, T_A ; p_B, T_B *etc. respectively.*

Given, $T_A = 1000K$, $p_B = \left(\frac{2}{3}\right)p_A$ *and* $p_C = \left(\frac{1}{3}\right)p_A$. *Calculate*

(a) the work done by the gas in the process $A \to B$
(b) the heat lost by the gas in the process $B \to C$

Given, $\left(\frac{2}{3}\right)^{0.4} = 0.85$ *and* $R = 8.31$ *J/mol-K*

Solution (a) As for adiabatic change $pV^\gamma =$ constant

$$\text{i.e.} \qquad p\left(\frac{nRT}{p}\right)^\gamma = \text{constant} \qquad (\text{as } pV = nRT)$$

$$\text{i.e.} \qquad \frac{T^\gamma}{p^{\gamma-1}} = \text{constant so} \left(\frac{T_B}{T_A}\right)^\gamma = \left(\frac{p_B}{p_A}\right)^{\gamma-1}, \text{ where } \gamma = \frac{5}{3}$$

i.e. $$T_B = T_A \left(\frac{2}{3}\right)^{1-\frac{1}{\gamma}} = 1000\left(\frac{2}{3}\right)^{2/5} = 850\ \text{K}$$

So, $$W_{AB} = \frac{nR[T_F - T_I]}{[1-\gamma]} = \frac{1 \times 8.31\ [1000 - 850]}{\left[\left(\frac{5}{3}\right) - 1\right]}$$

i.e. $$W_{AB} = 1869.75\ \text{J}$$

(b) For $B \rightarrow C$, $V = \text{constant}$ so $\Delta W = 0$

So, from first law of thermodynamics

$$\Delta Q = \Delta U + \Delta W = nC_V \Delta T + 0$$

or $$\Delta Q = 1 \times \left(\frac{3}{2}R\right)(T_C - 850) \qquad \left(\text{as } C_V = \frac{3}{2}R\right)$$

Now, along path BC, $V = \text{constant}$; $p \propto T$

i.e. $$\frac{p_C}{p_B} = \frac{T_C}{T_B}$$

$$T_C = \frac{\left(\frac{1}{3}\right)p_A}{\left(\frac{2}{3}\right)p_A} \times T_B = \frac{T_B}{2} = \frac{850}{2} = 425\ \text{K} \qquad \text{...(ii)}$$

So, $$\Delta Q = 1 \times \frac{3}{2} \times 8.31\ (425 - 850) = -5297.625\ \text{J}$$

[Negative heat means, heat is lost by the system]

Example 13 *A gas undergoes a process such that* $p \propto \frac{1}{T}$. *If the molar heat capacity for this process is* $C = 33.24$ *J/mol-K, find the degree of freedom of the molecules of the gas.*

Solution As $$p \propto \frac{1}{T}$$

or $$pT = \text{constant} \qquad \text{...(i)}$$

We have for one mole of an ideal gas

$$pV = RT \qquad \text{...(ii)}$$

From Eqs. (i) and (ii),

$$p^2V = \text{constant}$$

or $$pV^{1/2} = K\ (\text{say}) = p_i V_i^{1/2} = p_f V_f^{1/2} \qquad \text{...(iii)}$$

From first law of thermodynamics,

$$\Delta Q = \Delta U + \Delta W$$

or $$C\Delta T = C_V \Delta T + \Delta W$$

or $$C = C_V + \frac{\Delta W}{\Delta T} \qquad \text{...(iv)}$$

Here, $$\Delta W = \int p\,dV = K\int_{V_i}^{V_f} V^{-1/2} dV$$

$$= 2K\ [V_f^{1/2} - V_i^{1/2}] = 2\ [p_f V_f^{1/2} V_f^{1/2} - p_i V_i^{1/2} V_i^{1/2}]$$

$$= 2\ [p_f V_f - p_i V_i] = 2R\ [T_f - T_i]$$

$$= \frac{R\Delta T}{1/2} \Rightarrow \frac{\Delta W}{\Delta T} = 2R$$

Substituting in Eq. (iv), we have

$$C = C_V + 2R = \frac{R}{\gamma - 1} + 2R$$

Substituting the values, $33.24 = R\left(\frac{1}{\gamma - 1} + 2\right) = 8.31\left(\frac{1}{\gamma - 1} + 2\right)$

Solving this we get $\gamma = 1.5$

Now, $\gamma = 1 + \frac{2}{F}$

or degree of freedom $F = \frac{2}{\gamma - 1} = \frac{2}{1.5 - 1} = 4$

Alternate Solution In the process pV^x = constant, molar heat capacity is given by

$$C = \frac{R}{\gamma - 1} + \frac{R}{1 - x}$$

The given process is $pV^{1/2}$ = constant or $x = \frac{1}{2}$

$$\therefore \qquad C = \frac{R}{\gamma - 1} + \frac{R}{1 - \frac{1}{2}} = \frac{R}{\gamma - 1} + 2R$$

Now, we may proceed in the similar manner.

Example 14 *A gaseous mixture enclosed in a vessel consists of one gram mole of a gas A with* $\gamma = \left(\frac{5}{3}\right)$ *and some amount of gas B with* $\gamma = \frac{7}{5}$ *at a temperature* T. *The gases A and B do not react with each other and are assumed to be ideal. Find the number of gram moles of the gas B if* γ *for the gaseous mixture is* $\left(\frac{19}{13}\right)$.

Solution As for an ideal gas, $C_p - C_V = R$ and $\gamma = \left(\frac{C_p}{C_V}\right)$

So, $C_V = \frac{R}{(\gamma - 1)}$

$$\therefore \qquad (C_V)_1 = \frac{R}{\left(\frac{5}{3}\right) - 1} = \frac{3}{2}R;$$

$$(C_V)_2 = \frac{R}{\left(\frac{7}{5}\right) - 1} = \frac{5}{2}R$$

and $(C_V)_{\text{mix}} = \frac{R}{\left(\frac{19}{13}\right) - 1} = \frac{13}{6}R$

Now, from conservation of energy,

i.e $\Delta U = \Delta U_1 + \Delta U_2$

$$(n_1 + n_2)\,(C_V)_{\text{mix}}\,\Delta T = [n_1 (C_V)_1 + n_2 (C_V)_2]\,\Delta T$$

i.e.
$$(C_V)_{\text{mix}} = \frac{n_1 (C_V)_1 + n_2 (C_V)_2}{n_1 + n_2}$$

We have
$$\frac{13}{6} R = \frac{1 \times \frac{3}{2} R + n_2 \frac{5}{2} R}{1 + n_2}$$

$$= \frac{(3 + 5n_2)R}{2\,(1 + n_2)}$$

or
$$13 + 13n_2 = 9 + 15n_2,$$

i.e.
$$n_2 = 2$$ **Ans.**

Example 15 *An ideal gas having initial pressure p, volume V and temperature T is allowed to expand adiabatically until its volume becomes $5.66\,V$, while its temperature falls to $T/2$.*

(a) How many degrees of freedom do the gas molecules have?

(b) Obtain the work done by the gas during the expansion as a function of the initial pressure p and volume V.

Given that $(5.66)^{0.4} = 2$

Solution (a) For adiabatic expansion,

$$TV^{\gamma - 1} = \text{constant}$$

i.e.
$$TV^{\gamma - 1} = T' V'^{\gamma - 1}$$

$$= \frac{T}{2} (5.66\,V)^{\gamma - 1}$$

i.e.
$$(5.66)^{\gamma - 1} = 2$$

i.e.
$$\gamma = 1.4$$

Using $\gamma = 1 + \frac{2}{F}$

We get degree of freedom,

$$F = 5$$ **Ans.**

(b) Work done during adiabatic process for one mole gas is

$$W = \frac{1}{1 - \gamma} [p' V' - pV]$$

From relation,
$$\frac{pV}{T} = \frac{p' V'}{T'}$$

We get
$$p' = \frac{T'}{T} \cdot \frac{pV}{V'} = \frac{1}{2} \times \frac{1}{5.66} p = \frac{p}{11.32}$$

∴
$$W = \frac{1}{1 - 1.4} \left[\frac{p}{11.32} \times \frac{V}{5.66} - pV \right]$$

$$= \frac{1}{0.4} \left[1 - \frac{1}{11.32 \times 5.66} \right] pV$$

$$= 2.461\,pV$$ **Ans.**

Exercises

LEVEL 1

Assertion and Reason

Directions : *Choose the correct option.*

(*a*) *If both **Assertion** and **Reason** are true and the **Reason** is correct explanation of the **Assertion.***

(*b*) *If both **Assertion** and **Reason** are true but **Reason** is not the correct explanation of **Assertion.***

(*c*) *If **Assertion** is true, but the **Reason** is false.*

(*d*) *If **Assertion** is false but the **Reason** is true.*

1. Assertion : In adiabatic expansion, temperature of gas always decreases.

Reason : In adiabatic process exchange of heat is zero.

2. Assertion : In a thermodynamic process, initial volume of gas is equal to final volume of gas. Work done by gas in this process should be zero.

Reason : Work done by gas in isochoric process is zero.

3. Assertion : First law of thermodynamics can be applied for ideal gases only.

Reason : First law is simply, law of conservation of energy.

4. Assertion : When ice melts, work is done by atmosphere on (ice + water) system.

Reason : On melting of ice volume of (ice + water) system decreases.

5. Assertion : Between two thermodynamic states, the value of $(Q - W)$ is constant for any process.

Reason : Q and W are path functions.

6. Assertion : Efficiency of a heat engine can't be greater than efficiency of Carnot engine.

Reason : Efficiency of any engine is never 100%.

7. Assertion : In the process $pT =$ constant, if temperature of gas is increased work done by the gas is positive.

Reason : For the given process, $V \propto T$.

8. Assertion : In free expansion of a gas inside an adiabatic chamber Q, W and ΔU all are zero.

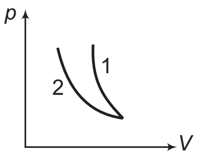
Reason : In such an expansion $p \propto \frac{1}{V}$.

9. Assertion : For an ideal gas in a cyclic process and in an isothermal process change in internal energy is zero.

Reason : In both processes there is no change in temperature.

10. Assertion : Isothermal and adiabatic, two processes are shown on p-V diagram. Process-1 is adiabatic and process-2 is isothermal.

Reason : At a given point, slope of adiabatic process $= \gamma \times$ slope of isothermal process.



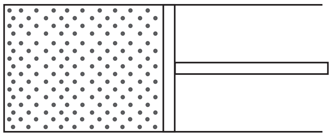
Objective Questions

1. In a process, the pressure of an ideal gas is proportional to square of the volume of the gas. If the temperature of the gas increases in this process, then work done by this gas

(a) is positive (b) is negative

(c) is zero (d) may be positive or negative

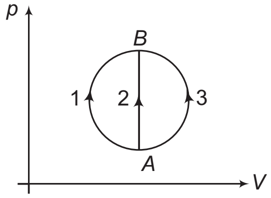
2. n moles of a gas are filled in a container at temperature T. If the gas is slowly and isothermally compressed to half its initial volume, the work done by the atmosphere on the gas is



(a) $\frac{nRT}{2}$ (b) $-\frac{nRT}{2}$

(c) $nRT \ln 2$ (d) $-nRT \ln 2$

3. A gas undergoes A to B through three different processes 1, 2 and 3 as shown in the figure. The heat supplied to the gas is Q_1, Q_2 and Q_3 respectively, then



(a) $Q_1 = Q_2 = Q_3$ (b) $Q_1 < Q_2 < Q_3$

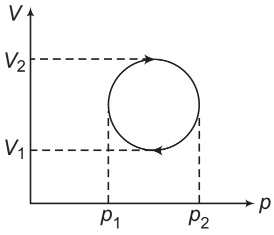
(c) $Q_1 > Q_2 > Q_3$ (d) $Q_1 = Q_3 > Q_2$

4. For an adiabatic compression the quantity pV

(a) increases (b) decreases

(c) remains constant (d) depends on γ

5. The cyclic process form a circle on a pV diagram as shown in figure. The work done by the gas is



(a) $\frac{\pi}{4}(p_2 - p_1)^2$ (b) $\frac{\pi}{4}(V_2 - V_1)^2$

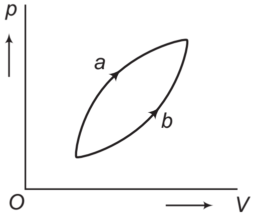
(c) $\frac{\pi}{2}(p_2 - p_1)(V_2 - V_1)$ (d) $\frac{\pi}{4}(p_2 - p_1)(V_1 - V_2)$

6. An ideal gas has initial volume V and pressure p. In doubling its volume the minimum work done will be in the process (of the given processes)

(a) isobaric process (b) isothermal process

(c) adiabatic process (d) same in all given processes

7. Figure shows two processes a and b for a given sample of a gas. If $\Delta Q_1, \Delta Q_2$ are the amounts of heat absorbed by the system in the two cases and $\Delta U_1, \Delta U_2$ are changes in internal energies respectively, then



(a) $\Delta Q_1 = \Delta Q_2; \Delta U_1 = \Delta U_2$
(b) $\Delta Q_1 > \Delta Q_2; \Delta U_1 > \Delta U_2$
(c) $\Delta Q_1 < \Delta Q_2; \Delta U_1 < \Delta U_2$
(d) $\Delta Q_1 > \Delta Q_2; \Delta U_1 = \Delta U_2$

8. A Carnot engine works between 600 K and 300 K. The efficiency of the engine is

(a) 50% (b) 70%
(c) 20% (d) 80%

9. Air in a cylinder is suddenly compressed by a piston which is then maintained at the same position. As the time passes pressure of the gas

(a) increases
(b) decreases
(c) remains the same
(d) may increase or decrease depending on the nature of the gas

10. A cycle pump becomes hot near the nozzle after a few quick strokes even if they are smooth because

(a) the volume of air decreases (b) the number of air molecules increases
(c) the compression is adiabatic (d) collision between air particles increases

11. In an adiabatic change, the pressure p and temperature T of a diatomic gas are related by the relation $p \propto T^{\alpha}$, where α equals

(a) 1.67 (b) 0.4
(c) 0.6 (d) 3.5

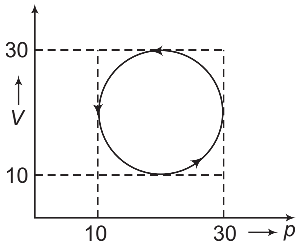
12. A diatomic gas obeys the law pV^x = constant. For what value of x, it has negative molar specific heat ?

(a) $x > 1.4$ (b) $x < 1.4$
(c) $1 < x < 1.4$ (d) $0 < x < 1$

13. The molar specific heat at constant volume of gas mixture is $\frac{13R}{6}$. The gas mixture consists of

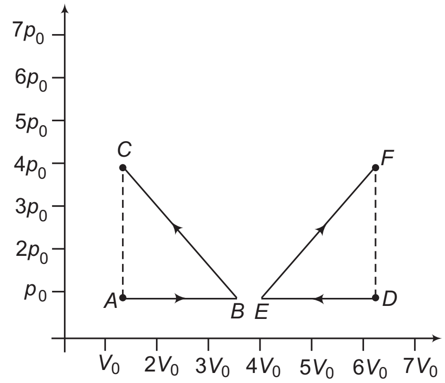
(a) 2 moles of O_2 and 4 moles of H_2 (b) 2 moles of O_2 and 4 moles of argon
(c) 2 moles of argon and 4 moles of O_2 (d) 2 moles of CO_2 and 4 moles of argon

14. Heat energy absorbed by a system in going through a cyclic process as shown in the figure [V in litres and p in kPa] is



(a) $10^7 \pi$J (b) $10^4 \pi$J (c) $10^2 \pi$J (d) $10^3 \pi$J

15. If W_{ABC} is the work done in process $A \to B \to C$ and W_{DEF} is work done in process $D \to E \to F$ as shown in the figure, then



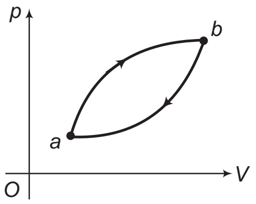
(a) $|W_{DEF}| > |W_{ABC}|$
(b) $|W_{DEF}| < |W_{ABC}|$
(c) $W_{DEF} = W_{ABC}$
(d) $W_{DEF} = -W_{ABC}$

Subjective Questions

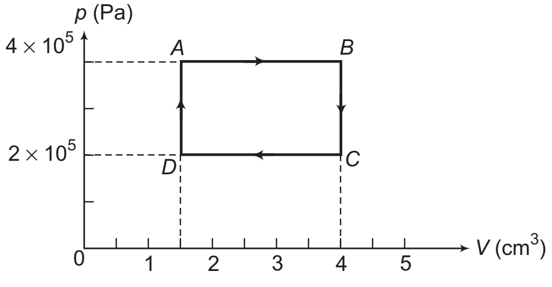
1. How many moles of helium at temperature 300 K and 1.00 atm pressure are needed to make the internal energy of the gas 100 J?

2. Show how internal energy U varies with T in isochoric, isobaric and adiabatic process?

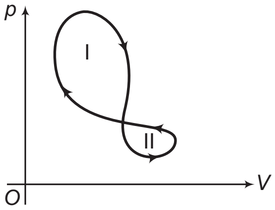
3. A system is taken around the cycle shown in figure from state a to state b and then back to state a. The absolute value of the heat transfer during one cycle is 7200 J. (a) Does the system absorb or liberate heat when it goes around the cycle in the direction shown in the figure? (b) What is the work W done by the system in one cycle? (c) If the system goes around the cycle in a counter-clock wise direction, does it absorb or liberate heat in one cycle? What is the magnitude of the heat absorbed or liberated in one counter-clockwise cycle?



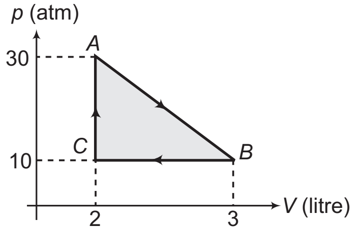
4. For the thermodynamic cycle shown in figure find (a) net output work of the gas during the cycle, (b) net heat flow into the gas per cycle.



5. A thermodynamic system undergoes a cyclic process as shown in figure. The cycle consists of two closed loops, loop I and loop II. (a) Over one complete cycle, does the system do positive or negative work? (b) In each of loops I and II, is the net work done by the system positive or negative ? (c) Over one complete cycle, does heat flow into or out of the system? (d) In each of loops I and II, does heat flow into or out of the system?



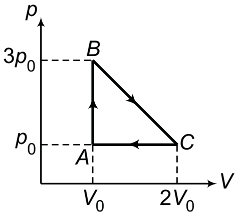
6. A gas undergoes the cycle shown in figure. The cycle is repeated 100 times per minute. Determine the power generated.



7. One mole of an ideal monoatomic gas is initially at 300 K. Find the final temperature if 200 J of heat is added (a) at constant volume (b) at constant pressure.

8. A closed vessel 10 L in volume contains a diatomic gas under a pressure of 10^5N/m^2. What amount of heat should be imparted to the gas to increase the pressure in the vessel five times?

9. One mole of an ideal monatomic gas is taken round the cyclic process *ABCA* as shown in figure. Calculate



(a) the work done by the gas.
(b) the heat rejected by the gas in the path *CA* and heat absorbed in the path *AB*.
(c) the net heat absorbed by the gas in the path *BC*.
(d) the maximum temperature attained by the gas during the cycle.

10. A diatomic ideal gas is heated at constant volume until its pressure becomes three times. It is again heated at constant pressure until its volume is doubled. Find the molar heat capacity for the whole process.

11. Two moles of a certain gas at a temperature $T_0 = 300\,\text{K}$ were cooled isochorically so that the pressure of the gas got reduced 2 times. Then as a result of isobaric process, the gas is allowed to expand till its temperature got back to the initial value. Find the total amount of heat absorbed by gas in this process.

12. Five moles of an ideal monoatomic gas with an initial temperature of $127°C$ expand and in the process absorb 1200 J of heat and do 2100 J of work. What is the final temperature of the gas?

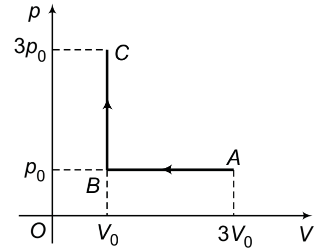
13. Find the change in the internal energy of 2 kg of water as it is heated from $0°C$ to $4°C$. The specific heat capacity of water is 4200 J/kg-K and its densities at $0°C$ and 4°C are 999.9 kg/m^3 and 1000 kg/m^3, respectively. Atmospheric pressure = 10^5 Pa.

14. Calculate the increase in the internal energy of 10 g of water when it is heated from $0°C$ to $100°C$ and converted into steam at 100 kPa. The density of steam = 0.6 kg/m^3. Specific heat capacity of water = 4200 J/kg-°C and the latent heat of vaporisation of water = 2.5×10^6 J/kg.

15. One gram of water (1 cm^3) becomes 1671 cm^3 of steam when boiled at a constant pressure of 1 atm (1.013×10^5 Pa). The heat of vaporization at this pressure is $L_v = 2.256 \times 10^6$ J/kg. Compute (a) the work done by the water when it vaporizes and (b) its increase in internal energy.

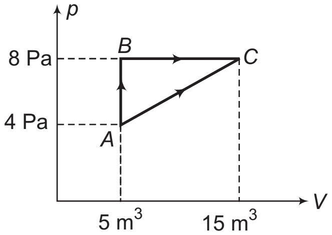
16. A gas in a cylinder is held at a constant pressure of 2.30×10^5 Pa and is cooled and compressed from 1.70 m^3 to 1.20 m^3. The internal energy of the gas decreases by 1.40×10^5 J. (a) Find the work done by the gas. (b) Find the absolute value $|Q|$ of the heat flow into or out of the gas and state the direction of the heat flow. (c) Does it matter whether or not the gas is ideal? Why or why not?

17. *p*-*V* diagram of an ideal gas for a process *ABC* is as shown in the figure.



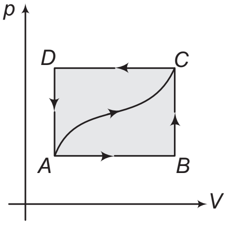
(a) Find total heat absorbed or released by the gas during the process *ABC*.
(b) Change in internal energy of the gas during the process *ABC*.
(c) Plot pressure *versus* density graph of the gas for the process *ABC*.

18. In the given graph, an ideal gas changes its state from *A* to *C* by two paths *ABC* and *AC*.



(a) Find the path along which work done is less.
(b) The internal energy of gas at *A* is 10 J and the amount of heat supplied in path *AC* is 200 J. Calculate the internal energy of gas at *C*.
(c) The internal energy of gas at state *B* is 20 J. Find the amount of heat supplied to the gas to go from *A* to *B*.

19. When a gas expands along *AB*, it does 500 J of work and absorbs 250 J of heat. When the gas expands along *AC*, it does 700 J of work and absorbs 300 J of heat.



(a) How much heat does the gas exchange along *BC*?

(b) When the gas makes the transition from *C* to *A* along *CDA*, 800 J of work are done on it from *C* to *D*. How much heat does it exchange along *CDA*?

20. A 1.0 kg bar of copper is heated at atmospheric pressure ($1.01 \times 10^5\ \text{N/m}^2$). If its temperature increases from 20°C to 50°C, calculate the change in its internal energy. $\alpha = 7.0 \times 10^{-6}\ /°\text{C}$, $\rho = 8.92 \times 10^3\ \text{kg/m}^3$ and $c = 387\ \text{J/kg-°C}$

21. One mole of an ideal monoatomic gas occupies a volume of $1.0 \times 10^{-2}\ \text{m}^3$ at a pressure of $2.0 \times 10^5\ \text{N/m}^2$.

(a) What is the temperature of the gas?

(b) The gas undergoes an adiabatic compression until its volume is decreased to $5.0 \times 10^{-3}\ \text{m}^3$. What is the new gas temperature?

(c) How much work is done on the gas during the compression?

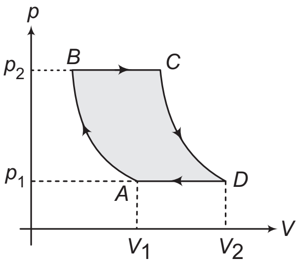
(d) What is the change in the internal energy of the gas?

22. A bullet of mass 10 g travelling horizontally at 200 m/s strikes and embeds in a pendulum bob of mass 2.0 kg.

(a) How much mechanical energy is dissipated in the collision?

(b) Assuming that C_v for the bob plus bullet is 3 *R*, calculate the temperature increase of the system due to the collision. Take the molecular mass of the system to be 200 g/mol.

23. An ideal gas is carried through a thermodynamic cycle consisting of two isobaric and two isothermal processes as shown in figure. Show that the net work done in the entire cycle is given by the equation. $W_{\text{net}} = p_1 (V_2 - V_1) \ln \frac{p_2}{p_1}$



24. An ideal gas is enclosed in a cylinder with a movable piston on top. The piston has mass of 8000 g and an area of 5.00 cm^2 and is free to slide up and down, keeping the pressure of the gas constant. How much work is done as the temperature of 0.200 mol of the gas is raised from 200°C to 300°C?

LEVEL 2

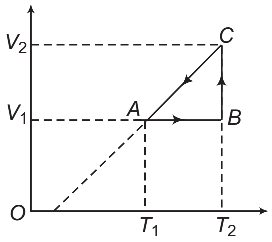
Single Correct Option

1. The equation of a state of a gas is given by $p(V - b) = nRT$. If 1 mole of a gas is isothermally expanded from volume V and $2V$, the work done during the process is

(a) $RT \ln \left|\frac{2V - b}{V - b}\right|$ (b) $RT \ln \left|\frac{V - b}{V}\right|$

(c) $RT \ln \left|\frac{V - b}{2V - b}\right|$ (d) $RT \ln \left|\frac{V}{V - b}\right|$

2. A cyclic process for 1 mole of an ideal gas is shown in the V-T diagram. The work done in AB, BC and CA respectively is



(a) $0, RT_2 \ln \left|\frac{V_2}{V_1}\right|, R(T_1 - T_2)$

(b) $R(T_1 - T_2), 0, RT_1 \ln \left|\frac{V_1}{V_2}\right|$

(c) $0, RT_1 \ln \left|\frac{V_1}{V_2}\right|, R(T_1 - T_2)$

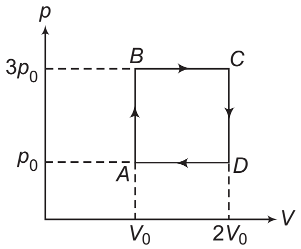
(d) $0, RT_2 \ln \left|\frac{V_2}{V_1}\right|, R(T_2 - T_1)$

3. Ten moles of a diatomic perfect gas are allowed to expand at constant pressure. The initial volume and temperature are V_0 and T_0, respectively. If $\frac{7}{2} RT_0$ heat is transferred to the gas, then the final volume and temperature are

(a) $1.1\, V_0, 1.1\, T_0$ (b) $0.9\, V_0, 0.9\, T_0$

(c) $1.1\, V_0, \frac{10}{11} T_0$ (d) $0.9\, V_0, \frac{10}{9} T_0$

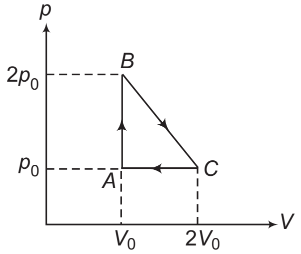
4. An ideal monoatomic gas is carried around the cycle $ABCDA$ as shown in the figure. The efficiency of the gas cycle is



(a) $\frac{4}{21}$ (b) $\frac{2}{21}$

(c) $\frac{4}{31}$ (d) $\frac{2}{31}$

5. In the process shown in figure, the internal energy of an ideal gas decreases by $\frac{3p_0V_0}{2}$ in going from point C to A. Heat transfer along the process CA is



(a) $(-3\ p_0V_0)$
(b) $(-5\ p_0V_0/2)$
(c) $(-3\ p_0V_0/2)$
(d) zero

6. One mole of an ideal monoatomic gas at temperature T_0 expands slowly according to the law $\frac{p}{V}$ = constant. If the final temperature is $2T_0$, heat supplied to the gas is

(a) $2RT_0$
(b) $\frac{3}{2}RT_0$
(c) RT_0
(d) $\frac{1}{2}RT_0$

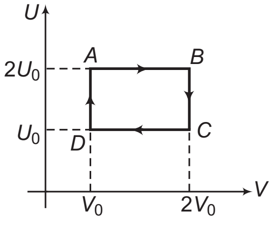
7. A mass of gas is first expanded isothermally and then compressed adiabatically to its original volume. What further simplest operation must be performed on the gas to restore it to its original state?

(a) An isobaric cooling to bring its temperature to initial value
(b) An isochoric cooling to bring its pressure to its initial value
(c) An isothermal process to take its pressure to its initial value
(d) An isochoric heating to bring its temperature to initial value

8. A monatomic ideal gas, initially at temperature T_1, is enclosed in a cylinder fitted with a frictionless piston. The gas is allowed to expand adiabatically to a temperature T_2 by releasing the piston suddenly. If L_1 and L_2 are the lengths of gas column before and after expansion respectively, then $\frac{T_1}{T_2}$ is given by

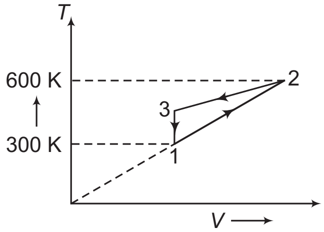
(a) $\left(\frac{L_1}{L_2}\right)^{\frac{2}{3}}$
(b) $\frac{L_1}{L_2}$
(c) $\frac{L_2}{L_1}$
(d) $\left(\frac{L_2}{L_1}\right)^{\frac{2}{3}}$

9. One mole of an ideal gas is taken through a cyclic process. The minimum temperature during the cycle is 300 K. Then, net exchange of heat for complete cycle is



(a) $600\ R \ln 2$
(b) $300\ R \ln 2$
(c) $-300\ R \ln 2$
(d) $900\ R \ln 2$

10. Two moles of an ideal gas are undergone a cyclic process 1-2-3-1. If net heat exchange in the process is 300 J, the work done by the gas in the process 2-3 is



(a) –500 J (b) – 5000 J (c) – 3000 J (d) None of these

11. Two cylinders fitted with pistons contain equal amount of an ideal diatomic gas at 300 K. The piston of *A* is free to move, while that of *B* is held fixed. The same amount of heat is given to the gas in each cylinder. If the rise in temperature of the gas in *A* is 30 K, then the rise in temperature of gas in *B* is

(a) 30 K (b) 18 K
(c) 50 K (d) 42 K

12. A gas follows a process TV^{n-1} = constant, where T = absolute temperature of the gas and V = volume of the gas. The bulk modulus of the gas in the process is given by

(a) $(n-1)p$ (b) $p/(n-1)$
(c) np (d) p/n

13. One mole of an ideal gas at temperature T_1 expands slowly according to the law $\frac{p}{V}$ = constant. Its final temperature is T_2. The work done by the gas is

(a) $R(T_2-T_1)$ (b) $2R(T_2-T_1)$
(c) $\frac{R}{2}(T_2-T_1)$ (d) $\frac{2R}{3}(T_2-T_1)$

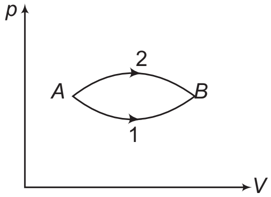
14. 600 J of heat is added to a monoatomic gas in a process in which the gas performs a work of 150 J. The molar heat capacity for the process is

(a) $3R$ (b) $4R$
(c) $2R$ (d) $6R$

15. The internal energy of a gas is given by $U = 2pV$. It expands from V_0 to $2V_0$ against a constant pressure p_0. The heat absorbed by the gas in the process is

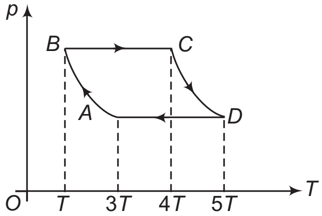
(a) $2p_0V_0$ (b) $4p_0V_0$
(c) $3p_0V_0$ (d) p_0V_0

16. The figure shows two paths for the change of state of a gas from *A* to *B*. The ratio of molar heat capacities in path 1 and path 2 is



(a) < 1 (b) > 1
(c) 1 (d) Data insufficient

17. *p*-*T* diagram of one mole of an ideal monatomic gas is shown. Processes *AB* and *CD* are adiabatic. Work done in the complete cycle is

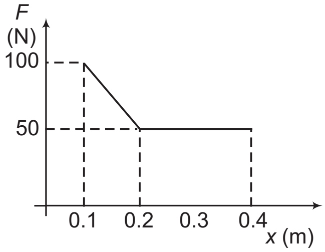


(a) 2.5 *RT*
(b) −2 *RT*
(c) 1.5 *RT*
(d) −3.5 *RT*

18. An ideal monoatomic gas undergoes a process in which its internal energy U and density ρ vary as $U\rho$ = constant. The ratio of change in internal energy and the work done by the gas is

(a) $\frac{3}{2}$
(b) $\frac{2}{3}$
(c) $\frac{1}{3}$
(d) $\frac{3}{5}$

19. The given figure shows the variation of force applied by ideal gas on a piston which undergoes a process during which piston position changes from 0.1 to 0.4 m. If the internal energy of the system at the end of the process is 2.5 J higher, then the heat absorbed during the process is



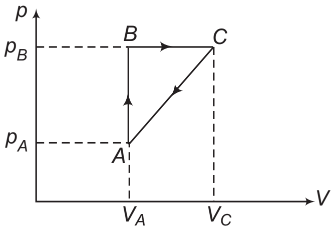
(a) 15 J
(b) 17.5 J
(c) 20 J
(d) 22.5 J

20. A gas can expand through two processes : (i) isobaric, (ii) $\frac{p}{V}$ = constant. Assuming that the initial volume is same in both processes and the final volume which is two times the initial volume is also same in both processes, which of the following is true?

(a) Work done by gas in process (i) is greater than the work done by the gas in process (ii)
(b) Work done by gas in process (i) is smaller than the work done by the gas in process (ii)
(c) Final pressure is greater in process (i)
(d) Final temperature is greater in process (i)

21. An ideal gas of adiabatic exponent γ is expanded so that the amount of heat transferred to the gas is equal to the decrease of its internal energy. Then, the equation of the process in terms of the variables T and V is

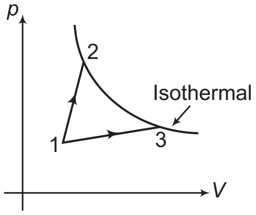
(a) $TV^{\frac{(\gamma-1)}{2}} = C$
(b) $TV^{\frac{(\gamma-2)}{2}} = C$
(c) $TV^{\frac{(\gamma-1)}{4}} = C$
(d) $TV^{\frac{(\gamma-2)}{4}} = C$



22. A thermodynamical process is shown in the figure with $p_A = 3 \times p_{\text{atm}}$, $V_A = 2 \times 10^{-4}\ \text{m}^3$, $p_B = 8 \times p_{\text{atm}}$, $V_C = 5 \times 10^{-4}\ \text{m}^3$. In the process AB and BC, 600 J and 200 J heat are added to the system. Find the change in internal energy of the system in the process CA. $[1\ p_{\text{atm}} = 10^5\ \text{N/m}^2]$

(a) 560 J (b) –560 J
(c) –240 J (d) +240 J

23. A gas takes part in two processes in which it is heated from the same initial state 1 to the same final temperature. The processes are shown on the p-V diagram by the straight lines 1-3 and 1-2. 2 and 3 are the points on the same isothermal curve. Q_1 and Q_2 are the heat transfer along the two processes. Then,

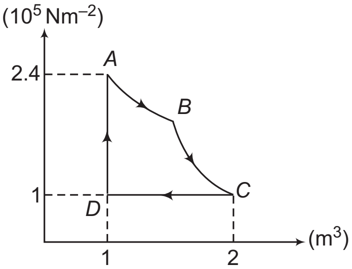


(a) $Q_1 = Q_2$ (b) $Q_1 < Q_2$
(c) $Q_1 > Q_2$ (d) Insufficient data

24. A closed system receives 200 kJ of heat at constant volume. It then rejects 100 kJ of heat while it has 50 kJ of work done on it at constant pressure. If an adiabatic process can be found which will restore the system to its initial state, the work done by the system during this process is

(a) 100 kJ (b) 50 kJ
(c) 150 kJ (d) 200 kJ

25. 100 moles of an ideal monatomic gas undergoes the thermodynamic process as shown in the figure

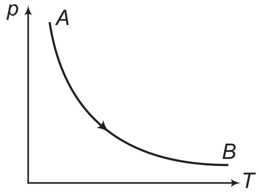


$A \to B$: isothermal expansion $B \to C$: adiabatic expansion
$C \to D$: isobaric compression $D \to A$: isochoric process

The heat transfer along the process AB is 9×10^4 J. The net work done by the gas during the cycle is [Take $R = 8\ \text{JK}^{-1}\ \text{mol}^{-1}$)

(a) -0.5×10^4 J (b) $+0.5 \times 10^4$ J
(c) -5×10^4 J (d) $+5 \times 10^4$ J

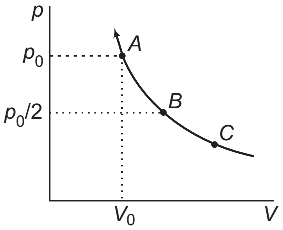
26. Two moles of an ideal monoatomic gas are expanded according to the equation pT = constant from its initial state (p_0, V_0) to the final state due to which its pressure becomes half of the initial pressure. The change in internal energy is



(a) $\frac{3p_0V_0}{4}$ (b) $\frac{3p_0V_0}{2}$

(c) $\frac{9p_0V_0}{2}$ (d) $\frac{5p_0V_0}{2}$

27. The state of an ideal gas is changed through an isothermal process at temperature T_0 as shown in figure. The work done by the gas in going from state B to C is double the work done by gas in going from state A to B. If the pressure in the state B is $\frac{p_0}{2}$, then the pressure of the gas in state C is



a) $\frac{p_0}{3}$ (b) $\frac{p_0}{4}$

(c) $\frac{p_0}{6}$ (d) $\frac{p_0}{8}$

More than One Correct Options

1. An ideal gas is taken from the state A (pressure p, volume V) to the state B (pressure $\frac{p}{2}$, volume $2V$) along a straight line path in the p-V diagram. Select the correct statement(s) from the following.

(a) The work done by the gas in the process A to B is negative
(b) In the T-V diagram, the path AB becomes a part of a parabola
(c) In the p-T diagram, the path AB becomes a part of a hyperbola
(d) In going from A to B, the temperature T of the gas first increases to a maximum value and then decreases

2. In the process pV^2 = constant, if temperature of gas is increased, then

(a) change in internal energy of gas is positive
(b) work done by gas is positive
(c) heat is given to the gas
(d) heat is taken out from the gas

3. T-V diagram of two moles of a monoatomic gas is as shown in figure.

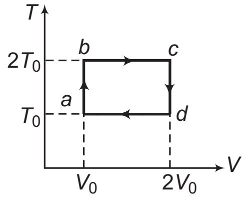
For the process *abcda* choose the correct options given below

(a) $\Delta U = 0$

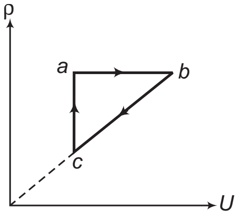
(b) work done by gas > 0

(c) heat given to the gas is $4RT_0$

(d) heat given to the gas is $2RT_0$



4. Density (ρ) *versus* internal energy (U) graph of a gas is as shown in figure. Choose the correct options.



(a) $Q_{bc} = 0$ (b) $W_{bc} = 0$ (c) $W_{ca} < 0$ (d) $Q_{ab} > 0$

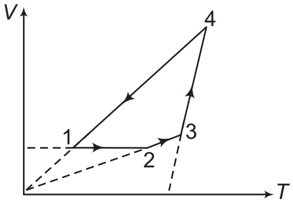
Here, W is work done by gas and Q is heat given to the gas.

5. Temperature of a monatomic gas is increased from T_0 to $2T_0$ in three different processes : isochoric, isobaric and adiabatic. Heat given to the gas in these three processes are Q_1, Q_2 and Q_3 respectively. Then, choose the correct option.

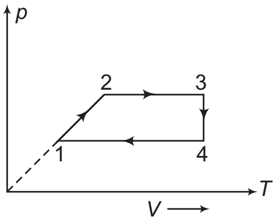
(a) $Q_1 > Q_3$ (b) $Q_2 > Q_1$

(c) $Q_2 > Q_3$ (d) $Q_3 = 0$

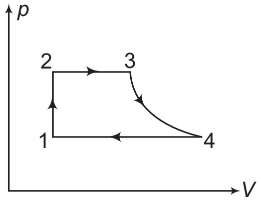
6. A cyclic process 1-2-3-4-1 is depicted on V-T diagram. The p-T and p-V diagrams for this cyclic process are given below. Select the correct choices (more than one options is/are correct)



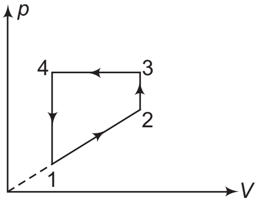
(a)



(b)



(c)

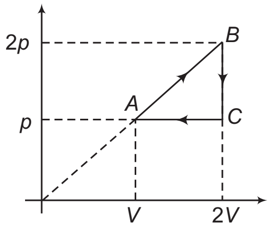


(d) None of these

Comprehension Based Questions

Passage I (Q. No. 1 and 2)

One mole of a monatomic ideal gas is taken along the cycle ABCA as shown in the diagram.



1. The net heat absorbed by the gas in the given cycle is

(a) pV (b) $\frac{pV}{2}$

(c) $2pV$ (d) $4pV$

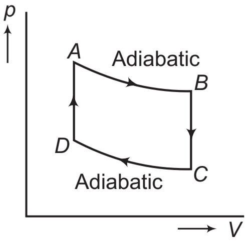
2. The ratio of specific heat in the process CA to the specific heat in the process BC is

(a) 2 (b) $\frac{5}{3}$

(c) 4 (d) None of these

Passage II (Q. No. 3 to 5)

One mole of a monatomic ideal gas is taken through the cycle ABCDA as shown in the figure. $T_A = 1000\,K$ *and* $2p_A = 3p_B = 6p_C$.



$$\left[Assume \left(\frac{2}{3}\right)^{0.4} = 0.85 \text{ and } R = \frac{25}{3} JK^{-1}\, mol^{-1} \right]$$

3. The temperature at B is

(a) 350 K (b) 1175 K

(c) 850 K (d) 577 K

4. Work done by the gas in the process $A \to B$ is

(a) 5312 J (b) 1875 J

(c) 6251 J (d) 8854 J

5. Heat lost by the gas in the process $B \to C$ is

(a) 5312 J (b) 1875 J

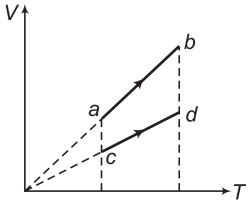
(c) 6251 J (d) 8854 J

Match the Columns

1. Temperature of 2 moles of a monatomic gas is increased from T to $2T$. Match the following two columns.

Column I	Column II
(a) Work done by gas in isobaric process	(p) $3RT$
(b) Change in internal energy in isobaric process	(q) $4RT$
(c) Work done by gas in adiabatic process	(r) $2RT$
(d) Change in internal energy in an adiabatic process	(s) None of these

2. For V-T diagrams of two processes a - b and c - d are shown in figure for same gas. Match the following two columns.



Column I	Column II
(a) Work done	(p) is more in process ab
(b) Change in internal energy	(q) is more in process ca
(c) Heat exchange	(r) is same in both processes
(d) Molar heat capacity	(s) Can't say anything

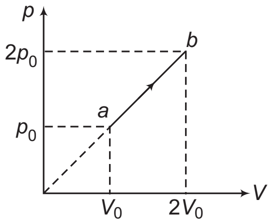
3. Temperature of a monatomic gas is increased by ΔT in process p^2V = constant. Match the following two columns.

Column I	Column II
(a) Work done by gas	(p) $2nR\Delta T$
(b) Change in internal energy of gas	(q) $5nR\Delta T$
(c) Heat taken by the gas	(r) $3nR\Delta T$
(d) Work done on the gas	(s) None of these

4. Match the following two columns.

Column I	Column II
(a) Isobaric expansion	(p) $W > \Delta U$
(b) Isochoric cooling	(q) $W < \Delta U$
(c) Adiabatic expansion	(r) $Q = \Delta U$
(d) Isothermal expansion	(s) $Q < \Delta U$

5. Heat taken by a gas in process a-b is $6p_0V_0$. Match the following columns.

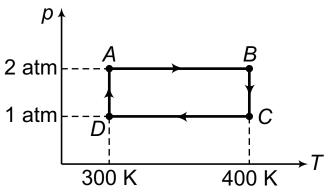


Column I	Column II
(a) W_{ab}	(p) $2p_0V_0$
(b) ΔU_{ab}	(q) $4p_0V_0$
(c) Molar heat capacity in given process	(r) $2R$
(d) C_V of gas	(s) None of these

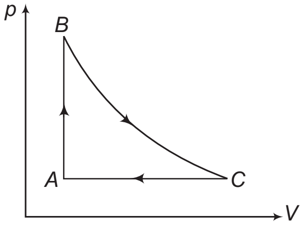
Subjective Questions

1. Two moles of helium gas undergo a cyclic process as shown in figure. Assuming the gas to be ideal, calculate the following quantities in this process.

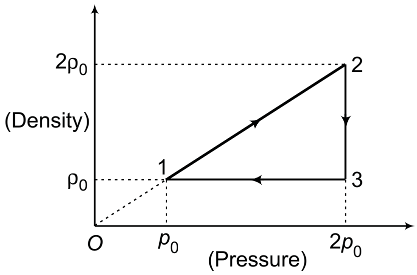
(a) The net change in the heat energy.
(b) The net work done.
(c) The net change in internal energy.



2. 1.0 k-mol of a sample of helium gas is put through the cycle of operations shown in figure. BC is an isothermal process and $p_A = 1.00$ atm, $V_A = 22.4$ m^3, $p_B = 2.00$ atm. What are T_A, T_B and V_C?



3. The density (ρ) *versus* pressure (p) graph of one mole of an ideal monoatomic gas undergoing a cyclic process is shown in figure. Molecular mass of gas is M.



(a) Find work done in each process.
(b) Find heat rejected by gas in one complete cycle.
(c) Find the efficiency of the cycle.

4. An ideal gas goes through the cycle *abc*. For the complete cycle 800 J of heat flows out of the gas. Process *ab* is at constant pressure and process *bc* is at constant volume . In process *c-a*, $p \propto V$. States *a* and *b* have temperatures $T_a = 200\,\text{K}$ and $T_b = 300\,\text{K}$. (a) Sketch the p-V diagram for the cycle. (b) What is the work done by the gas for the process *ca*?

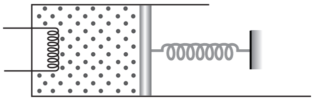
5. A cylinder of ideal gas is closed by an 8 kg movable piston of area $60\ \text{cm}^2$. The atmospheric pressure is 100 kPa. When the gas is heated from 30° C to 100° C, the piston rises 20 cm. The piston is then fastened in the place and the gas is cooled back to 30° C. If ΔQ_1 is the heat added to the gas during heating and ΔQ_2 is the heat lost during cooling, find the difference.

6. Three moles of an ideal gas $\left(C_p = \frac{7}{2} R\right)$ at pressure p_0 and temperature T_0 is isothermally expanded to twice its initial volume. It is then compressed at a constant pressure to its original volume.

(a) Sketch p-V and p-T diagram for complete process.
(b) Calculate net work done by the gas.
(c) Calculate net heat supplied to the gas during complete process.
(Write your answer in terms of gas constant = R)

7. Two moles of a gas ($\gamma = 5/3$) are initially at temperature 27°C and occupy a volume of 20 litres. The gas is first expanded at constant pressure until the volume is doubled. Then, it is subjected to an adiabatic change until the temperature returns to its initial value.

(a) Sketch the process on a p-V diagram.
(b) What are final volume and pressure of the gas?
(c) What is the work done by the gas?



8. An ideal monoatomic gas is confined by a spring loaded massless piston of cross-section $8.0 \times 10^{-3}\ \text{m}^2$. Initially, the gas is at 300 K and occupies a volume of $2.4 \times 10^{-3}\ \text{m}^3$ and the spring is in its relaxed state. The gas is heated by an electric heater until the piston moves out slowly without friction by 0.1 m. Calculate

(a) the final temperature of the gas and
(b) the heat supplied by the heater.
The force constant of the spring is 8000 N/m, atmospheric pressure is $1.0 \times 10^5\ \text{N/m}^2$. The cylinder and the piston are thermally insulated.

9. An ideal diatomic gas $\left(\gamma = \frac{7}{5}\right)$ undergoes a process in which its internal energy relates to the volume as $U = \alpha\sqrt{V}$, where α is a constant.

(a) Find the work performed by the gas to increase its internal energy by 100 J.
(b) Find the molar specific heat of the gas.

10. For an ideal gas the molar heat capacity varies as $C = C_V + 3aT^2$. Find the equation of the process in the variables (T, V) where a is a constant.

11. One mole of an ideal monatomic gas undergoes the process $p = \alpha T^{1/2}$, where α is a constant.

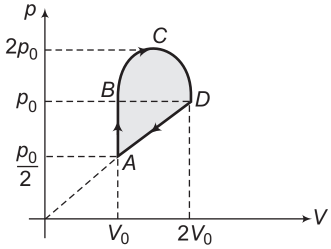
(a) Find the work done by the gas if its temperature increases by 50 K.
(b) Also, find the molar specific heat of the gas.

12. One mole of a gas is put under a weightless piston of a vertical cylinder at temperature T. The space over the piston opens into atmosphere. Initially, piston was in equilibrium. How much work should be performed by some external force to increase isothermally the volume under the piston to twice the volume? (Neglect friction of piston).

13. An ideal monatomic gas undergoes a process where its pressure is inversely proportional to its temperature.
(a) Calculate the molar specific heat for the process.
(b) Find the work done by two moles of gas if the temperature changes from T_1 to T_2.

14. The volume of one mole of an ideal gas with the adiabatic exponent γ is changed according to the relation $V = \frac{a}{T}$, where a is a constant. Find the amount of heat absorbed by the gas in the process, if the temperature is increased by ΔT.

15. Two moles of a monatomic ideal gas undergo a cyclic process *ABCDA* as shown in figure. *BCD* is a semicircle. Find the efficiency of the cycle.



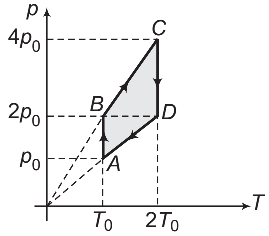
16. Pressure p, volume V and temperature T for a certain gas are related by

$$p = \frac{\alpha T - \beta T^2}{V}$$

where, α and β are constants. Find the work done by the gas if the temperature changes from T_1 to T_2 while the pressure remains the constant.

17. An ideal gas has a specific heat at constant pressure $C_p = \frac{5R}{2}$. The gas is kept in a closed vessel of volume V_0 at temperature T_0 and pressure p_0. An amount of 10 p_0V_0 of heat is supplied to the gas.
(a) Calculate the final pressure and temperature of the gas.
(b) Show the process on p-V diagram.

18. Pressure *versus* temperature (p-T) graph of n moles of an ideal gas is shown in figure. Plot the corresponding:
(a) density *versus* volume (ρ-V) graph,
(b) pressure *versus* volume (p-V) graph and
(c) density *versus* pressure (ρ-p) graph.



19. Three moles of an ideal gas being initially at a temperature $T_i = 273$ K were isothermally expanded 5 times its initial volume and then isochorically heated so that the pressure in the final state becomes equal to that in the initial state. The total heat supplied in the process is 80 kJ. Find $\gamma \left(= \frac{C_p}{C_V} \right)$ of the gas.

Answers

Introductory Exercise 21.1

1. $a = 80$ J, $b = 0$, $c = 50$ J, $d = 40$ J, $e = 40$ J, $f = 40$ J, $g = 40$ J **2.** 327 J

Introductory Exercise 21.2

1. (a) -6.8×10^4 J (b) 1.78×10^5 J, out of gas (c) No

2. (a) Positive (b) Into the system (c) In loop 1, into the system, In loop 2, out of the system

Calorimetary and Heat Transfer

Chapter Contents

22.1 Calorimetry
22.2 Heat Transfer

22.1 Calorimetry

Heat transfer between two substances, due to a temperature difference (may be in same or different states) comes under the topic calorimetry. Let us discuss this topic pointwise.

Specific Heat (c)

The amount of heat required to raise the temperature of unit mass of a substance by 1°C (or 1 K) is called its specific heat. Thus,

$$\boxed{c = \frac{Q}{m\Delta\theta} \quad \text{or} \quad \frac{Q}{m\Delta T}} \qquad \text{...(i)}$$

The SI unit of specific heat is J/kg-K. Because heat is so frequently measured in calories, the unit cal/g-°C is also used quite often.

Heat Required to Change The Temperature

From Eq. (i), we can write

$$\boxed{Q = mc\Delta\theta \quad \text{or} \quad mc\Delta T} \qquad \text{...(ii)}$$

Thus Eq. (ii) is used when temperature of a substance changes without change in state.

Note *(i) In general c is a function of temperature. But normally variation in c is small. So, it is assumed to be constant for wide range of temperature. For example*

"Specific heat of water is 1 cal/g-°C between 14.5 °C to 15.5 °C". This implies that 1 cal of heat will be required to raise the temperature of 1 g of water from 14.5 °C to 15.5 °C. From 15.5 °C to 16.5 °C, a different amount of heat (≠ 1 cal) will be required. But normally this variation is very small. So, it is assumed constant (= 1 cal/g-°C) from `0 °C to 100 °C.

(ii) If c is given a function of temperature, then Eq. (ii) cannot be applied directly for calculation of Q. Rather integration will be used. Thus,

$$\boxed{Q = m\int_{T_i}^{T_f} c\,dT \quad \text{or} \quad m\int_{\theta_i}^{\theta_f} c\,d\theta} \qquad \text{...(iii)}$$

In the above expression, c is a function of T (or θ).

(iii) The specific heat of water is much larger than that of most other substances. Consequently, for the same amount of added heat, the temperature change of a given mass of water is generally less than that for the same mass of another substance. For this reason a large body of water moderates the climate of nearby land. In the winter, the water cools off more slowly than the surrounding land and tends to warm the land. In the summer, the opposite effect occurs as the water heats up more slowly than the land.

(iv) Specific heat is also represented by s or S. So, in different problems we have taken all notations for it.

Latent Heat (L)

The amount of heat required to change the state (or phase) of unit mass of a substance at constant temperature is called latent heat L. Thus,

$$\boxed{L = \frac{Q}{m}} \qquad \text{...(iv)}$$

For a solid-liquid transition, the latent heat is known as the **latent heat of fusion (L_f)** and for the liquid-gas transition, it is known as the **latent heat of vaporization (L_v).**

For water at 1 atmosphere, latent heat of fusion is 80.0 cal/g. This simply means 80.0 cal of heat are required to melt 1.0 g of water or 80.0 cal heat is liberated when 1.0 g of water freezes at 0°C. Similarly, latent heat of vaporization for water at 1 atmosphere is 539 cal/g.

Heat Required to Change the State (or Phase) at Constant Temperature

From Eq. (iv), we can see that

$$\boxed{Q = mL} \qquad \ldots\text{(v)}$$

So, this is the heat required to change the state (or phase) at constant temperature.

Extra Points to Remember

- In some problems, two or more than two substances at different temperatures are mixed. Heat is given by the hot bodies and taken by the cold bodies. Finally, all substances reach to a common equilibrium temperature. All such problems can be solved by a single equation,

  Heat given by hot bodies = Heat taken by cold bodies

  But note that, on both sides of this equation, we have to take the positive signs. To make them positive, always write

  $$\Delta\theta = \theta_{\text{Higher}} - \theta_{\text{Lower}}$$

  in the equation $Q = mc\Delta\theta$ when there is a change of temperature without change in state.
- **Water equivalent of a container** Normally, a liquid is heated in a container. So, some heat is wasted in heating the container also. Suppose water equivalent of a container is 10 g, then it implies that heat required to increase the temperature of this container is equal to heat required to increase the temperature of 10 g of water.

Example 22.1 *How much heat is required to convert 8.0 g of ice at – 15°C to steam at 100°C? (Given,* $c_{ice} = 0.53\ cal/g\text{-}°C$, $L_f = 80\ cal/g$ *and* $L_v = 539\ cal/g$, *and* $c_{water} = 1\ cal/g\text{-}°C$*)*

Solution

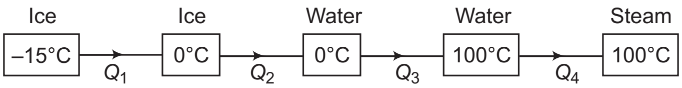

Fig. 22.1

$$Q_1 = mc_{\text{ice}}\,(T_f - T_i)$$
$$= (8.0)(0.53)[0 - (-15)] = 63.6\,\text{cal}$$
$$Q_2 = mL_f = (8)(80) = 640\,\text{cal}$$
$$Q_3 = mc_{\text{water}}\,(T_f - T_i)$$
$$= (8.0)(1.0)[100 - 0] = 800\,\text{cal}$$
$$Q_4 = mL_v = (8.0)(539) = 4312\,\text{cal}$$

∴ Net heat required,

$$Q = Q_1 + Q_2 + Q_3 + Q_4$$
$$= 5815.6\ \text{cal}$$

Ans.

Example 22.2 *In the above problem if heat is supplied at a constant rate of $q = 10$ cal/min, then plot temperature versus time graph.*

Solution

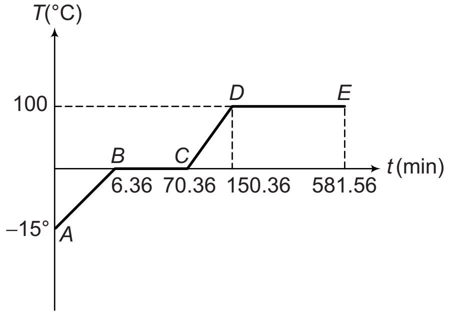

Fig. 22.2

From *A* to *B*

(i) Temperature of ice will increase from –15° C to 0°C.

(ii)
$$t_{AB} = \frac{\text{Total heat required}}{\text{Heat supplied per minute}} = \frac{Q_1}{q}$$
$$= \frac{63.6}{10} = 6.36 \text{ min}$$

(iii) Between *A* and *B* we will get only ice.

From *B* to *C*

(i) Temperature of (ice + water) mixture will remain constant at 0°C.

(ii)
$$t_{BC} = \frac{Q_2}{q} = \frac{640}{10} = 64 \text{ min}$$

$$\therefore \quad t_{\text{Total}} = t_{AB} + t_{BC} = 70.36 \text{ min}$$

(iii) Between *B* and *C* we will get both ice and water.

From *C* to *D*

(i) Temperature of water increases from 0°C to 100°C

(ii)
$$t_{CD} = \frac{Q_3}{q} = \frac{800}{10} = 80 \text{ min}$$

$$\therefore \quad t_{\text{Total}} = t_{AB} + t_{BC} + t_{CD} = 150.36 \text{ min}$$

(iii) Between *C* and *D* we will get only water.

From *D* to *E*

(i) Temperature of (water + steam) mixture will remain constant at 100°C.

(ii)
$$t_{DE} = \frac{Q_4}{q} = \frac{4312}{10} = 431.2 \text{ min}$$

$$\therefore \quad t_{\text{Total}} = t_{AB} + t_{BC} + t_{CD} + t_{DE} = 581.56 \text{ min}$$

(iii) Between *D* and *A* we will get both water and steam.

The corresponding graph is as shown in Fig. 22.2.

Exercise AB and CD correspond to temperature change without change in state. BC and DE correspond to state change without change in temperature.

In the given condition, prove that AB and CD are straight lines and slope of these lines is inversely proportional to specific heat in that state. Further, prove that lengths of lines BC and DE are proportional to latent heat in that state.

Example 22.3 *10 g of water at 70°C is mixed with 5 g of water at 30°C. Find the temperature of the mixture in equilibrium. Specific heat of water is 1 cal/g-°C*

Solution Let $t°$ C be the temperature of the mixture. From energy conservation,

$$\text{Heat given by 10 g of water} = \text{Heat taken by 5 g of water}$$

or $$m_1 c_{\text{water}} |\Delta t_1| = m_2 c_{\text{water}} |\Delta t_2|$$

$\therefore$ $$(10)(1)(70 - t) = 5(1)(t - 30)$$

$\therefore$ $$t = 56.67° \text{ C}$$ **Ans.**

Example 22.4 *The temperature of equal masses of three different liquids A, B and C are 12°C, 19°C and 28°C respectively. The temperature when A and B are mixed is 16°C and when B and C are mixed it is 23°C. What should be the temperature when A and C are mixed?*

Solution Let m be the mass of each liquid and s_A, s_B, s_C specific heats of liquids A, B and C respectively. When A and B are mixed. The final temperature is 16° C.

$\therefore$ $$\text{Heat gained by } A = \text{Heat lost by } B$$

i.e. $$ms_A(16 - 12) = ms_B(19 - 16)$$

i.e. $$s_B = \frac{4}{3} s_A \qquad \text{...(i)}$$

When B and C are mixed.

$$\text{Heat gained by } B = \text{Heat lost by } C$$

i.e. $$ms_B(23 - 19) = ms_C(28 - 23)$$

i.e. $$s_C = \frac{4}{5} s_B \qquad \text{...(ii)}$$

From Eqs. (i) and (ii), $$S_C = \frac{4}{5} \times \frac{4}{3} S_A = \frac{16}{15} S_A$$

When A and C are mixed, let the final temperature be θ

$$\text{Heat gained by } A = \text{Heat lost by } C$$

$\therefore$ $$ms_A(\theta - 12) = ms_C(28 - \theta)$$

i.e. $$\theta - 12 = \frac{16}{15}(28 - \theta)$$

By solving, we get

$$\theta = \frac{628}{31} = 20.26°\text{C}$$ **Ans.**

Example 22.5 *In a container of negligible mass 30 g of steam at 100°C is added to 200 g of water that has a temperature of 40°C. If no heat is lost to the surroundings, what is the final temperature of the system? Also find masses of water and steam in equilibrium. Take* $L_v = 539$ *cal/g and* $c_{water} = 1$ *cal/g-° C.*

Solution Let Q be the heat required to convert 200 g of water at 40°C into 100°C, then

$$Q = mc\Delta T = (200)(1.0)(100 - 40) = 12000 \text{ cal}$$

Now, suppose m_0 mass of steam converts into water to liberate this much amount of heat, then

$$m_0 = \frac{Q}{L} = \frac{12000}{539} = 22.26 \text{ g}$$

Since, it is less than 30 g, the temperature of the mixture is 100°C. **Ans.**

Mass of steam in the mixture = 30 – 22.26 = 7.74 g **Ans.**

and mass of water in the mixture = 200 + 22.26 = 222.26 g **Ans.**

Example 22.6 *In an insulated vessel,* 0.05 *kg steam at* 373 *K and* 0.45 *kg of ice at* 253 *K are mixed. Find the final temperature of the mixture (in kelvin).*

Given, $L_{fusion} = 80 \text{ cal/g} = 336 \text{ J/g}$

$L_{vaporization} = 540 \text{ cal/g} = 2268 \text{ J/g}$

$s_{ice} = 2100 \text{ J/kg-K} = 0.5 \text{ cal/g-K}$

and $s_{water} = 4200 \text{ J/kg-K} = 1 \text{ cal/g-K}$ **(JEE 2006)**

Solution

$$0.05 \text{ kg steam at } 373 \text{ K} \xrightarrow{Q_1} 0.05 \text{ kg water at } 373 \text{ K}$$

$$0.05 \text{ kg water at } 373 \text{ K} \xrightarrow{Q_2} 0.05 \text{ kg water at } 273 \text{ K}$$

$$0.45 \text{ kg ice at } 253 \text{ K} \xrightarrow{Q_3} 0.45 \text{ kg ice at } 273 \text{ K}$$

$$0.45 \text{ kg ice at } 273 \text{ K} \xrightarrow{Q_4} 0.45 \text{ kg water at } 273 \text{ K}$$

$$Q_1 = (50)(540) = 27{,}000 \text{ cal} = 27 \text{ kcal}$$

$$Q_2 = (50)(1)(100) = 5000 \text{ cal} = 5 \text{ kcal}$$

$$Q_3 = (450)(0.5)(20) = 4500 \text{ cal} = 4.5 \text{ kcal}$$

$$Q_4 = (450)(80) = 36000 \text{ cal} = 36 \text{ kcal}$$

Now, since $Q_1 + Q_2 > Q_3$ but $Q_1 + Q_2 < Q_3 + Q_4$ ice will come to 273 K from 253 K, but whole ice will not melt. Therefore, temperature of the mixture is 273 K.

Example 22.7 *An ice cube of mass* 0.1 *kg at* 0°C *is placed in an isolated container which is at* 227°C. *The specific heat s of the container varies with temperature T according to the empirical relation* $s = A + BT$, *where* $A = 100$ *cal/kg-K and* $B = 2 \times 10^{-2}$ *cal/kg-K*^{2}. *If the final temperature of the container is* 27°C, *determine the mass of the container.*

(Latent heat of fusion for water $= 8 \times 10^4$ *cal/kg, specific heat of water* $= 10^3$ *cal/kg-K).* **(JEE 2001)**

Solution Let m be the mass of the container.

Initial temperature of container,

$$T_i = (227 + 273) = 500 \text{ K}$$

and final temperature of container,

$$T_f = (27 + 273) = 300 \text{ K}$$

Now, heat gained by the ice cube = heat lost by the container

$$\therefore \qquad (0.1)(8 \times 10^4) + (0.1)(10^3)(27) = -m \int_{500}^{300} (A + BT)\, dT$$

or

$$10700 = -m \left[AT + \frac{BT^2}{2} \right]_{500}^{300}$$

After substituting the values of A and B and the proper limits, we get

$$m = 0.495 \text{ kg}$$ **Ans.**

INTRODUCTORY EXERCISE 22.1

(Take $c_{\text{ice}} = 0.53$ cal/g-°C, $c_{\text{water}} = 1.0$ cal/g-°C, $(L_f)_{\text{water}} = 80$ cal/g and $(L_v)_{\text{water}} = 529$ cal/g unless given in the question.)

1. 10 g ice at 0°C is converted into steam at 100°C. Find total heat required. ($L_f = 80$ cal/g, $S_w = 1$ cal/g-°C, $L_v = 540$ cal/g)
2. Three liquids A, B and C of specific heats 1 cal/g -°C, 0.5 cal/g -°C and 0.25 cal/g -°C are at temperatures 20 °C, 40 °C and 60 °C respectively. Find temperature in equilibrium if they are mixed together. Their masses are equal.
3. Equal masses of ice (at 0°C) and water are in contact. Find the temperature of water needed to just melt the complete ice.
4. A lead bullet just melts when stopped by an obstacle. Assuming that 25 per cent of the heat is absorbed by the obstacle, find the velocity of the bullet if its initial temperature is 27°C. (Melting point of lead = 327°C, specific heat of lead = 0.03 cal/g-°C, latent heat of fusion of lead = 6 cal/g, $J = 4.2$ J/cal). **(JEE 1981)**
5. The temperature of 100 g of water is to be raised from 24°C to 90°C by adding steam to it. Calculate the mass of the steam required for this purpose. **(JEE 1996)**
6. 15 g ice at 0°C is mixed with 10 g water at 40°C. Find the temperature of mixture. Also, find mass of water and ice in the mixture.
7. Three liquids P, Q and R are given 4 kg of P at 60 °C and 1 kg of R at 50 °C when mixed produce a resultant temperature 55 °C. A mixture of 1 kg of P at 60 °C and 1 kg of Q at 50 °C shows a temperature of 55 °C. What will be the resulting temperature when 1 kg of Q at 60 °C is mixed with 1 kg of R at 50 °C?

22.2 Heat Transfer

Heat can be transferred from one place to the other by any of three possible ways : **conduction, convection** and **radiation.** In the first two processes, a medium is necessary for the heat transfer. Radiation, however, does no have this restriction. This is also the fastest mode of heat transfer, in which heat is transferred from one place to the other in the form of electromagnetic radiation.

Conduction

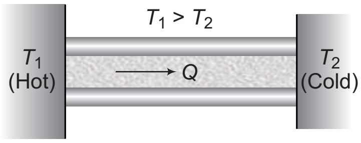

Fig. 22.3

Figure shows a rod whose ends are in thermal contact with a hot reservoir at temperature T_1 and a cold reservoir at temperature T_2. The sides of the rod are covered with insulating medium, so the transport of heat is along the rod, not through the sides. The molecules at the hot reservoir have greater vibrational energy. This energy is transferred by collisions to the atoms at the end face of the rod. These atoms in turn transfer energy to their neighbours further along the rod. Such transfer of heat through a substance in which heat is transported without direct mass transport is called conduction.

Most metals use another, more effective mechanism to conduct heat. The free electrons, which move throughout the metal can rapidly carry energy from the hotter to cooler regions, so metals are generally good conductors of heat. The presence of 'free' electrons also causes most metals to be good electrical conductors. A metal rod at 5°C feels colder than a piece of wood at 5°C because heat can flow more easily from your hand into the metal.

Heat transfer occurs only between regions that are at different temperatures, and the rate of heat flow is $\frac{dQ}{dt}$. This rate is also called the **heat current**, denoted by H. Experiments show that the heat current is proportional to the cross-section area A of the rod and to the temperature gradient $\frac{dT}{dx}$, which is the rate of change of temperature with distance along the bar. In general,

$$\boxed{H = \frac{dQ}{dt} = -KA\frac{dT}{dx}} \qquad \ldots\text{(i)}$$

The negative sign is used to make $\frac{dQ}{dt}$ a positive quantity since $\frac{dT}{dx}$ is negative. The constant K, called the **thermal conductivity** is a measure of the ability of a material to conduct heat. A substance with a large thermal conductivity k is a good heat conductor. The value of k depends on the temperature, increasing slightly with increasing temperature, but K can be taken to be practically constant throughout a substance if the temperature difference between its ends is not too great. Let us apply Eq. (i) to a rod of length l and constant cross-sectional area A in which a steady state has been reached. In a steady state, the temperature at each point is constant in time. Hence,

$$-\frac{dT}{dx} = T_1 - T_2$$

Therefore, the heat ΔQ transferred in time Δt is

$$\boxed{\Delta Q = KA\left(\frac{T_1 - T_2}{l}\right)\Delta t} \qquad \ldots\text{(ii)}$$

Thermal Resistance (*R*)

Eq. (ii) in differential form can be written as

$$\boxed{\frac{dQ}{dt} = H = \frac{\Delta T}{l/KA} = \frac{\Delta T}{R}} \qquad \ldots\text{(iii)}$$

Here, ΔT = temperature difference (TD) and $R = \frac{l}{KA}$ = thermal resistance of the rod.

Extra Points to Remember

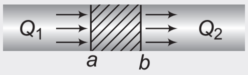

Fig. 22.4

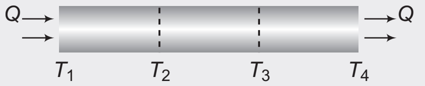
- Consider a section *ab* of a rod as shown in figure. Suppose Q_1 heat enters into the section at '*a*' and Q_2 leaves at '*b*', then $Q_2 < Q_1$. Part of the energy $Q_1 - Q_2$ is utilized in raising the temperature of section *ab* and the remaining is lost to atmosphere through *ab*. If heat is continuously supplied from the left end of the rod, a stage comes when temperature of the section becomes constant. In that case, $Q_1 = Q_2$ if rod is insulated from the surroundings (or loss through *ab* is zero). This is called the **steady state** condition. Thus, in steady state temperature of different sections of the rod becomes constant (but not same).

  Hence, in the figure :



Insulated rod in steady state

Fig. 22.5

$$T_1 = \text{constant},\ T_2 = \text{constant etc. and } T_1 > T_2 > T_3 > T_4$$

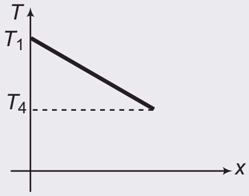


Fig. 22.6

Now, a natural question arises, why the temperature of whole rod not becomes equal when heat is being continuously supplied? The answer is : there must be a temperature difference in the rod for the heat flow, same as we require a potential difference across a resistance for the current flow through it.

In steady state, the temperature varies linearly with distance along the rod if it is insulated.

- Comparing equation number (iii), i.e. heat current

$$H = \frac{dQ}{dt} = \frac{\Delta T}{R} \qquad \left(\text{where, } R = \frac{l}{KA}\right)$$

with the equation, of current flow through a resistance,

$$i = \frac{dq}{dt} = \frac{\Delta V}{R} \qquad \left(\text{where, } R = \frac{l}{\sigma A}\right)$$

We find the following similarities in heat flow through a rod and current flow through a resistance.

Table 22.1

S.No	Heat flow through a conducting rod	Current flow through a resistance
1.	Conducting rod	Electrical resistance
2.	Heat flows	Charge flows
3.	TD is required	PD is required
4.	Heat current $H = \frac{dQ}{dt}$ = rate of heat flow	Electric current $i = \frac{dq}{dt}$ = rate of charge flow
5.	$H = \frac{\Delta T}{R} = \frac{\text{TD}}{R}$	$i = \frac{\Delta V}{R} = \frac{\text{PD}}{R}$
6.	$R = \frac{l}{KA}$	$R = \frac{l}{\sigma A}$
7.	K = thermal conductivity	σ = electrical conductivity

From the above table it is evident that flow of heat through rods in series and parallel is analogous to the flow of current through resistance in series and parallel. This analogy is of great importance in solving complicated problems of heat conduction.

Convection

Although conduction does occur in liquids and gases also, heat is transported in these media mostly by convection. In this process, the actual motion of the material is responsible for the heat transfer. Familiar examples include hot-air and hot-water home heating systems, the cooling system of an automobile engine and the flow of blood in the body.

You probably have warmed your hands by holding them over an open flame. In this situation, the air directly above the flame is heated and expands. As a result, the density of this air decreases and then air rises. When the movement results from differences in density, as with air around fire, it is referred to as **natural convection.** Air flow at a beach is an example of natural convection. When the heated substance is forced to move by a fan or pump, the process is called **forced convection.** If it were not for convection currents, it would be very difficult to boil water. As water is heated in a kettle, the heated water expands and rises to the top because its density is lowered. At the same time, the denser, cool water at the surface sinks to the bottom of the kettle and is heated. Heating a room by a radiator is an example of forced convection.

Radiation

The third means of energy transfer is radiation which does not require a medium. The best known example of this process is the radiation from sun. All objects radiate energy continuously in the form of electromagnetic waves.

Now, let us define few terms before studying the other topics.

Radiant Energy

All bodies radiate energy in the form of electromagnetic waves by virtue of their temperature. This energy is called the radiant energy.

Absorptive Power '*a*'

"It is defined as the ratio of the radiant energy absorbed by it in a given time to the total radiant energy incident on it in the same interval of time."

$$\boxed{a = \frac{\text{energy absorbed}}{\text{energy incident}}}$$

As a perfectly black body absorbs all radiations incident on it, the absorptive power of a perfectly black body is maximum and unity.

Spectral Absorptive Power 'a_λ'

The absorptive power '*a*' refers to radiations of all wavelengths (or the total energy) while the spectral absorptive power is the ratio of radiant energy absorbed by a surface to the radiant energy incident on it for a particular wavelength λ. It may have different values for different wavelengths for a given surface. Let us take an example, suppose $a = 0.6$, $a_\lambda = 0.4$ for 1000 Å and $a_\lambda = 0.7$ for 2000 Å for a given surface. Then, it means that this surface will absorb only 60% of the total radiant energy incident on it. Similarly, it absorbs 40% of the energy incident on it corresponding to 1000 Å and 70% corresponding to 2000 Å. The spectral absorptive power a_λ is related to absorptive power *a* through the relation

$$\boxed{a = \int_0^\infty a_\lambda \, d\lambda}$$

Emissive Power ‘*e*’

(Do not confuse it with the emissivity *e* which is different from it, although both have the same symbol *e*).

“For a given surface it is defined as the radiant energy emitted per second per unit area of the surface.” It has the units of W/m^2 or $J/s\text{-}m^2$. For a black body $e = \sigma T^4$.

Spectral Emissive Power ‘e_λ’

“It is emissive power for a particular wavelength λ.” Thus,

$$\boxed{e = \int_0^\infty e_\lambda \, d\lambda}$$

Stefan’s Law

The rate at which an object radiates energy is proportional to the fourth power of its absolute temperature. This is known as the **Stefan’s law** and is expressed in equation form as

$$\boxed{P = \sigma A e T^4}$$

Here, P is the power in watts (J/s) radiated by the object, A is the surface area in m^2, e is a fraction between 0 and 1 called the **emissivity** of the object and σ is a universal constant called **Stefan’s constant**, which has the value

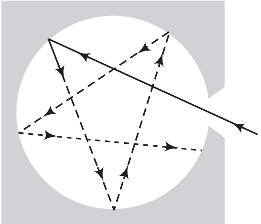
$$\boxed{\sigma = 5.67 \times 10^{-8} \ W/m^2\text{-}K^4}$$

Note *Emissivity e is also sometimes denoted by* e_r.

Perfectly Black Body

A body that absorbs all the radiation incident upon it and has an emissivity equal to 1 is called a perfectly black body. A black body is also an ideal radiator. It implies that if a black body and an identical another body are kept at the same temperature, then the black body will radiate maximum power as is obvious from equation $P = eA\sigma T^4$ also. Because $e = 1$ for a perfectly black body while for any other body $e < 1$.

Materials like black velvet or lamp black come close to being ideal black bodies, but the best practical realization of an ideal black body is a small hole leading into a cavity, as this absorbs 98% of the radiation incident on them.



Cavity approximating an ideal black body. Radiation entering the cavity has little chance of leaving before it is completely absorbed.

Fig. 22.7

Note *(i) Energy radiated by a body per unit area per unit time is called emissive power and given by*

$$\boxed{e = e_r \sigma T^4} \qquad (e_r = \text{emissivity})$$

It has the units of W/m^2 or $J/s\text{-}m^2$.

Energy radiated per unit time is called power and it is called power and it is given by

$$\boxed{P = e_r \sigma T^4 A}$$

It has the unit J/s or watt.

Total energy radiated by the body in time t is

$$\boxed{E = e_r \sigma T^4 A t}$$

(ii) *For a given body, values of e_r and a are same. But their meanings are different. For example if, $e_r = 0.6$ then a is also 0.6.*

Further, $e_r = 0.6$ means if this body and perfectly black body are kept under identical conditions then this body will radiate 60% of the energy radiated by a perfectly black body. But $a = 0.6$ means this body will absorb 60% of the total energy incident on its surface.

(iii) *Absorptive power (a), spectral absorptive power (a_λ) and emissivity (e_r) are the constants which are temperature independent. But emissive power (e) and spectral emissive power (e_λ) are temperature dependent. As,*

$$e = e_r \sigma T^4 \quad \Rightarrow \quad e \propto T^4$$

Kirchhoff's Law

"According to this law the ratio of emissive power to absorptive power is same for all surfaces at the same temperature."

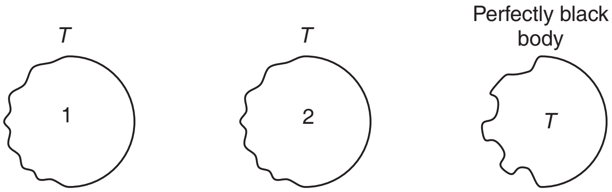


Fig. 22.8

Hence,
$$\frac{e_1}{a_1} = \frac{e_2}{a_2} = \left(\frac{e}{a}\right)_{\text{perfectly black body}}$$

but
$$(a)_{\text{black body}} = 1$$

and
$$(e)_{\text{black body}} = E \quad \text{(say)}$$

Then,
$$\boxed{\left(\frac{e}{a}\right)_{\text{for any surface}} = \text{constant} = E}$$

Similarly, for a particular wavelength λ,

$$\boxed{\left(\frac{e_\lambda}{a_\lambda}\right)_{\text{for any body}} = E_\lambda}$$

Here, E = emissive power of black body at temperature T

$= \sigma T^4$

From the above expression, we can see that

$$\boxed{e_\lambda \propto a_\lambda}$$

i.e. good absorbers for a particular wavelength are also good emitters of the same wavelength.

Note *According to Kirchhoff's law, at a given temperature, the ratio* $\frac{e}{a}$ *is constant for all bodies and this constant is equal to e of perfectly black body at that temperature. Similarly, the ratio* $\frac{e_\lambda}{a_\lambda}$ *is constant for all bodies at given temperature and value of this constant is* e_λ *of perfectly black body at that temperature.*

Cooling by Radiation

Consider a hot body at temperature T placed in an environment at a lower temperature T_0. The body emits more radiation than it absorbs and cools down while the surroundings absorb radiation from the body and warm up. The body is losing energy by emitting radiations at a rate

$$P_1 = eA\sigma T^4$$

and is receiving energy by absorbing radiations at a rate

$$P_2 = aA\sigma T_0^4$$

Here, 'a' is a pure number between 0 and 1 indicating the relative ability of the surface to absorb radiation from its surroundings. Note that this 'a' is different from the absorptive power 'a'. In thermal equilibrium, both the body and the surroundings have the same temperature (say T_c) and,

$$P_1 = P_2 \quad \text{or} \quad eA\sigma T_c^4 = aA\sigma T_c^4 \quad \text{or} \quad e = a$$

Thus, when $T > T_0$, the net rate of heat transfer from the body to the surroundings is

$$\frac{dQ}{dt} = eA\sigma\,(T^4 - T_0^4) \quad \text{or} \quad mc\left(-\frac{dT}{dt}\right) = eA\sigma\,(T^4 - T_0^4)$$

Rate of cooling

$$\boxed{\left(-\frac{dT}{dt}\right) = \frac{eA\sigma}{mc}(T^4 - T_0^4)} \quad \text{or} \quad -\frac{dT}{dt} \propto (T^4 - T_0^4)$$

Newton's Law of Cooling

According to this law, if the temperature T of the body is not very different from that of the surroundings T_0, then rate of cooling $-\frac{dT}{dt}$ is proportional to the temperature difference between them. To prove it, let us assume that

$$T = T_0 + \Delta T$$

So that

$$T^4 = (T_0 + \Delta T)^4 = T_0^4\left(1 + \frac{\Delta T}{T_0}\right)^4$$

$$\approx T_0^4\left(1 + \frac{4\Delta T}{T_0}\right) \qquad \text{(from binomial expansion)}$$

$$\therefore \qquad (T^4 - T_0^4) = 4T_0^3\,(\Delta T)$$

$$\text{or} \qquad (T^4 - T_0^4) \propto \Delta T \qquad (\text{as } T_0 = \text{constant})$$

Now, we have already shown that rate of cooling

$$\left(-\frac{dT}{dt}\right) \propto (T^4 - T_0^4)$$

and here we have shown that

$$(T^4 - T_0^4) \propto \Delta T$$

if the temperature difference is small.

Thus, rate of cooling

$$\boxed{-\frac{dT}{dt} \propto \Delta T} \quad \text{or} \quad \boxed{-\frac{d\theta}{dt} \propto \Delta\theta}$$

as $\qquad dT = d\theta \quad \text{or} \quad \Delta T = \Delta\theta$

Variation of Temperature of a Body According to Newton's Law

Suppose a body has a temperature θ_i at time $t = 0$. It is placed in an atmosphere whose temperature is θ_0. We are interested in finding the temperature of the body at time t. Assuming Newton's law of cooling to hold good or by assuming that the temperature difference is small. As per this law,

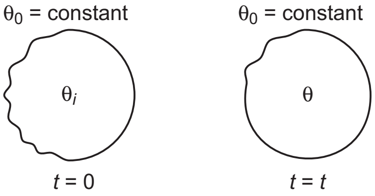

Fig. 22.9

Rate of cooling ∝ temperature difference

or
$$\left(-\frac{d\theta}{dt}\right) = \left(\frac{eA\sigma}{mc}\right)(4\theta_0^3)\,(\theta - \theta_0)$$

or
$$\left(-\frac{d\theta}{dt}\right) = \alpha\,(\theta - \theta_0)$$

Here,
$$\alpha = \left(\frac{4eA\sigma\theta_0^3}{mc}\right) \qquad \text{(is a constant)}$$

∴
$$\int_{\theta_i}^{\theta} \frac{d\theta}{\theta - \theta_0} = -\alpha \int_0^t dt$$

∴
$$\boxed{\theta = \theta_0 + (\theta_i - \theta_0)\,e^{-\alpha t}}$$

From this expression we see that $\theta = \theta_i$ at $t = 0$ and $\theta = \theta_0$ at $t = \infty$, i.e. temperature of the body varies exponentially with time from θ_i to θ_0 $(< \theta_i)$. The temperature *versus* time graph is as shown in Fig.22.10.

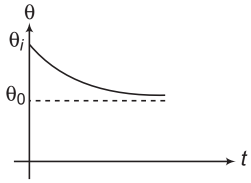

Fig. 22.10

Note *If the body cools by radiation from* θ_1 *to* θ_2 *in time* t, *then taking the approximation*

$$\left(-\frac{d\theta}{dt}\right) = \frac{\theta_1 - \theta_2}{t} \quad \text{and} \quad \theta = \theta_{\text{av}} = \left(\frac{\theta_1 + \theta_2}{2}\right)$$

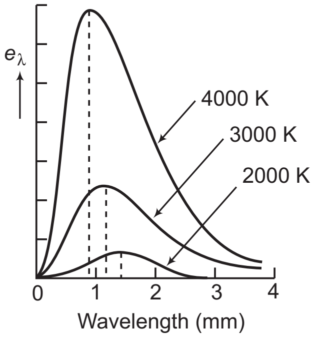
The equation $\left(-\frac{d\theta}{dt}\right) = \alpha\,(\theta - \theta_0)$ *becomes*

$$\boxed{\frac{\theta_1 - \theta_2}{t} = \alpha\left(\frac{\theta_1 + \theta_2}{2} - \theta_0\right)}$$

This form of the law helps in solving numerical problems related to ***Newton's law of cooling****.*

Wien's Displacement Law

At ordinary temperatures (below about 600°C) the thermal radiation emitted by a body is not visible, most of it is concentrated in wavelengths much longer than those of visible light.



Power of black body radiation *versus* wavelength at three temperatures. Note that the amount of radiation emitted (the area under a curve) increase with increasing temperature.

Fig. 22.11

Figure shows how the energy of a black body radiation varies with temperature and wavelength. As the temperature of the black body increases, two distinct behaviors are observed. The first effect is that the peak of the distribution shifts to shorter wavelengths. This shift is found to obey the following relationship called **Wien's displacement law.**

$$\boxed{\lambda_m T = b}$$

Here, b is a constant called Wien's constant. The value of this constant for perfectly black body in SI unit is 2.898×10^{-3} m-K. Thus,

$$\boxed{\lambda_m \propto \frac{1}{T}}$$

Here, λ_m is the wavelength corresponding to the maximum spectral emissive power e_λ.

The second effect is that the total amount of energy the black body emits per unit area per unit time $(=\sigma T^4)$ increases with fourth power of absolute temperature T. This is also known as the emissive power. We know

$$e = \int_0^\infty e_\lambda \, d\lambda = \text{Area under } e_\lambda \text{ - } \lambda \text{ graph} = \sigma T^4$$

or $\boxed{\text{Area} \propto T^4} \Rightarrow A_2 = (2)^4 A_1 = 16A_1$

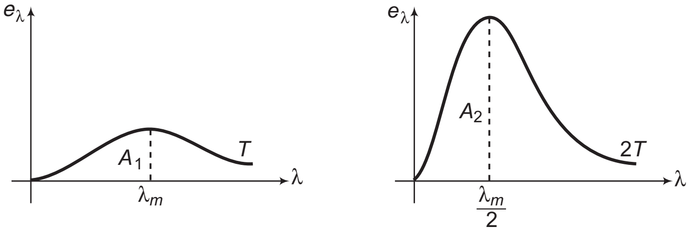


Fig. 22.12

Thus, if the temperature of the black body is made two fold, λ_m remains half while the area becomes 16 times.

Example 22.8 *In which of the following process, convection does not take place primarily?* (JEE 2005)

(a) Sea and land breeze
(b) Boiling of water
(c) Warming of glass of bulb due to filament
(d) Heating air around a furnace

Solution (c) Glass of bulb heats due to filament by radiation.

Example 22.9 *A copper rod 2 m long has a circular cross-section of radius 1 cm. One end is kept at 100°C and the other at 0°C. The surface is insulated so that negligible heat is lost through the surface. In steady state, find*

(a) the thermal resistance of the bar
(b) the thermal current H
(c) the temperature gradient $\frac{dT}{dx}$ *and*
(d) the temperature at a distance 25 cm from the hot end.

Thermal conductivity of copper is 401 W/m-K.

Solution (a) Thermal resistance, $R = \frac{l}{KA} = \frac{l}{K(\pi r^2)}$

or $$R = \frac{(2)}{(401)(\pi)(10^{-2})^2}$$

$$= 15.9\ \text{K/W}$$ **Ans.**

(b) Thermal current, $H = \frac{\Delta T}{R} = \frac{\Delta\theta}{R} = \frac{100}{15.9}$

or $$H = 6.3\ \text{W}$$ **Ans.**

(c) Temperature gradient

$$= \frac{0 - 100}{2} = -50\ \text{K/m}$$

$$= -50°\ \text{C/m}$$ **Ans.**

(d) Let θ be the temperature at 25 cm from the hot end, then

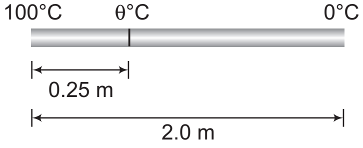

Fig. 22.13

$$(\theta - 100) = (\text{temperature gradient}) \times (\text{distance})$$

or $$\theta - 100 = (-50)(0.25)$$

or $$\theta = 87.5°\ \text{C}$$ **Ans.**

Example 22.10 *Three rods made of the same material and having the same cross-section have been joined as shown in the figure. Each rod is of the same length. The left and right ends are kept at 0°C and 90°C, respectively. The temperature of junction of the three rods will be* **(JEE 2001)**

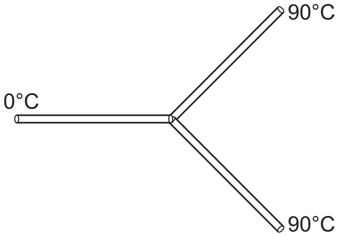

Fig. 22.14

(a) $45^\circ C$ *(b)* $60^\circ C$

(c) $30^\circ C$ *(d)* $20^\circ C$

Solution Let θ be the temperature of the junction (say B). Thermal resistance of all the three rods is equal. Rate of heat flow through AB + Rate of heat flow through CB = Rate of heat flow through BD

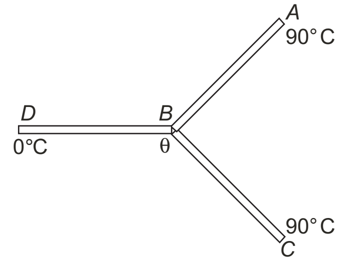

Fig. 22.15

$$\therefore \qquad \frac{90^\circ - \theta}{R} + \frac{90^\circ - \theta}{R} = \frac{\theta - 0}{R}$$

Solving this equation, we get $\theta = 60^\circ \mathrm{C}$

$\therefore$ The correct option is (b).

Here, R = Thermal resistance

Note *Rate of heat flow,* $H = \dfrac{\text{Temperature difference (TD)}}{\text{Thermal resistance } (R)}$

where, $R = \dfrac{l}{KA}$

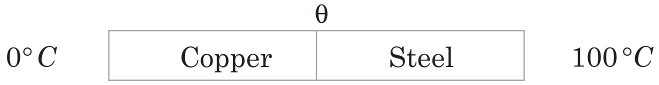
K = Thermal conductivity of the rod.

This is similar to the current flow through a resistance (R) where current (i) = Rate of flow of charge

$$= \frac{\text{Potential difference (PD)}}{\text{Electrical resistance } (R)}$$

Here, $R = \dfrac{l}{\sigma A}$ *where* σ *= Electrical conductivity.*

Example 22.11 *Figure shows a copper rod joined to a steel rod. The rods have equal length and equal cross- sectional area. The free end of the copper rod is kept at* $0^\circ C$ *and that of the steel rod is kept at* $100^\circ C$*. Find the temperature* θ *at the junction of the rods. Conductivity of copper* $= 390\ W/m\text{-}^\circ C$ *and that of steel* $= 46\ W/m\text{-}^\circ C$*.*



Solution $H_{\text{steel}} = H_{\text{copper}}$ (two rods are in series)

$$\therefore \qquad \frac{(\mathrm{TD})_S}{(l/KA)_S} = \frac{(\mathrm{TD})_C}{(l/KA)_C}$$

or $$K_S\ (\mathrm{TD})_S = K_C\ (\mathrm{TD})_C$$

or $$46\,(100 - \theta) = 390\,(\theta - 0)$$

Solving we get, $\theta = 10.6^\circ$ C **Ans.**

Note *In the above problem heat flows from right to left or from higher temperature to lower temperature.*

Example 22.12 *A spherical black body with a radius of 12 cm radiates 450 W power at 500 K. If the radius were halved and the temperature doubled, the power radiated in watt would be* **(JEE 1997)**

(a) 225 *(b)* 450

(c) 900 *(d)* 1800

Solution Power radiated $= e_r \sigma T^4 A$ or Power radiated $\propto$ (surface area) $(T)^4$. The radius is halved, hence, surface area will become $\frac{1}{4}$ times. Temperature is doubled, therefore, T^4 becomes 16 times.

$$\text{New power} = (450)\left(\frac{1}{4}\right)(16) = 1800\,\text{W}.$$

$\therefore$ The correct option is (d).

Example 22.13 *A cylinder of radius R made of a material of thermal conductivity K_1 is surrounded by a cylindrical shell of inner radius R and outer radius 2R made of a material of thermal conductivity K_2. The two ends of the combined system are maintained at two different temperatures. There is no loss of heat across the cylindrical surface and the system is in steady state. The effective thermal conductivity of the system is* **(JEE 1998)**

(a) $K_1 + K_2$ *(b)* $K_1K_2/(K_1 + K_2)$

(c) $(K_1 + 3K_2)/4$ *(d)* $(3K_1 + K_2)/4$

Solution Let R_1 and R_2 be the thermal resistances of inner and outer portions. Since, temperature difference at both ends is same, the resistances are in parallel. Hence,

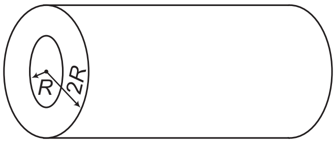


Fig. 22.16

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}$$

$$R = \frac{l}{KA}$$

or
$$\frac{1}{R} = \frac{KA}{l}$$

$$\therefore \quad \frac{K(4\pi R^2)}{l} = \frac{K_1(\pi R^2)}{l} + \frac{K_2(3\pi R^2)}{l}$$

$$\therefore \quad K = \frac{K_1 + 3K_2}{4}$$

$\therefore$ The correct option is (c).

Example 22.14 *A body cools in 10 minutes from 60°C to 40°C. What will be its temperature after next 10 minutes? The temperature of the surroundings is 10°C.*

Solution According to Newton's law of cooling,

$$\left(\frac{\theta_1-\theta_2}{t}\right)=\alpha\left[\left(\frac{\theta_1+\theta_2}{2}\right)-\theta_0\right]$$

For the given conditions,

$$\frac{60-40}{10}=\alpha\left[\frac{60+40}{2}-10\right] \qquad \text{...(i)}$$

Let θ be the temperature after next 10 minutes. Then,

$$\frac{40-\theta}{10}=\alpha\left[\frac{40+\theta}{2}-10\right] \qquad \text{...(ii)}$$

Solving Eqs. (i) and (ii), we get

$$\theta = 28°\,\text{C}$$ **Ans.**

INTRODUCTORY EXERCISE 22.2

1. A rod is heated at one end as shown in figure. In steady state temperature of different sections becomes constant but not same. Why so?

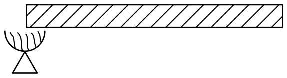

Fig. 22.17

2. Show that the SI units of thermal conductivity are W/m-K.
3. Find SI units of thermal resistance.
4. Suppose a liquid in a container is heated at the top rather than at the bottom. What is the main process by which the rest of the liquid becomes hot?
5. Three rods each of same length and cross-section are joined in series. The thermal conductivity of the materials are $K, 2K$ and $3K$ respectively. If one end is kept at 200 °C and the other at 100 °C. What would be the temperature of the junctions in the steady state? Assume that no heat is lost due to radiation from the sides of the rods.
6. A rod *CD* of thermal resistance 5.0 K/W is joined at the middle of an identical rod *AB* as shown in figure. The ends *A*, *B* and *D* are maintained at 100°C and 25°C respectively. Find the heat current in *CD*.

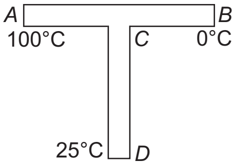

Fig. 22.18

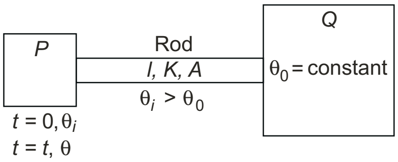
7. A liquid takes 5 minutes to cool from 80 °C to 50 °C. How much time will it take to cool from 60 °C to 30°C? The temperature of surroundings is 20 °C.

Final Touch Points

1. Cooling by conduction or radiation

(i) **By conduction** A body P of mass m and specific heat c is connected to a large body Q (of specific heat infinite) through a rod of length l, thermal conductivity K and area of cross-section A. Temperature of Q is $\theta_0 (< \theta_i)$. This temperature will remain constant as its specific heat is very high. Heat will flow from P to Q through the rod. If we neglect the loss of heat due to radiation then due to this heat transfer, temperature of P will decrease but temperature of Q will remain almost constant. At time t, suppose temperature of P becomes θ then due to temperature difference heat transfer through the rod.



$$\frac{dQ}{dt} = H = \frac{\text{TD}}{R} = \frac{\theta - \theta_0}{R} \qquad \text{...(i)}$$

Here, $$R = \frac{l}{KA}$$

Now, if we apply equation of calorimetry in P, then

$$Q = mc(-\Delta\theta) \quad \text{or} \quad \frac{dQ}{dt} = mc\left(\frac{-d\theta}{dt}\right) \qquad \text{...(ii)}$$

Equating Eqs. (i) and (ii), we have

$$\boxed{-\frac{d\theta}{dt} = \frac{\text{TD}}{mcR} = \frac{\theta - \theta_0}{mcR} = \text{Rate of cooling}} \qquad \text{...(iii)}$$

So, this is the rate of cooling by conduction.

or $$\boxed{-\frac{d\theta}{dt} \propto \text{TD}} \qquad \text{...(iv)}$$

(ii) **By radiation** In article 22.2, we have already derived the expression of rate of cooling,

$$\boxed{-\frac{dT}{dt} = \frac{eA\sigma}{mc}(T^4 - T_0^4) \quad \text{or} \quad -\frac{dT}{dt} \propto (T^4 - T_0^4)} \qquad \text{...(v)}$$

Further in Newton's law of cooling, we have also seen that, if temperature difference between body and atmosphere is less than this rate of cooling,

$$\boxed{-\frac{dT}{dt} \propto \Delta T \quad \text{or} \quad \text{TD}} \qquad \text{...(vi)}$$

In Newton's law of cooling, we have also seen that temperature of the body falls exponentially, if

$$\text{rate of cooling, } -\frac{dT}{dt} \quad \text{or} \quad -\frac{d\theta}{dt} \propto \text{TD}$$

In Eq. (iv) of conduction and Eq. (vi) of radiation (special case when TD is small)

$$-\frac{dT}{dt} \quad \text{or} \quad -\frac{d\theta}{dt} \propto \text{TD}$$

So, in both cases temperature of the body will fall exponentially like,

$$\theta = \theta_0 + (\theta_i - \theta_0)\, e^{-\alpha t} \quad \text{or} \quad T = T_0 + (T_i - T_0)\, e^{-\alpha t}$$

In radiation, $\alpha = \dfrac{4eA\sigma T_0^3}{mc}$ and in conduction $\alpha = \dfrac{1}{mcR}$

2.

For emissivity, we have used the term e or e_r. This is sometimes confused with emissive power e. Emissivity is unitless and always less than or equal to one. But emissive power has the units J/s-m^2 or watt/m^2.

Solved Examples

TYPED PROBLEMS

Type 1. *Based on calculation of thermal resistance*

Concept

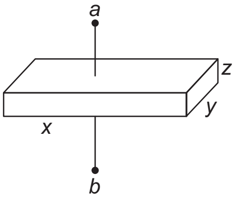
(i) A thermal resistance of a conducting rod is calculated/required between two points or two surfaces (say a and b). The formula of thermal resistance is

$$R = \frac{l}{KA}$$

Here, l is that dimension of conductor which is parallel to a and b and A is that cross-sectional area which is perpendicular to a and b.

(ii) From a to b if A is uniform at every point then direct formula $R = \frac{l}{KA}$ can be applied otherwise we will have to use integration.

Example 1 *Thermal conductivity of the conductor shown in figure is K. Find thermal resistance between points a and b.*

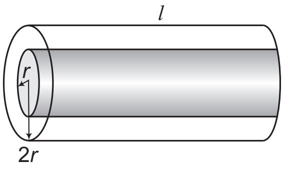


Solution From a to b area of cross-section perpendicular to ab is uniform ($A = xy$) and length along ab is z. Therefore, using the formula

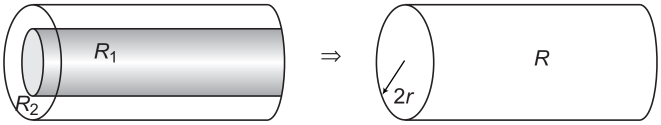
$$R = \frac{l}{KA}, \text{ we have}$$

$$R = \frac{z}{Kxy}$$ **Ans.**

Example 2 *Thermal conductivity of inner core of radius r is K and of the outer one of radius 2r is 2K. Find equivalent value of thermal conductivity between its two ends.*



Solution The meaning of equivalent value of thermal conductivity means, if a single material of K_e is used with same dimensions then value of thermal resistance should remain unchanged.



Between two ends R_1 and R_2 are in parallel. Hence,

$$\frac{1}{R_1}+\frac{1}{R_2}=\frac{1}{R} \qquad \text{...(i)}$$

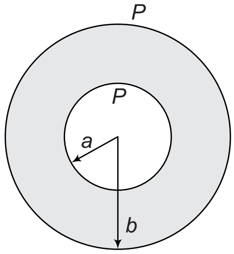
R is given by $\frac{l}{KA}$. Therefore, $\frac{1}{R}$ will be given by $\frac{KA}{l}$. Using this in Eq. (i), we have

$$\frac{K(\pi r^2)}{l}+\frac{2K[(\pi)(2r)^2-\pi r^2]}{l}=\frac{K_e(\pi)(2r)^2}{l}$$

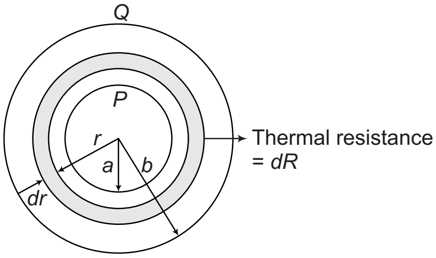
Solving this equation, we get

$$K_e=\frac{7}{4}K \qquad \textbf{Ans.}$$

Example 3 *A spherical body of radius 'b' has a concentric cavity of radius 'a' as shown. Thermal conductivity of the material is K. Find thermal resistance between inner surface P and outer surface Q.*



Solution As we move from P to Q surface perpendicular to PQ is spherical and its size keeps on increasing (just like different layers of a spherical onion). So, first we will calculate thermal resistance of one layer at a distance r from centre and thickness dr by using the formula $R=\frac{l}{KA}$.



In this formula, dimension of the layer along PQ is dr and the surface area perpendicular to PQ is $4\pi r^2$

$$\therefore \qquad dR = \frac{dr}{K(4\pi r^2)}$$

Now, if we integrate dR from $r = a$ to $r = b$, we will get the total thermal resistance between P and Q. Thus,

$$R = \int_a^b dR = \int_a^b \frac{dr}{K(4\pi r^2)}$$

Solving this expression, we get

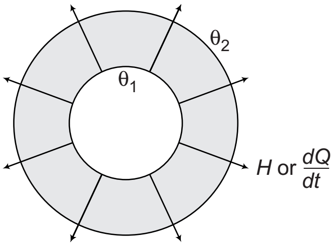
$$R = \frac{1}{4\pi K}\left(\frac{1}{a} - \frac{1}{b}\right) \qquad \textbf{Ans.}$$

Example 4 *In the above example, if temperature of inner surface P is kept constant at θ_1 and of the outer surface Q at $\theta_2 (< \theta_1)$. Then, Find*

(a) rate of heat flow or heat current from inner surface to outer surface.

(b) temperature θ at a distance $r (a < r < b)$ from centre.

Solution (a)

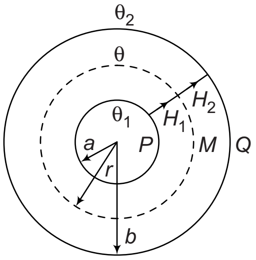


$$H \quad \text{or} \quad \frac{dQ}{dt} = \frac{\text{Temperature difference}}{\text{Thermal resistance}}$$

$$= \frac{(\theta_1 - \theta_2)(4\pi K)}{\left(\frac{1}{a} - \frac{1}{b}\right)}$$

$$= \frac{(\theta_1 - \theta_2)(ab)(4\pi K)}{(b - a)} \qquad \textbf{Ans.}$$

(b)



In the figure, we can see that

$$\text{Heat current } H_1 = \text{Heat current } H_2$$

$$\therefore \qquad \frac{(\text{TD})_{\text{PM}}}{R_{\text{PM}}} = \frac{(\text{TD})_{\text{MQ}}}{R_{\text{MQ}}} \qquad \text{...(i)}$$

Using the result obtained in Example-3 of thermal resistance, we can find

$$R_{\text{PM}} = \frac{1}{4\pi K}\left(\frac{1}{a} - \frac{1}{r}\right)$$

and $$R_{\text{MQ}} = \frac{1}{4\pi K}\left(\frac{1}{r} - \frac{1}{b}\right)$$

Substituting the values in Eq. (i), we have

$$\frac{\theta_1 - \theta}{\frac{1}{4\pi K}\left(\frac{1}{a} - \frac{1}{r}\right)} = \frac{\theta - \theta_2}{\frac{1}{4\pi K}\left(\frac{1}{r} - \frac{1}{b}\right)}$$

Solving this equation we can find θ.

Type 2. *Mixed problems of calorimetry and conduction*

Concept

(i) In calorimetry, we have two equations,

$$Q = mc\Delta\theta \qquad \text{(when temperature changes without change in state)}$$

and $$Q = mL \qquad \text{(when state changes without change in temperature)}$$

The above two equations in differential form can be written as

$$\frac{dQ}{dt} = mc\left(\pm\frac{d\theta}{dt}\right) \quad \text{or} \quad L\left(\frac{dm}{dt}\right) \qquad \text{...(i)}$$

In the above equation $\frac{dm}{dt}$ is rate of conversion of mass from one state to another state.

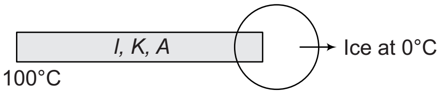
(ii) In conduction, we have the equation,

$$\frac{dQ}{dt} \quad \text{or} \quad H = \frac{\text{TD}}{R} \qquad \text{...(ii)}$$

where, $$R = \frac{l}{KA}$$

In these types of problems $\frac{dQ}{dt}$ of calorimetry is equated with $\frac{dQ}{dt}$ of conduction.

Example 5 *One end of the rod of length l, thermal conductivity K and area of cross-section A is maintained at a constant temperature of* 100 °C. *At the other end large quantity of ice is kept at* 0 °C. *Due to temperature difference, heat flows from left end to right end of the rod. Due to this heat ice will start melting. Neglecting the radiation losses find the expression of rate of melting of ice.*



Solution Putting,

$$\left(\frac{dQ}{dt}\right)_{\text{conduction}} = \left(\frac{dQ}{dt}\right)_{\text{calorimetry}}$$

$$\therefore \qquad \frac{\text{TD}}{R} = L \cdot \frac{dm}{dt}$$

$$\Rightarrow \qquad \frac{dm}{dt} = \frac{\text{TD}}{RL} \qquad \textbf{Ans.}$$

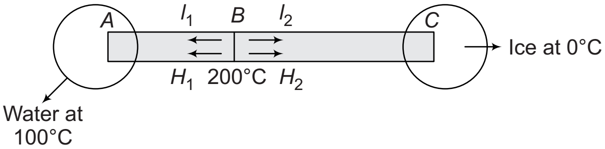
So, this is the desired expression of $\frac{dm}{dt}$.

In the above expression,

$$\text{TD} = 100°\text{C}, R = \frac{l}{KA}$$

and L = latent heat of fusion

Example 6 *B point of the rod shown in figure is maintained at 200°C. At left end A, there is water at 100°C and at right end C there is ice at 0°C. Heat currents H_1 and H_2 will flow on both sides. Due to H_1, water will convert into steam and due to H_2 ice will be melted. If latent heat of vaporization is 540 cal/g and latent heat of fusion is 80 cal/g then neglecting the radiation losses find $\frac{l_1}{l_2}$ so that rate of melting of ice is two times the rate of conversion of water into steam.*



Solution Using the relation of $\frac{dm}{dt}$ derived in above example,

$$\frac{dm}{dt} = \frac{\text{TD}}{RL} = \frac{(\text{TD})KA}{lL} \qquad \left(\text{as } R = \frac{l}{KA}\right)$$

Given that,

$$\left(\frac{dm}{dt}\right)_{\text{RHS}} = 2\left(\frac{dm}{dt}\right)_{\text{LHS}}$$

or

$$\left[\frac{(\text{TD})KA}{lL}\right]_{\text{RHS}} = 2\left[\frac{(\text{TD})KA}{lL}\right]_{\text{LHS}}$$

K and A are same on both sides. Hence,

$$\left(\frac{\text{TD}}{lL}\right)_{\text{RHS}} = 2\left(\frac{\text{TD}}{lL}\right)_{\text{LHS}}$$

Substituting the proper values, we have

$$\frac{200}{l_2 \times 80} = 2\left[\frac{100}{l_1 \times 540}\right]$$

$$\therefore \qquad \frac{l_1}{l_2} = \frac{80}{540} = \frac{4}{27} \qquad \textbf{Ans.}$$

Type 3. *Mixed problems of Stefan's law and Wien's displacement law*

Concept

Stefan's law

Energy radiated per unit time = emissive power = $e_r \sigma T^4$

Energy radiated per unit time called power = $e_r \sigma T^4 A$

Total energy radiated in time 't' = $e_r \sigma T^4 At$

Above all three terms $\propto T^4$

Wien's displacement law

$$\lambda_m \propto \frac{1}{T}$$

From Wien's law normally we find the ratio of temperatures of two bodies and then this ratio is used in Stefan's law.

Example 7 *Three discs, A, B and C having radii 2m, 4m and 6m respectively are coated with carbon black on their outer surfaces. The wavelengths corresponding to maximum intensity are 300 nm, 400 nm and 500 nm, respectively. The power radiated by them are Q_A, Q_B and Q_C respectively*

(JEE 2004)

(a) Q_A is maximum *(b) Q_B is maximum* *(c) Q_C is maximum* *(d) $Q_A = Q_B = Q_C$*

Solution (b) $Q \propto AT^4$ and $\lambda_m T$ = constant.

Hence,

$$Q \propto \frac{A}{(\lambda_m)^4} \quad \text{or} \quad Q \propto \frac{r^2}{(\lambda_m)^4}$$

$$Q_A : Q_B : Q_C = \frac{(2)^2}{(3)^4} : \frac{(4)^2}{(4)^4} : \frac{(6)^2}{(5)^4} = \frac{4}{81} : \frac{1}{16} : \frac{36}{625} = 0.05 : 0.0625 : 0.0576$$

i.e. Q_B is maximum.

Type 4. *Problems of cooling either by conduction or radiation*

Concept

In final touch points we have seen that if a body cools by conduction, then

$$\text{rate of cooling,} \quad -\frac{d\theta}{dt} = \frac{\text{TD}}{mcR} \qquad \text{...(i)}$$

Here, $mc = C$ = heat capacity of the body

This C is the heat required to raise the temperature of whole body by 1°C or 1K and R is the thermal resistance of conducting rod. So, Eq. (i) can also be written as

$$-\frac{d\theta}{dt} = \frac{\text{TD}}{CR}$$

If the body cools by radiation, then

$$\text{rate of cooling or } -\frac{dT}{dt} = \frac{eA\sigma}{mc}(T^4 - T_0^4) \qquad \text{...(ii)}$$

For small temperature difference, Newton's law of cooling can be applied and

$$-\frac{dT}{dt} \propto \text{TD} \qquad \text{...(iii)}$$

Further, if rate of cooling ∝ TD as Eqs. (i) or (iii), temperature of the body falls exponentially.

Example 8 *Two spheres, one solid and other hollow are kept in atmosphere at same temperature. They are made of same material and their radii are also same. Which sphere will cool at a faster rate initially?*

Solution In the equation,

$$-\frac{dT}{dt} = \frac{eA\sigma}{mc}(T^4 - T_0^4)$$

Only mass is different. Therefore,

$$-\frac{dT}{dt} \propto \frac{1}{m}$$

Mass of hollow sphere is less. So, hollow sphere will cool at a faster rate initially.

Example 9 *The ratio of specific heats of two spheres is $2:3$, radii $1:2$, emissivity $3:1$ and density $1:1$. Initially, they are kept at same temperatures in atmosphere. Which sphere will cool at a faster rate initially.*

Solution In the equation,

$$-\frac{dT}{dt} = \frac{eA\sigma}{mc}(T^4 - T_0^4)$$

$$A = \text{surface area } = 4\pi R^2$$

$$m = \text{Volume} \times \text{density} = \frac{4}{3}\pi R^3 \rho$$

Substituting in the above equation, we have

$$-\frac{dT}{dt} = \frac{3e\sigma}{R\rho c}(T^4 - T_0^4) \quad \text{or} \quad -\frac{dT}{dt} \propto \frac{e}{R\rho c}$$

Now,

$$\left(\frac{e}{R\rho c}\right)_{\text{sphere-1}} = \frac{3}{1 \times 1 \times 2} = \frac{3}{2}$$

and

$$\left(\frac{e}{R\rho c}\right)_{\text{sphere-2}} = \frac{1}{2 \times 1 \times 3} = \frac{1}{6}$$

$$\left(\frac{e}{R\rho c}\right) \text{ for sphere-1 is more.}$$

So, first sphere will cool at faster rate initially.

Example 10 *Two metallic spheres S_1 and S_2 are made of the same material and have got identical surface finish. The mass of S_1 is thrice that of S_2. Both the spheres are heated to the same high temperature and placed in the same room having lower temperature but are thermally insulated from each other. The ratio of the initial rate of cooling of S_1 to that of S_2 is* **(JEE 1995)**

(a) $\frac{1}{3}$ (b) $\frac{1}{\sqrt{3}}$ (c) $\frac{\sqrt{3}}{1}$ (d) $\left(\frac{1}{3}\right)^{1/3}$

Solution $-\dfrac{dT}{dt} = \dfrac{eA\sigma}{mc}(T^4 - T_o^4)$

$$m_1 = 3m_2$$

$$\therefore \qquad R_1 = (3)^{\frac{1}{3}} R_2$$

$$\left(-\frac{dT}{dt}\right) \propto \frac{A}{m} \propto \frac{R^2}{R^3} \propto \frac{1}{R}$$

$$\therefore \qquad \frac{(-dT/dt)_1}{(-dT/dt)_2} = \frac{R_2}{R_1} = \left(\frac{1}{3}\right)^{\frac{1}{3}}$$

∴ The correct option is (d).

Example 11 *Two identical conducting rods are first connected independently to two vessels, one containing water at 100°C and the other containing ice at 0°C. In the second case, the rods are joined end to end and connected to the same vessels. Let q_1 and q_2 gram per second be the rate of melting of ice in the two cases respectively. The ratio $\dfrac{q_1}{q_2}$ is* **(JEE 2004)**

(a) $\dfrac{1}{2}$ (b) $\dfrac{2}{1}$ (c) $\dfrac{4}{1}$ (d) $\dfrac{1}{4}$

Solution (c) $\dfrac{dQ}{dt} = L\left(\dfrac{dm}{dt}\right)$ or $\dfrac{\text{Temperature difference}}{\text{Thermal resistance}} = L\left(\dfrac{dm}{dt}\right)$

or $$\frac{dm}{dt} \propto \frac{1}{\text{Thermal resistance}} \quad \Rightarrow \quad q \propto \frac{1}{R}$$

In the first case rods are in parallel and thermal resistance is $\dfrac{R}{2}$ while in second case rods are in series and thermal resistance is $2R$.

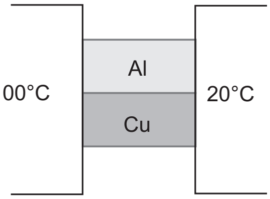
$$\frac{q_1}{q_2} = \frac{2R}{R/2} = \frac{4}{1}$$

Miscellaneous Examples

Example 12 *Two metal cubes with 3 cm-edges of copper and aluminium are arranged as shown in figure. Find*

(a) the total thermal current from one reservoir to the other

(b) the ratio of the thermal current carried by the copper cube to that carried by the aluminium cube. Thermal conductivity of copper is 401 W/m-K and that of aluminium is 237 W/m-K.



Solution (a) Thermal resistance of aluminium cube, $R_1 = \dfrac{l}{KA}$

or $$R_1 = \frac{(3.0 \times 10^{-2})}{(237)\,(3.0 \times 10^{-2})^2}$$

$$= 0.14 \text{ K/W}$$

and thermal resistance of copper cube, $R_2 = \dfrac{l}{KA}$

or $$R_2 = \frac{(3.0 \times 10^{-2})}{(401)\,(3.0 \times 10^{-2})^2} = 0.08 \text{ K/W}$$

As these two resistance are in parallel, their equivalent resistance will be

$$R = \frac{R_1 R_2}{R_1 + R_2} = \frac{(0.14)\,(0.08)}{(0.14) + (0.08)} = 0.05 \text{ K/W}$$

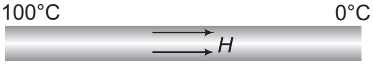
$\therefore$ $$\text{Thermal current, } H = \frac{\text{Temperature difference}}{\text{Thermal resistance}} = \frac{(100 - 20)}{0.05} = 1.6 \times 10^3 \text{ W}$$ **Ans.**

(b) In parallel thermal current distributes in the inverse ratio of resistance. Hence,

$$\frac{H_{\text{Cu}}}{H_{\text{Al}}} = \frac{R_{\text{Al}}}{R_{\text{Cu}}} = \frac{R_1}{R_2} = \frac{0.14}{0.08} = 1.75$$ **Ans.**

Example 13 *One end of a copper rod of length* 1 *m and area of cross-section* 4.0×10^{-4} *m*^{2} *is maintained at* 100°C. *At the other end of the rod ice is kept at* 0°C. *Neglecting the loss of heat from the surroundings, find the mass of ice melted in* 1 *h. Given,* $K_{Cu} = 401$ *W/m-K and* $L_f = 3.35 \times 10^5$ *J/kg.*

Solution Thermal resistance of the rod,



$$R = \frac{l}{KA} = \frac{1.0}{(401)\,(4 \times 10^{-4})} = 6.23 \text{ K/W}$$

$\therefore$ $$\text{Heat current, } H = \frac{\text{Temperature difference}}{\text{Thermal resistance}} = \frac{(100 - 0)}{6.23} = 16 \text{ W}$$

Heat transferred in 1 h,

$$Q = Ht \qquad \left(\because \; H = \frac{Q}{t}\right)$$

$$= (16)\,(3600) = 57600 \text{ J}$$

Now, let m mass of ice melts in 1 h, then

$$m = \frac{Q}{L} \qquad (Q = mL)$$

$$= \frac{57600}{3.35 \times 10^5}$$

$$= 0.172 \text{ kg}$$

or $= 172$ g **Ans.**

Example 14 *Two bodies A and B have thermal emissivities of* 0.01 *and* 0.81 *respectively. The outer surface areas of the two bodies are same. The two bodies emit total radiant power at the same rate. The wavelength* λ_B *corresponding to maximum spectral radiancy from B is shifted from the wavelength corresponding to maximum spectral radiancy in the radiation from A by* 1.0 μm. *If the temperature of A is* 5802 *K, calculate (a) the temperature of B, (b) wavelength* λ_B.

Solution (a)

$$P_A = P_B$$

∴ $$e_A \sigma A_A T_A^4 = e_B \sigma A_B T_B^4$$

∴ $$T_B = \left(\frac{e_A}{e_B}\right)^{1/4} T_A \qquad \text{(as } A_A = A_B\text{)}$$

Substituting the values,

$$T_B = \left(\frac{0.01}{0.81}\right)^{1/4} (5802) = 1934 \text{ K}$$ **Ans.**

(b) According to Wien's displacement law,

$$\lambda_A T_A = \lambda_B T_B$$

∴ $$\lambda_B = \left(\frac{T_A}{T_B}\right)\lambda_A = \left(\frac{5802}{1934}\right)\lambda_A$$

or $$\lambda_B = 3\lambda_A$$

Also, $$\lambda_B - \lambda_A = 1\ \mu\text{m}$$

or $$\lambda_B - \left(\frac{1}{3}\right)\lambda_B = 1\ \mu\text{m}$$

or $$\lambda_B = 1.5\ \mu\text{m}$$ **Ans.**

Example 15 5 *g of water at* 30°*C and* 5 *g of ice at* – 20°*C are mixed together in a calorimeter. Find the final temperature of mixture. Water equivalent of calorimeter is negligible, specific heat of ice* = 0.5 *cal/g-°C and latent heat of ice* = 80 *cal/g.*

Solution In this case heat is given by water and taken by ice

Heat available with water to cool from 30° C to 0° C

$$= ms\Delta\theta = 5 \times 1 \times 30$$

$$= 150 \text{ cal}$$

Heat required by 5 g ice to increase its temperature upto 0°C

$$ms\Delta\theta = 5 \times 0.5 \times 20$$

$$= 50 \text{ cal}$$

Out of 150 cal heat available, 50 cal is used for increasing temperature of ice from – 20° C to 0° C. The remaining heat 100 cal is used for melting the ice.

If mass of ice melted is m g, then

$$m \times 80 = 100$$

⇒ $$m = 1.25 \text{ g}$$

Thus, 1.25 g ice out of 5 g melts and mixture of ice and water is at 0° C.

Example 16 *A bullet of mass* 10 *g moving with a speed of* 20 *m/s hits an ice block of mass* 990 *g kept on a frictionless floor and gets stuck in it. How much ice will melt if* 50% *of the lost kinetic energy goes to ice?*
(Temperature of ice block $= 0°C$ *).*

Solution Velocity of bullet + ice block,

$$V = \frac{(10\ \text{g}) \times (20\ \text{m/s})}{1000\ \text{g}} = 0.2\ \text{m/s} \qquad (P_i = P_f)$$

$$\text{Loss of KE} = \frac{1}{2}mv^2 - \frac{1}{2}(m+M)V^2$$

$$= \frac{1}{2}[0.01 \times (20)^2 - 1 \times (0.2)^2]$$

$$= \frac{1}{2}[4 - 0.04] = 1.98\ \text{J}$$

$\therefore$ Heat received by ice block $= \dfrac{1.98}{4.2 \times 2}$ cal

$$= 0.24\ \text{cal}$$

$\therefore$ Mass of ice melted $= \dfrac{(0.24\ \text{cal})}{(80\ \text{cal/g})}$

$$= 0.003\ \text{g}$$ **Ans.**

Example 17 *At* 1 *atmospheric pressure,* 1.000 *g of water having a volume of* 1.000 cm^3 *becomes* 1671 cm^3 *of steam when boiled. The heat of vaporization of water at* 1 *atmosphere is* 539 *cal/g. What is the change in internal energy during the process?*

Solution Heat spent during vaporisation,

$$Q = mL = 1.000 \times 539 = 539\ \text{cal}$$

$$\text{Work done, } W = P(V_v - V_l)$$

$$= 1.013 \times 10^5 \times (1671 - 1.000) \times 10^{-6}$$

$$= 169.2\ \text{J} = \frac{169.2}{4.18}\ \text{cal}$$

$$= 40.5\ \text{cal}$$

$\therefore$ Change in internal energy,

$\therefore$ $$\Delta U = 539\ \text{cal} - 40.5\ \text{cal}$$

$$= 498.5\ \text{cal}$$ **Ans.**

Example 18 *At* 1 *atmospheric pressure,* 1.000 *g of water having a volume of* 1.000 cm^3 *becomes* 1.091 cm^3 *of ice on freezing. The heat of fusion of water at* 1 *atmosphere is* 80.0 *cal/g. What is the change in internal energy during the process?*

Solution Heat given out during freezing,

$$Q = -mL = -1 \times 80 = -80\ \text{cal}$$

External work done $$W = P(V_{\text{ice}} - V_{\text{water}})$$

$$= 1.013 \times 10^5 \times (1.091 - 1.000) \times 10^{-6}$$

$$= 9.22 \times 10^{-3}\ \text{J}$$

$$= \frac{9.22 \times 10^{-3}}{4.18}\ \text{cal}$$

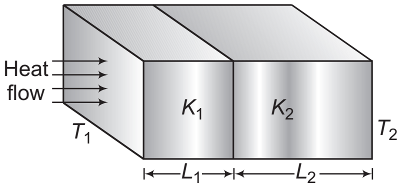
$$= 0.0022\ \text{cal}$$

∴ Change in internal energy,

$$\Delta U = Q - W = -80 - 0.0022$$

$$= -80.0022\ \text{cal}$$ **Ans.**

Example 19 *Two plates each of area A, thickness L_1 and L_2 thermal conductivities K_1 and K_2 respectively are joined to form a single plate of thickness $(L_1 + L_2)$. If the temperatures of the free surfaces are T_1 and T_2. Calculate*



(a) rate of flow of heat
(b) temperature of interface and
(c) equivalent thermal conductivity.

Solution (a) If the thermal resistance of the two plates are R_1 and R_2 respectively. Plates are in series.

$$R_S = R_1 + R_2 = \frac{L_1}{AK_1} + \frac{L_2}{AK_2}$$

as $$R = \frac{L}{KA}$$

and so $$H = \frac{dQ}{dt} = \frac{\Delta T}{R}$$

$$= \frac{(T_1 - T_2)}{(R_1 + R_2)} = \frac{A(T_1 - T_2)}{\left[\frac{L_1}{K_1} + \frac{L_2}{K_2}\right]}$$ **Ans.**

(b) If T is the common temperature of interface, then as in series rate of flow of heat remains same, i.e. $H = H_1\ (= H_2)$

$$\frac{T_1 - T_2}{R_1 + R_2} = \frac{T_1 - T}{R_1}$$

i.e. $$T = \frac{T_1R_2 + T_2R_1}{(R_1 + R_2)}$$

or $$T = \frac{\left[T_1\frac{L_2}{K_2} + T_2\frac{L_1}{K_1}\right]}{\left[\frac{L_1}{K_1} + \frac{L_2}{K_2}\right]} \qquad \left(\text{as } R = \frac{L}{KA}\right)$$

(c) If K is the equivalent conductivity of composite slab, i.e. slab of thickness $L_1 + L_2$ and cross-sectional area A, then as in series

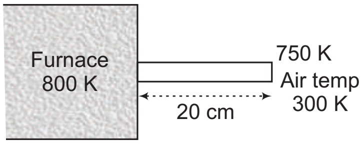
$$R_S = R_1 + R_2 \quad \text{or} \quad \frac{(L_1 + L_2)}{AK_{\text{eq}}} = R_1 + R_2$$

i.e.

$$K_{\text{eq}} = \frac{L_1 + L_2}{A(R_1 + R_2)} = \frac{L_1 + L_2}{\left[\dfrac{L_1}{K_1} + \dfrac{L_2}{K_2}\right]} \qquad \left(\text{as } R = \frac{L}{KA}\right)$$

Example 20 *One end of a rod of length 20 cm is inserted in a furnace at 800 K. The sides of the rod are covered with an insulating material and the other end emits radiation like a black body. The temperature of this end is 750 K in the steady state. The temperature of the surrounding air is 300 K. Assuming radiation to be the only important mode of energy transfer between the surroundings and the open end of the rod, find the thermal conductivity of the rod. Stefan constant* $\sigma = 6.0 \times 10^{-8}\ W/m^2\text{-}K^4$. *Take emissivity of the open end* $e = 1$

Solution Heat flowing through the rod per second in steady state,



$$\frac{dQ}{dt} = \frac{KAd\theta}{x} \qquad \text{...(i)}$$

Heat radiated from the open end of the rod per second in steady state,

$$\frac{dQ}{dt} = A\sigma\,(T^4 - T_0^4) \qquad \text{...(ii)}$$

From Eqs. (i) and (ii),

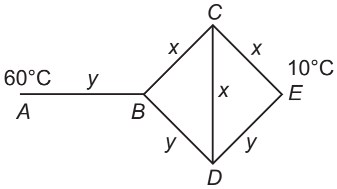
$$\frac{Kd\theta}{x} = \sigma\,(T^4 - T_0^4)$$

$$\frac{K \times 50}{0.2} = 6.0 \times 10^{-8}\ [(7.5)^4 - (3)^4] \times 10^8$$

or

$$K = 74 \text{ W/m-K}$$ **Ans.**

Example 21 *Three rods of material x and three rods of material y are connected as shown in figure. All the rods are of identical length and cross-sectional area. If the end A is maintained at 60°C and the junction E at 10°C, calculate temperature of junctions B, C and D. The thermal conductivity of x is 0.92 cal/cm-s°C and that of y is 0.46 cal/cm-s°C.*



Solution Thermal resistance, $R = \dfrac{l}{KA}$

$$\therefore \qquad \frac{R_x}{R_y} = \frac{K_y}{K_x} \qquad \text{(as } l_x = l_y \text{ and } A_x = A_y\text{)}$$

$$= \frac{0.46}{0.92} = \frac{1}{2}$$

So, if $R_x = R$ then $R_y = 2R$

CEDB forms a balanced Wheatstone bridge, i.e. $T_C = T_D$ and no heat flows through *CD*.

$$\therefore \qquad \frac{1}{R_{BE}} = \frac{1}{R+R} + \frac{1}{2R+2R}$$

or

$$R_{BE} = \frac{4}{3} R$$

The total resistance between *A* and *E* will be

$$R_{AE} = R_{AB} + R_{BE} = 2R + \frac{4}{3} R = \frac{10}{3} R$$

$\therefore$ Heat current between *A* and *E* is

$$H = \frac{(\Delta T)_{AE}}{R_{AE}} = \frac{(60-10)}{(10/3)\,R} = \frac{15}{R}$$

Now, if T_B is the temperature at *B*,

$$H_{AB} = \frac{(\Delta T)_{AB}}{R_{AB}}$$

or

$$\frac{15}{R} = \frac{60 - T_B}{2R}$$

or

$$T_B = 30°\,\text{C} \qquad \textbf{Ans.}$$

Further,

$$H_{AB} = H_{BC} + H_{BD}$$

or

$$\frac{15}{R} = \frac{30 - T_C}{R} + \frac{30 - T_D}{2R} \qquad [T_C = T_D = T \text{ (say)}]$$

or

$$15 = (30 - T) + \frac{(30 - T)}{2}$$

Solving this, we get $T = 20°\,\text{C}$

or

$$T_C = T_D = 20°\,\text{C} \qquad \textbf{Ans.}$$

Example 22 *A hollow sphere of glass whose external and internal radii are* 11 *cm and* 9 *cm respectively is completely filled with ice at* 0°C *and placed in a bath of boiling water. How long will it take for the ice to melt completely? Given that density of ice* $= 0.9\ g/cm^3$, *latent heat of fusion of ice* $= 80\ cal/g$ *and thermal conductivity of glass* $= 0.002\ cal/cm\text{-}s°C$.

Solution In steady state, rate of heat flow (result is taken from Example 4)

$$H = \frac{4\pi K r_1 r_2 \Delta T}{r_2 - r_1}$$

Substituting the values, $$H = \frac{(4)(\pi)(0.002)(11)(9)(100-0)}{(11-9)}$$

or $$\frac{dQ}{dt} = 124.4 \text{ cal/s}$$

This rate should be equal to, $L\dfrac{dm}{dt}$

$$\therefore \quad \left(\frac{dm}{dt}\right) = \frac{dQ/dt}{L} = \frac{124.4}{80} = 1.555 \text{ g/s}$$

Total mass of ice, $$m = \rho_{\text{ice}}(4\pi r_1^2) = (0.9)(4)(\pi)(9)^2 = 916 \text{ g}$$

∴ Time taken for the ice to melt completely

$$t = \frac{m}{(dm/dt)} = \frac{916}{1.555} = 589 \text{ s}$$ **Ans.**

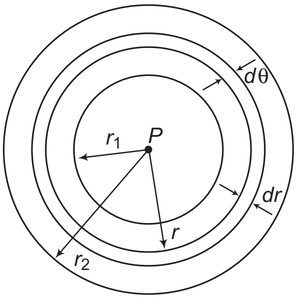
Example 23 *A point source of heat of power P is placed at the centre of a spherical shell of mean radius R. The material of the shell has thermal conductivity K. Calculate the thickness of the shell if temperature difference between the outer and inner surfaces of the shell in steady state is T.*

Solution Consider a concentric spherical shell of radius r and thickness dr as shown in figure. In steady state, the rate of heat flow (heat current) through this shell will be

$$H = \frac{\Delta T}{R} = \frac{(-d\theta)}{\dfrac{dr}{(k)(4\pi r^2)}} \qquad \left(R = \frac{l}{KA}\right)$$

or $$H = -(4\pi K r^2)\frac{d\theta}{dr}$$

Here, negative sign is used because with increase in r, θ decreases



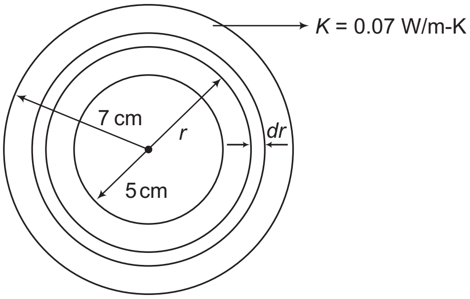
$$\therefore \quad \int_{r_1}^{r_2} \frac{dr}{r^2} = -\frac{4\pi K}{H}\int_{\theta_1}^{\theta_2} d\theta$$

This equation gives, $$H = \frac{4\pi K r_1 r_2 (\theta_1 - \theta_2)}{(r_2 - r_1)}$$

In steady state, $$H = P,\ r_1 r_2 \approx R^2 \text{ and } \theta_1 - \theta_2 = T$$

∴ Thickness of shell, $$r_2 - r_1 = \frac{4\pi K R^2 T}{P}$$ **Ans.**

Example 24 *A steam cylindrical pipe of radius* 5 *cm carries steam at* 100°*C. The pipe is covered by a jacket of insulating material* 2 *cm thick having a thermal conductivity* 0.07 *W/m-K. If the temperature at the outer wall of the pipe jacket is* 20°*C, how much heat is lost through the jacket per metre length in an hour?*



Solution Thermal resistance per metre length of an element at distance r of thickness dr is

$$dR = \frac{dr}{K\,(2\pi r)} \qquad \left(R = \frac{l}{KA}\right)$$

∴ Total resistance

$$R = \int_{r_1 = 5\text{ cm}}^{r_2 = 7\text{ cm}} dR$$

$$= \frac{1}{2\pi K}\int_{5.0\times10^{-2}\text{ m}}^{7.0\times10^{-2}\text{ m}} \frac{dr}{r}$$

$$= \frac{1}{2\pi K}\ln\left(\frac{7}{5}\right)$$

$$= \frac{1}{(2\pi)(0.07)}\ln(1.4)$$

$$= 0.765\text{ K/W}$$

$$\text{Heat current, } H = \frac{\text{Temperature difference}}{\text{Thermal resistance}}$$

$$= \frac{(100-20)}{0.765} = 104.6\text{ W}$$

∴ Heat lost in one hour = Heat current × time

$$= (104.6)\,(3600)\text{ J}$$

$$= 3.76\times10^{5}\text{ J}$$

Ans.

Exercises

LEVEL 1

Take $c_{\text{ice}} = 0.53$ cal/g-°C, $c_{\text{water}} = 1.0$ cal/g-°C, $(L_f)_{\text{water}} = 80$ cal/g and $(L_v)_{\text{water}} = 529$ cal/g unless given in the question.

Assertion and Reason

Directions : *Choose the correct option.*

(*a*) *If both **Assertion** and **Reason** are true and the **Reason** is correct explanation of the **Assertion.***

(*b*) *If both **Assertion** and **Reason** are true but **Reason** is not the correct explanation of **Assertion.***

(*c*) *If **Assertion** is true, but the **Reason** is false.*

(*d*) *If **Assertion** is false but the **Reason** is true.*

1. Assertion : Specific heat of any substance remains constant at all temperatures.

Reason : It is given by $$s = \frac{1}{m} \cdot \frac{dQ}{dT}$$

2. Assertion : When temperature of a body is increased, in radiant energy, number of low wavelength photons get increased.

Reason : According to Wien's displacement law $\lambda_m \propto \frac{1}{T}$.

3. Assertion : Warming a room by a heat blower is an example of forced convection.

Reason : Natural convection takes place due to gravity.

4. Assertion : A conducting rod is placed between boiling water and ice. If rod is broken into two equal parts and two parts are connected side by side, then rate of melting of ice will increase to four times.

Reason : Thermal resistance will become four times.

5. Assertion : A normal body can radiate energy more than a perfectly black body.

Reason : A perfectly black body is always black in colour.

6. Assertion : According to Newton's law, good conductors of electricity are also good conductors of heat.

Reason : At a given temperature, $e_\lambda \propto a_\lambda$ for any body.

7. Assertion : Good conductors of electricity are also good conductors of heat due to large number of free electrons.

Reason : It is easy to conduct heat from free electrons.

8. Assertion : Emissivity of any body (e) is always less than its absorptive power (a).

Reason : Both the quantities are dimensionless.

9. Assertion : Heat is supplied at constant rate from one end of a conducting rod. In steady state, temperature of all points of the rod becomes uniform.

Reason : In steady state, temperature of rod does not increase.

10. **Assertion :** A solid sphere and a hollow sphere of same material and same radius are kept at same temperatures in atmosphere. Rate of cooling of hollow sphere will be more.

Reason : If all other conditions are same, then rate of cooling is inversely proportional to the mass of body.

Objective Questions

1. For an enclosure maintained at 2000 K, the maximum radiation occurs at wavelength λ_m. If the temperature is raised to 3000 K, the peak will shift to

(a) $0.5\,\lambda_m$ (b) λ_m (c) $\frac{2}{3}\lambda_m$ (d) $\frac{3}{2}\lambda_m$

2. A substance cools from 75°C to 70°C in T_1 minute, from 70°C to 65°C in T_2 minute and from 65°C to 60°C in T_3 minute, then

(a) $T_1 = T_2 = T_3$ (b) $T_1 < T_2 < T_3$
(c) $T_1 > T_2 > T_3$ (d) $T_1 < T_2 > T_3$

3. Two liquids are at temperatures 20°C and 40°C. When same mass of both of them is mixed, the temperature of the mixture is 32°C. What is the ratio of their specific heats?

(a) 1/3 (b) 2/5
(c) 3/2 (d) 2/3

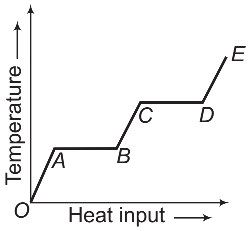
4. The specific heat of a metal at low temperatures varies according to $S = aT^3$, where a is a constant and T is absolute temperature. The heat energy needed to raise unit mass of the metal from temperature $T = 1$ K to $T = 2$ K is

(a) $3a$ (b) $\frac{15a}{4}$ (c) $\frac{2a}{3}$ (d) $\frac{13a}{4}$

5. The intensity of radiation emitted by the sun has its maximum value at a wavelength of 510 nm and that emitted by the North star has the maximum value at 350 nm. If these stars behave like black bodies, then the ratio of the surface temperatures of the sun and the north star is

(a) 1.46 (b) 0.69
(c) 1.21 (d) 0.83

6. A solid material is supplied heat at a constant rate. The temperature of material is changing with heat input as shown in the figure. What does the slope of DE represent?



(a) Latent heat of liquid (b) Latent heat of vaporization
(c) Heat capacity of vapour (d) Inverse of heat capacity of vapour

7. Two ends of rods of length L and radius R of the same material are kept at the same temperature. Which of the following rods conducts the maximum heat?

(a) $L = 50$ cm, $R = 1$ cm (b) $L = 100$ cm, $R = 2$ cm
(c) $L = 25$ cm, $R = 0.5$ cm (d) $L = 75$ cm, $R = 1.5$ cm

8. 1 g of ice at 0°C is mixed with 1 g of steam at 100°C. After thermal equilibrium is achieved, the temperature of the mixture is

(a) 100°C (b) 55°C (c) 75°C (d) 0°C

9. A wall has two layers *A* and *B* each made of different materials. The layer *A* is 10 cm thick and *B* is 20 cm thick. The thermal conductivity of *A* is thrice that of *B*. Under thermal equilibrium temperature difference across the wall is 35°C. The difference of temperature across the layer *A* is

(a) 30°C (b) 14°C (c) 8.75°C (d) 5°C

10. A wall has two layers *A* and *B* each made of different materials. Both the layers have the same thickness. The thermal conductivity of material *A* is twice of *B*. Under thermal equilibrium the temperature difference across the layer *B* is 36°C. The temperature difference across layer *A* is

(a) 6°C (b) 12°C (c) 18°C (d) 24°C

11. The end of two rods of different materials with their thermal conductivities, area of cross-section and lengths all in the ratio 1 : 2 are maintained at the same temperature difference. If the rate of flow of heat in the first rod is 4 cal/s. Then, in the second rod rate of heat flow in cal/s will be

(a) 1 (b) 2 (c) 8 (d) 16

Subjective Questions

1. A thin square steel plate 10 cm on a side is heated in a black smith's forge to temperature of $800° \text{C}$. If the emissivity is 0.60, what is the total rate of radiation of energy?

2. A lead bullet penetrates into a solid object and melts. Assuming that 50% of its kinetic energy was used to heat it, calculate the initial speed of the bullet. The initial temperature of the bullet is $27° \text{C}$ and its melting point is $327° \text{C}$. Latent heat of fusion of lead $= 2.5 \times 10^4$ J/kg and specific heat capacity of lead = 125 J/kg-K.

3. A ball is dropped on a floor from a height of 2.0 m . After the collision it rises upto a height of 1.5 m. Assume that 40% of the mechanical energy lost goes as thermal energy into the ball. Calculate the rise in the temperature of the ball in the collision. Specific heat of the ball is 800 J/K.

4. A nuclear power plant generates 500 MW of waste heat that must be carried away by water pumped from a lake. If the water temperature is to rise by 10°C, what is the required flow rate in kg/s?

5. The emissivity of tungsten is 0.4. A tungsten sphere with a radius of 4.0 cm is suspended within a large evacuated enclosure whose walls are at 300 K. What power input is required to maintain the sphere at a temperature of 3000 K if heat conduction along supports is neglected? Take, $\sigma = 5.67 \times 10^{-8}\ \text{Wm}^2\text{-K}^4$.

6. A pot with a steel bottom 1.2 cm thick rests on a hot stove. The area of the bottom of the pot is $0.150\ \text{m}^2$. The water inside the pot is at 100°C and 0.440 kg are evaporated every 5.0 minute. Find the temperature of the lower surface of the pot, which is in contact with the stove. Take $L_v = 2.256 \times 10^6$ J/kg and $k_{\text{steel}} = 50.2$ W/m-K

7. A carpenter builds an outer house wall with a layer of wood 2.0 cm thick on the outside and a layer of an insulation 3.5 cm thick as the inside wall surface. The wood has $K = 0.08$ W/m-K and the insulation has $K = 0.01$ W/m-K. The interior surface temperature is $19° \text{C}$ and the exterior surface temperature is $-10° \text{C}$.

(a) What is the temperature at the plane where the wood meets the insulation?

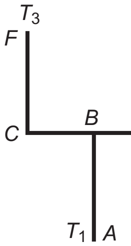
(b) What is the rate of heat flow per square metre through this wall?

8. A closely thermally insulated vessel contains 100 g of water at 0°C. If the air from this vessel is rapidly pumped out, intensive evaporation will produce cooling and as a result of this, water freeze. How much ice will be formed by this method? If latent heat of fusion is 80 cal/g and of evaporation 560 cal/g.
[**Hint** If m gram ice is formed, $mL_f = (100 - m) L_v$]

9. In a container of negligible mass 140 g of ice initially at $-15°$ C is added to 200 g of water that has a temperature of 40°C. If no heat is lost to the surroundings, what is the final temperature of the system and masses of water and ice in mixture?

10. A certain amount of ice is supplied heat at a constant rate for 7 minutes. For the first one minute the temperature rises uniformly with time. Then, it remains constant for the next 4 minutes and again the temperature rises at uniform rate for the last two minutes. Calculate the final temperature at the end of seven minutes.
(Given, L of ice $= 336 \times 10^3$ J/ kg and specific heat of water = 4200 J/ kg-K)

11. Four identical rods AB, CD, CF and DE are joined as shown in figure. The length, cross-sectional area and thermal conductivity of each rod are l, A and K respectively. The ends A, E and F are maintained at temperatures T_1, T_2 and T_3 respectively. Assuming no loss of heat to the atmosphere. Find the temperature at B, the mid-point of CD.



12. The ends of a copper rod of length 1 m and area of cross-section 1 cm^2 are maintained at 0° C and 100° C. At the centre of the rod there is a source of heat of power 25 W. Calculate the temperature gradient in the two halves of the rod in steady state. Thermal conductivity of copper is 400 $\text{Wm}^{-1}\text{K}^{-1}$.

13. A copper sphere is suspended in an evacuated chamber maintained at 300 K. The sphere is maintained at a constant temperature of 500 K by heating it electrically . A total of 210 W of electric power is needed to do it. When the surface of the copper sphere is completely blackened, 700 W is needed to maintain the same temperature of the sphere. Calculate the emissivity of copper.

LEVEL 2

Single Correct Options

1. A cylindrical rod with one end in a steam chamber and the other end in ice results in melting of 0.1 g of ice per second. If the rod is replaced by another with half the length and double the radius of the first and if the thermal conductivity of material of second rod is 1/4 that of first, the rate at which ice melts in g/s will be

(a) 0.4
(b) 0.05
(c) 0.2
(d) 0.1

2. Two sheets of thickness d and $3d$, are touching each other. The temperature just outside the thinner sheet is T_1 and on the side of the thicker sheet is T_3. The interface temperature is T_2. T_1, T_2 and T_3 are in arithmetic progression. The ratio of thermal conductivity of thinner sheet to thicker sheet is

(a) 1 : 3
(b) 3 : 1
(c) 2 : 3
(d) 3 : 9

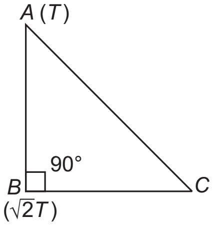
3. A long rod has one end at 0°C and other end at a high temperature. The coefficient of thermal conductivity varies with distance from the low temperature end as $K = K_0(1 + ax)$, where $K_0 = 10^2$ SI unit and $a = 1\ \text{m}^{-1}$. At what distance from the first end the temperature will be 100°C ? The area of cross-section is $1\ \text{cm}^2$ and rate of heat conduction is 1 W.

(a) 2.7 m
(b) 1.7 m
(c) 3 m
(d) 1.5 m

4. Two rods are of same material and having same length and area. If heat ΔQ flows through them for 12 min when they are joined side by side. If now both the rods are joined in parallel, then the same amount of heat ΔQ will flow in

(a) 24 min
(b) 3 min
(c) 12 min
(d) 6 min

5. Three rods of identical cross-sectional area and made from the same metal form the sides of an isosceles triangle ABC right angled at B as shown in the figure. The points A and B are maintained at temperatures T and $\sqrt{2}\,T$ respectively in the steady state. Assuming that only heat conduction takes place, temperature of point C will be

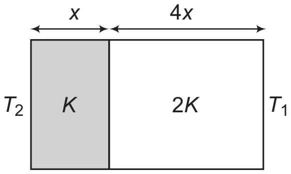


(a) $\dfrac{T}{\sqrt{2}-1}$
(b) $\dfrac{T}{\sqrt{2}+1}$
(c) $\dfrac{3T}{\sqrt{2}+1}$
(d) $\dfrac{T}{\sqrt{3}(\sqrt{2}-1)}$

6. A kettle with 2 litre water at 27°C is heated by operating coil heater of power 1 kW. The heat is lost to the atmosphere at constant rate 160 J/s, when its lid is open. In how much time will water heated to 77°C with the lid open? (specific heat of water = 4.2 kJ/° C-kg)

(a) 8 min 20 s
(b) 6 min 2 s
(c) 14 min
(d) 7 min

7. The temperature of the two outer surfaces of a composite slab consisting of two materials having coefficients of thermal conductivity K and $2K$ and thickness x and $4x$ respectively are T_2 and $T_1 (T_2 > T_1)$. The rate of heat transfer through the slab in steady state is $\dfrac{AK(T_2 - T_1)}{x} f$. where, f is equal to



(a) 1
(b) 1/2
(c) 2/3
(d) 1/3

More than One Correct Options

1. A solid sphere and a hollow sphere of the same material and of equal radii are heated to the same temperature

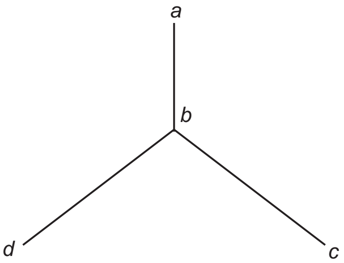
(a) both will emit equal amount of radiation per unit time in the beginning

(b) both will absorb equal amount of radiation per second from the surroundings in the beginning

(c) the initial rate of cooling will be the same for both the spheres

(d) the two spheres will have equal temperatures at any instant

2. Three identical conducting rods are connected as shown in figure. Given that $\theta_a = 40°\,\text{C}$, $\theta_c = 30°\,\text{C}$ and $\theta_d = 20°\,\text{C}$. Choose the correct options.



(a) temperature of junction *b* is 15°C

(b) temperature of junction *b* is 30°C

(c) heat will flow from *c* to *b*

(d) heat will flow from *b* to *d*

3. Two liquids of specific heat ratio 1 : 2 are at temperatures 2θ and θ

(a) if equal amounts of them are mixed, then temperature of mixture is $1.5\,\theta$

(b) if equal amounts of them are mixed, then temperature of mixture is $\frac{4}{3}\theta$

(c) for their equal amounts, the ratio of heat capacities is 1 : 1

(d) for their equal amounts, the ratio of their heat capacities is 1 : 2

4. Two conducting rods when connected between two points at constant but different temperatures separately, the rate of heat flow through them is q_1 and q_2

(a) When they are connected in series, the net rate of heat flow will be $q_1 + q_2$

(b) When they are connected in series, the net rate of heat flow is $\dfrac{q_1 q_2}{q_1 + q_2}$

(c) When they are connected in parallel, the net rate of heat flow is $q_1 + q_2$

(d) When they are connected in parallel, the net rate of heat flow is $\dfrac{q_1 q_2}{q_1 + q_2}$

5. Choose the correct options.

(a) Good absorbers of a particular wavelength are good emitters of same wavelength. This statement was given by Kirchhoff

(b) At low temperature of a body the rate of cooling is directly proportional to temperature of the body. This statement was given by the Newton

(c) Emissive power of a perfectly black body is 1

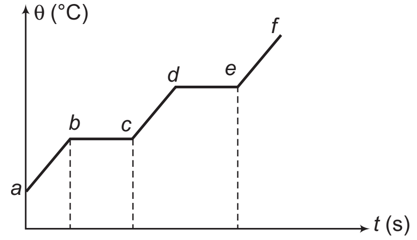
(d) Absorptive power of a perfectly black body is 1

Match the Columns

1. Match the following two columns.

Column I	Column II
(a) Stefan's constant	(p) $[L\theta]$
(b) Wien's constant	(q) $[ML^2T^{-3}\theta^{-2}]$
(c) Emissive power	(r) $[MT^{-3}]$
(d) Thermal resistance	(s) None of these

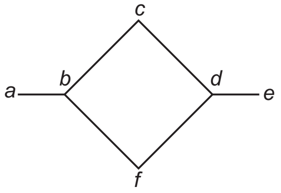
2. Heat is supplied to a substance in solid state at a constant rate. Its temperature varies with time as shown in figure. Match the following two columns.



Column I	Column II
(a) Slope of line *ab*	(p) *de*
(b) Length of line *bc*	(q) *cd*
(c) Solid + liquid state	(r) directly proportional to mass
(d) Only liquid state	(s) None of these

3. Six identical conducting rods are connected as shown in figure. In steady state temperature of point *a* is fixed at 100°C and temperature of *e* at – 80° C. Match the following two columns.

Column I	Column II
(a) Temperature of *b*	(p) 10°C
(b) Temperature of *c*	(q) 40°C
(c) Temperature of *f*	(r) – 20°C
(d) Temperature of *d*	(s) None of these



4. Three liquids A, B and C having same specific heats have masses m, $2m$ and $3m$. Their temperatures are, θ, 2θ and 3θ respectively. For temperature of mixture, match the following two columns.

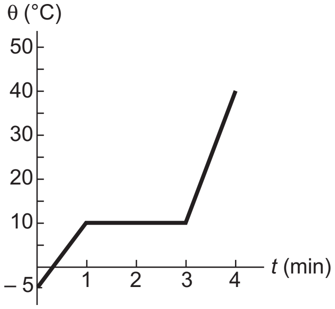
Column I	Column II
(a) When A and B are mixed	(p) $\frac{5}{2}\theta$
(b) When A and C are mixed	(q) $\frac{5}{3}\theta$
(c) When B and C are mixed	(r) $\frac{7}{3}\theta$
(d) When A, B and C all are mixed	(s) $\frac{13}{5}\theta$

5. Match the following two columns.

Column I	Column II
(a) Specific heat	(p) watt
(b) Heat capacity	(q) J/kg-°C
(c) Heat current	(r) J/s
(d) Latent heat	(s) None of these

Subjective Questions

1. As a physicist, you put heat into a 500 g solid sample at the rate of 10.0 kJ/ min, while recording its temperature as a function of time. You plot your data and obtain the graph shown in figure.



(a) What is the latent heat of fusion for this solid?
(b) What is the specific heat of solid state of the material?

2. A hot body placed in air is cooled according to Newton's law of cooling, the rate of decrease of temperature being k times the temperature difference from the surroundings. Starting from $t = 0$, find the time in which the body will lose half the maximum temperature it can lose.

3. Three rods of copper, brass and steel are welded together to form a Y-shaped structure. The cross-sectional area of each rod is 4 cm^2. The end of copper rod is maintained at 100 °C and the ends of the brass and steel rods at 80 °C and 60 °C respectively. Assume that there is no loss of heat from the surfaces of the rods. The lengths of rods are : copper 46 cm, brass 13 cm and steel 12 cm.

(a) What is the temperature of the junction point?
(b) What is the heat current in the copper rod?
K (copper) = 0.92, K (steel) = 0.12 and K (brass) = 0.26 cal/ cm-s °C

4. Ice at 0°C is added to 200 g of water initially at 70°C in a vacuum flask. When 50 g of ice has been added and has all melted the temperature of the flask and contents is 40°C. When a further 80 g of ice has been added and has all melted the temperature of the whole becomes 10°C. Find the latent heat of fusion of ice.

5. A copper cube of mass 200 g slides down a rough inclined plane of inclination 37° at a constant speed. Assuming that the loss in mechanical energy goes into the copper block as thermal energy. Find the increase in temperature of the block as it slides down through 60 cm. Specific heat capacity of copper is equal to 420 J/ kg-K. (Take, $g = 10$ m/ s^2)

6. A cylindrical block of length 0.4 m and area of cross-section 0.04 m^2 is placed coaxially on a thin metal disc of mass 0.4 kg and of the same cross-section. The upper face of the cylinder is maintained at a constant temperature of 400 K and the initial temperature of the disc is 300 K. If the thermal conductivity of the material of the cylinder is 10 watt/m-K and the specific heat of the material of the disc is 600 J/kg-K, how long will it take for the temperature of the disc to increase to 350 K? Assume for purpose of calculation the thermal conductivity of the disc to be very high and the system to be thermally insulated except for the upper face of the cylinder.

7. A metallic cylindrical vessel whose inner and outer radii are r_1 and r_2 is filled with ice at 0° C. The mass of the ice in the cylinder is m. Circular portions of the cylinder is sealed with completely adiabatic walls. The vessel is kept in air. Temperature of the air is 50° C. How long will it take for the ice to melt completely. Thermal conductivity of the cylinder is K and its length is l. Latent heat of fusion is L.

8. An electric heater is placed inside a room of total wall area 137 m^2 to maintain the temperature inside at 20° C . The outside temperature is –10° C. The walls are made of three composite materials. The inner most layer is made of wood of thickness 2.5 cm the middle layer is of cement of thickness 1 cm and the exterior layer is of brick of thickness 2.5 cm. Find the power of electric heater assuming that there is no heat losses through the floor and ceiling . The thermal conductivities of wood, cement and brick are 0.125 W/m°-C, 1.5 W/m°-C and 1.0 W/m°-C respectively.

9. A 2 m long wire of resistance 4 Ω and diameter 0.64 mm is coated with plastic insulation of thickness 0.66 mm. A current of 5 A flows through the wire. Find the temperature difference across the insulation in the steady state. Thermal conductivity of plastic is 0.16×10^{-2} cal/s cm°-C.

10. Two chunks of metal with heat capacities C_1 and C_2 are interconnected by a rod of length l and cross-sectional area A and fairly low conductivity K. The whole system is thermally insulated from the environment. At a moment $t = 0$, the temperature difference between two chunks of metal equals $(\Delta T)_0$. Assuming the heat capacity of the rod to be negligible, find the temperature difference between the chunks as a function of time .

11. A rod of length l with thermally insulated lateral surface consists of material whose heat conductivity coefficient varies with temperature as $k = a/T$, where a is a constant. The ends of the rod are kept at temperatures T_1 and T_2. Find the function $T(x)$, where x is the distance from the end whose temperature is T_1.

12. One end of a uniform brass rod 20 cm long and 10 cm^2 cross-sectional area is kept at 100° C. The other end is in perfect thermal contact with another rod of identical cross-section and length 10 cm. The free end of this rod is kept in melting ice and when the steady state has been reached, it is found that 360 g of ice melts per hour. Calculate the thermal conductivity of the rod, given that the thermal conductivity of brass is 0.25 cal/s cm° C and $L = 80$ cal/g.

13. Heat flows radially outward through a spherical shell of outside radius R_2 and inner radius R_1. The temperature of inner surface of shell is θ_1 and that of outer is θ_2. At what radial distance from centre of shell the temperature is just half way between θ_1 and θ_2?

14. A layer of ice of thickness y is on the surface of a lake. The air is at a constant temperature $-\theta°$ C and the ice water interface is at 0°C. Show that the rate at which the thickness increases is given by

$$\frac{dy}{dt} = \frac{K\theta}{L\rho y}$$

where, K is the thermal conductivity of the ice, L the latent heat of fusion and ρ is the density of the ice.

Hints & Solutions

17. Wave Motion

INTRODUCTORY EXERCISE 17.1

1. $$\frac{\partial^2 y}{\partial t^2} = -\omega^2 a \sin \omega t$$

and $$\frac{\partial^2 y}{\partial x^2} = 0$$

Since, $$\frac{\partial^2 y}{\partial t^2} \neq \frac{\partial^2 y}{\partial x^2} \qquad \text{(constant)}$$

Hence, the given equation does not represent a wave equation.

2. Speed of wave $= \dfrac{\text{Coefficient of } t}{\text{Coefficient of } x} = \dfrac{c}{b}$

3. The converse is not true means if the function can be represented in the form $y = f(x \pm vt)$, it does not necessarily express a travelling wave. As the essential condition for a travelling wave is that the vibrating particle must have finite displacement value for all x and t.

4. (a) A has the dimensions of y.

$$\frac{x}{a} \text{ and } \frac{t}{T} \text{ are dimensionless.}$$

(b) $v = \dfrac{\text{coefficient of } t}{\text{coefficient of } x}$

(c) $\dfrac{x}{a}$ and $\dfrac{t}{T}$ are of same sign

(d) $y_{\max} = A$

INTRODUCTORY EXERCISE 17.2

1. Comparing the given equation with

$$y = \sin(kx - \omega t)$$

we find,

(a) Amplitude $A = 5$ mm

(b) Angular wave number $k = 1\ \text{cm}^{-1}$

(c) Wavelength, $\lambda = \dfrac{2\pi}{k} = 2\pi$ cm

(d) Frequency, $\nu = \dfrac{\omega}{2\pi} = \dfrac{60}{2\pi}$ Hz

$$= \frac{30}{\pi}\ \text{Hz}$$

(e) Time period, $T = \dfrac{1}{\nu} = \dfrac{\pi}{30}$ s

(f) Wave velocity, $v = \nu\lambda = 60\ \text{cm s}^{-1}$

2. (a) $T = \dfrac{2\pi}{\omega}$, $\lambda = \dfrac{2\pi}{k}$

(b) Find $\dfrac{\partial y}{\partial t}$ and then substitute the given values of x and t.

(c) and (d) Procedure is same.

INTRODUCTORY EXERCISE 17.3

1. (a) coefficient of x and t are of same sign.

(b) $v = \dfrac{314}{31.4} = 10\ \text{m/s} \Rightarrow \lambda = \dfrac{2\pi}{k},\ f = \dfrac{\omega}{2\pi}$

(c) $v_{\max} = \omega A$

2. (a) The velocity of the particle at x at time t is

$$v = \frac{\partial y}{\partial t} = (3.0\ \text{cm})(-314\ \text{s}^{-1}) \cos[(3.14\ \text{cm}^{-1}) x - (314\ \text{s}^{-1})t]$$

$$= (-9.4\ \text{ms}^{-1}) \cos[(3.14\text{cm}^{-1})x - (314\ \text{s}^{-1})t]$$

The maximum velocity of a particle will be

$$v = 9.4\ \text{ms}^{-1}$$

(b) The acceleration of the particle at x at time t is

$$a = \frac{\partial v}{\partial t} = -(9.4\ \text{ms}^{-1})(314\ \text{s}^{-1}) \sin[(3.14\ \text{cm}^{-1}) x - (314\ \text{s}^{-1})t]$$

$$= -(2952\ \text{ms}^{-1}) \sin[(3.14\ \text{cm}^{-1})x - (314\ \text{s}^{-1})t].$$

The acceleration of the particle at $x = 6.0$ cm at time $t = 0.11$ s is

$$a = -(2952\ \text{ms}^{-2}) \sin[6\pi - 11\pi] = 0$$

3. (a) Wave velocity $= \dfrac{\text{Coefficient of } t}{\text{Coefficient of } x}$

$$= \frac{1/0.01}{1/0.05} = 5\ \text{m/s}$$

Since, coefficient of t and coefficient of x are of same sign. Hence, wave is travelling in negative x-direction.

or $v = -5$ m/s

(b) Velocity of particle,

$$v_P = \frac{\partial y}{\partial t} = 2\cos\left(\frac{x}{0.05} + \frac{t}{0.01}\right)$$

Substituting $x = 0.2$ and $t = 0.3$, we have

$$v_P = 2\cos(34) = 2(-0.85)$$

$$= -1.7\ \text{m/s}$$

4. (a)
$$\Delta\phi = \frac{2\pi}{\lambda}\,\Delta x$$

$$\therefore \quad \Delta x = \frac{\lambda\Delta\phi}{2\pi} = \frac{v\,(\Delta\phi)}{2\pi f}$$

$$= \frac{(350)\,(\pi/3)}{(2\pi)\,(500)}$$

$$= 0.116 \text{ m}$$

(b)
$$\Delta\phi = (\omega)\Delta t$$

$$= (2\pi f)\,(\Delta t)$$

$$= (2\pi)\,(500)(10^{-3})$$

$$= \pi \text{ or } 180^\circ$$

INTRODUCTORY EXERCISE 17.4

1. $f_{\max} = \dfrac{c}{\lambda_{\min}}$

$f_{\min} = \dfrac{c}{\lambda_{\max}}$

2. $\lambda = \dfrac{v}{f}$ for both

INTRODUCTORY EXERCISE 17.5

1. The tension in the string is $F = mg = 10$ N. The mass per unit length is $\mu = 1.0 \text{ g cm}^{-1} = 0.1 \text{ kg m}^{-1}$. The wave velocity is, therefore, $v = \sqrt{F\mu} = \sqrt{\dfrac{10 \text{ N}}{0.1 \text{ kg m}^{-1}}} = 10 \text{ ms}^{-1}$. The time taken by the pulse in travelling through 50 cm is, therefore 0.05 s.

2. $v = \sqrt{\dfrac{T}{\mu}}$

3. $T_{CD} = 3.2 \text{ g}, T_{AB} = 6.4 \text{ g}$

and $\qquad v = \sqrt{\dfrac{T}{\mu}}$

4. $v = \sqrt{\dfrac{T}{\mu}}, \quad \mu = \dfrac{m}{l} \quad$ and $\quad t = \dfrac{d}{v}$

5.
$$v = \sqrt{\frac{T}{\rho S}} = \sqrt{\frac{T}{\rho\,(\pi d^2/A)}}$$

$$= \sqrt{\frac{4T}{\rho\pi d^2}} \qquad (T = mg)$$

$$= \sqrt{\frac{4 \times 20}{(8920)\,(\pi)\,(2.4 \times 10^{-3})^2}}$$

$$= 22 \text{ m/s}$$

6. (a)
$$v = \sqrt{\frac{T}{\mu}} = \sqrt{\frac{mg}{\mu}} \qquad \ldots\text{(i)}$$

$$= \sqrt{\frac{1.5 \times 9.8}{0.055}} = 16.3 \text{ m/s}$$

(b) $\lambda = \dfrac{v}{f} = \dfrac{16.3}{120} = 0.136$ m

(c) From Eq. (i), we can see that $v \propto \sqrt{m}$. If m is doubled, then v will become $\sqrt{2}$ times. Hence, from the relation $\lambda = \dfrac{v}{f} \cdot \lambda$ will also become $\sqrt{2}$ times. As f remains unchanged.

INTRODUCTORY EXERCISE 17.6

1. $I = \dfrac{P}{4\pi r^2} = \dfrac{1.0}{4\pi\,(1)^2} = \dfrac{1}{4\pi} \text{ W/m}^2$

2. Suppose power of line source is P. Then, at distance r, surface area is $2\pi rl$.

$$\therefore \quad I = \frac{P}{S} = \frac{P}{2\pi rl}$$

or
$$I \propto \frac{1}{r}$$

Further,
$$I \propto A^2$$

$$\therefore \quad A \propto \frac{1}{\sqrt{r}}$$

3. Energy density, $u = \dfrac{1}{2}\rho\omega^2 A^2$

Total energy $= (u)\,(V)$
$$= \frac{1}{2}(\rho V)\,(2\pi f)^2 A^2$$

$$= 2\pi^2\, m f^2 A^2$$

$$= (2)(\pi)^2(0.08)(120)^2(0.16 \times 10^{-3})^2$$

$$= 581 \times 10^{-3} \text{J}$$

$$= 0.58 \text{ mJ}$$

4. Power $= \dfrac{1}{2}\rho\omega^2 A^2 S v$

But, $\qquad \rho S = \mu$

and $\qquad v = \sqrt{\dfrac{T}{\mu}}$

$$\therefore \quad \rho S v = \sqrt{\mu T}$$

Hence, Power $= \dfrac{1}{2}\,(2\pi f)^2 A^2 \sqrt{T\mu}$
$$= 2\pi^2 f^2\, A^2 \sqrt{T\mu}$$

$$= (2)\,(\pi)^2\,(60)^2\,(0.06)^2 \sqrt{80 \times 5 \times 10^{-2}}$$

$$= 512 \text{W}$$

5. (a) As derived in above problem, power

$$= 2\pi^2 f^2 A^2 \sqrt{T\mu}$$

$$= (2)\,(\pi)^2\,(200)^2\,(10^{-3})^2\,\sqrt{60 \times (0.006)}$$

$$= 0.47 \text{ W}$$

(b) Energy density, $u = \frac{1}{2}\rho\omega^2 A^2$

$$\text{Total energy} = (u)\,(V)$$

$$= \left(\frac{1}{2}\rho\omega^2 A^2\right)(lS)$$

But, $\rho S = \mu$

$$\therefore \text{ Total energy} = \frac{1}{2}\mu l\,(2\pi f)^2\,A^2$$

$$= 2\pi^2 f^2 A^2 \mu l$$

$$= (2)\,(\pi)^2\,(200)^2 (10^{-3})^2\,(0.006)\,(2.0)$$

$$= 9.4 \times 10^{-3} \text{J} = 9.4 \text{ mJ}$$

6. $P = \frac{1}{2}\rho\omega^2 A^2 Sv$ ...(i)

But, $\rho S = \mu$

and $v = \sqrt{\frac{T}{\mu}} = \sqrt{\frac{T}{\rho S}}$

$\therefore$ $\rho S = \frac{T}{v^2}$ or $\rho S v = \frac{T}{v}$

Substituting in Eq. (i), we have

$$P = \frac{1}{2}\,(2\pi f)^2 A^2 \frac{T}{v}$$

$$= \frac{2\pi^2 f^2 A^2 T}{v}$$

$$= \frac{(2)\,(\pi)^2\,(100)^2\,(0.0005)^2\,(100)}{100}$$

$$= 0.049 \text{ J} = 49 \text{ mJ}$$

Exercise

LEVEL 1

Assertion and Reason

3. If both waves ωt and kx are of opposite signs, then both are travelling in positive directions.

4. If f is doubled (which is source dependant), then λ will automatically become half, so that speed remains same. Because speed is only medium dependant.

5. Longitudinal or sound wave cannot travel in vacuum.

7. Electromagnetic wave which can travel with or without medium.

8. Just by observation we cannot say that $\mu_2 > \mu_1$ and hence $v_2 > v_1$.

If their densities are different, then μ_2 may be less than μ_1 also.

9. At mean position kinetic energy is maximum and there is a maximum stretch in string. Because one side particles are moving up and the other side particles are moving down. Hence, potential energy is also maximum.

10. In $v_P = -v\,\frac{\partial y}{\partial x}$,

v_P is negative and $\frac{\partial y}{\partial x}$ (the slope) is also negative.

Hence, the velocity v should also be negative.

Objective Questions

1. $\lambda = \frac{2\pi}{k} = \frac{2\pi}{\pi/9} = 18 \text{ m}$

2. $\Delta\phi = \frac{2\pi}{\lambda}\,\Delta x = k\Delta x$

$$= (10\pi \times 0.01)\,(10) = \pi$$

3. At $t = 0$, $y_{\max} = \frac{1}{2}$ at $x = 0$

At $t = 2$ s, $y_{\max} = \frac{1}{2}$ at $x = 2$ m

$\therefore$ In 2 s, $y_{\max}$ has travelled 2 m in positive direction

$$\therefore \quad v = +\frac{2}{3} = +1 \text{ m/s}$$

4. Wave velocity and particle velocity are two different things.

5. $\Delta\phi = \frac{2\pi}{\lambda}\,(\Delta x) = \frac{2\pi\,\phi(\Delta x)}{v}$ $\left(\text{as } \lambda = \frac{v}{f}\right)$

$$= \frac{2\pi\,(25)\,(16-10)}{300} = \pi$$

6. $v = \frac{\omega}{k} = \sqrt{\frac{T}{\mu}}$

$$\therefore \quad T = \mu\left(\frac{\omega}{k}\right)^2 = (1.3 \times 10^{-4})\left(\frac{30}{1}\right)^2$$

$$= 0.12 \text{ N}$$

7. $\because \quad \omega = \dfrac{2\pi}{T} = \dfrac{2\pi}{(t/N)} = \dfrac{2\pi N}{t}$

$$= \frac{(2\pi)\,(150)}{60}$$

$$= (5\pi)\ \text{rad/s}$$

Subjective Questions

1. (b) $\lambda = \dfrac{2\pi}{k} = \dfrac{2\pi}{2\pi/28}$

$$= 28\ \text{cm}$$

(c) $f = \dfrac{\omega}{2\pi} = \dfrac{2\pi/0.036}{2\pi}$

$$= 27.8\ \text{Hz}$$

(d) $v = f\lambda = 778.4\ \text{cm/s}$

$$= 7.8\ \text{m/s}$$

Since, ωt and kx have opposite signs. Hence, wave is travelling in positive direction.

2. (a) Put $t = 0$, $x = 2\,\text{cm}$

(b) $\lambda = \dfrac{2\pi}{k} = \dfrac{2\pi}{(30\pi/240)} = 16\ \text{cm}$

(c) Wave velocity $= \dfrac{\text{Coefficient of } t}{\text{Coefficient of } x}$

$$= \frac{1}{1/240}$$

$$= 240\ \text{cm/s}$$

(d) $f = \dfrac{\omega}{2\pi} = \dfrac{30\pi}{2\pi} = 15\ \text{Hz}$

3. At $t = 0$, y is maximum at $x = 0$.

At $t = 2\,\text{s}$, y is maximum at $x = 1\,\text{m}$. Hence, in 2 s wave has travelled 2 m in positive x-direction

$\therefore \qquad v = +\dfrac{1}{2}\ \text{m/s}$

$$= +\ 0.5\ \text{m/s}$$

4. Since, coefficient of t and x are opposite signs, then wave is travelling along negative x-direction.

Further, speed of wave $= \dfrac{\text{Coefficient of } t}{\text{Coefficient of } x}$

$$= \frac{2}{1} = 2\ \text{m/s}$$

Amplitude = maximum value of y

$$= \frac{10}{5} = 2\ \text{m}$$

5. Wave speed, $\quad v = \dfrac{\omega}{k}$

and maximum particle speed,

$$(v_P)_{\max} = \omega A$$

From these two expressions, we can see that

$$(v_P)_{\max} = (kA)\,V$$

6. Mass per unit length, $\mu = \dfrac{m}{l}$

$$v = \sqrt{\frac{T}{\mu}} = \sqrt{\frac{Tl}{m}} = \sqrt{\frac{500 \times 2}{0.06}}$$

$$= 129.1\ \text{m/s}$$

7. $\quad v = \sqrt{\dfrac{T}{\rho S}}$ as mass per unit length $= \rho S$

$\therefore \qquad v = \sqrt{\dfrac{0.98}{9.8 \times 10^{3} \times 10^{-6}}}$

$$= 10\ \text{m/s}$$

8. Since, wave is travelling along positive x-direction. Hence, coefficient of t and coefficient of x should have opposite signs. Further,

$$v = \frac{\text{Coefficient of } t}{\text{Coefficient of } x}$$

$\therefore \qquad 2 = \dfrac{\text{Coefficient of } t}{\text{Coefficient of } x}$

$\therefore$ Coefficient of $t = 2$ (coefficient of x)

$$= 2 \times 1 = 2\ \text{SI units}$$

$\therefore \qquad y = \dfrac{10}{(x - 2t)^2 + 2}$

9. (a) $\dfrac{\lambda}{2} = 2\ \text{cm}$

$\Rightarrow \qquad \lambda = 4\ \text{cm}$

$$f = \frac{v}{\lambda} = \frac{40}{4} = 10\ \text{Hz}$$

(b) $\Delta\phi = \dfrac{2\pi}{\lambda}\,\Delta x = \left(\dfrac{2\pi}{4}\right)(2.5) = \dfrac{5\pi}{4}$

(c) $\omega t = \theta$

or $\quad (2\pi/t) = \theta$

$\therefore \qquad t = \dfrac{\theta}{2\pi f} = \dfrac{\pi/3}{(2\pi)\,(10)}$

$$= \frac{1}{60}\ \text{s}$$

(d) At P, particle is at mean position. So,

$$v = \text{maximum velocity}$$

$$= \omega A$$

$$= 2\pi f A$$

$$= (2\pi)(10)(2)$$

$$= (40\pi)\ \text{cm/s}$$

$$= 125.7\ \text{cm/s} = 1.26\ \text{m/s}$$

Further, $$v_P = -(v)\left(\frac{\partial y}{\partial x}\right) \qquad \ldots\text{(i)}$$

Sign of v_1, the wave velocity is given positive.

Sign of $\frac{\partial y}{\partial x}$, slope of y - x graph is also positive.

Hence, from Eq. (i) particle velocity is negative.

$$\therefore \qquad v_P = -1.26\ \text{m/s}$$

10. (a) Wave velocity $= \dfrac{\text{Coefficient of } t}{\text{Coefficient of } x}$

$$= \frac{(1/0.01)}{(1/0.05)} = 5\ \text{m/s}$$

Since, coefficient of t and coefficient of x are of same sign. Hence, wave is travelling in negative x-direction.

or $$v = -5\ \text{m/s}$$

(b) Particle velocity, $v_P = \dfrac{\partial y}{\partial t}$

$$= 2\cos\left(\frac{x}{0.05} + \frac{t}{0.01}\right)$$

Substituting $x = 0.2$ and $t = 0.3$, we have

$$v_P = 2\cos 34$$
$$= (2)(-0.85)$$
$$= -1.7\ \text{m/s}$$

11. (a) $\omega = 2\pi f = 2\pi\left(\dfrac{v}{\lambda}\right) = 2\pi\left(\dfrac{12}{0.4}\right)$

$$= (60\,\pi)\ \text{rad/s}$$
$$k = \frac{2\pi}{\lambda} = \frac{2\pi}{0.4} = (5\pi)\ \text{m}^{-1}$$

Since, wave is travelling along + ve x-direction, ωt and kx should have opposite sign. Further at $t = 0$, $x = 0$ the string has zero displacement and moving upward (in positive direction). Hence at $x = 0$, we should have $A\sin\omega t$ not $-A\sin\omega t$. Therefore, the correct expression is

$$y = A\sin(\omega t - kx)$$

or $$y = 0.05\sin(60\pi t - 5\pi x)$$

(b) Putting $x = 0.2$ m and $t = 0.15$ s in above equation we have,

$$y = -0.035\,4\ \text{m}$$
$$= -3.54\ \text{cm}$$

(c) In part (b), $y = A/\sqrt{2}$

From $y = \dfrac{A}{\sqrt{2}}$ to $y = 0$, time taken is

$$t = \frac{T}{8} = \frac{2\pi}{\omega\times 8}$$
$$= \frac{2\pi}{(60\pi)(8)}$$
$$= 4.2\times 10^{-3}\ \text{s}$$
$$= 4.2\ \text{ms}$$

12. (a) $\because \quad T = \dfrac{2\pi}{\omega} = \dfrac{2\pi}{\pi/0.01} = 0.02$ s

$$= 20\ \text{ms}$$
$$\lambda = \frac{2\pi}{k} = \frac{2\pi}{\pi/2}$$
$$= 4.0\ \text{cm}$$

(b) $v_P = \dfrac{\partial y}{\partial x}$

$$= \left(-\frac{\pi}{0.01}\,\frac{\text{mm}}{\text{s}}\right)\cos\pi\left(\frac{x}{2.0\ \text{cm}} - \frac{t}{0.01\ \text{s}}\right)$$
$$= \left(-\frac{\pi}{10}\,\frac{\text{m}}{\text{s}}\right)\cos\pi\left(\frac{x}{2.0\ \text{cm}} - \frac{t}{0.01\ \text{s}}\right)$$

Put $x = 1$ cm and $t = 0.01$ s in above equation We get,

$$v_P = 0$$

(c) and (d) Putting the given values in the above equation, we get the answers.

13. (a) $k = \dfrac{2\pi}{\lambda} = \dfrac{2\pi}{40} = 0.157$ rad/cm

$$T = \frac{1}{f} = \frac{1}{8} = 0.125\ \text{s}$$
$$\omega = \frac{2\pi}{T} = \frac{2\pi}{0.215} = 50.3\ \text{rad/s}$$
$$v = \frac{\omega}{k} = 320\ \text{cm/s}$$

(b) Amplitude is 15 cm.

At $t = 0$, $x = 0$, $y = +A$. Hence, equation should be a cos equation. Further, wave is travelling in positive x-direction. Hence, ωt and kx should have opposite signs.

14. (a) $T_x = (m_{L-x})\,g = \mu\,(L - x)\,g$

where, μ = mass per unit length

$$\therefore \qquad v_x = \sqrt{\frac{T_x}{\mu}} = \sqrt{g\,(L - x)}$$

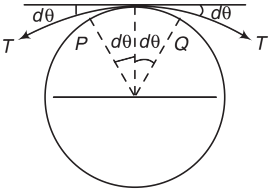
(b) $$v_x = -\frac{dx}{dt} = \sqrt{g\,(L - x)}$$

$$\therefore \quad \int_0^t dt = -\int_{x=L}^{x=0} \sqrt{g\,(L - x)}\,dx$$

Solving we get,

$$t = 2\sqrt{\frac{L}{g}}$$

15. (a) $T\cos d\theta$ components are cancelled. $T\sin d\theta$ components provide the necessary centripetal force to $P\theta$.



$$\therefore \qquad 2T\sin d\theta = m_{PQ}R\omega^2$$

For small angles $\sin d\theta \approx d\theta$

$$\therefore \qquad 2T\,d\theta = [\mu\,(2R)\,d\theta]\,R\omega^2$$

Solving the equation, we get

$$\sqrt{\frac{T}{\mu}} = v = R\omega$$

16. $$M = \int_0^L kx\,dx = \frac{kL^2}{2}$$

$$\therefore \qquad k = \frac{2M}{L^2}$$

$$v_x = \sqrt{\frac{T}{\mu_x}} = \sqrt{\frac{T}{kx}} = \sqrt{\frac{T}{(2M/L^2)\,x}}$$

$$= \left(L\sqrt{\frac{T}{2M}}\right)x^{-1/2} = \frac{dx}{dt}$$

$$\therefore \qquad \int_0^t dt = \frac{1}{L}\sqrt{\frac{2M}{T}}\int_0^L x^{1/2}\,dx$$

$$\text{or} \qquad t = \left(\frac{2}{3L}\sqrt{\frac{2M}{T}}\right)L^{3/2}$$

$$= \frac{2}{3}\sqrt{\frac{2ML}{T}}$$

LEVEL 2

Single Correct Option

1. $\because \quad v = \dfrac{\omega}{k}$

$$\therefore \qquad k = \frac{\omega}{v} = \frac{600\pi}{300}$$

$$= 2\pi\ \text{m}^{-1}$$

$$\therefore \qquad y = 0.04\sin(600\,\pi t - 2\pi x)$$

Now, put $t = 0.01$ s and $x = 0.75$ m

2. $\because \quad \omega = 2\pi f = (2\pi)(100)$

$$= (200\,\pi)\ \text{rad/s}$$

$$v = \frac{\omega}{k}$$

$$\therefore \qquad k = \frac{\omega}{v} = \omega\sqrt{\frac{\mu}{T}}$$

$$= (200\pi)\sqrt{\frac{3.5\times 10^{-3}}{35}}$$

$$= 2\pi\ \text{m}^{-1}$$

At zero displacement,

$$v_P = \omega A = -v\frac{\partial y}{\partial x}$$

$$\therefore \qquad |A| = \frac{v\left(\dfrac{\partial y}{\partial x}\right)}{\omega} = \frac{\left(\sqrt{\dfrac{T}{\mu}}\right)(\text{slope})}{\omega}$$

$$= \frac{\left(\sqrt{\dfrac{35}{3.5\times 10^{-3}}}\right)(\pi/20)}{200\pi}$$

$$= 0.025\ \text{m}$$

3. $\because \quad \omega = \dfrac{2\pi}{T} = \dfrac{2\pi}{0.25}$

$$= 8\pi\ \text{rad/s}$$

$$v = \frac{\omega}{k}$$

$$\therefore \qquad k = \frac{\omega}{v} = \frac{8\pi}{0.48} = \left(\frac{50}{3}\right)\pi\ \text{m}^{-1}$$

$$y = A\sin(\omega t - kx)$$

$$= A\sin\left(8\pi t - \frac{50}{3}\pi x\right)$$

Put $y = 3$ cm, $t = 1$ s, $x = 0.47$ m

showing we get $A = 6$ cm

4. $v = \sqrt{\dfrac{T}{\rho S}} = \sqrt{\dfrac{T}{\rho\,(\pi d^2/4)}}$

$$\therefore \qquad v \propto \sqrt{\frac{T}{d^2}}$$

5. $E \propto \omega^2 A^2$

$$\text{or} \qquad E \propto f^2 A^2$$

E is same

$$\therefore \qquad fA = \text{constant}$$

$$\text{or} \qquad A \propto \frac{1}{f}$$

6. The wave pulse is travelling along positive x-axis. Hence, at and bx should have opposite signs. Further, wave speed

$$v = \frac{\text{Coefficient of } t}{\text{Coefficient of } x}$$

$$\therefore \qquad 4 = \frac{\text{Coefficient of } t}{1}$$

$\therefore$ Coefficient of $t = 4\text{ s}^{-1}$

More than One Correct Options

1. $\because$
$$v = \frac{\text{Coefficient of } t}{\text{Coefficient of } x}$$
$$= \frac{6.2}{2} = 3.1 \text{ m/s}$$
$$A = \frac{2}{20} = 0.1 \text{ m}$$

3.
$$y = A \sin(\pi x + \pi t)$$
$$v_P = \frac{\partial y}{\partial t} = \pi A \cos(\pi x + \pi t)$$
$$a_P = \frac{\partial^2 y}{\partial t^2} = -\pi^2 A \sin(\pi x + \pi t)$$

Now, substitute $t = 0$ and given value of x.

Since, ωt and kx are of same sign, hence the wave is travelling in negative x-direction.

4. Speed of wave
$$= \frac{\text{Coefficient of } t}{\text{Coefficient of } x} = \frac{b}{1} = b$$
$$\lambda = \frac{2\pi}{k} = \frac{2\pi}{(2\pi/a)} = a$$

5. Speed of wave $= \dfrac{\text{Coefficient of } t}{\text{Coefficient of } x}$
$$= \frac{1/b}{1/a} = \frac{a}{b}$$
$$\lambda = \frac{2\pi}{k} = \frac{2\pi}{2\pi/a} = a$$
$$T = \frac{2\pi}{\omega} = \frac{2\pi}{2\pi/b} = b$$

6. y - t graph is sine graph. Therefore, v - t graph is cos graph and a - t is − sine graph as
$$v_P = \frac{\partial y}{\partial t} \quad \text{and} \quad a_P = \frac{\partial^2 y}{\partial t^2}$$

Match the Columns

1. (a) Wave speed $= \dfrac{\text{Coefficient of } t}{\text{Coefficient of } x} = \dfrac{b}{c}$

(b) Maximum particle speed $= \omega A = (b)(a)$

(c) $f = \dfrac{\omega}{2\pi} = \dfrac{b}{2\pi}$

(d) $\lambda = \dfrac{2\pi}{k} = \dfrac{2\pi}{c}$

2. $v_P = \dfrac{\partial y}{\partial t} = (4\pi) \text{ cm/s} \cos[\pi t + 2\pi x]$

$$a_P = \frac{\partial^2 y}{\partial t^2} = (-4\pi^2) \text{ cm/s}^2 \sin[\pi t + 2\pi x]$$

Now substitute the values of t and x.

3. For velocity, $v_P = -v \dfrac{\partial y}{\partial x}$

$\dfrac{\partial y}{\partial x}$ = Slope of y-x graph.

Sign of v is not given in the question.

Hence, direction of v_P cannot be determined.

For particle acceleration,
$$a_P \propto -y$$
i.e. a_P and y are away in opposite directions

If $y = 0$, then $a_P = 0$

4. Energy density $= \dfrac{1}{2}\rho\omega^2 A^2$

= Energy per unit volume

Power = energy transfer per unit

Time $= \dfrac{1}{2}\rho\omega^2 A^2 S v$

Intensity = energy transfer per unit per unit area

$= \dfrac{1}{2}\rho\omega^2 A^2 v = \dfrac{P}{S}$

Wave number $= \dfrac{1}{\lambda}$

5. $v_P = \dfrac{\partial y}{\partial t}$, $a_P = \dfrac{\partial^2 y}{\partial t^2}$

If ωt and kx are of same sign, then wave travel in negative x-direction.

If they are of opposite signs, then wave travels in positive direction.

Subjective Questions

1. (a) $v_P = -v\left(\dfrac{dy}{dx}\right)$

As v_P and $(\text{slope})_P$ are both positive, v must be negative. Hence, the wave is moving in negative x-axis.

(b) $y = A \sin(\omega t - kx + \phi)$ ...(i)

$$k = \frac{2\pi}{\lambda} = \frac{\pi}{2} \text{ cm}^{-1}$$
$$A = 4 \times 10^{-3} \text{ m} = 0.4 \text{ cm}$$

At $t = 0,\ x = 0,$ slope $\frac{dy}{dx} = +$ ve

$\therefore\quad v_P = -v(\text{slope}) = +$ ve

Further at $t = 0, x = 0,\ y = +$ ve

$$\therefore\quad \phi = \frac{\pi}{4}$$

Further, $20\sqrt{3} = -v \tan 60°$

$$\therefore\quad v = -20 \text{ cm/s}$$

$$f = \frac{v}{\lambda} = 5 \text{ Hz}$$

$$\therefore\quad \omega = 2\pi f = 10\pi$$

$$\therefore\quad y = (0.4 \text{ cm}) \sin\left(10\pi t + \frac{\pi}{2}x + \frac{\pi}{4}\right)$$ **Ans.**

(c) $P = 2\pi^2 A^2 f^2 \mu v$

$\therefore$ Energy carried per cycle

$$E = PT = \frac{P}{f} = 2\pi^2 A^2 f \mu v$$

Substituting the values, we have

$$E = 1.6 \times 10^{-5} \text{ J}$$ **Ans.**

2. (a) $v = \sqrt{\frac{T}{\rho S}}$

$$= \sqrt{\frac{64}{12.5 \times 10^3 \times 0.8 \times 10^{-6}}}$$

$= 80$ m/s **Ans.**

(b) $\omega = 2\pi f = 2\pi(20) = 40\pi$ rad/s

$$k = \frac{\omega}{v} = \frac{40\pi}{80} = \frac{\pi}{2} \text{ m}^{-1}$$

$$\therefore\quad y = (1.0 \text{ cm}) \cos\left[(40\pi s^{-1})t - \left(\frac{\pi}{2}m^{-1}\right)x\right]$$

Ans.

(c) Substituting $x = 0.5$ m and $t = 0.05$ s, we get

$$y = \frac{1}{\sqrt{2}} \text{ cm}$$ **Ans.**

(d) Particle velocity at time t.

$$v_P = \frac{\partial y}{\partial t}$$

$$= -(40\pi \text{ cm/s}) \sin\left[(40\pi \text{ s}^{-1})t - \left(\frac{\pi}{2} \text{ m}^{-1}\right)x\right]$$

Substituting $x = 0.5$ m and $t = 0.05$ s, we get

$$v_P = 89 \text{ cm/s}$$ **Ans.**

3. $k_{\text{eff}} = 2k = 1.0$ N/m

$$f = \frac{1}{2\pi}\sqrt{\frac{k_{\text{eff}}}{m}} = \frac{10}{2\pi} \text{ s}^{-1}$$

$$v = 0.1 \text{ m/s},\quad A = 0.02 \text{ m}$$

$$\lambda = \frac{v}{f} = \frac{0.1}{\left(\frac{10}{2\pi}\right)} = \frac{2\pi}{100} \text{ m}$$

$$y = A \cos\left(\frac{2\pi}{\lambda}\right)(vt - x)$$

$$= 0.02 \cos 100(0.1t - x)$$

$$= 0.02 \cos (10t - 100x) \text{ m}$$ **Ans.**

The distance between two successive maxima

$$= \lambda = \frac{2\pi}{100} = 0.0628 \text{ m}$$ **Ans.**

4. (a) Dimensions of A and Y are same.

Similarly, dimensions of a and x are same.

(b) As the wave is travelling towards positive x-axis, there should be negative sign between term of x and term of t.

Further, speed of wave

$$v = \frac{\text{Coefficient of } t}{\text{Coefficient of } x}$$

$\therefore$ Coefficient of $t = (v) \times$ coefficient of x

5. From the given figure, we can see that

(a) Amplitude, $A = 1.0$ mm

(b) Wavelength, $\lambda = 4$ cm

(c) Wave number, $k = \frac{2\pi}{\lambda} = 1.57 \text{ cm}^{-1} \approx 1.6 \text{ cm}^{-1}$

(d) Frequency, $f = \frac{v}{\lambda} = \frac{20}{4} = 5$ Hz

6. $v = \sqrt{\frac{T}{\rho S}}$ or $v \propto \frac{1}{\sqrt{\rho}}$

$$\therefore\quad \frac{v_1}{v_2} = \sqrt{\frac{\rho_2}{\rho_1}}$$

$$\therefore\quad \frac{\rho_1}{\rho_2} = \left(\frac{v_2}{v_1}\right)^2 = \left(\frac{1}{2}\right)^2 = \frac{1}{4}$$

7. $$v_1 = \sqrt{\frac{T_1}{\mu_1}}$$

$$= \sqrt{\frac{4.8}{1.2 \times 10^{-2}}} = 20 \text{ m/s}$$

$$v_2 = \sqrt{\frac{T_2}{\mu_2}} = \sqrt{\frac{7.5}{1.2 \times 10^{-2}}}$$

$$= 25 \text{ m/s}$$

Pulses will meet when $x_A = x_B$

or $\quad 20t = 25(t - 0.02)$

$\therefore\quad t = 0.1$ s

and $\quad x_A$ or $x_B = 20 \times 0.1 = 2$ m

8. (a) $P = \frac{1}{2}\rho\omega^2 A^2 S v$

or $$A = \frac{1}{\omega}\sqrt{\frac{2P}{\rho S v}} \qquad \ldots\text{(i)}$$

Here, $\rho S = \mu$ = mass per unit length

$$= \frac{6 \times 10^{-3}}{8} \text{ kg/m}$$

$$\omega = 2\pi f = \frac{2\pi v}{\lambda}$$

$$= \frac{2\pi \times 30}{0.2}$$

Substituting these values in Eq. (i), we have

$$A = \frac{0.2}{2\pi \times 30}\sqrt{\frac{2 \times 50 \times 8}{6 \times 10^{-3} \times 30}}$$

$$= 0.0707 \text{ m}$$

$$= 7.07 \text{ cm}$$

(b) $P \propto v\omega^2$

or $$P \propto v(v^2)$$

or $$P \propto v^3$$

When wave speed is doubled, then power will become eight times.

9. $-\,dT = (dm)x\omega^2 = \left(\frac{m}{L}dx\right)x\omega^2$

or $$-\int_0^T dT = \frac{m}{L}\omega^2 \int_{x=L}^{x} x\,dx$$

∴ $$-T = \frac{m}{L}\omega^2\left(\frac{x^2}{2} - \frac{L^2}{2}\right)$$

or $$T = \frac{m\omega^2}{2L}(L^2 - x^2)$$

$$v = \sqrt{\frac{T}{\mu}}$$

$$= \sqrt{\frac{\frac{m\omega^2}{2L}(L^2 - x^2)}{m/L}}$$

$$= \omega\sqrt{\frac{L^2 - x^2}{2}}$$

or $$\frac{dx}{dt} = \frac{\omega}{\sqrt{2}}\sqrt{L^2 - x^2}$$

∴ $$\int_0^t dt = \frac{\sqrt{2}}{\omega}\int_0^L \frac{dx}{\sqrt{L^2 - x^2}}$$

∴ $$t = \frac{\sqrt{2}}{\omega}\left[\sin^{-1}\left(\frac{x}{L}\right)\right]_0^L$$

$$= \frac{\sqrt{2}}{\omega}\cdot\frac{\pi}{2} = \frac{\pi}{\sqrt{2}\omega}$$ **Ans.**

18. Superposition of Waves

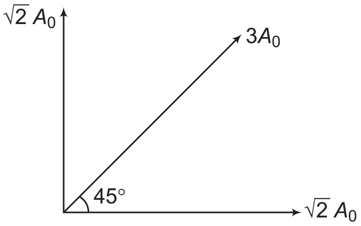
INTRODUCTORY EXERCISE 18.1

1. $\dfrac{I_{\max}}{I_{\min}} = \left(\dfrac{\sqrt{I_1/I_2} + 1}{\sqrt{I_1/I_2} - 1}\right)^2$

2. (a) $\dfrac{A_{\max}}{A_{\min}} = \dfrac{A_1 + A_2}{A_1 - A_2}$

(b) $\dfrac{I_{\max}}{I_{\min}} = \left(\dfrac{A_{\max}}{A_{\min}}\right)^2$

3. Path difference of $\dfrac{\lambda}{4}$ is equivalent to a phase difference of $\dfrac{\pi}{2}$.



$$A_{\text{net}} = 5A_0$$
$$I \propto A^2$$
$$\Rightarrow \qquad I_{\text{net}} = 25\,I_0$$

INTRODUCTORY EXERCISE 18.2

1. It is either 0 or π.

2. (a) $$v = \frac{\omega}{k} = \frac{40\pi}{\pi/3}$$
$$= 120 \text{ cm/s}$$

(b) Distance between adjacent nodes
$$= \frac{\lambda}{2} = \frac{\pi}{k} = \frac{\pi}{(\pi/3)}$$
$$= 3 \text{ cm}$$

(c) $v_P = \dfrac{\partial y}{\partial t} = (-\,200\,\pi)\sin\dfrac{\pi x}{3}\sin 40\pi t$

Now, substitute the given values of *x* and *t*.

3. In this case, node points will also oscillate, but standing waves are formed.

4. $\lambda = \dfrac{2\pi}{k} = \dfrac{2\pi}{0.4} = 15.7 \text{ m}$
$$f = \frac{\omega}{2\pi} = \frac{200}{2\pi} = 31.8 \text{ Hz}$$
$$v = f\lambda = 500 \text{ m/s}$$

INTRODUCTORY EXERCISE 18.3

1. Wall will be a node (displacement). Therefore, shortest distance from the wall at which air particles have maximum amplitude of vibration (displacement antinode) should be $\lambda/4$.

Here, $\qquad \lambda = \dfrac{v}{f} = \dfrac{330}{660} = 0.5 \text{ m}$

$\therefore$ Desired distance is $\dfrac{0.5}{4} = 0.125$ m.

2. $5f - 2f = 54$
$$3f = 54$$
$$\therefore \qquad f = 18 \text{ Hz}$$

3. $$f \propto \sqrt{T}$$
$$\therefore \qquad \frac{f_1}{f_2} = \sqrt{\frac{T_1}{T_2}}$$
$$\text{or} \qquad \frac{220}{260} = \sqrt{\frac{2.2\text{g}}{(2.2 + M)\,\text{g}}}$$

Solving we get,
$$M = 0.873 \text{ kg}$$

4. (a) $\dfrac{f_1}{f_2} = \dfrac{250}{300} = \dfrac{5}{6}$

So, f_1 is 5th harmonic and f_2 is 6th harmonic.

(b) $f_1 = (5) = \dfrac{v}{2l} = \dfrac{2.5\sqrt{T/\mu}}{l}$
$$\therefore \qquad T = \frac{\mu\, f_1^2\, l^2}{(2.5)^2} = \frac{(0.036)\,(250)^2\,(1)^2}{(2.5)^2}$$
$$= 360 \text{ N}$$

5. $6\left[\dfrac{T/\mu}{2l_1}\right] = 2\left[\dfrac{T/\mu}{2l_2}\right]$
$$\therefore \qquad \frac{l_1}{l_2} = 3$$

INTRODUCTORY EXERCISE 18.4

1. At mean position, energy is in the form of kinetic energy.

2. (a) Assuming tension to be same
$$v \propto \frac{1}{\sqrt{\mu}}$$
$$\mu_{\text{RHS}} = \frac{\mu_{\text{RHS}}}{4}$$
$$\therefore \qquad v_{\text{RHS}} = 2v_{\text{LHS}} = 20 \text{ cm/s}$$

(b) $A_r = \left(\dfrac{v_2 - v_1}{v_2 + v_1}\right) A_i$

$$\therefore \quad \frac{A_r}{A_i} = \frac{20 - 10}{20 + 10} = \frac{1}{3}$$

$$\frac{A_t}{A_i} = \left(\frac{2v_2}{v_1 + v_2}\right) = \frac{2 \times 20}{20 + 10} = \frac{4}{5}$$

3. Speed of wave in first medium is,

$$v_1 = \frac{\text{Coefficient of } t}{\text{Coefficient of } x}$$

$$= \frac{50}{2} = 25 \text{ m/s}$$

$$v_2 = 50 \text{ m/s}$$

$$A_i = 2 \times 10^{-3} \text{m}$$

$$A_r = \left(\frac{v_2 - v_1}{v_2 + v_1}\right) A_i = \frac{2}{3} \times 10^{-3} \text{m}$$

$$A_t = \left(\frac{2v_2}{v_1 + v_2}\right) A_i = \frac{8}{3} \times 10^{-3} \text{m}$$

In second medium, speed becomes two times. Therefore, λ also becomes two times. So, k remains one-half, value of ω will remain unchanged. Further, second medium is rarer medium ($v_2 > v_1$). Hence, there is no change in phase angle anywhere.

$$\therefore \quad y_r = \frac{2}{3} \times 10^{-3} \cos \pi \ (2.0x + 50t)$$

$$\text{and} \quad y_t = \frac{8}{3} \times 10^{-3} \cos \pi \ (x - 50t)$$

Exercises

LEVEL 1

Assertion and Reason

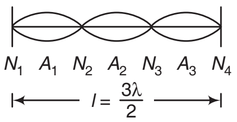
1. At $x = 0$, $y = y_1 + y_2 = A \sin \omega t + A \cos \omega t$. So, it is neither a node nor an antinode.

2. They are called stationary because net energy transfers from any section is zero, if amplitudes of constituent waves are zero.

3. $A_t = \left(\dfrac{2v_2}{v_1 + v_2}\right) A_i$

If $v_1 > v_2$ or 2 is rarer, then $A_t > A_i$

4.

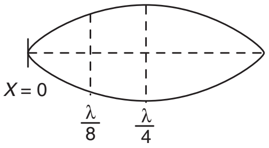


5. $f = \eta \left(\dfrac{v}{2l}\right)$

As η increases, frequency increases. Hence, λ decreases.

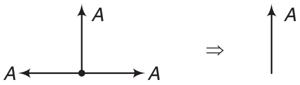
6. Amplitudes may be different also.

7.



Energy lying between $\dfrac{\lambda}{8}$ and $\dfrac{\lambda}{4}$ will be more.

9.



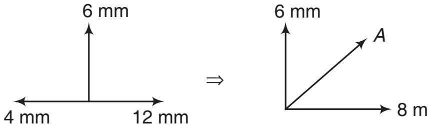
Resultant amplitude is A.

So, intensity will remain same.

10. Phase difference may be different but it should remain constant with time.

Objective Questions

2.



$$A = \sqrt{(8)^2 + (6)^2} = 10 \text{ mm}$$

3. (i) Two waves must travel in opposite directions.

(ii) At $x = 0$, $y = y_1 + y_2$ should be zero at all times.

6. $f_1 : f_2 : f_3 = 1 : 2 : 3$

$$\lambda = \frac{v}{f} \quad \text{or} \quad \lambda \propto \frac{1}{f}$$

$$\therefore \quad \lambda_1 : \lambda_2 : \lambda_3 = 1 : \frac{1}{2} : \frac{1}{3}$$

8. All frequencies are integral multiples of 35 Hz.

9. $3\left(\dfrac{v}{2l}\right) = 300$

$$\therefore \quad v = 200\, l = (200)\,(1)$$

$$= 200 \text{ m/s}$$

10. These are multiples of 30 Hz. Hence, fundamental frequency

$$f_0 = 30 \text{ Hz}$$

Now, $$f_0 = \frac{v}{2l}$$

$$\therefore \quad v = 2 f_0 l$$
$$= 2 \times 30 \times 0.8$$
$$= 48 \text{ m/s}$$

11. $$\because \quad \Delta\phi = \left(\frac{2\pi}{\lambda}\right)(\Delta x)$$

$$= \left(\frac{2\pi}{v/f}\right)(\Delta x) = \left(\frac{2\pi}{vT}\right)(\Delta x)$$

$$= \left(\frac{2\pi}{300 \times 0.04}\right)(16 - 10)$$

$$= \pi$$

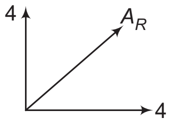
12. $$v = \frac{\omega}{k} = \sqrt{\frac{T}{\rho S}}$$

$$\therefore \quad T = \rho S \left(\frac{\omega}{k}\right)^2 = (8000 \times 10^{-6})\left(\frac{30}{1}\right)^2$$

$$= 7.2 \text{ N}$$

Subjective Questions

1. $$A_R = 4\sqrt{2} \text{ cm}$$
$$= 5.66 \text{ cm}$$



2. $$v_2 = \frac{v_1}{2}$$

(a) $$A_r = \left(\frac{v_2 - v_1}{v_1 + v_2}\right) A$$

$$= \left[\frac{(v_1/2) - v_1}{v_1 + v_1/2}\right] A$$

$$= -\frac{A}{3}$$

$$A_t = \left(\frac{2v_2}{v_1 + v_2}\right) A$$

$$= \left[\frac{2 \times v_1/2}{v_1 + v_1/2}\right] A$$

$$= \frac{2}{3} A$$

(b) Since, reflected waves come in the same medium, we can say that

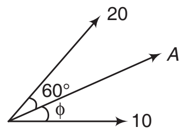
$$P \propto A^2$$

$$\frac{P_r}{P_i} = \left(\frac{A_r}{A_i}\right)^2 = \left(\frac{-A/3}{A}\right)^2 = \frac{1}{9}$$

$\therefore$ Fraction of power transmitted

$$= 1 - \frac{1}{9} = \frac{8}{9}$$

3. $$A = \sqrt{(10)^2 + (20)^2 + 2(10)(20)\cos 60^\circ}$$
$$= 26.46 \text{ cm}$$



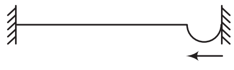
$$\tan\phi = \frac{20 \sin 60^\circ}{10 + 20 \cos 60^\circ}$$
$$= 0.866$$
$$\therefore \quad \phi = 40.89^\circ$$
$$= 0.714 \text{ rad}$$

4. Find y_1 and y_2 at given values of x and t and then simply add them to get net value of y.

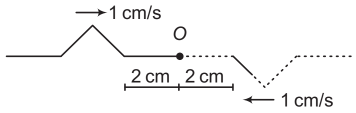
5. $$v = \sqrt{\frac{T}{\mu}} = \sqrt{\frac{16}{(0.4 \times 10^{-3})/(10^{-2})}} = 20 \text{ m/s}$$

(a) $$t = \frac{d}{v} = \frac{2l}{v} = \frac{0.4 \text{ m}}{20}$$
$$= 0.02 \text{ s}$$

(b) At half the time pulse is at other end and it gets a phase difference of π. Hence, the shape is as shown below.

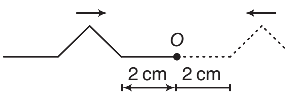


6. (a) **For fixed end.**



By the superposition of these two pulses we will get the resultant. But only to the left of point O, where string is actually present.

(b) **For free end**



7. $y = y_1 + y_2 = (6.0\text{ cm})\sin(\pi x)\cos(0.6\pi t)$

$\therefore \quad A_x = 6.0\text{ cm}\sin(\pi x) \qquad \ldots\text{(i)}$

In parts (*a*), (*b*) and (*c*) substitute the given values of *x* and find the displacement amplitude at these locations.

(d) At antinodes

$$A_x = \text{maximum} = \pm\ 6.0\text{ cm}$$

$$\therefore \quad \pi x = \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{2}$$

or $\quad x = 0.5\text{ cm}, 1.5\text{ cm}, 2.5\text{ cm}$

8. (a) Distance between successive antinodes

$$= \frac{\lambda}{2} = \frac{\pi}{k} = \frac{\pi}{(\pi/2)} = 2\text{cm}$$

(b) $A_{\text{max}} = 2A = (2\pi)\text{ cm}$

If $x = 0$ is taken as node, we shall taken sin equation for A_x

$$\therefore \quad A_x = A_{\text{max}} = \sin kx$$

$$= (2\pi\text{ cm})\sin kx$$

Put $k = \dfrac{\pi}{2}$ and $x = 0.5$

9.
$$v = \sqrt{\frac{T}{\mu}} = \sqrt{\frac{20}{9\times10^{-3}}} = 47.14\text{ m/s}$$

$$f_1 = \frac{v}{2l} = \frac{47.14}{2\times30}$$

$$= 0.786\text{ Hz}$$

Next three frequencies are $2f_1$, $3f_1$ and $4f_1$

10. (a)
$$f = \frac{v}{2l} = \frac{\sqrt{T/\mu}}{2l}$$

$$\therefore \quad T = 4l^2f^2\mu$$

$$= (4)(0.7)^2(220)^2\left(\frac{1.2\times10^{-3}}{0.7}\right)$$

$$= 163\text{ N}$$

(b) $f_3 = 3f_1 = 3\times220 = 660\text{ Hz}$

11. Fundamental frequency,

$$f = \frac{v}{2l} = \frac{\sqrt{T/\mu}}{2l}$$

$$= \frac{\sqrt{(50)/(0.1\times10^{-3}/10^{-2})}}{2\times0.6}$$

$$= 58.93\text{ Hz}$$

Let, *n* th harmonic is the highest frequency, then

$$(58.93)\,n = 20000$$

$$\therefore \quad n = 339.38$$

Hence, 339 is the highest frequency.

$$\therefore \quad f_{\text{max}} = (339)(58.93)\text{ Hz} = 19977\text{ Hz}$$

12. Fundamental frequency = (490− 420) Hz

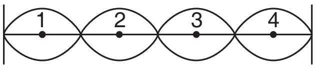
$$f_0 = 70\text{ Hz}$$

But, $\quad f_0 = \dfrac{v}{2l} = \dfrac{\sqrt{T/\mu}}{2l}$

$$\therefore \quad l = \frac{\sqrt{T/\mu}}{2f_0} = \frac{\sqrt{(450)/0.005}}{2\times70}$$

$$= 2.142\text{ m}$$

13. $\lambda = \dfrac{v}{f} = 0.5\text{ m}$



$$l = 4\left(\frac{\lambda}{2}\right) = 1\text{ m}$$

14. (a) $f_4 = 4f_0$

$$\therefore \quad f_0 = \frac{f_4}{4} = \frac{400}{4} = 100\text{ Hz}$$

(b) $\quad f_7 = 7f_0 = 700\text{ Hz}$

15. Fundamental frequency $\propto \dfrac{1}{l}$

$$f_1 : f_2 : f_3 = \frac{1}{l_1} : \frac{1}{l_2} : \frac{1}{l_3}$$

$$= 1 : 2 : 3$$

$$\therefore \quad l_1 : l_2 : l_3 = \frac{1}{1} : \frac{1}{2} : \frac{1}{3} = 6 : 3 : 2$$

$$l_1 = \left(\frac{6}{11}\right)(1)\text{ m} = \frac{6}{11}\text{ m}$$

$$l_2 = \left(\frac{3}{11}\right)(1)\text{ m} = \frac{3}{11}\text{ m}$$

$$l_3 = \left(\frac{2}{11}\right)(1)\text{ m} = \frac{2}{11}\text{ m}$$

16. $f \propto \dfrac{1}{l}$

$$\therefore \quad \frac{f_1}{f_2} = \frac{l_2}{l_1} \quad \text{or} \quad l_2 = \left(\frac{f_1}{f_2}\right)l_1$$

$$= \left(\frac{124}{186}\right)(90\text{ cm}) = 60\text{ cm}$$

17. (a) $\dfrac{\lambda}{2} = 15\text{ cm}$

$$\therefore \quad \lambda = 30\text{ cm}$$

$$k = \frac{2\pi}{\lambda} = \left(\frac{\pi}{15}\right)\text{cm}^{-1}$$

$$\omega = \frac{2\pi}{T} = \frac{2\pi}{0.075}\text{ s}^{-1}$$

Since, $x = 0$ is a node we will write sin equation.

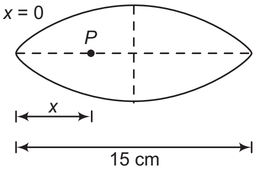
$$\therefore \quad A_x = A_{\max} \sin kx \qquad \text{...(i)}$$

and $y = A_x \sin \omega t$

(b) $v = \dfrac{\omega}{k} = \dfrac{(2\pi/0.075)}{(\pi/15)}$

$= 400 \text{ cm/s} = 4 \text{ m/s}$

(c) $x = 0$



$x = 7.5 - 3 = 4.5 \text{ cm}$

From Eq. (i),

$$A_x = (0.85 \text{ cm}) \sin\left(\frac{\pi}{15} \times 4.5\right)$$

$= 0.688 \text{ cm}$

18. (a) $f_1 = \dfrac{v}{2l} = \dfrac{48}{3}$

$= 16 \text{ Hz}$

$\lambda_1 = \dfrac{v}{f_1} = 3 \text{m}$

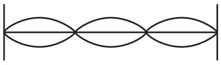
(b) Second overtone means f_3.

$f_3 = 3f_1$ and hence $\lambda_3 = \dfrac{\lambda_1}{3}$

(c) Forth harmonic means f_4.

$f_4 = 4f_1$ and $\lambda_4 = \dfrac{\lambda_1}{4}$

19. (a)



Third harmonic

(b) $A = \dfrac{5.6}{2} = 2.8 \text{ cm}$

(c) $k = 0.034 \text{ cm}^{-1}$

$\lambda = \dfrac{2\pi}{k} = 184.7 \text{ cm}$

$l = \dfrac{3\lambda}{2} = 277 \text{ cm}$

(d) $\lambda = 184.7 \text{ cm}$

$f = \dfrac{\omega}{2\pi} = \dfrac{50}{2\pi} = 7.96 \text{ Hz}$

$T = \dfrac{1}{f} = 0.126 \text{ s}$

$v = f\lambda = 1470 \text{ cm/s}$

(e) $v_{\max} = \omega A_{\max}$

$= (50)(5.60)$

$= 280 \text{ cm/s}$

(f) Frequency and hence ω will become $\dfrac{8}{3}$ times.

$\therefore \quad \omega' = 50 \times \dfrac{8}{3} = 133 \text{ rad/s}$

$k = \dfrac{\omega}{v}$ or $k \propto \omega$

Hence, k will become $\dfrac{8}{3}$ times.

$k' = \left(\dfrac{8}{3}\right)(0.034) = 0.0907 \text{ rad/cm}$

20. (a) $\dfrac{\lambda}{2} = l$ or $\lambda = 2l = 1.6 \text{ m}$

$v = f\lambda = 60 \times 1.6 = 96 \text{ m/s}$

(b) $v = \sqrt{\dfrac{T}{\mu}}$

$\therefore \quad T = \mu v^2 = \left(\dfrac{0.04}{0.8}\right)(96)^2$

$= 461 \text{ N}$

(c) $v_{\max} = \omega A_{\max}$

$= (2\pi f) A_{\max}$

$= (2\pi)(60)(0.003)$

$= 1.13 \text{ m/s}$

$a_{\max} = \omega^2 A_{\max}$

$= (2\pi f)^2 A_{\max}$

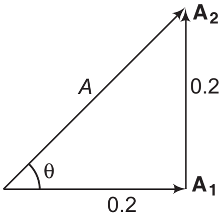
$= (2\pi \times 60)^2 (0.003)$

$= 426.4 \text{ m/s}^2$

21. (a) $y = y_1 + y_2$

$= 0.2 \sin(x - 3.0t) + 0.2 \sin\left(x - 3.0t + \dfrac{\pi}{2}\right)$

$= A \sin(x - 3.0t + \theta)$



Here, $A = \sqrt{(0.2)^2 + (0.2)^2}$

and $\theta = \dfrac{\pi}{4}$

$\therefore$ $y = 0.28 \sin \left(x - 3.0t + \dfrac{\pi}{4}\right)$ **Ans.**

(b) Since, the amplitude of the resulting wave is 0.32 m and $A = 0.2$ m, we have

$$0.32 = \sqrt{(0.2)^2 + (0.2)^2 + (2)(0.2)(0.2)\cos\phi}$$

Solving this, we get

$\phi = \pm 1.29$ rad **Ans.**

22. (i) $f_a = \dfrac{v}{2l} = \dfrac{\sqrt{T/\mu}}{2l}$

$= \dfrac{\sqrt{(100/4 \times 10^{-2})}}{2 \times 2}$

$= 12.5$ Hz

$f_b = 3\left(\dfrac{v}{2l}\right) = 3\, fa = 37.5$ Hz

(ii) $\omega = 2\pi f$

$\therefore$ $\omega_a = 2\pi f_a = 25\pi$

$\omega_b = 2\pi f_b = 75\pi$

$v = \sqrt{\dfrac{T}{\mu}} = \sqrt{\dfrac{100}{4 \times 10^{-2}}}$

$= 50$ m/s

$k = \dfrac{\omega}{v}$

$\therefore$ $k_a = \dfrac{\omega a}{v} = \dfrac{25\pi}{50} = \dfrac{\pi}{2}$

$k_b = \dfrac{\omega_b}{v} = \dfrac{75\pi}{50} = \dfrac{3\pi}{2}$

23. (a) $l = \lambda_1/4$

$\therefore$ $\lambda_1 = 4l = 16$ m , $l = 3\lambda_2/4$

$\therefore$ $\lambda_2 = \dfrac{4l}{3} = 5.33$ m

$l = 5\lambda_3/4$

$\therefore$ $\lambda_3 = \dfrac{4l}{5} = 3.2$ m

(b) $v = \sqrt{\dfrac{T}{\mu}}$

$= \sqrt{\dfrac{400}{(0.16/4)}} = 100$ m/s

Now, $f_1 = \dfrac{v}{\lambda_1} = \dfrac{100}{16} = 6.25$ Hz

Similarly, f_2 and f_3.

24. (a) $\dfrac{n\lambda_1}{2} = l$

$\therefore$ $\dfrac{n\,(0.54)}{2} = l$

or $n = \dfrac{l}{0.27}$ ...(i)

Similarly, $\dfrac{(n+1)\lambda_2}{2} = l$

or $\dfrac{(n+1)\,(0.48)}{2} = l$

or $(n+1) = \dfrac{l}{0.24}$ ...(ii)

From Eqs. (i) and (ii) we have,

$\dfrac{n}{n+1} = \dfrac{8}{9}$

(b) From Eq. (i),

$l = (0.27)\,n$

$= 0.27 \times 8$

$= 2.16$ m

(c) $\dfrac{\lambda}{2} = l$ (Fundamental)

$\therefore$ $\lambda = 2l = 4.32$ m

25. From fixed end there will be a phase change of π. Further, wave will start travelling in opposite direction. Hence, ωt and kx both will now become position. From free end there is no change in phase.

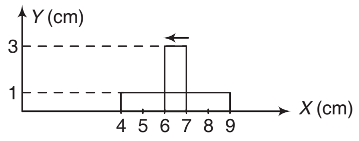
26. $t_1 = \dfrac{d_1}{v} = \dfrac{4+4}{1} = 8$ s

After one reflection from fixed boundary wave is inverted.

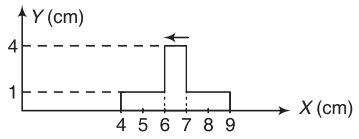
$t_2 = \dfrac{d_2}{v} = \dfrac{4+10+16}{1} = 20$ s

After two times reflection from fixed boundaries wave pulse will again become upright.

27. Let us plot at $t = 3$ s



Net $y = y_1 + y_2$



Similarly, we can draw at other times.

LEVEL 2

Single Correct option

1. $\because \quad f \propto \sqrt{T}$

$$\therefore \qquad \frac{f_1}{f_2} = \sqrt{\frac{T_1}{T_2}}$$

$$\therefore \qquad \frac{3}{2} = \sqrt{\frac{T + 2.5}{T}}$$

Solving, we get $T = 2\,\text{N}$

2. $f = \dfrac{v}{2l} = \dfrac{\sqrt{T/\mu}}{2l} = \dfrac{\sqrt{T/\rho S}}{l}$

$$= \frac{\sqrt{T/\rho\,(\pi d^2/4)}}{l}$$

or $\qquad f \propto \dfrac{\sqrt{T}}{dl}$

$$\therefore \qquad \frac{f_1}{f_2} = \left(\sqrt{\frac{T_1}{T_2}}\right)\left(\frac{d_2}{d_1}\right)\left(\frac{l_2}{l_1}\right)$$

$$= \sqrt{\frac{1}{2}}\left(\frac{3}{1}\right)\left(\frac{2}{1}\right) = 3\sqrt{2}$$

3. $f \propto \dfrac{1}{l} \quad \Rightarrow \quad l = \dfrac{k}{f}$

Now, $\qquad l = l_1 + l_2 + l_3$

$$\therefore \qquad \frac{k}{f_0} = \frac{k}{f_1} + \frac{k}{f_2} + \frac{k}{f_3}$$

$$\therefore \qquad \frac{1}{f_0} = \frac{1}{f_1} + \frac{1}{f_2} + \frac{1}{f_3}$$

4. $y_1 + y_2 = 2A \sin(\omega t - kx) = y_4$ (say)

Now, y_4 and y_3 produce standing waves where,

$A_{\max} = 2$ (Amplitude of constituent wave)

$= 2\,(2A) = 4A$

5. Tension in the string will be given by

$$T = \frac{YA\Delta l}{l} = \frac{YA}{\eta} \qquad \left(\text{as } \frac{\Delta l}{l} = \frac{1}{\eta}\right)$$

Now, $\qquad f \propto v$

$$\frac{f_1}{f_2} = \frac{v_1}{v_2} = \frac{\sqrt{T/\rho A}}{\sqrt{Y/\rho}}$$

$$= \sqrt{\frac{T}{YA}} = \frac{1}{\sqrt{\eta}}$$

6. $f_1 = \dfrac{v}{2l} = \dfrac{\sqrt{T/\mu}}{2l}$

$$= \frac{\sqrt{100/0.01}}{2} = 50\text{ Hz}$$

$$f_2 = 2f_1 = 100\text{ Hz}$$

$$f_3 = 3f_1 = 150\text{ Hz}$$

$$n_1 = \frac{v}{4l} = 25\text{ Hz}$$

$$n_2 = 3n_1 = 75\text{ Hz}$$

$$n_3 = 5n_1 = 125\text{ Hz}$$

7. $\because \qquad f \propto \dfrac{1}{l}$

$$\therefore \qquad l_1 : l_2 : l_3 = \frac{1}{f_1} : \frac{1}{f_2} : \frac{1}{f_3}$$

$$= \frac{1}{1} : \frac{1}{3} : \frac{1}{4} = 12 : 4 : 3$$

$$\therefore \qquad l_1 = \left(\frac{12}{12 + 4 + 3}\right)(114)$$

$$= 72\text{ cm}$$

$$l_2 = \left(\frac{4}{12 + 4 + 3}\right)(114)$$

$$= 24\text{ cm}$$

$$l_3 = \left(\frac{3}{12 + 4 + 3}\right)(114)$$

$$= 18\text{ cm}$$

8. $f \propto \sqrt{T}$

$$\frac{f}{f/2} = \sqrt{\frac{T_1}{T_2}} = \sqrt{\frac{W}{W - V_1}}$$

$$2 = \sqrt{\frac{v\rho g}{V\rho g - V\rho_w g}} = \sqrt{\frac{\rho}{\rho - \rho_w}}$$

Solving $\quad \rho = \dfrac{4}{3}\rho_w$

$$\frac{f}{f/3} = \sqrt{\frac{W}{W - V_2}} = \sqrt{\frac{V\rho g}{V\rho g - V\rho_l g}}$$

$$9 = \frac{\rho}{\rho - \rho_l}$$

$$\therefore \qquad \rho_l = \frac{8}{9}\rho = \frac{32}{27}\rho_\omega$$

$\therefore$ Relative density of liquid $= \dfrac{\rho_l}{\rho_w}$

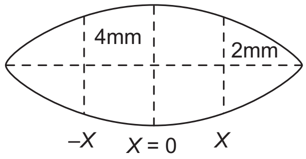
$$= \frac{32}{27} = 1.18$$

9. $\dfrac{\lambda}{2} = 1.5\text{ m}$

$$\therefore \qquad \lambda = 3.0\text{ m}$$

$$= k = \frac{2\pi}{\lambda} = \left(\frac{2\pi}{3}\right)\text{m}^{-1}$$

Let us take antinode at $x=0$, then



$$A_x = A_{\max} \cos kx$$

$$\therefore \quad (2\text{ mm}) = (4\text{ mm}) \cos\left(\frac{2\pi}{3}\right)x$$

$$\therefore \quad \left(\frac{2\pi}{3}\right)x = \frac{\pi}{3}$$

or $\quad x = 0.5$ m

The asked distance is $2x$ or 1.0 m.

10. $f = 3\text{Hz}$

$$\therefore \quad \omega = 2\pi f = (6\pi)\text{ rad/s}$$

$$k = \frac{\omega}{v} = \frac{6\pi}{3} = (2\pi)\text{ rad/m}$$

$$y = A\sin(kx - \omega t)$$

$$= A\sin(2\pi x - 6\pi t)$$

Putting $\quad y = \pm A$

and $x = 3$, we get

$$(2\pi)(3) - 6\pi\, t = \frac{\pi}{2}$$

$$\therefore \quad 6\pi t = \frac{11}{2}\pi$$

$$\therefore \quad t = \frac{11}{12}\text{ s}$$

11. $\Delta\phi_1 = \pi/2$

$$\Delta\phi_2 = \left(\frac{2\pi}{\lambda}\right)(\Delta x)$$

$$= \left(\frac{2\pi}{\lambda}\right)(1.5\lambda)$$

$$= 3\pi$$

$$\therefore \quad \Delta\phi_{\text{net}} = \Delta\phi_2 - \Delta\phi_1 = \frac{5\pi}{2}$$

12. Fundamental frequency,

$$f_0 = 450 - 400$$

$$= 50\text{ Hz}$$

$$f_0 = \frac{v}{2l} = \frac{\sqrt{T/\mu}}{2l}$$

$$\therefore \quad l = \frac{\sqrt{T/\mu}}{2f_0} = \frac{\sqrt{490/0.1}}{2 \times 50}$$

$$= 0.7\text{ m}$$

13. $\dfrac{f_5}{f_2} = \dfrac{5f_1}{2f_1} = \dfrac{5}{2}$

$$\therefore \quad f_2 = \frac{2}{5}f_5$$

$$= \frac{2}{5} \times 480$$

$$= 192\text{ Hz}$$

14. $I \propto A^2$

$$I_r = 0.64\, I_i$$

$$\therefore \quad A_r = 0.8\, A_i$$

$$= 0.8\text{A}$$

Reflected from a denser medium. Hence, a phase change of π will occur. Reflected wave will travel in opposite direction. Hence, ωt and kx will have positive signs.

15. $\eta\left(\dfrac{v}{2l}\right)_B = \left(\dfrac{v}{2l}\right)_A$

$$\eta = \left(\frac{\sqrt{T/\rho S}}{2l}\right)_B = \left(\frac{v}{2l}\right)_A$$

or $\quad \eta\left(\dfrac{\sqrt{4T/\rho\pi}}{2ld}\right)_B = \left(\dfrac{\sqrt{4T/\rho\pi}}{2ld}\right)_A \quad$ ...(i)

Given, $T_B = 2T_A,\ l_B = 2l_A$

$$d_B = 2d_A$$

and $\quad \rho_B = 2\rho_A$

Putting in Eq. (i), we get

$$\eta = 4$$

$\eta = 4$ means 4th harmonic or 3rd overtone.

More than One Correct Options

1. $f \propto \sqrt{T}$

$$\frac{f_2}{f_1} = \sqrt{\frac{T_2}{T_1}}$$

$$\therefore \quad \frac{f_1 + 15}{f_1} = \sqrt{\frac{1.21\,T_1}{T_1}}$$

$$= 1.1$$

Solving we get $f_1 = 150$ Hz

$$v \propto \sqrt{T}$$

$$\therefore \quad \frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1}}$$

or $\quad v_2 = \left(\sqrt{\dfrac{1.21\,T_1}{T_1}}\right)v_1$

$$= 1.1\,v_1$$

Hence, increase in v is 10%

$$\frac{\lambda}{2} = l$$

$\therefore \quad \lambda = 2l$

$\therefore$ Fundamental wavelength $= 2\lambda$ is unchanged.

4. $A_t = \left(\dfrac{2v_2}{v_1 + v_2}\right) A_i$

If $\quad v_2 > v_1,\ A_t > A_i$

5.

$$l = 4\frac{\lambda}{2} = 2\lambda = 2\left(\frac{2\pi}{k}\right)$$

$$= \frac{4\pi}{k}$$

6. Two identical waves should travel in opposite directions.

7. $y = y_1 + y_2 = (2A \cos kx) \sin \omega t$

$$= A_x \sin \omega t$$

Here, $A_x = 2A \cos kx$

At $x = 0$, A_x is maximum or $2A$.

So, it is an antinode. Next antinode will occur at

$$x = \frac{\lambda}{2}, \lambda \ \ldots \text{ etc.}$$

or $\quad x = \dfrac{\pi}{k}, \dfrac{2\pi}{k} \ldots$ etc.

Comprehension Based Questions

1. Reflected and incident rays are in the same medium. Hence,

$$I \propto A^2$$

I_r has become 64% or 0.64 times of I_i

$\therefore \quad A_r = 0.8\ A_i = 0.8\ A$

2. $y = y_i + y_r$

$$= A \sin (ax + bt + \pi/2) + 0.8\ A \sin (ax - bt + \pi/2)$$

$$= \left[0.8\ A \sin\left(ax + bt + \frac{\pi}{2}\right) + 0.8\ A \sin\left(ax - bt + \frac{\pi}{2}\right)\right] + 0.2A \sin\left(ax + bt + \frac{\pi}{2}\right)$$

$$= -1.6 \sin ax \sin bt + 0.2A \cos (bt + ax)$$

$\therefore \quad c = 0.2$

3. $A_x = -1.6 \sin ax$

$\therefore \quad x = 0$ is a node

Second antinode is at a distance.

$$x = \frac{\lambda}{4} + \frac{\lambda}{2} = \frac{3\lambda}{4} = \frac{3}{4}\left(\frac{2\pi}{k}\right)$$

But, $k = a$

$\therefore \quad x = \dfrac{3\pi}{2a}$

Match the Columns

1. $v \propto \dfrac{1}{\sqrt{\mu}}$

$$\mu_2 = 9\mu_1$$

Hence, $\quad v_2 = \dfrac{v_1}{3}$

So let $v_1 = 3$ units, then $v_2 = 1$ unit

(a) $\quad A_1 = \left(\dfrac{v_2 - v_1}{v_1 + v_2}\right) A_i$

and $\quad A_2 = \left(\dfrac{2v_2}{v_1 + v_2}\right) A_i$

$\therefore \quad \left|\dfrac{A_1}{A_2}\right| = \left|\dfrac{v_2 - v_1}{2v_2}\right| = \left|\dfrac{3-1}{2}\right| = 1$

(b) $\dfrac{v_1}{v_2} = 3$

(c) $\quad I = \dfrac{1}{2}\rho\omega^2 A^2 v$

ρ is not given, so we cannot find I_1/I_2.

(d) $P = \dfrac{1}{2}\rho\omega^2 A^2 S v$

But, $\quad S\rho = \mu$

$\therefore \quad P = \dfrac{1}{2}\omega^2 A^2 \mu v$

or $\quad P \propto A^2 \mu v \qquad$ (as $\omega \to$ same)

$$\frac{P_1}{P_2} = \left(\frac{A_1}{A_2}\right)^2 \left(\frac{\mu_1}{\mu_2}\right)\left(\frac{v_1}{v_2}\right)$$

$$= (1)^2 \left(\frac{1}{9}\right)(3) = \frac{1}{3}$$

or $\quad \dfrac{P_2}{P_1} = 3$

2.

(i)

(ii)

(a) Second overtone mode = $f_3 = 3f_1$

Fifth harmonic mode = $f_5 = 5f_1$

So, the ratio is 3/5,

(d) $\lambda = \dfrac{v}{f}$ or $\lambda \propto \dfrac{1}{f}$

$$\therefore \quad \frac{\lambda_3}{\lambda_5} = \frac{f_5}{f_3} = \frac{5}{3}$$

3. (d) $A_t = \left(\dfrac{2v_2}{v_1 + v_2}\right) A_i$

If $v_2 > v_1$, i.e. 2 is rarer then $A_t > A_i$.

4. $A = 2A_0 \cos\dfrac{\phi}{2}$ and $I = 4I_0 \cos^2\dfrac{\phi}{2}$

5. Second overtone frequency means

$$f_3 = 3f_1 = 210 \text{ Hz}$$

$\therefore$ $f_1 = 70$ Hz = fundamental frequency

Third overtone frequency = $f_4 = 4f_1$

Second harmonic frequency = $f_2 = 2f_1$

Subjective Questions

1. (a) $v_1 = \sqrt{T/\mu_1}$

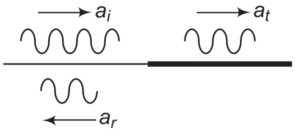
$$v_2 = \sqrt{F/4\mu_1} = \frac{1}{2}\sqrt{F/\mu_1},$$

$$v_3 = \sqrt{F/(\mu_1/4)} = 2\sqrt{F/\mu_1}$$

$$\therefore \quad t = t_1 + t_2 + t_3 = \frac{L}{v_1} + \frac{L}{v_2} + \frac{L}{v_3}$$

$$= \frac{7L}{2}\sqrt{\frac{\mu_1}{F}}$$ **Ans**

2. Let a_i and a_r be the amplitudes of incident and reflected waves.



Then,

$$\frac{a_i + a_r}{a_i - a_r} = 6 \qquad \text{(given)}$$

Hence, $$\frac{a_r}{a_i} = \frac{5}{7}$$

Now, $$\frac{E_r}{E_i} = \left(\frac{a_r}{a_i}\right)^2 = \left(\frac{5}{7}\right)^2$$

$$= 0.51$$

or percentage of energy reflected is

$$100 \times \frac{E_r}{E_i} = 51\%.$$

So, percentage of energy transmitted will be

$$(100 - 51)\% \text{ or } 49\%.$$ **Ans.**

3. Amplitude at a distance x is $A = a \sin kx$

First node can be obtained at $x = 0$,

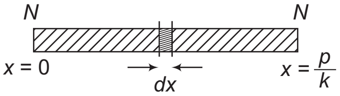
and the second at $x = \pi/k$

At position x, mass of the element PQ is

$$dm = (\rho S)dx$$

Its amplitude is $A = a \sin kx$

Hence mechanical energy stored in this element is



(energy of particle in SHM) $dE = \dfrac{1}{2}(dm)A^2\omega^2$

or $$dE = \frac{1}{2}(\rho S A^2 \omega^2)\, dx$$

$$= \frac{1}{2}(\rho S a^2 \omega^2 \sin^2 kx)\, dx$$

Therefore, total energy stored between two adjacent nodes will be

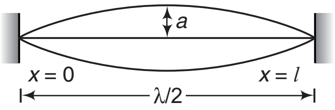
$$E = \int_{x=0}^{x=\pi/k} dE$$

Solving this, we get

$$E = \frac{\pi S \rho \omega^2 a^2}{4k}$$ **Ans.**

4. $l = \dfrac{\lambda}{2}$

or $$\lambda = 2l, k = \frac{2\pi}{\lambda} = \frac{\pi}{l}$$



The amplitude at a distance x from $x = 0$ is given by

$$A = a \sin kx$$

Total mechanical energy at x of length dx is

$$dE = \frac{1}{2}(dm)A^2\omega^2$$

$$= \frac{1}{2}(\mu dx)(a \sin kx)^2(2\pi f)^2$$

or $$dE = 2\pi^2 \mu f^2 a^2 \sin^2 kx\, dx \qquad \text{...(i)}$$

Here, $$f = \frac{v^2}{\lambda^2} = \frac{\left(\dfrac{T}{\mu}\right)}{(4l^2)} \text{ and } k = \frac{\pi}{l}$$

Substituting these values in Eq. (i) and integrating it from $x = 0$ to $x = l$, we get total energy of string.

$$E = \frac{\pi^2 a^2 T}{4l} \qquad \textbf{Ans.}$$

5. Tension, $T = 80$ N

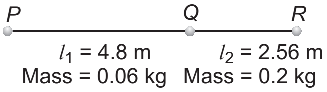
Amplitude of incident wave, $A_i = 3.5$ cm

Mass per unit length of wire PQ is

$$m_1 = \frac{0.06}{4.8} = \frac{1}{80} \text{ kg/m}$$

and mass per unit length of wire QR is

$$m_2 = \frac{0.2}{2.56} = \frac{1}{12.8} \text{ kg/m}$$



(a) Speed of wave in wire PQ is

$$v_1 = \sqrt{T/m_1} = \sqrt{\frac{80}{1/80}} = 80 \text{ m/s}$$

and speed of wave in wire QR is

$$v_2 = \sqrt{T/m_2}$$

$$= \sqrt{\frac{80}{1/12.8}} = 32 \text{ m/s}$$

$\therefore$ Time taken by the wave pulse to reach from P to R is

$$t = \frac{4.8}{v_1} + \frac{2.56}{v_2} = \left(\frac{4.8}{80} + \frac{2.56}{32}\right) \text{s}$$

$$= 0.14 \text{ s} \qquad \textbf{Ans.}$$

(b) The expressions for reflected and transmitted amplitudes (A_r and A_t) in terms of v_1, v_2 and A_i are as follows :

$$A_r = \frac{v_2 - v_1}{v_2 + v_1} A_i$$

and $$A_t = \frac{2v_2}{v_1 + v_2} A_i$$

Substituting the values, we get

$$A_r = \left(\frac{32 - 80}{32 + 80}\right)(3.5) = -1.5 \text{ cm}$$

i.e. the amplitude of reflected wave will be 1.5 cm. Negative sign of A_r indicates that there will be a phase change of π in reflected wave.

Similarly, $A_t = \left(\dfrac{2 \times 32}{32 + 80}\right)(3.5) = 2.0$ cm

i.e. the amplitude of transmitted wave will be 2.0 cm.

The expressions of A_r and A_t are derived as below.

Derivation

Suppose the incident wave of amplitude A_i and angular frequency ω is travelling in positive x-direction with velocity v_1, then we can write

$$y_i = A_i \sin \omega[t - x/v_1] \qquad \ldots\text{(i)}$$

In reflected as well as transmitted wave, ω will not change, therefore, we can write

$$y_r = A_r \sin \omega\,[t + x/v_1] \qquad \ldots\text{(ii)}$$

and $$y_t = A_t \sin \omega\,[t - x/v_2] \qquad \ldots\text{(iii)}$$

Now as wave is continuous, so at the boundary ($x = 0$).

Continuity of displacement requires

$$y_i + y_r = y_t \quad \text{for} \quad x = 0$$

Substituting from Eqs. (i), (ii) and (iii) in the above, we get

$$A_i + A_r = A_t \qquad \ldots\text{(iv)}$$

Also at the boundary, slope of wave will be continuous, i.e.

$$\frac{\partial y_i}{\delta x} + \frac{\partial y_r}{\delta x} = \frac{\partial y_t}{\partial x} \qquad [\text{for } x = 0]$$

which gives $$A_i - A_r = \left(\frac{v_1}{v_2}\right) A_t \qquad \ldots\text{(v)}$$

Solving Eqs. (iv) and (v) for A_r and A_t, we get the required equations, i.e.

$$A_r = \frac{v_2 - v_1}{v_2 + v_1} A_i \quad \text{and} \quad A_t = \frac{2v_2}{v_2 + v_1} A_i$$

6. **When A is a node** Suppose n_1 and n_2 are the complete loops formed on left and right side of point A. Then,

$$f_1 = f_2$$

or $$n_1\left(\frac{v_1}{2L}\right) = n_2\left(\frac{v_2}{2L}\right)$$

or $$\frac{n_1}{n_2} = \left(\frac{v_2}{v_1}\right) = \sqrt{\frac{\mu_1}{\mu_2}} = \frac{1}{3}, \frac{2}{6}, \frac{3}{9}, \ldots, \text{etc}$$

$$\left(\text{as } v \propto \frac{1}{\sqrt{\mu}}\right)$$

$\therefore$ Possible frequencies are

$$\frac{v_1}{2L}, 2\left(\frac{v_1}{2L}\right), \frac{3v_1}{2L}, \ldots, \text{etc.} \qquad \left(v_1 = \sqrt{\frac{T}{\mu}}\right)$$

or $$\frac{1}{2L}\sqrt{\frac{T}{\mu}}, \frac{1}{L}\sqrt{\frac{T}{\mu}}, \frac{3}{2L}\sqrt{\frac{T}{2\mu}}, \ldots, \text{ etc.}$$

When *A* is an antinode Suppose n_1 and n_2 are complete loops on left and right side of point *A*,

$$n_1\frac{\lambda_1}{2}+\frac{\lambda_1}{4}=L$$

or $$f_1=\frac{v_1}{L}\left(\frac{n_1}{2}+\frac{1}{4}\right)$$

$$n_2\frac{\lambda_2}{2}+\frac{\lambda_2}{4}=L$$

or $$f_2=\frac{v_2}{L}\left(\frac{n_2}{2}+\frac{1}{4}\right)$$

Substituting $f_1=f_2$,

we get, $$\frac{2n_1+1}{2n_2+1}=\frac{1}{3}$$

For $$n_1=1,\quad n_2=4$$
$$n_1=2,\quad n_2=7$$
$$n_1=3,\quad n_2=10,\quad \text{etc.}$$
$$\ldots\quad\ldots\quad\ldots$$

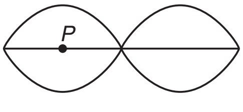
Therefore, the possible frequencies are

$$\frac{v_1}{L}\left(\frac{1}{2}+\frac{1}{4}\right), \frac{v_1}{L}\left(\frac{2}{2}+\frac{1}{4}\right), \frac{v_1}{L}\left(\frac{3}{2}+\frac{1}{4}\right), \ldots, \text{ etc.}$$

or $$\frac{3}{4L}\sqrt{\frac{T}{\mu}}, \frac{5}{4L}\sqrt{\frac{T}{\mu}}, \frac{7}{4L}\sqrt{\frac{T}{\mu}}, \ldots, \text{ etc.}$$

7. $$\frac{L}{4}=\frac{\lambda}{4}$$

$\therefore$ $L=\lambda$



In the next higher mode, there will be total 6 loops and the desired frequency is

$$\left(\frac{6}{2}\right)(100)=300\text{ Hz}$$ **Ans.**

8. $\because$ $$k=\frac{\omega}{v}=\frac{\pi}{3}$$

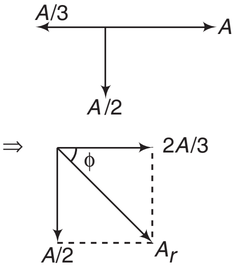
$$y_1=0.06\,(\pi t-kx)=0.06\sin\left(\pi t-\frac{\pi}{3}\times 12\right)$$
$$=0.06\sin(\pi t-4\pi)$$

Similarly,

$$y_2=0.02\sin(\pi t-kx')=0.02\sin\left(\pi t-\frac{\pi}{3}\times 8\right)$$
$$=0.02\sin\left(\pi t-\frac{8\pi}{3}\right)$$

$$y=y_1+y_2$$
$$=0.06\sin\pi t\cos 4\pi-0.06\cos\pi t\sin 4\pi$$
$$+\,0.02\sin\pi t\cos\frac{8\pi}{3}-0.02\cos\pi t\sin\frac{8\pi}{3}$$
$$=0.05\sin\pi t-0.0173\cos\pi t$$ **Ans.**

9. Resultant amplitude



$$A_r=\sqrt{\left(\frac{2A}{3}\right)^2+\left(\frac{A}{2}\right)^2}$$
$$=\frac{5}{6}A$$ **Ans.**

$$\tan\phi=-\frac{A/2}{2A/3}=-\frac{3}{4}$$

or $$\phi=-\tan^{-1}(3/4)$$ **Ans.**

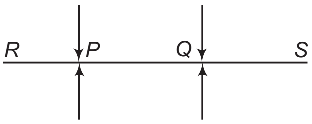
10. Speed of longitudinal waves in the rod,

$$v=\sqrt{\frac{Y}{\rho}}=\sqrt{\frac{1.6\times10^{11}}{2500}}=8000\text{ m/s}$$

At the clamped position nodes will be formed. Between the clamps integer number of loops will be formed. Hence,

$$n_1\frac{\lambda}{2}=80$$

or $$n_1\lambda=160 \qquad \ldots\text{(i)}$$



Between *P* and *R, P* is a fixed end and *R* is the free end. It means the number of loops between *P* and *R* will be odd multiple of $\frac{\lambda}{4}$. Then,

$$\frac{(2n_2-1)}{2}\frac{\lambda}{2}=5$$

or $$(2n_2-1)\lambda=20 \qquad \ldots\text{(ii)}$$

Also between Q and S,

$$(2n_3 - 1)\lambda = 60 \qquad \ldots\text{(iii)}$$

From Eqs. (i) and (ii), we get

$$\frac{n_1}{2n_2 - 1} = \frac{160}{20} = 8 \qquad \ldots\text{(iv)}$$

and from Eqs. (i) and (iii).

$$\frac{n_1}{2n_3 - 1} = \frac{160}{60} = \frac{8}{3} \qquad \ldots\text{(v)}$$

For minimum frequency n_1, n_2 and n_3 should be least from Eqs. (iv) and (v).

We get, $\quad n_1 = 8,\ n_2 = 1,\ n_3 = 2$

$$\lambda = \frac{20}{2n_2 - 1} = 20 \text{ cm} \qquad \text{[from Eq. (ii)]}$$

$$= 0.2 \text{ m}$$

$$\therefore \qquad f_{\min} = \frac{v}{\lambda} = \frac{8000}{0.2}$$

$$= 40 \text{ kHz}$$ **Ans.**

Next higher frequency corresponds to

$$n_1 = 24,\ n_2 = 2$$

and $\quad n_3 = 5$

$$f = 120 \text{ kHz}$$ **Ans.**

11. (a) Distance between two nodes is $\lambda/2$ or π/k. The volume of string between two nodes is

$$V = \frac{\pi}{k} s \qquad \ldots\text{(i)}$$

Energy density (energy per unit volume) of each wave will be

$$u_1 = \frac{1}{2}\rho\omega^2(8)^2 = 32\,\rho\omega^2$$

and $\quad u_2 = \frac{1}{2}\rho\omega^2(6)^2 = 18\,\rho\omega^2$

$\therefore$ Total mechanical energy between two consecutive nodes will be

$$E = (u_1 + u_2)V$$

$$= 50\frac{\pi}{k}\rho\omega^2 S$$

(b) $y = y_1 + y_2$

$$= 8\sin(\omega t - kx) + 6\sin(\omega t + kx)$$

$$= 2\sin(\omega t - kx) + \{6\sin(\omega t + kx) + 6\sin(\omega t + kx)\}$$

$$= 2\sin(\omega t - kx) + 12\cos kx \sin \omega t$$

Thus, the resultant wave will be a sum of standing wave and a travelling wave.

Energy crossing through a node per second = power or travelling wave

$$\therefore \qquad P = \frac{1}{2}\rho\omega^2(2)^2 Sv$$

$$= \frac{1}{2}\rho\omega^2(4)(S)\left(\frac{\omega}{k}\right)$$

$$= \frac{2\rho\omega^3 S}{k}$$

19. Sound Waves

INTRODUCTORY EXERCISE 19.1

1. $\Delta p_{\max} = BAk$

$$B = \frac{\Delta p_{\max}}{Ak} = \frac{\Delta p_{\max}}{A\,(2\pi/\lambda)}$$

$$= \frac{(\Delta p_{\max})\,\lambda}{2\pi A}$$

$$= \frac{(14)\,(0.35)}{(2\pi)\,(5.5 \times 10^{-6})}$$

$$= 1.4 \times 10^5\,\text{N/m}^2$$

2. $\lambda_{\min} = \dfrac{v}{f_{\max}} = \dfrac{1450}{20000}$

$$= 0.0725\text{ m} = 7.25\text{ cm}$$

$$\lambda_{\max} = \frac{v}{f_{\min}} = \frac{1450}{20} = 72.5\text{ m}$$

3. (a) Displacement is zero when pressure is maximum.

(b) $\Delta p_{\max} = BAk$

$$= (\rho v^2)\,A\left(\frac{\omega}{v}\right) = 2\pi f A \rho v$$

$$\therefore\quad A = \frac{\Delta p_{\max}}{2\pi f \rho v}$$

$$= \frac{10}{(2\pi)\,(10^3)\,(1.29)\,(340)}$$

$$= 3.63 \times 10^{-6}\text{ m}$$

4. In the above problem, we have found that

$$A = \frac{\Delta p_{\max}}{2\pi f \rho v}$$

$$= \frac{(\Delta p_{\max})k}{\rho \omega^2} \quad \left(\text{as } v = \frac{\omega}{k} \text{ and } 2\pi f = \omega\right)$$

Now substituting the value, we have

$$A = \frac{(12)\,(8.18)}{(1.29)\,(2700)^2} = 1.04 \times 10^{-5}\text{ m}$$

INTRODUCTORY EXERCISE 19.2

1. $v \propto \sqrt{T}$

$$\therefore\quad \frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1}} \quad \text{or } T_2 = \left(\frac{v_2}{v_1}\right)^2 T_1 = (2)^2\,(273)$$

$$= 1092\text{ K}$$

$$= 819°\text{C}$$

2. $\because\quad v \propto \sqrt{T}$

$$\therefore\quad v_2 = \left(\sqrt{\frac{T_2}{T_1}}\right) v_1$$

$$v_{-3°\text{C}} = \left(\sqrt{\frac{270}{273}}\right)(332)$$

$$= 330.17\text{ m/s}$$

$$v_{30°\text{C}} = \left(\sqrt{\frac{273 + 30}{273}}\right)(332)$$

$$= 349.77\text{ m/s}$$

The difference in these two speeds is approximately 19.6 m/s.

3. $\because\quad v = f\lambda = \sqrt{\dfrac{B}{\rho}}$

$$\therefore\quad B = \rho\ (f\lambda)^2$$

$$= (900)\,(250 \times 8)^2$$

$$= 3.6 \times 10^9\ \text{N/m}^2$$

4. $v = \sqrt{\dfrac{\gamma RT}{M}}$

$$= \sqrt{\frac{(7/5)\,(8.31)\,(273)}{(32 \times 10^{-3})}}$$

$$= 315\text{ m/s}$$

INTRODUCTORY EXERCISE 19.3

1. (a) $\Delta p_{\max} = BAk$

$$= (\rho v^2)\,(A)\left(\frac{\omega}{v}\right)$$

$$= (2\pi f A\,\rho v)$$

$$= (2\pi)\,(300)\,(6.0 \times 10^{-3})(1.2)\,(344)$$

$$= 4.67\text{ Pa}$$

(b) $I = \dfrac{v\,(\Delta p)^2_{\max}}{2B}$

$$= \frac{(\Delta p)^2_{\max}}{2\rho v} \qquad (\text{as } B = \rho v^2)$$

$$= \frac{(4.67)^2}{(2)\,(1.2)\,(344)}$$

$$= 0.0264\ \text{W/m}^2$$

$$= 2.64 \times 10^{-2}\ \text{W/m}^2$$

(c) $$L = \log_{10}\left(\frac{I}{I_0}\right)$$

$$= 10\log_{10}\left(\frac{2.64\times10^{-2}}{10^{-12}}\right)$$

$$= 104 \text{ dB}$$

2. $L_2 - L_1 = 10\log_{10}\frac{I_1}{I_2}$

Given, $L_2 - L_1 = 9$ dB

Solving the equation, we get

$$\frac{I_1}{I_2} = 7.9$$

3. $I \propto \frac{1}{r^2}$

$$\therefore \quad \frac{I_1}{I_2} = \left(\frac{r_2}{r_1}\right)^2 = \left(\frac{300}{30}\right)^2 = 100$$

Now, $L_1 - L_2 = 10\log_{10}\frac{I_1}{I_2}$

Substituting $\frac{I_1}{I_2} = 100$

We get, $L_1 - L_2 = 20$ dB

4. (a) $$I = \frac{v(\Delta p)^2_{\max}}{2B}$$

$$= \frac{(\Delta p)^2_{\max}}{2\rho v}$$

For finest sound,

$$I = \frac{(2\times10^{-5})^2}{2\times1.29\times345}$$

$$= 4.49\times10^{-13}\ \text{W/m}^2$$

$$L = 10\log_{10}\left(\frac{I}{I_0}\right)$$

$$= 10\log_{10}\left(\frac{4.49\times10^{-13}}{10^{-12}}\right)$$

$$= -3.48 \text{ dB}$$

Same formulae can be applied for loudest sound.

(b) $(\Delta p)_{\max} = BAk$

$$= (\rho v^2)(A)\left(\frac{\omega}{v}\right)$$

$$= 2\pi f\rho v$$

$$\therefore \quad A = \frac{(\Delta p)_{\max}}{2\pi f\rho v}$$

For finest sound,

$$A = \frac{2\times10^{-5}}{(2\pi)(500)(1.29)(345)}$$

$$= 1.43\times10^{-11} \text{ m}$$

INTRODUCTORY EXERCISE 19.4

1. $\Delta x = \lambda/2 = \frac{v}{2f}$

$$\therefore \quad f = \frac{v}{2\Delta x} = \frac{330}{2(0.12)} = 1375 \text{ Hz}$$

2. (a) $\Delta\phi = \frac{2\pi}{\lambda}(\Delta x)$

$$\therefore \quad \Delta x = \frac{\lambda\Delta\phi}{2\pi} = \frac{v(\Delta\phi)}{(f)(2\pi)}$$

$$= \frac{(350)(\pi/3)}{(500)(2\pi)}$$

$$= 0.1166 \text{ m} = 11.7 \text{ cm}$$

(b) $$\Delta\phi = \left(\frac{2\pi}{T}\right)\Delta t = (2\pi f)\,\Delta t$$

$$= (2\pi)(500)(10^{-3})$$

$$= \pi \text{ or } 180°$$

INTRODUCTORY EXERCISE 19.5

1. Length of the organ pipe is same in both the cases. Fundamental frequency of open pipe is $f_1 = \frac{v}{2l}$ and frequency of third harmonic of closed pipe will be

$$f_2 = 3\left(\frac{v}{4l}\right)$$

Given that, $f_2 = f_1 + 100$

or $f_2 - f_1 = 100$

or $$\frac{3}{4}\left(\frac{v}{l}\right) - \left(\frac{1}{2}\right)\left(\frac{v}{l}\right) = 100$$

$$\Rightarrow \quad \frac{v}{4l} = 100 \text{ Hz}$$

$$\therefore \quad \frac{v}{2l} \text{ or } f_1 = 200\,\text{Hz}$$

Therefore, fundamental frequency of the open pipe is 200 Hz.

2. First harmonic of closed pipe = Third harmonic of open pipe

$$\therefore \quad \frac{v}{4l_1} = 3\left(\frac{v}{2l_2}\right) \Rightarrow \therefore \quad \frac{l_1}{l_2} = \frac{1}{6}$$

3. $f_c = \frac{v}{4l} = 512\text{ Hz}$

$$f_o = \frac{v}{2l} = 2f_c = 1024\text{ Hz}$$

4. (a) $f_1 = \frac{v}{4l}$

$$\therefore \quad l = \frac{v}{4f_1} = \frac{345}{4 \times 220}$$

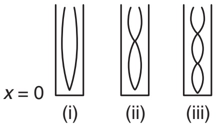
$$= 0.392\text{ m}$$

(b) $5\left(\frac{v}{4l_c}\right) = 3\left(\frac{v}{2l_0}\right)$

$$\therefore \quad l_0 = \frac{6}{5}l_c = \left(\frac{6}{5}\right)(0.392)$$

$$= 0.47\text{ m}$$

5.



(a) In second figure, $l = \frac{3\lambda}{4}$

$$\therefore \quad \frac{\lambda}{4} = \frac{l}{3} = \frac{0.8}{3}$$

$$= 0.267\text{ m}$$

Displacement antinode is at

$$x = \frac{\lambda}{4} = 0.267\text{ m}$$

and $\quad x = 3\frac{\lambda}{4} = 0.8\text{ m}$

(b) Pressure antinode is displacement node:

In third figure,

Pressure antinode or displacement node is at

$$x = 0, x = \frac{\lambda}{2}$$

and $\quad x = \lambda$

6. (a) $\frac{400}{560} = \frac{5}{7}$

Since, these are odd harmonics (5 and 7). Hence, pipe is closed.

(c) Given frequencies are integer multiples of 80 Hz. Hence, fundamental frequency is 80 Hz.

$$\frac{v}{4l} = 80$$

$$\therefore \quad l = \frac{v}{320} = \frac{344}{320}$$

$$= 1.075\text{ m}$$

INTRODUCTORY EXERCISE 19.6

1. Frequency of first will decrease by loading wax over it. Beat frequency is increasing. Hence,

$$f_2 > f_1$$

or $\quad f_2 - f_1 = 4$

$$\therefore \quad f_1 = f_2 - 4 = 256 - 4$$

$$= 252\text{ Hz}$$

2. By putting wax on first tuning fork, its frequency will decrease.

Beat frequency is also decreasing. Hence,

$$f_1 > f_2$$

$$\therefore \quad f_1 - f_2 = 3$$

or $\quad f_1 = 3 + f_2 = 3 + 384$

$$= 387\text{ Hz}$$

INTRODUCTORY EXERCISE 19.7

1. Source is moving towards the observer

$$f' = f\left(\frac{v}{v - v_s}\right) = 450\left(\frac{330}{330 - 33}\right)$$

$$f' = 500\text{ Hz}$$

2. $\quad f_1 = f\left(\frac{v}{v - v_s}\right)$

$$f_1 = f\left(\frac{340}{340 - 34}\right) = f\left(\frac{340}{306}\right)$$

and $\quad f_2 = f\left(\frac{340}{340 - 17}\right) = f\left(\frac{340}{323}\right)$

$$\therefore \quad \frac{f_1}{f_2} = \frac{323}{306} = \frac{19}{18}$$

3. Using the formula, $f' = f\left(\frac{v + v_0}{v}\right)$

We get, $\quad 5.5 = 5\left(\frac{v + v_A}{v}\right) \quad \ldots\text{(i)}$

and $\quad 6.0 = 5\left(\frac{v + v_B}{v}\right) \quad \ldots\text{(ii)}$

Here, $\quad v$ = speed of sound

v_A = speed of train *A*

v_B = speed of train *B*

Solving Eqs. (i) and (ii), we get $\frac{v_B}{v_A} = 2$

4. Observer is stationary and source is moving.

During approach, $f_1 = f\left(\frac{v}{v - v_s}\right)$

$$= 1000\left(\frac{320}{320-20}\right)$$

$$= 1066.67 \text{ Hz}$$

During recede, $f_2 = f\left(\dfrac{v}{v+v_s}\right)$

$$= 1000\left(\frac{320}{320+20}\right) = 941.18 \text{ Hz}$$

$$|\% \text{ change in frequency}| = \left(\frac{f_1 - f_2}{f_1}\right)\times 100$$

$$\approx 12\%$$

Exercise

LEVEL 1

Assertion and Reason

1. **Closed pipe**

Frequencies are, $\dfrac{v}{4l}, \dfrac{3v}{4l}, \dfrac{5v}{4l}$

Open pipe Frequencies are

$$\frac{v}{2l}, 2\left(\frac{v}{2l}\right), 3\left(\frac{v}{2l}\right)$$

They are never same.

2. $f' = f\left(\dfrac{v}{v-v_s}\right) \Rightarrow f' > f$ but $f' =$ constant.

3. Change in pressure is maximum at a point where displacement is zero.

5. $L = 10 \log_{10} \dfrac{I}{I_0}$

Increase in the value of L is not linear with I.

$$\Delta L = L_2 - L_1 = 10 \log \frac{I_2}{I_1}$$

$$\Delta L = 3\,\text{dB} \quad \text{if} \quad I_2 = 2I_1$$

6. It is independent of pressure as long as temperature remains constant.

7. $f_A - f_B = 4$ Hz

When A is loaded with wax f_A will decrease. So, $f_A - f_B$ will be less than 4 Hz till $f_A > f_B$. But $f_B - f_A$ may be greater than 4 Hz when f_B becomes greater than f_A.

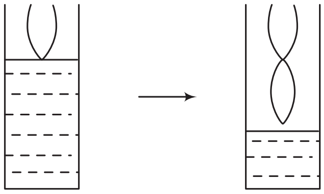
8. $\dfrac{450}{750} = \dfrac{3}{5}$

Successive harmonics are odd 3 and 5. Hence, it is a closed pipe.

9. $f_0 = \dfrac{v}{2\,(l + 1.2\,r)}$ of an open pipe and

$f_0 = \dfrac{v}{4\,(l + 0.6\,r)}$ for a closed pipe.

10. Wavelength remains same.



Objective Questions

1. Sound waves cannot travel in vacuum.

3. $f_0 = \dfrac{v}{2l}$ and $f_c = \dfrac{v}{4l}$

$$\therefore \quad f_0 = 2f_c$$

4. $v = \sqrt{\dfrac{\gamma RT}{M}} \propto \sqrt{\dfrac{T}{M}}$ ($\gamma = 1.4$ for both)

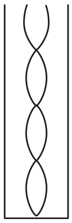
$$\therefore \quad \frac{T_{O_2}}{M_{O_2}} = \frac{T_{N_2}}{M_{N_2}}$$

$$\therefore \quad T_{O_2} = \left(\frac{M_{O_2}}{M_{N_2}}\right) T_{N_2}$$

$$= \left(\frac{32}{28}\right)(273 + 15)$$

$$= 329 \text{ K} = 56°\text{C}$$

5.



Third overtone

6. $f \propto v$ and $v \propto \sqrt{T}$

7. In air speed of sound is less, hence air is denser medium.

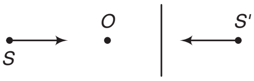
8. $\dfrac{v}{2l_0} = \dfrac{v}{4l_c} \Rightarrow l_c : l_0 = 1:2$

9. $f \propto v \propto \sqrt{T}$ ($T \to$ tension)

$$\therefore \quad \frac{f_1}{f_2} = \sqrt{\frac{T_1}{T_2}} \Rightarrow T_2 = T_1\left(\frac{f_2}{f_1}\right)^2$$

$$= (10)\left(\frac{256}{320}\right)^2 = 6.4 \text{ kg}$$

10.



Both S and S' are moving toward observer. Hence,

$$f_S = f_{S'} \quad \text{or} \quad f_b = 0$$

11. $f_b = \frac{10}{3} = f_1 - f_2 = \frac{v}{1} - \frac{v}{1.01}$

Solving we get, $v = 337$ m/s

12. $f' = f\left(\frac{v}{v + v_s}\right) = f\left(\frac{v}{v + v}\right) = 0.5f$

13. $I_R = I_{\max} = (\sqrt{I_1} + \sqrt{I_2})^2$

If $I_1 = I_2 = I_0$, then

$I_R = 4I_0$

14. $\frac{\lambda}{2} = 52 - 17 = 35$ cm

$$\therefore \quad \lambda = 70 \text{ cm} = 0.7 \text{ m}$$

$$v = f\lambda = 500 \times 0.7$$

$$= 350 \text{ m/s}$$

15. $f' = f\left(\frac{v}{v \pm v_s \cos\theta}\right)$

At $\theta = 90°$; $f' = f$

$\therefore \quad n_1 = 0$

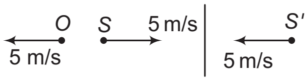
16. Fundamental frequency,

$$f_0 = \frac{v}{4l} = \frac{340}{4 \times 1} = 85 \text{ Hz}$$

Six frequencies can be produced below 1 kHz. Those six frequencies are, f_0, $3f_0$, $5f_0$, $7f_0$, $9f_0$ and $11f_0$.

As $13f_0 = 1105$ Hz > 1000 Hz or 1 kHz.

17. There is no relative motion between O and S'.



$$f_b = f_{S'} - f_S$$

$$= f - f_S = 180 - 180\left(\frac{355 - 5}{355 + 5}\right)$$

$$= 5 \text{ Hz}$$

18. $$n = n_1 - n_2 = \frac{v}{\lambda_1} - \frac{v}{\lambda_2}$$

$$\therefore \quad v = \frac{n\lambda_1\lambda_2}{\lambda_2 - \lambda_1}$$

19. By putting wax on A. Its frequency will decrease. But beat frequency between A and B is also decreasing.

$\therefore \quad f_A > f_B$

or $\quad f_A - f_B = 5$ Hz ...(i)

$\therefore \quad f_B = f_A - 5 = 345$ Hz

Now, $\quad f_B \sim f_C = 4$ Hz

f_C is either 341 Hz or 349 Hz.

If it is 341 Hz, then beat frequency with A will be 9 Hz.

If it is 349 Hz, then beat frequency will be 1 Hz.

If wax is loaded on A, its frequency will decrease.

To produce 6 beats/s with C it should become either 347 Hz (if $f_C = 341$ Hz) or it should become 343 Hz (if $f_C = 349$ Hz).

If it becomes 347 Hz, then only it produces 2 beats/s with B, which is given in the question.

$\therefore \quad f_C = 341$ Hz **Ans.**

20. $\frac{\lambda}{2} = 122 - 40 = 82$ cm

$\therefore$ Next resonance length $= 122$ cm $+ 82$ cm

$= 204$ cm

21. $f \propto \sqrt{T}$

$$\frac{f'}{f} = \sqrt{\frac{T'}{T}} = \sqrt{\frac{101}{100}} = 1.0049$$

$$f' = (1.0049)(200)$$

$$\approx 201 \text{ Hz}$$

$$\therefore \quad f_b = f' - f = 1 \text{ Hz}$$

22. $\lambda = \frac{v}{f} = \frac{340}{340} = 1 \text{ m} = 100$ cm

$\frac{\lambda}{4} = 25$ cm

Air column lengths required are,

$$\frac{\lambda}{4}, \frac{3\lambda}{4}, \frac{5\lambda}{4} \text{ etc.}$$

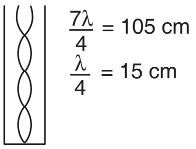
or 25 cm, 75 cm, 125 cm etc.

Maximum we can take 75 cm.

$\therefore$ Minimum water length

$= 120 - 75 = 45$ cm

23. Pressure node means displacement antinode



Displacement antinodes are at a distance $\frac{\lambda}{4}, \frac{3\lambda}{4}, \frac{5\lambda}{4}$ and $\frac{7\lambda}{4}$ from closed end or at a distance of 15 cm, 45 cm, 75 cm and 105 cm.

24. Number of moles ∝ Volume

$$M = \frac{n_1 M_{O_2} + n_2 M_{H_2}}{n_1 + n_2}$$

$$= \frac{(1)(32) + (1)(2)}{2} = 17$$

Now, $v = \sqrt{\frac{\gamma RT}{M}} \propto \frac{1}{\sqrt{M}}$

$$\frac{v_1}{v_2} = \sqrt{\frac{M_2}{M_1}} = \sqrt{\frac{2}{17}}$$

25. $f_1 = f\left(\frac{v}{v - v_s}\right) =$ constant. But $f_1 > f$

$f_2 = f\left(\frac{v}{v + v_s}\right) =$ constant, but $f_2 < f$

26. $f \propto \frac{1}{l}$

Both frequencies will becomes half. Hence, $f_b = f_1 - f_2$ will also become half.

27. $f_b = 243\left(\frac{320}{320 - 4}\right) - 243\left(\frac{320}{320 + 4}\right) = 6$ Hz

28. **Closed pipe**

Fundamental frequency is

$$f_1 = \frac{v}{4l} = \frac{320}{4 \times 1} = 80 \text{ Hz}$$

Other frequencies are

$3f_1 : 5f_1$ etc. or 240 Hz, 400 Hz etc.

Open pipe Fundamental frequency is

$$f_1 = \frac{v}{2l} = \frac{320}{2 \times 1.6} = 100 \text{ Hz}$$

Other frequencies are $2f_1 : 3f_1 : 4f_1$ etc. or 200 Hz, 300 Hz and 400 Hz etc. So, then resonate at 400 Hz.

29. Resultant amplitude will become 4 time.

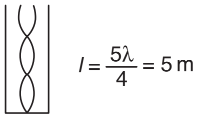
Therefore, resultant intensity is 16 times

$$L_2 - L_1 = 10 \log_{10} \frac{I_1}{I_2}$$

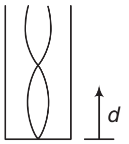
or $\quad L_2 - 10 = 10 \log_{10} (16)$

or $\quad L_2 = 22$ dB

30. $\lambda = \frac{2\pi}{k} = \frac{2\pi}{\pi/2} = 4$ m



31. $\lambda = \frac{v}{f} = \frac{330}{600} = 0.55$ m $= 55$ cm



The desired distance, $d = \frac{\lambda}{4} = 13.75$ cm

32. $f_b = f_1 - f_2 = \frac{v}{\lambda_1} - \frac{v}{\lambda_2}$

$$= \frac{332}{0.49} - \frac{332}{0.5} \approx 13 \text{ Hz}$$

33. $(f_b)_A = f_B - f_A$

$$= 300\left(\frac{300 + 30}{300}\right) - 300 = 30 \text{ Hz}$$

$(f_b)_B = f_A - f_B$

$$= 300\left(\frac{300}{300 - 30}\right) - 300 = 33.33 \text{ Hz}$$

34. $f_a = f\left(\frac{v + v_0}{v}\right)$

$$\therefore \quad \frac{v_0}{v} = \frac{f_a}{f} - 1 \quad \ldots\text{(i)}$$

$$f_r = f\left(\frac{v - v_0}{v}\right)$$

$$\therefore \quad \frac{v_0}{v} = 1 - \frac{f_r}{f} \quad \ldots\text{(ii)}$$

From Eqs. (i) and (ii), we get

$$f = \frac{f_a + f_r}{2}$$

Subjective Questions

1. Speed of sound wave,

$$v = \sqrt{\frac{B}{\rho}} = \sqrt{\frac{(2 \times 10^9)}{10^3}} = 1414 \text{ m/s}$$

Wavelength, $\lambda = \frac{v}{f} = 5.84$ m **Ans.**

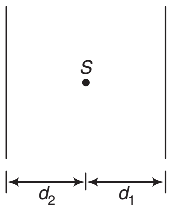
2. $f' = f\left(\dfrac{v \pm v_m}{v \pm v_m}\right) = f$

3.
$$v = \sqrt{\frac{\gamma RT}{M}}$$
$$= \sqrt{\frac{1.40 \times 8.31 \times 300}{2 \times 10^{-3}}} = 1321 \text{ m/s}$$

4.
$$L_1 = 10 \log_{10}\left(\frac{I_1}{I_0}\right)$$
$$= 10 \log_{10}\left(\frac{10^{-6}}{10^{-12}}\right) = 60 \text{ dB}$$
$$L_2 = 10 \log_{10}\left(\frac{I_2}{I_0}\right)$$
$$= 10 \log_{10}\left(\frac{10^{-9}}{10^{-12}}\right) = 30 \text{ dB}$$
$$L_1 = 2L_2$$

5.
$$f' = f\left(\frac{v - v_w - v_0}{v - v_w + v_S}\right)$$
$$= 300\left[\frac{340 - 5 - 20}{340 - 5 + 10}\right]$$
$$= 274 \text{ Hz}$$

6.



$$2d_1 = vt_1$$
$$\therefore \quad d_1 = \frac{vt_1}{2} = \frac{332 \times 3/2}{2}$$
$$= 249 \text{ m}$$
Similarly, $d_2 = \dfrac{vt_2}{2} = \dfrac{332 \times 5/2}{2}$
$$= 415 \text{ m}$$
$\therefore$ Total distance $= d_1 + d_2 = 664$ m

Next echo he will hear after time,
$$t = t_2 + t_1 = \frac{5}{2} + \frac{3}{2} = 4 \text{ s}$$

7.
$$v = \sqrt{\frac{\gamma p}{\rho}} = \sqrt{\frac{(5/3) \times 0.76 \times 13.6 \times 10^3 \times 9.8}{0.179}}$$
where, $p = h\rho g$

$\therefore \quad v = 972$ m/s

8. (a)
$$v = f\lambda = \sqrt{\frac{B}{\rho}}$$
$$\therefore \quad B = \rho\,(f\lambda)^2$$
$$= (1300)\,(400 \times 8)^2$$
$$= 1.33 \times 10^{10} \text{ N/m}^2$$
(b)
$$v = \frac{l}{t} = \sqrt{\frac{Y}{\rho}}$$
$$\therefore \quad Y = \rho\left(\frac{l}{t}\right)^2 = (6400)\left(\frac{1.5}{3.9 \times 10^{-4}}\right)^2$$
$$= 9.47 \times 10^{10} \text{ N/m}^2$$

9.
$$\sqrt{\frac{Y}{\rho}} = 30\sqrt{\frac{T}{\mu}} = 30\sqrt{\frac{F}{\rho A}} \qquad (\text{as } T = F \text{ and } \mu = \rho A)$$
$$\therefore \quad \frac{F}{A} = \frac{Y}{900}$$

10. Equal volume of different gases contains equal number of moles at STP.
$$\therefore \quad n \propto V$$
$$M = \frac{n_1 M_1 + n_2 M_2}{n_1 + n_2}$$
$$= \frac{(2)\,(2) + (1)\,(28)}{2 + 1} = 10.67$$
$$v = \sqrt{\frac{\gamma RT}{M}}$$
$$\therefore \quad \frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1} \cdot \frac{M_1}{M_2}}$$
$$\text{or} \quad v_2 = \left(\sqrt{\frac{T_2}{T_1} \cdot \frac{M_1}{M_2}}\right) v_1$$
$$= \left(\sqrt{\frac{300}{273} \times \frac{2}{10.67}}\right)(1300)$$
$$\approx 591 \text{ m/s}$$

11.
$$L_1 = 10 \log_{10}\left(\frac{I}{I_0}\right)$$
$$100 = 10 \log_{10}\left(\frac{I}{10^{-12}}\right)$$
Solving we get, $I = 10^{-2}$ W/m^2

Now, $I = \dfrac{P}{4\pi r^2}$
$$\therefore \quad P = I\,(4\pi r^2)$$
$$= (10^{-2})(4\pi)(40)^2$$
$$= 201 \text{ W}$$

12. (a) $$L = 10 \log_{10}\left(\frac{I}{I_0}\right)$$

$$60 = 10 \log_{10}\left(\frac{I}{10^{-12}}\right)$$

Solving we get,

$$I = 10^{-6}\ \text{W/m}^2$$

(b) $I = \dfrac{P}{S}$

$$\therefore \quad P = (I)(S) = (10^{-6})(120 \times 10^{-4}) = 1.2 \times 10^{-8}\ \text{W}$$

13. (a) $$L_2 - L_1 = 10 \log_{10}\left(\frac{I_2}{I_1}\right)$$

$$\therefore \quad 13 = 10 \log_{10}\left(\frac{I_2}{I_1}\right)$$

Solving we get, $\dfrac{I_2}{I_1} = 20$

(b) From the above equation we can see that we do not need L_1 and L_2 separately.

14. (a) $$I = \frac{P}{4\pi r^2} = \frac{5}{4\pi\ (20)^2} = 9.95 \times 10^{-4}\ \text{W/m}^2$$

(b) $I = \dfrac{1}{2}\rho\omega^2 A^2 v$

$$\therefore \quad A = \sqrt{\frac{2I}{\rho\ (2\pi f)^2\ v}} = \sqrt{\frac{2 \times 9.95 \times 10^{-4}}{1.29\ (2\pi \times 300)^2\ (330)}} = 1.15 \times 10^{-6}\text{m}$$

15. $$L = 10 \log_{10}\left(\frac{I}{I_0}\right)$$

$$60 = 10 \log_{10}\ (I/10^{-12})$$

Solving, we get $I = 10^{-6}\ \text{W/m}^2$

Now, using the result derived in above problem.

$$A = \sqrt{\frac{2I}{\rho\ (2\pi f)^2\ v}} = \sqrt{\frac{2 \times 10^{-6}}{1.29\ (2\pi \times 800)^2 (330)}} = 1.36 \times 10^{-8}\text{m} = 13.6\ \text{nm}$$

16. $$L = 10 \log_{10}\left(\frac{I}{I_0}\right)$$

$$\therefore \quad 10^2 = 10 \log_{10}\left(\frac{I}{10^{-12}}\right)$$

Solving we get,

$$I = 1.59 \times 10^{-2}\ \text{W/m}^2$$

$$I = \frac{P}{4\pi r^2}$$

$$\therefore \quad P = (I)(4\pi r^2) = (1.59 \times 10^{-2})(4\pi)(20)^2 = 80\ \text{W}$$

17. $$I = \frac{1}{2}\rho\omega^2 A^2 v$$

$$= 2\rho\pi^2 f^2 A^2 v \qquad (\text{as } \omega = 2\pi f)$$

$$= (2)(1.29)(\pi)^2(300)^2\ (0.2 \times 10^{-3})^2\ (330)$$

$$= 30.27\ \text{W/m}^2$$

$$L = 10 \log_{10}\ (I/I_0)$$

where, $I_0 = 10^{-12}\ \text{W/m}^2$

Substituting the value we get,

$$L = 134.4\ \text{dB}$$

18. (a) $$v = \sqrt{\frac{B}{\rho}} = \sqrt{\frac{2.18 \times 10^9}{1000}} = 1476\ \text{m/s}$$

$$\lambda = \frac{v}{f} = \frac{1476}{3400} = 0.43\ \text{m}$$

$$I = \frac{1}{2}\rho\omega^2 A^2 v$$

$$\therefore \quad A = \sqrt{\frac{2I}{\rho\ (2\pi f)^2 v}} = \sqrt{\frac{2 \times 3 \times 10^{-6}}{(1000)\ (2\pi \times 3400)^2\ (1476)}} = 9.44 \times 10^{-11}\text{m}$$

(b) $$v = \sqrt{\frac{\gamma p}{\rho}} = \sqrt{\frac{(1.4)(10^5)}{(1.2)}} = 341.56\ \text{m/s}$$

$$\lambda = \frac{v}{f} = \frac{341.56}{3400} = 0.1\ \text{m}$$

$$A = \sqrt{\frac{2I}{\rho\ (2\pi f)^2\ v}}$$

$$= \sqrt{\frac{2 \times 3.0 \times 10^{-6}}{1.2 \times (2\pi \times 3400)^2\ (341.56)}}$$

$$= 5.66 \times 10^{-9}\ \text{m}$$

(c) $\dfrac{A_{\text{air}}}{A_{\text{water}}} = \dfrac{5.66 \times 10^{-9}}{9.44 \times 10^{-11}} = 60$

$$I = \frac{1}{2}\rho\omega^2 A^2 v$$

ρ and v are less in air. So, for same intensity A should be large.

19. $I = \dfrac{v\,(\Delta p)^2_{\text{max}}}{2B} \quad \Rightarrow \quad v = \sqrt{\dfrac{B}{\rho}}$

$$\therefore \qquad B = \rho v^2$$

$$\therefore \qquad I = \frac{(\Delta p)^2_{\text{max}}}{2\rho v}$$

$$= \frac{(6 \times 10^{-5})^2}{2 \times 1.29 \times 330}$$

$$= 4.2 \times 10^{-12}\ \text{W/m}^2$$

$$L = 10 \log_{10}\left(\frac{I}{I_0}\right)$$

$$= 10 \log_{10}\left(\frac{4.2 \times 10^{-12}}{10^{-12}}\right)$$

$$= 6.23\ \text{dB}$$

20. (a) Fundamental, $f_1 = \dfrac{v}{2l} = \dfrac{344}{2 \times 0.45} = 382.2$ Hz

First two overtones are $2f_1$ and $3f_1$.

(b) Fundamental, $f_1 = \dfrac{v}{4l} = \dfrac{344}{4 \times 0.45} = 191.1$ Hz

First two overtones are $3f_1$ and $5f_1$.

21. $\dfrac{\lambda}{2} = (45 - 15)$ cm

$$\therefore \qquad \lambda = 60\ \text{cm}$$

$$v = f\lambda = (500)\,(0.6)$$

$$= 300\ \text{m/s}$$

Lowest frequency when open from both ends is $\dfrac{v}{2l}$.

$$= \frac{300}{2 \times 0.6} = 250\ \text{Hz}$$

22. Fundamental frequency $= \dfrac{v}{2l}$

$$f = \frac{330}{2 \times 0.8}$$

$$f = 206.25\ \text{Hz}$$

$$\omega = 2\pi f = 1297\ \text{rad/s}$$

$$k = \frac{\omega}{v} = \frac{1297}{330} = 3.93\ \text{rad/s}$$

Now, $x = 0$ (the open end) is an antinode. Hence, we can write the equation,

$$y = A \cos kx \sin \omega t$$

23. $\dfrac{\lambda}{2} = (84 - 50)$ cm $= 34$ cm

Next length $= 84 + \dfrac{\lambda}{2} = 118$ cm

$$\lambda = 68\ \text{cm} \quad \text{or} \quad 0.68\ \text{m}$$

$$v = f\lambda = (512)\,(0.68)$$

$$= 348.16\ \text{m/s}$$

24. $2\left(\dfrac{v}{2l_1}\right) = \left(\dfrac{v_2}{4l_2}\right)$

or $\dfrac{\sqrt{T/\mu}}{l_1} = \left(\dfrac{v_2}{4l_2}\right)$

$$\therefore \qquad T = \mu\left(\frac{v_2\, l_1}{4l_2}\right)^2$$

$$= \left(\frac{4 \times 10^{-3}}{0.4}\right)\left(\frac{340 \times 40}{4 \times 100}\right)^2$$

$$= 11.56\ \text{N}$$

25. $f = \dfrac{v}{4\,(l + 0.6\,\pi)}$

$$\therefore \qquad v = 4f\,(l + 0.6\,\pi)$$

$$= 4 \times 480\,(0.16 + 0.6 \times 0.025)$$

$$= 336\ \text{m/s}$$

26. (a) $f = \dfrac{v}{4l}$

$$\therefore \qquad l = \frac{v}{4f} = \frac{345}{4 \times 220}$$

$$= 0.392\ \text{m}$$

(b) $5\left(\dfrac{v}{4l_c}\right) = 3\left(\dfrac{v}{2l_0}\right)$

$$\therefore \qquad l_0 = \frac{6}{5}\, l_c = \frac{6}{5}\,(0.392)$$

$$= 0.470\ \text{m}$$

27. $\dfrac{v_1}{2\,(0.8l)} = \dfrac{v_2}{4l} \quad \Rightarrow \quad \dfrac{v_1}{v_2} = 0.4$

28. (a) $\lambda = \dfrac{v}{f} = \dfrac{340}{300} = 1.13$ m

(b) **Ahead**

$$f' = f\left(\frac{v}{v - v_s}\right) = 300\left(\frac{340}{340 - 30}\right)$$

$$= 329\ \text{Hz}$$

$$\lambda' = \frac{v}{f'} = \frac{340}{329} = 1.03 \text{ m}$$

Behind

$$f' = f\left(\frac{v}{v + v_s}\right) = 300\left(\frac{340}{340 + 30}\right)$$

$$= 275.67 \text{ Hz}$$

$$\lambda' = \frac{v}{f'} = \frac{340}{275.67}$$

$$= 1.23 \text{ m}$$

29. (a) Possible fundamental frequencies of retuned string is (440 ± 1.5) Hz.

(b) $f \propto \sqrt{T}$

$$\therefore \quad \frac{f_1}{f_2} = \sqrt{\frac{T_1}{T_2}}$$

$$\therefore \quad T_2 = \left(\frac{f_2}{f_1}\right)^2 T_1$$

(i) $T_2 = \left(\dfrac{441.5}{440}\right)^2$

$$T_1 = 1.0068\, T_1$$

$$\% \text{ change} = \frac{T_2 - T_1}{T_1} \times 100$$

$$= +\, 0.68\%$$

(ii) $T_2 = \left(\dfrac{438.5}{440}\right)^2 T_1 = 0.9932\, T_1$

$$\% \text{ change} = \frac{T_2 - T_1}{T_1} \times 100$$

$$= -\, 0.68\%$$

30. (a) $\lambda = 0.12$

Surface wave speed, $v = 0.32$ m/s

$$f' = \frac{v}{\lambda} = \frac{0.32}{0.12} = 2.66 \text{ Hz}$$

$$f = \frac{1}{T} = \frac{1}{1.6} = 0.625 \text{ Hz}$$

Now, using $f' = f\left(\dfrac{v}{v - v_s}\right)$

Here, $v_s =$ velocity of source or velocity of duck

$$\therefore \quad 2.66 = 0.625\left(\frac{0.32}{0.32 - v_s}\right)$$

Solving we get, $v_s = 0.245$ m/s

(b) **Behind the duck**

$$f' = f\left(\frac{v}{v + v_s}\right)$$

$$= 0.625\left(\frac{0.32}{0.32 + 0.245}\right)$$

$$= 0.354 \text{ Hz}$$

$$\lambda = \frac{v}{f'} = \frac{0.32}{0.354} = 0.904 \text{ m}$$

31. (a) $f' = f\left(\dfrac{v + v_0}{v - v_s}\right)$

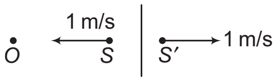
$$= 262\left(\frac{340 + 18}{340 - 30}\right)$$

$$= 302 \text{ Hz}$$

(b) $f' = f\left(\dfrac{v - v_0}{v + v_s}\right)$

$$= 262\left(\frac{340 - 18}{340 + 30}\right) = 228 \text{ Hz}$$

32.



$$f_b = f_S - f_{S'}$$

$$4 = f\left(\frac{340}{340 - 1}\right) - f\left(\frac{340}{340 + 1}\right)$$

or $\quad 4 = f\left(1 - \dfrac{1}{340}\right)^{-1} - f\left(1 + \dfrac{1}{340}\right)^{-1}$

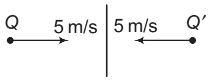
Applying Binomial, we get

$$4 = f\left(1 + \frac{1}{340}\right) - f\left(1 - \frac{1}{340}\right)$$

$$= \frac{f}{170} \quad \text{or} \quad f = 680 \text{ Hz}$$

33. Beat frequency between P and Q is $\dfrac{7}{2}$ or 3.5 Hz.

On loading P with wax, its frequency will decrease and beat frequency is increasing.



$$\therefore \quad f_Q > f_P$$

or $\quad f_Q - f_P = 3.5 \quad \ldots\text{(i)}$

Given, $\quad f'_Q - f_Q = 5$

or $\quad f_Q\left(\dfrac{332 + 5}{332 - 5}\right) - f_Q = 5$

Solving this equation, we get

$$f_Q = 163.5 \text{ Hz}$$

Now, from Eq. (i) we have

$$f_P = 160 \text{ Hz}$$

34. $f_b = f_1 - f_2$

$$2 = 680\left(\frac{340}{340 - v_s}\right) - 680\left(\frac{340}{340 + v_s}\right)$$

$$= 680\left(1 - \frac{v_s}{340}\right)^{-1} - 680\left(1 + \frac{v_s}{340}\right)^{-1}$$

Using Binomial expansion, we have

$$2 = 680\left[\frac{2v_s}{340}\right] \Rightarrow v_s = 0.5 \text{ m/s}$$

35. $\frac{\lambda}{2} = 11.5$ cm or $\lambda = 23$ cm or 0.23 m

$$f = \frac{v}{\lambda} = \frac{331.2}{0.23} = 1440 \text{ Hz}$$

36. $\lambda = \frac{v}{f} = \frac{330}{220} = 1.5$ m

$$\Delta\phi_1 = \left(\frac{2\pi}{\lambda}\right)(\Delta x_1) = \left(\frac{2\pi}{1.5}\right)(0.75) = \pi$$

$$\Delta\phi_2 = \left(\frac{2\pi}{\lambda}\right)(\Delta x_2) = \left(\frac{2\pi}{1.5}\right)(3) = 4\pi$$

Since, $\phi = \Delta\phi_2 - \Delta\phi_1 = 3\pi$

They will interfere destructively.

$\therefore$ $$I_R = (\sqrt{I_1} - \sqrt{I_2})^2 \qquad \text{…(i)}$$

where,

$$I_1 = \frac{P_1}{4\pi r_1^2} = \frac{1.2 \times 10^{-3}}{(4\pi)(0.75)^2}$$

$$= 16.97 \times 10^{-5} \text{ W/m}^2$$

$$I_2 = \frac{P_2}{4\pi r_2^2} = \frac{1.8 \times 10^{-3}}{(4\pi)(3)^2}$$

$$= 1.59 \times 10^{-5} \text{ W/m}^2$$

Substituting in Eq. (i), we get

$$I_R = 8.2 \times 10^{-5} \text{ W/m}^2$$

37. $SOD - SD = \lambda$

where, $\lambda = \frac{v}{f} = \frac{360}{360} = 1$ m

$\therefore$ $$2\sqrt{\frac{x^2}{4} + (2)^2} - x = \lambda = 1$$

Solving this equation, we get

$$x = 7.5 \text{ m}$$

38. $\because$ $v = f\lambda = (1000)(2 \times 6.77 \times 10^{-2})$

$$= 135.4 \text{ m/s} = \sqrt{\frac{\gamma RT}{M}}$$

$\therefore$ $$\gamma = (135.4)^2\left(\frac{M}{RT}\right)$$

$$= \frac{(135.4)^2 (0.127)}{(8.31 \times 400)}$$

$$= 0.7$$

Since, $\gamma \nless 1$

So, we will have to substitute,

$$M = 2 \times 0.127$$

The γ comes out to be 1.4 which is the γ of a diatomic gas.

39. $\frac{\lambda}{2} = (100 - 60) \times 10^{-2}$ m

$\therefore$ $\lambda = 0.8$ m

Now, $v = f\lambda = 440 \times 0.8$

$= 352$ m/s

40. When T_A is increased, f_A will increase. So, it will become (600 + 6) = 606 Hz

Now, $f \propto \sqrt{T}$

$\therefore$ $$\frac{T_A}{T_B} = \left(\frac{f_A}{f_B}\right)^2 = \left(\frac{606}{600}\right)^2$$

$$= 1.02$$

41. $f \propto \frac{1}{l}$

By decreasing the length, frequency of wire will increase. But beat frequency is decreasing. Hence, its original frequency was (256 – 4) Hz or 252 Hz. Now, we have to make it 256 Hz for no beats.

$$\frac{f_1}{f_2} = \frac{l_2}{l_1}$$

$\therefore$ $$l_2 = \left(\frac{f_1}{f_2}\right) l_1$$

$$= \left(\frac{252}{256}\right)(25)$$

$$= 24.6 \text{ cm}$$

$\therefore$ $\Delta l = l_1 - l_2 = 0.4$ cm

42. If observer is moving, then

$$f' = f\left(\frac{v \pm v_0}{v}\right) = f\left(1 \pm \frac{v_0}{v}\right)$$

If source is moving, then

$$f' = f\left(\frac{v}{v \mp v_s}\right)$$

$$= f\left(1 \mp \frac{v_s}{v}\right)^{-1} = f\left(1 \pm \frac{v_s}{v}\right)$$

If $v_s << v$

Both expressions come out to be of similar type.

43. $f' = f\left(\frac{v}{v - v_s}\right) = 200\left(\frac{340}{340 - 80}\right)$

$$= 261.53 \text{ Hz} \approx 262 \text{ Hz}$$

$$\lambda' = \frac{v}{f'} = \frac{340}{261.53} = 1.3 \text{ m}$$

44. In front of locomotive,

$$f' = f\left(\frac{v}{v - v_s}\right)$$

$$= 500\left(\frac{344}{344 - 30}\right) = 548 \text{ Hz}$$

$$\therefore \quad \lambda' = \frac{v}{f'} = \frac{344}{548} = 0.628 \text{ m}$$

Behind the locomotive,

$$f' = f\left(\frac{v}{v + v_s}\right)$$

$$= 500\left(\frac{344}{344 + 30}\right) = 460 \text{ Hz}$$

$$\therefore \quad \lambda' = \frac{v}{f'} = \frac{344}{460} = 0.748 \text{ cm}$$

45. (a) The given frequencies are in the ratio 5 : 7 : 9. As the frequencies are odd multiple of 85 Hz, the pipe must be closed at one end.

(b) Now, the fundamental frequency is the lowest, i.e. 85 Hz.

$$\therefore \quad 85 = \frac{v}{4l}$$

$$\Rightarrow \quad l = \frac{340}{4 \times 85} = 1 \text{ m} \qquad \textbf{Ans.}$$

46. Let the frequency of the first fork be f_1 and that of second be f_2.

We then have,

$$f_1 = \frac{v}{4 \times 32}$$

and $$f_2 = \frac{v}{4 \times 33}$$

We also see that $f_1 > f_2$

$$\therefore \quad f_1 - f_2 = 8 \qquad \ldots\text{(i)}$$

and $$\frac{f_1}{f_2} = \frac{33}{32} \qquad \ldots\text{(ii)}$$

Solving Eqs. (i) and (ii), we get

$$f_1 = 264 \text{ Hz}$$

and $$f_2 = 256 \text{ Hz} \qquad \textbf{Ans.}$$

LEVEL 2

Single Correct Option

1. $\sin \theta_C = \frac{330}{1400} = 0.2357$

$\therefore \quad \theta_C = 13.6°$

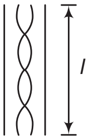
Since, $i > \theta_C$, therefore only reflection will take place.

2. $$\Delta p_{\max} = BAk \qquad \ldots\text{(i)}$$

$$v = \sqrt{\frac{B}{\rho}}$$

$$\therefore \quad B = \rho v^2$$

$$l = \frac{3\lambda}{2}$$



$$\therefore \quad \lambda = \frac{2l}{3}$$

$$k = \frac{2\pi}{\lambda} = \frac{2\pi}{2l/3} = \frac{3\pi}{l}$$

$$= \frac{3\pi}{3.9\,\pi} = \frac{1}{1.3} \text{ m}^{-1}$$

Substituting in Eq. (i), we have

$$A = \frac{\Delta p_{\max}}{Bk} = \frac{\Delta p_{\max}}{\rho v^2 k}$$

$$= \frac{(0.01 \times 10^5)}{1.3 \times (200)^2 \times (1/1.3)}$$

$$= 0.025 \text{ m} = 2.5 \text{ cm}$$

3. $$A_t = \left(\frac{2v_2}{v_1 + v_2}\right) A_i$$

$$\therefore \quad \frac{A_t}{A_i} = \frac{2 \times 100}{200 + 100} = \frac{2}{3}$$

4. $f_b = f_1 - f_2$

or $$10 = 1700\left(\frac{340}{340 + v_2}\right) - 1700\left(\frac{340}{340 + v_1}\right)$$

$$= 1700\left(1 + \frac{v_2}{340}\right)^{-1} - 1700\left(1 + \frac{v_1}{340}\right)^{-1}$$

Using Binomial therefore, we get

$$10 = 1700\left(1 - \frac{v_2}{340}\right) - 1700\left(1 - \frac{v_1}{340}\right)$$

$$= (v_1 - v_2)\left(\frac{1700}{340}\right)$$

$$\therefore \quad v_1 - v_2 = 2 \text{ m/s}$$

5. Velocity of source after 1 s,

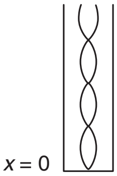
$$v_s = gt = 10 \times 1 = 10 \text{ m/s}$$

$$\Delta f = f\left(\frac{v+v_0}{v-v_s}\right) - f\left(\frac{v-v_0}{v+v_s}\right)$$

$$= 150\left(\frac{300+2}{300-10}\right) - 150\left(\frac{300-2}{300+10}\right)$$

$$= 12 \text{ Hz}$$

6. $L = \frac{7\lambda}{4}$



$\therefore \quad \lambda = \frac{4L}{7}$

$$k = \frac{2\pi}{\lambda}$$

$$= \frac{2\pi}{4L/7} = \frac{7\pi}{2L}$$

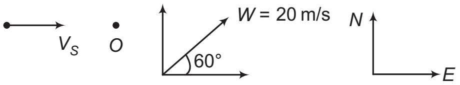
$x = 0$ is a node

$\therefore \quad A_x = a \sin kx = a \sin\left(\frac{7\pi}{2L}\right)\left(\frac{L}{7}\right) = a$

7. $\Delta x_{\max} = 3\text{m} = \lambda$

$\therefore \quad f = \frac{v}{\lambda} = \frac{330}{3} = 110$ Hz. For frequencies less than 100 Hz, λ will be more than 3m and no maximum will be obtained.

8.

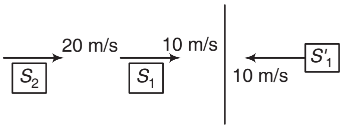


$$f' = f\left(\frac{v + w\cos 60^\circ}{v + w\cos 60^\circ - v_s}\right)$$

$$= 500\left(\frac{300+10}{300+10-20}\right)$$

$$= 534 \text{ Hz}$$

9.



$$f_b = f_{S'} - f_{S_1}$$

$$= 500\left[\frac{340+20}{340-10}\right] - 500\left[\frac{340+20}{340+10}\right]$$

$$\approx 31 \text{ Hz}$$

10. $f_1 = \frac{\omega_1}{2\pi} = \frac{(400\pi)}{2\pi} = 200$ Hz

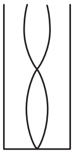
$$f_2 = \frac{\omega_2}{2\pi} = \frac{404\,\pi}{2\pi} = 202 \text{ Hz}$$

$\therefore \quad f_b = f_2 - f_1 = 2$ Hz

$A_1 = 2$ and $A_2 = 1$

$$\frac{I_{\max}}{I_{\min}} = \left(\frac{A_1 + A_2}{A_1 - A_2}\right)^2 = \frac{9}{1}$$

11. $l = \frac{3\lambda}{4}$



$\therefore \quad \lambda = \frac{4l}{3} = \frac{4\,(34)}{3} = 45.33$ cm

$$\lambda = \frac{v}{f}$$

$\lambda \propto v$ (as $f =$ constant)

and $v \propto \sqrt{T}$ ($T =$ temperature)

$\therefore \quad \lambda \propto \sqrt{T}$

$\therefore \quad \frac{\lambda_2}{\lambda_1} = \sqrt{\frac{T_2}{T_1}}$

$\therefore \quad \lambda_2 = \left(\sqrt{\frac{T_2}{T_1}}\right)\lambda_1$

$$= \left(\sqrt{\frac{16+273}{51+273}}\right)(45.33)$$

$$= 42.8 \text{ cm}$$

12. $\because \quad f_1 = f_2$

$\therefore \quad 176\left(\frac{330-v}{330-22}\right) = 165\left(\frac{330+v}{330}\right)$

Solving this equation we get,

$$v = 22 \text{ m/s}$$

13. $M = \frac{n_1 M_1 + n_2 M_2}{n_1 + n_2}$

$$= \frac{(2)\,(32) + (3)\,(48)}{5} = 41.6$$

$$f = \frac{v}{4l} \quad \text{or} \quad f \propto v$$

But, $v = \sqrt{\frac{\gamma RT}{M}}$

or $v \propto \frac{1}{\sqrt{M}}$

$\therefore \quad f \propto \frac{1}{\sqrt{M}}$

$\therefore \quad \frac{f_2}{f_1} = \sqrt{\frac{M_1}{M_2}}$

or $f_2 = \left(\sqrt{\frac{M_1}{M_2}}\right) f_1$

$$= \left(\sqrt{\frac{32}{48}}\right)(200) = 175.4 \text{ Hz}$$

14. $$f = f_0\left(\frac{v + v_0}{v}\right)$$

$$= 10^3\left(1 + \frac{10t}{v}\right) \qquad (\text{as } v_0 = gt)$$

Hence, f *versus* t graph is a straight line of slope $\frac{10^4}{v}$.

$$\therefore \qquad \frac{10^4}{v} = \text{slope} = \frac{100}{3}$$

$$\therefore \qquad v = 300 \text{ m/s}$$

15. $\because \quad v_p = -v\left(\frac{\partial y}{\partial x}\right)$, where $v = +$ ve.

At E, $\frac{\partial y}{\partial x}$ or slope is positive.

Hence, v_p is negative.

At D, $\frac{\partial y}{\partial x}$ or slope is zero. Hence, v_p is zero.

More than One Correct Options

1. $\because \quad f = n\left(\frac{v}{4l}\right) \qquad (n = 1, 3, 5\ldots)$

$$\therefore \qquad l = \frac{nv}{4f} = n\left(\frac{330}{4 \times 264}\right)$$

$$= (0.3125\, n) \text{ m}$$

$$= (31.25\, n) \text{ cm}$$

Now, keep on substituting $n = 1, 3$, etc.

2. (a) Velocity of sound wave in air independent of pressure if T = constant

(b) $v = \sqrt{\frac{\gamma RT}{M}} = \sqrt{\frac{\gamma R\,(t + 273)}{M}}$

or $\qquad v^2 \propto (t + 273)$

(c) $v = \sqrt{T/\mu}$

$\therefore \qquad v \propto \sqrt{T}$

or $\qquad v^2 \propto T$

(d) $f_0 = \frac{v}{2l}$ or $\frac{v}{4l}$

$\Rightarrow \qquad f_0 \propto \frac{1}{l}$

4. Let f_1 = fundamental frequency of closed pipe and

f_2 = fundamental frequency of open pipe.

Given, $\qquad 5 f_1 = 4 f_2$

or $\qquad f_2 = \frac{5}{4} f_1$

$\therefore \qquad f_2 > f_1$

(b) First overtone frequency of closed pipe = $3 f_1$ and first overtone frequency of open pipe

$$= 2 f_2 = 2\left(\frac{5}{4} f_1\right) = 2.5\ f_1$$

(c) Fifteenth harmonic of closed pipe = $15 f_1$

Twelfth harmonic of open pipe

$$= 12 f_2 = 12\left(\frac{5}{4} f_1\right) = 15\ f_1$$

(d) Tenth harmonic of closed pipe = $10\ f_1$

Eighth harmonic of open pipe

$$= 8 f_2 = 8\left(\frac{5}{4} f_1\right) = 10 f_1$$

5. $f = \frac{v}{4\,(l + 0.6\text{r})} = \frac{\sqrt{\gamma RT/M}}{4\,(l + 0.6\,r)}$

(d) v does not depend on pressure if temperature is kept constant.

6. During approach,

$$f = f_0\left(\frac{v}{v - v_s}\right)$$

$> f_0$ but f is constant.

During receding.

$$f = f_0\left(\frac{v}{v - v_s}\right)$$

$< f_0$ but f is again constant.

Comprehension Based Questions

1. 
From conservation of linear momentum,

$$50\,(8 - v) = 150 v$$

$$\therefore \qquad v = 2 \text{ m/s}$$

$$8 - v = 6 \text{ m/s}$$

$$f_1 = f_0\left(\frac{v + v_0}{v - v_s}\right)$$

$$= f_0\left(\frac{330 + 2}{330 - 6}\right) = \frac{332}{324}\ f_0$$

2. 
$$f_2 = f_0\left(\frac{v - v_0}{v + v_s}\right)$$

$$= f_0\left(\frac{330 - 2}{330 + 6}\right) = \left(\frac{328}{336}\right) f_0$$

3. $f_1 > f_0$ but f_1 = constant.

Similarly, $f_2 < f_0$ but f_2 = constant

Match the Columns

1. (a) $f = \dfrac{v}{2l}$

$$f_c = \frac{v}{4(2l)} = \frac{v}{8l} = \frac{f}{4}$$

(b) Second overtone frequency

$$= 5f_c = 5\,(f/4) = 1.25f$$

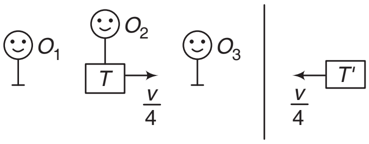
(c) Third harmonic frequency $= 3f_c$

$$= 3\,(f/4) = 0.75\ f$$

(d) First overtone frequency $= 3f_c$

$$= 3\,(f/4) = 0.75f$$

2.



(a) $f_b = f_{T'} - f_T$

$$= f\left(\frac{v}{v - v/4}\right) - f\left(\frac{v}{v + v/4}\right)$$

$$= \frac{8}{15}f$$

(b) $f_b = f_{T'} - f_T = f\left(\dfrac{v + v/4}{v - v/4}\right) - f$

$$= \frac{2}{3}f$$

(c) T and T' both are approaching towards O_3.

$\therefore \quad f_T = f_{T'}$ or $f_b = 0$

(d) Not T and T' both are receding from O_3. Hence, again

$f_T = f_{T'}$ or $f_b = 0$

3. Let $f_1 =$ frequency of tuning fork and

$f_2 =$ frequency of streamed wire

Given, $\quad f_1 > f_2$

$\therefore \quad f_b = f_1 - f_2$

(a) By loading wax on turning fork f_1 will decrease. Hence, $f_1 - f_2$ may be less than f_b or $f_2 - f_1$ may be greater than f_b.

(b) If prongs are filed, f_1 will increase. Hence,

$$f_1 - f_2 > f_b$$

(c) If tension in stretched wire is increased, f_2 will increase. Hence, $f_1 - f_2$ may be less than f_b or $f_2 - f_1$ may be greater than f_b.

(d) If tension in stretched wire is decreased, f_2 will decrease. Hence,

$$f_1 - f_2 > f_b$$

4. $I \propto A^2$ or $A \propto \sqrt{I}$

Due to a point source,

$$I = \frac{P}{4\pi r^2} \qquad (P = \text{power of source})$$

or $\quad I \propto \dfrac{1}{r^2}$ and $A \propto \dfrac{1}{r}$

Due to a line source

$$I = \frac{P}{2\pi l} \quad \text{or} \quad I \propto \frac{1}{r}$$

$$\therefore \qquad A \propto \frac{1}{\sqrt{r}}$$

5. $\because \quad k = \pi$

$$\lambda = \frac{2\pi}{k} = 2\text{ m}$$

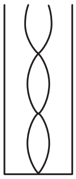
$$l = \frac{5\lambda}{4} = \frac{5}{4}(2)$$

$$= 2.5\text{ m}$$

Distance of displacement node from the closed end

$$= \frac{\lambda}{2} \quad \text{or} \quad \lambda$$

$$= 1\text{ m} \quad \text{or} \quad 2\text{m}$$



Pressure node means displacement antinode. Its distance from closed end

$$= \frac{\lambda}{4} \quad \text{or} \quad \frac{3\lambda}{4} \quad \text{or} \quad \frac{5\lambda}{4}$$

$$= 0.5\text{ m}, 1.5\text{ m and } 2.5\text{ m}$$

Subjective Questions

1. By definition sound level $= 10 \log \dfrac{I}{I_0} = 60$

or $\quad \dfrac{I}{I_0} = 10^6$

$\Rightarrow \quad I = 10^{-12} \times 10^6 = 1\,\mu\text{W/m}^2$

Power entering the room

$$= 1 \times 10^{-6} \times 2 = 2\,\mu\text{W}$$

Energy collected in a day $= 2 \times 10^{-6} \times 86400$

$= 0.173$ J **Ans.**

2. (a) At a distance r from a point source of power P, the intensity of the sound is

$$I = \frac{P}{4\pi r^2} = \frac{0.8}{(4\pi)(1.5)^2}$$

or $I = 2.83 \times 10^{-2}\ \text{W/m}^2$ ...(i)

Further, the intensity of sound in terms of $(\Delta p)_m$, ρ and v is given by

$$I = \frac{(\Delta p)_m^2}{2\rho v} \qquad \text{...(ii)}$$

From Eqs. (i) and (ii),

$$(\Delta p)_m = \sqrt{2 \times 2.83 \times 10^{-2} \times 1.29 \times 340}$$

$= 4.98\ \text{N/m}^2$ **Ans.**

(b) Pressure oscillation amplitude $(\Delta p)_m$ and displacement oscillation amplitude A are related by the equation

$$(\Delta p)_m = BAk$$

Substituting $B = \rho v^2,\ k = \frac{\omega}{v}$

and $\omega = 2\pi f$

We get, $(\Delta p)_m = 2\pi A\rho v f$

$$\therefore \quad A = \frac{(\Delta p)_m}{2\pi\rho v f} = \frac{4.98}{(2\pi)(1.29)(340)(600)}$$

$= 3.0 \times 10^{-6}$ m **Ans.**

3. (a) Fundamental frequency when the pipe is open at both ends is

$$f_1 = \frac{v}{2l} = \frac{340}{2 \times 0.6}$$

$= 283.33$ Hz **Ans.**

(b) Suppose the hole is uncovered at a length l from the mouthpiece, the fundamental frequency will be

$$f_1 = \frac{v}{2l}$$

$$\therefore \quad l = \frac{v}{2f_1} = \frac{340}{2 \times 330}$$

$= 0.515$ m

$= 51.5$ cm **Ans.**

Note *Opening holes in the side effectively shortens the length of the resonance column, thus increasing the frequency.*

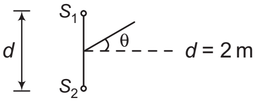
4. $2\sqrt{H^2 + d^2/4} - d = n\lambda$ ...(i)

Now, $2\sqrt{(H+h)^2 + d^2/4} - d = n\lambda + \frac{\lambda}{2}$ ...(ii)

Solving these two equations, we get

$$\lambda = 2\sqrt{4(H+h)^2 + d^2} - 2\sqrt{4H^2 + d^2}$$

5. (a) $\lambda = \frac{v}{f} = \frac{340}{600} = 0.57$ m



$$d \sin\theta = \frac{\lambda}{2}$$

$$\therefore \quad \theta = \sin^{-1}\left(\frac{\lambda}{2d}\right)$$

$$= \sin^{-1}\left(\frac{0.57}{4}\right)$$

$= 8.14°$

(b) $d \sin\theta = \lambda$ or $\theta = \sin^{-1}\left(\frac{\lambda}{d}\right)$

$$= \sin^{-1}\left(\frac{0.57}{2}\right)$$

$= 16.5°$

(c) $d \sin\theta = n\lambda$

$$\therefore \quad n_{\text{max}} = \frac{d}{\lambda} \qquad (\text{When } \sin\theta = 1)$$

$$= \frac{2}{0.57} = 3.5$$

∴ Maximum 3 maximas can be heard corresponding to $n = 1, 2$ and 3 (beyond $\theta = 0°$)

6. $\Delta\phi_1 = \left(\frac{2\pi}{\lambda}\right)\Delta x = \left(\frac{2\pi}{\lambda}\right)\frac{\lambda}{2} = \pi$

(a) $\Delta\phi_{\text{net}} = \Delta\phi_1 + \Delta\phi_2$

$= \pi + 0$

$= \pi$

So, they will interfere destructively and

$$I_{\text{net}} = 0$$

(b) No interference will take place. Hence,

$$I_{\text{net}} = I_1 + I_2 = 2I_0$$

(c) $\Delta\phi_{\text{net}} = \Delta\phi_1 \pm \Delta\phi_2$

$= 2\pi$ or 0 (as $\Delta\phi_2 = \pi$)

In both conditions, they interfere constructively. Hence,

$$I = I_{\text{max}} = 4I_0$$

7. (a) $\Delta\phi = \frac{2\pi}{\lambda}(\Delta x) = \left(\frac{2\pi f}{v}\right)(\Delta x)$

$$= \frac{(2\pi)(170)}{340}(11 - 8)$$

$= 3\pi = \phi$ (say)

$$I = 4I_0 \cos^2\frac{\theta}{2} \qquad \text{...(i)}$$

Substituting value of ϕ, we get

$$I = 0$$

(b) Now, $\phi = 3\pi \pm \pi = 4\pi$ or 2π

Hence, from Eq. (i)

$$I = 4I_0$$

Now, $L_1 - L_2 = 10 \log_{10} \dfrac{I_1}{I_2}$

$$\therefore \quad L_1 - 60 = 10 \log_{10}\left(\frac{4I_0}{I_0}\right) = 6$$

$$\therefore \quad L_1 = 66 \text{ dB}$$

(c) Sources are incoherent.

Hence,

$$I = I_0 + I_0 = 2I_0$$

$$L_1 - L_2 = 10\log_{10} \frac{I_1}{I_2}$$

$$= 10\log_{10} \frac{2I_0}{I_0}$$

$$\therefore \quad L_1 - 60 = 10 \log_{10} 2 = 3$$

or $\quad L_1 = 63$ dB

8. (a) $I = \dfrac{P}{4\pi r^2}$

$$\therefore \quad I_1 = \frac{1 \times 10^{-3}}{4\pi\,(2)^2} = 19.9 \times 10^{-6} \text{ W/m}^2$$

$$= 19.9\,\mu\text{W/m}^2$$

$$I_2 = \frac{1 \times 10^{-3}}{4\pi\,(3)^2} = 8.84 \times 10^{-6} \text{ W/m}^2$$

$$= 8.84\,\mu\text{W/m}^2$$

(b) $I_p = I_{\max} = (\sqrt{I_1} + \sqrt{I_2})^2$

$$= 55.3\,\mu\text{W/m}^2$$

(c) $I_p = I_{\min} = (\sqrt{I_1} - \sqrt{I_2})^2$

$$= 2.2\,\mu\text{W/m}^2$$

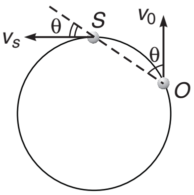
(d) $I_p = I_1 + I_2$

$$= 28.7\,\mu\text{W/m}^2$$

9. $v_s = v_0 = v$

Let u be the speed of sound.

Then,

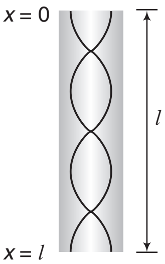


$$f' = f\left(\frac{u + v_0 \cos\theta}{u + v_s \cos\theta}\right)$$

$$= f\left(\frac{u + v \cos\theta}{u + v \cos\theta}\right)$$

or $\quad f' = f$ **Ans.**

10. Given length of pipe, $l = 3$ m



Third harmonic implies that

$$3\left(\frac{\lambda}{2}\right) = l$$

or $\quad \lambda = \dfrac{2l}{3} = \dfrac{2 \times 3}{3} = 2$ m

The angular frequency is

$\omega = 2\pi f.$

$= \dfrac{2\pi v}{\lambda} = \dfrac{(2\pi)(332)}{2}$ or

$\omega = 332\pi$ rad/s

The particle displacement $y(x, t)$ can be written as

$$y(x, t) = A \cos kx \sin \omega t$$

$$k = \frac{2\pi}{\lambda} = \frac{2\pi}{(2l/3)} = \frac{3\pi}{l}$$

and $\quad \omega = kv = \dfrac{3\pi v}{l} \qquad \left(v = \dfrac{\omega}{k}\right)$

$$\therefore \quad y(x, t) = A \cos\left(\frac{3\pi x}{l}\right) \cdot \sin\left(\frac{3\pi v}{l}\right) t$$

The longitudinal oscillations of an air column can be viewed as oscillations of particle displacement or pressure wave or density wave. Pressure variation is related to particle displacement as

$$p\,(x, t) = -B\frac{\partial y}{\partial x} \qquad (B = \text{Bulk modulus})$$

$$= \left(\frac{3BA\pi}{l}\right) \sin\left(\frac{3\pi x}{l}\right) \sin\left(\frac{3\pi v}{l}\right) t$$

The amplitude of pressure variation is

$$p_{\max} = \frac{3BA\pi}{l} \Rightarrow v = \sqrt{\frac{B}{\rho}} \text{ or } B = \rho v^2$$

$$\therefore \quad p_{\max} = \frac{3\rho v^2 A\pi}{l} \quad \text{or} \quad A = \frac{p_{\max} l}{3\rho v^2 \pi}$$

Here, $p_{\max} = 1\%$ or $p_0 = 10^3$ N/m^2

Substituting the values,

$$A = \frac{(10^3)(3)}{(3)(1.03)(332)^2\pi} = 0.0028 \text{ m}$$

or $\quad A = 0.28$ cm **Ans.**

According to definition of Bulk modulus (B)

$$B = \frac{-dP}{(dV/V)} \qquad \ldots\text{(i)}$$

$$\text{Volume} = \frac{\text{Mass}}{\text{Density}} \quad \text{or} \quad V = \frac{m}{\rho}$$

or $\quad dV = -\dfrac{m}{\rho^2}d\rho = -\dfrac{Vd\rho}{\rho}$

or $\quad \dfrac{dV}{V} = -\dfrac{d\rho}{\rho}$

Substituting in Eq. (i), we get

$$d\rho = \frac{\rho\,(dP)}{B}$$

or amplitude of density oscillation is

$$d\rho_{\max} = \frac{\rho}{B}\,p_{\max} = \frac{p_{\max}}{v^2} \qquad \left(\frac{\rho}{B} = \frac{1}{v^2}\right)$$

$$= \frac{10^3}{(332)^2} = 9 \times 10^{-3}\ \text{kg/m}^3$$

11. Sound level (in dB)

$$L = 10 \log_{10}\left(\frac{I}{I_0}\right)$$

where, $I_0 = 10^{-12}\ \text{W/m}^2$

$L = 60$ dB

Hence, $I = (10^6) I_0 = 10^{-6}\ \text{W/m}^2$

Intensity, $I = \dfrac{\text{Power}}{\text{Area}} = \dfrac{P}{4\pi r^2}$

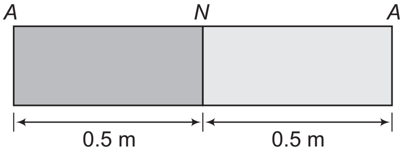
$\Rightarrow \quad P = I(4\pi r^2)$

$$P = (10^{-6})(4\pi)(500)^2 = 3.14\ \text{W}$$

$$\therefore \quad \text{Time, } t = \frac{(1.0 \times 10^3)\left(\dfrac{30}{100}\right)}{3.14}$$

$$t = 95.5\ \text{s}$$

12. Let n_1 harmonic of the chamber containing H_2 is equal to n_2 harmonic of the chamber containing O_2. Then,



$$n_1\left(\frac{v_{H_2}}{4l}\right) = n_2\left(\frac{v_{O_2}}{4l}\right)$$

$$\therefore \quad \frac{n_1}{n_2} = \frac{v_{O_2}}{v_{H_2}} = \frac{300}{1100} = \frac{3}{11}$$

$$\therefore \quad f_{\min} = 3\left(\frac{v_{H_2}}{4l}\right) = 3\left(\frac{1100}{4 \times 0.5}\right)$$

$= 1650$ Hz **Ans.**

13. This problem is a Doppler's effect analogy.

(a) Here, $f = 20\ \text{min}^{-1}$

$v = 300$ m/min

$v_s = 0$ and $v_0 = 0$

Spacing between the pies $= \dfrac{300}{20} = 15$ m **Ans.**

and $f' = f = 20\ \text{min}^{-1}$

(b) $v_s = 30$ m/min

Spacing between the pies will be

$$= \frac{300 - 30}{20} \quad \text{or} \quad 13.5\ \text{m}$$

and $$f' = f\left(\frac{v}{v - v_s}\right) = (20)\left(\frac{300}{300 - 30}\right)$$

$= 22.22\ \text{min}^{-1}$ **Ans.**

14. (a) Comparing with the equation of a travelling wave

$y = a \sin(kx - \omega t)$

$k = 15\pi$ and $\omega = 6000\pi$

$\therefore$ Velocity of the sound, $v = \dfrac{\omega}{k}$

$$= \frac{6000\pi}{15\pi} = 400\ \text{ms}^{-1} \quad \text{as} \quad v = \sqrt{\frac{B}{\rho}}$$

Hence, $\rho = \dfrac{B}{v^2} = \dfrac{1.6 \times 10^5}{(400)^2} = 1\ \text{kg/m}^3$ **Ans.**

(b) Pressure amplitude, $p_0 = BAk$

Hence, $A = \dfrac{p_0}{Bk} = \dfrac{24\pi}{1.6 \times 10^5 \times 15\pi}$

$= 10^{-5}\ \text{m} = 10\mu\text{m}$ **Ans.**

(c) Intensity received by the person,

$$I = \frac{W}{4\pi R^2} = \frac{W}{4\pi(10)^2}$$

Also, $I = \dfrac{p_0^2}{2\rho v} \Rightarrow \dfrac{W}{4\pi(10)^2} = \dfrac{(24\pi)^2}{2 \times 1 \times 400}$

$W = 288\pi^3$ W **Ans.**

15. (a) Path difference and hence phase difference at P from both the sources is 0°, whether $\theta = 45°$, or $\theta = 60°$. So, both the wave will interfere constructively. Or maximum intensity will be obtained. From

$I_{\max} = (\sqrt{I_1} + \sqrt{I_2})^2$ we have

$I_0 = (\sqrt{I} + \sqrt{I})^2 = 4I \quad (I_1 = I_2 = I,\ \text{say})$

$\therefore \quad I = I_0/4$

When one source is switched off, no interference will be obtained. Intensity will be due to a single source or $I_0/4$.

(b) At $\theta = 60°$, also maximum intensity or I_0 will be observed.

16. (a) Frequency of second harmonic in pipe A = frequency of third harmonic in pipe B

$$\therefore \quad 2\left(\frac{v_A}{2l_A}\right) = 3\left(\frac{v_B}{4l_B}\right)$$

or $$\frac{v_A}{v_B} = \frac{3}{4} \Rightarrow \frac{\sqrt{\dfrac{\gamma_A RT_A}{M_A}}}{\sqrt{\dfrac{\gamma_B RT_B}{M_B}}} = \frac{3}{4}$$

or $$\sqrt{\frac{\gamma_A}{\gamma_B}}\sqrt{\frac{M_B}{M_A}} = \frac{3}{4} \qquad (\text{as } T_A = T_B)$$

$$\therefore \quad \frac{M_A}{M_B} = \frac{\gamma_A}{\gamma_B}\left(\frac{16}{9}\right) = \left(\frac{5/3}{7/5}\right)\left(\frac{16}{9}\right)$$

or $$\frac{M_A}{M_B} = \left(\frac{25}{21}\right)\left(\frac{16}{9}\right) = \frac{400}{189}$$

(b) Ratio of fundamental frequency in pipe A and in pipe B is

$$\frac{f_A}{f_B} = \frac{v_A/2l_A}{v_B/2l_B} = \frac{v_A}{v_B} \qquad (\text{as } l_A = l_B)$$

$$= \sqrt{\frac{\dfrac{\gamma_A RT_A}{M_A}}{\dfrac{\gamma_B RT_B}{M_B}}} = \sqrt{\frac{\gamma_A}{\gamma_B}\cdot\frac{M_B}{M_A}} \qquad (\text{as } T_A = T_B)$$

Substituting $\frac{M_B}{M_A} = \frac{189}{400}$ from part (a), we get

$$\frac{f_A}{f_B} = \sqrt{\frac{25}{21}\times\frac{189}{400}} = \frac{3}{4}$$ **Ans.**

17. Velocity of sound in water is

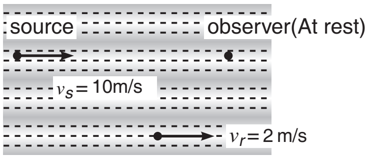
$$v_w = \sqrt{\frac{B}{\rho}} = \sqrt{\frac{2.088\times10^9}{10^3}} = 1445 \text{ m/s}$$

Frequency of sound in water will be

$$f_0 = \frac{v_w}{\lambda_w} = \frac{1445}{14.45\times10^{-3}} \text{ Hz}$$

$$f_0 = 10^5 \text{ Hz}$$

(a) Frequency of sound detected by receiver (observer) at rest would be

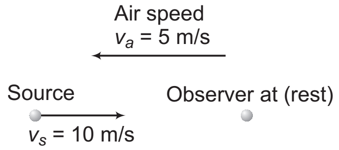


$$f_1 = f_0\left(\frac{v_w + v_r}{v_w + v_r - v_s}\right)$$

$$= 10^5\left(\frac{1445 + 2}{1445 + 2 - 10}\right) \text{Hz}$$

$$f_1 = 1.0069\times10^5 \text{ Hz}$$ **Ans.**

(b) Velocity of sound in air is



$$v_a = \sqrt{\frac{\gamma RT}{M}} = \sqrt{\frac{(1.4)(8.31)(20+273)}{28.8\times10^{-3}}}$$

$$= 344 \text{ m/s}$$

Frequency does not depend on the medium. Therefore, frequency in air is also $f_0 = 10^5$ Hz.

$\therefore$ Frequency of sound detected by receiver (observer) in air would be

$$f_2 = f_0\left(\frac{v_a - v_w}{v_a - v_w - v_s}\right)$$

$$= 10^5\left[\frac{344 - 5}{344 - 5 - 10}\right] \text{Hz}$$

$$f_2 = 1.0304\times10^5 \text{ Hz}$$ **Ans.**

18. Frequency of fundamental mode of closed pipe,

$$f_1 = \frac{v}{4l} = 200 \text{ Hz}$$

Decreasing the tension in the string decrease the beat frequency.

Hence, the first overtone frequency of the string should be 208 Hz (not 192 Hz)

$$\therefore \qquad 208 = \frac{1}{l}\sqrt{\frac{T}{\mu}}$$

$$\therefore \qquad T = \mu\cdot l^2(208)$$

$$= \left(\frac{2.5\times10^{-3}}{0.25}\right)(0.25)^2(208)^2$$

$$= 27.04 \text{ N}$$ **Ans.**

19. (a) Wavelength of sound ahead of the source is

$$\lambda' = \frac{v - v_s}{f} = \frac{332 - 32}{1000} = 0.3 \text{ m}$$ **Ans.**

(b) $$f' = f\left(\frac{v + v_0}{v - v_s}\right) = 1000\left(\frac{332 + 64}{332 - 32}\right)$$

$$= 1320 \text{ Hz}$$ **Ans.**

(c) Speed of reflected wave will remain 332 m/s. **Ans.**

(d) Wavelength of reflected wave.

$$\lambda'' = \frac{v - v_0}{f'} = \frac{332 - 64}{1320}$$

$$= 0.2 \text{ m}$$ **Ans.**

20. Thermometry, Thermal Expansion and Kinetic Theory of Gases

INTRODUCTORY EXERCISE 20.1

1. (a) $\frac{T_C-0}{100}=\frac{T_F-32}{180}$

Putting $T_F=0$, we get $T_C=-17.8°\text{C}$

(b) $\frac{T_C-0}{100}=\frac{T_F-32}{180}$ or $\frac{T_K-273}{100}=\frac{T_F-32}{180}$

Putting $T_K=0$, we get $T_F=-459.67°\text{F}$

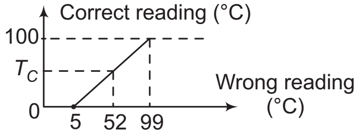
2. (a) $\frac{T_C-0}{100}=\frac{T_F-32}{180}$

Putting $T_F=2T_C$, we get $T_C=160°\text{C}$

(b) Putting $T_F=\frac{T_C}{2}$, we get $T_C=-24.6°\text{C}$

3. $\frac{T_C}{52-5}=\frac{100}{99-5}$

$\therefore\ T_C=50°\text{C}$



Now, using the equation, $\frac{T_C-0}{100}=\frac{T_F-32}{180}$

Putting $T_C=50°\text{C}$, we get $T_F=122°\text{F}$

4. $\frac{T_C-0}{100}=\frac{T_F-32}{180}$ or $\frac{T_K-273}{100}=\frac{T_F-32}{180}$

Putting $T_F=T_K$,

We get, T_F or $T_K=574.25$

5. $\frac{T_C-0}{100}=\frac{T_F-32}{180}$

Putting $T_C=T_F$, we get

T_C or $T_F=-40°\text{C}$ or $-40°\text{F}$

INTRODUCTORY EXERCISE 20.2

1. $\Delta T=\frac{1}{2}T\,\alpha\Delta\theta$

Temperature is decreased. Hence, l or T will decrease. So, it will gain time.

Time gained $=\frac{\Delta T}{T'}t\approx\frac{\Delta T}{T}t$ (as $T'\approx T$)

$$=\frac{1}{2}\alpha\Delta\theta t=\frac{1}{2}(1.2\times10^{-5})(30)(24\times60\times60)$$

$=15.55$ s

2. Density of water will increase by increasing the temperature from 0 to 4°C, then it will decrease. Fraction of volume immersed is given by

$$f_i=\frac{\rho_s}{\rho_l}$$

ρ_l is first increased the decreased first decreased the increased. Or percentage of volume above water level will first increased then decreased.

3. $f_i=\frac{\rho_s}{\rho_l}\ \Rightarrow\ f_i=\frac{\rho'_s}{\rho_l'}$

$$\therefore\ \frac{f_i'}{f_i}=\left(\frac{\rho'_s}{\rho_s}\right)\left(\frac{\rho_l}{\rho'_l}\right)=\left(\frac{1+\gamma_l\Delta T}{1+\gamma_s\,\Delta T}\right)=\left(\frac{1+\gamma_2\Delta T}{1+\gamma_1\Delta T}\right)$$

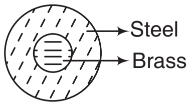
Now, $\frac{1}{1+\gamma_1\,\Delta T}\approx(1-\gamma_1\,\Delta T)$

$$\therefore\ \frac{f_i'}{f_i}=(1+\gamma_2\Delta T)(1-\gamma_1\Delta T)$$

Neglecting $\gamma_1\gamma_2\,(\Delta T)^2$ term, we get

$$\frac{f_i'}{f_i}\approx(\gamma_2-\gamma_1)\,\Delta T$$

4.



Since, $\alpha_{\text{B}}>\alpha_{\text{Fe}}$

On cooling brass will contract more.

5. $\Delta d=d\,(\alpha_{\text{B}}-\alpha_{\text{Fe}})\,\Delta\theta$

$$\therefore\ \Delta\theta=\frac{\Delta d}{d\,(\alpha_{\text{B}}-\alpha_{\text{Fe}})}$$

$$=\frac{0.01}{60\times0.8\times10^{-5}}=20.83°\text{C}$$

$\therefore$ New temperature $=(30+20.83)=50.83°\text{C}$

6. (a) $\Delta l=l\,\alpha\Delta\theta$

$=(88.42)(2.4\times10^{-5})(35-5)$

$=0.064$ cm

(b) At higher temperature, it measures less. Hence,

$l=l'+\Delta l$

$=(88.42)+(0.064)=88.484$ cm

7. $\frac{\Delta l}{l}\times100=\frac{-l\,\alpha\,\Delta\theta}{l}\times100$

$=-(\alpha\Delta\theta)\times100$

$=-(1.2\times10^{-5})(35)\times100$

$=-0.042\%$

INTRODUCTORY EXERCISE 20.3

1. $pV = nRT = \left(\frac{m}{M}\right) RT$

$\therefore \quad T = \left(\frac{VM}{mR}\right) p$

At constant volume T-p graph is a straight line of

slope, $= \frac{VM}{mR} \propto \frac{1}{m}$

Slope of m_1 is less. Hence, m_1 is greater.

2. $p=\frac{nRT}{V}$ or $p \propto nT$

$$\therefore \quad \frac{p_2}{p_1} = \frac{n_2 T_2}{n_1 T_1}$$

$$\text{or} \quad p_2 = \left(\frac{n_2}{n_1}\right)\left(\frac{T_2}{T_1}\right) p_1$$

$$= \left(\frac{1}{2}\right)\left(\frac{87 + 273}{27 + 273}\right) (20 \text{ atm})$$

$$= 12 \text{ atm}$$

3. $n_1 =$ number of moles of nitrogen $= \frac{7}{28} = \frac{1}{4}$

$n_2 =$ number of moles of $CO_2 = \frac{11}{44} = \frac{1}{4}$

$$M = \frac{n_1 M_1 + n_2 M_2}{n_1 + n_2}$$

$$= \frac{\left(\frac{1}{4}\right)(28) + \left(\frac{1}{4}\right)(44)}{\left(\frac{1}{4}\right) + \left(\frac{1}{4}\right)} = 36$$

$$\text{Now,} \quad \rho = \frac{RM}{RT}$$

$$= \frac{(1.01 \times 10^5)(36 \times 10^{-3})}{(8.31)(290)}$$

$$= 1.5 \text{ kg/m}^3$$

4. $pV = nRT$

$$\therefore \quad n = \frac{pV}{RT} = \frac{(\rho g h) V}{RT}$$

$$= \frac{(13.6 \times 10^3)(9.8)(10^{-6})(250 \times 10^{-6})}{8.31 \times 300}$$

$$= 1.33 \times 10^{-8}$$

$\therefore$ Number of molecules $= (n) N_A$

$$= (1.33 \times 10^{-8})(6.02 \times 10^{23})$$

$$= 8 \times 10^{15}$$

5. $V = \frac{nRT}{p} = \left(\frac{nR}{p}\right) T$

For given mass, V - T graph is a straight line passing through origin having

$$\text{slope} = \frac{nR}{p} \propto \frac{1}{p}$$

Slope of p_2 is more. Hence, $p_2 < p_1$.

6. $p = (nRT) \frac{1}{V}$

i.e. p *versus* $\frac{1}{V}$ graph is a straight line passing through origin of slope nRT.

7. pV and T both are constants.

INTRODUCTORY EXERCISE 20.4

1. Internal energy of n moles of an ideal gas at temperature T is given by

$$U = n\left(\frac{f}{2} RT\right)$$

where, $f =$ degrees of freedom

$= 5$ for O_2 and 3 for Ar

Hence, $U = U_{O_2} + U_{Ar}$

$$= 2\left(\frac{5}{2} RT\right) + 4\left(\frac{3}{2} RT\right)$$

$$= 11 RT$$

2. Average translational kinetic energy of an ideal gas molecule is $\frac{3}{2} kT$ which depends on temperature only. Therefore, if temperature is same, translational kinetic energy of O_2 and N_2 both will be equal.

3. $\frac{f_T}{f_R} = \frac{3}{2} = \frac{K_T}{K_R} = \frac{K_T}{K_O}$

$$\therefore \quad K_T = \frac{3}{2} K_O$$

INTRODUCTORY EXERCISE 20.5

1. $v_{\text{rms}} = \sqrt{\frac{3RT}{M}} = \sqrt{\frac{3 \times 8.31 \times 373.15}{2 \times 10^{-3}}}$

$$= 2156 \text{ m/s} = 2.15 \text{ km/s}$$

2. $v_{\text{av}} = \frac{500 + 600 + 700 + 800 + 900}{5} = 700 \text{ m/s}$

$$v_{\text{rms}} = \sqrt{\frac{(500)^2 + (600)^2 + (700)^2 + (800)^2 + (900)^2}{5}} = 714 \text{ m/s}$$

4. Helium gas is monoatomic. So, its degree of freedom $f = 3$. Average kinetic energy of 1 molecule of gas

$$= \frac{f}{2} kT = \frac{3}{2} kT$$

$$= \frac{3}{2}(1.38 \times 10^{-23})(300)$$

$$= 6.21 \times 10^{-21} \text{ J}$$

5. (a) $v_{\text{rms}} = \sqrt{\frac{3RT}{M}}$

For He gas : $v_{\text{rms}} = \sqrt{\frac{3 \times 8.31 \times 300}{4 \times 10^{-3}}}$

$$= 1368 \text{ m/s}$$

For Ne gas : $v_{\text{rms}} = \sqrt{\frac{3 \times 8.31 \times 300}{20.2 \times 10^{-3}}}$

$$= 609 \text{ m/s}$$

(b) Each gas is monoatomic for which degree of freedom $f = 3$. Hence, average kinetic energy of one atom

$$= \frac{f}{2} kT = \frac{3}{2} kT$$

$$= \left(\frac{3}{2}\right)(1.38 \times 10^{-23})(300)$$

$$= 6.21 \times 10^{-21} \text{ J}$$

6. $v_{\text{rms}} = \sqrt{\frac{3RT}{M}}$

$\therefore \quad T = \frac{mv^2_{\text{rms}}}{3R} = \frac{(4 \times 10^{-3})(10^3)^2}{3 \times 8.31}$

$$= 160 \text{ K}$$

7. Suppose n_1 molecules have v_1 velocity and n_2 molecules have v_2 velocity. Then,

$$v_{\text{av}} = \frac{n_1 v_1 + n_2 v_2}{n_2 + n_2}$$

But, $\quad v_{\text{rms}} = \sqrt{\frac{n_1 v_1^2 + n_2 v_2^2}{n_1 + n_2}}$

Now, $v_{\text{rms}} \geq v_{\text{av}}$ because v_1 and v_2 may be in opposite directions also.

Exercises

LEVEL 1

Assertion and Reason

1. Straight line passing through origin represents isochoric process.

3. In monoatomic gas, there is no rotational degree of freedom.

4. Temperature of the gas is associated with random or disordered motion of the gas molecules. By the motion of container total kinetic energy of gas molecules will increase. But temperature will not increase.

5. Internal energy is equally distributed in all degrees of freedom. For example

$$\frac{K_T}{K_R} = \frac{3}{2} \text{ in diatomic gas}$$

As $\quad f_T = 3$ and $f_R = 2$

7. Density of water is maximum at 4°C. Hence, volume is minimum at 4°C.

8. $U \propto T \propto pV$

9. $p = \frac{1}{3}\left(\frac{mN}{V}\right) v^2_{\text{rms}}$

$$\frac{mN}{V} = \frac{\text{Total mass of gas}}{\text{Volume of gas}} = \text{density of gas}$$

Objective Questions

2. $v_{\text{rms}} = \sqrt{\frac{(1)^2 + (0)^2 + (2)^2 + (3)^4}{4}}$

$$= \sqrt{3.5} \text{ m/s}$$

3. $T_1 = 273 + 27 = 300 \text{ K}$

$T_2 = 273 + 927 = 1200 \text{ K}$

$v_{\text{rms}} \propto \sqrt{T}$

T has become four times.

Therefore, v_{rms} will become two times.

4. Hydrogen and oxygen both are diatomic gases. Therefore, average kinetic energy per molecule is

$$\frac{f}{2} kT$$

or $\quad \frac{5}{2} kT \qquad$ (as $f = 5$)

5. $E \propto T$

$\therefore \quad \frac{T_2}{T_1} = \frac{E_2}{E_1} = \frac{2E}{E} = 2$

$\therefore \quad T_2 = 2T_1 = 2(273 + 10)$

$$= 566 \text{ K} = 293°\text{C}$$

7. If $p = \text{constant}$, then $V \propto T$

8. It means rod is compressed from its natural length by Δl.

$$\therefore \quad \text{Strain} = -\frac{\Delta l}{l} = -\frac{l\Delta\alpha\Delta\theta}{l}$$

$$= (-\alpha d\theta) = -(12\times10^{-6})(50)$$

$$= -6\times10^{-4}$$

9. $\Delta l_1 = \Delta l_2$

$$\therefore \quad l_1\alpha_1\Delta\theta = l_2\alpha_2\Delta\theta$$

$$\text{or} \quad \frac{l_1}{l_2} = \frac{\alpha_2}{\alpha_1} = \frac{9}{11}$$

In option (a), ratio is $\frac{19}{11}$.

10. $V = \frac{nRT}{p} = \frac{mR\,(t+273)}{Mp}$

$\frac{m}{p}$ ratio is same. Therefore, slope and intercept of straight line between V and t should also remain same.

Subjective Questions

1. For Q.Nos. 1 and 2

Apply the formula,

$$\frac{T_C-0}{100} = \frac{T_K-273}{100} = \frac{T_F-32}{180} = \frac{T_R-0}{80}$$

3. In the above equation, putting $T_F = T_C$,

We get $T_F = -40°\text{F}$ or $T_C = -40°\text{C}$

4. Initially $T_C = \left(\frac{T_F-32}{180}\right)(100)$

$$= \left(\frac{68.2-32}{180}\right)(100)$$

$$= 20.11°\text{C}$$

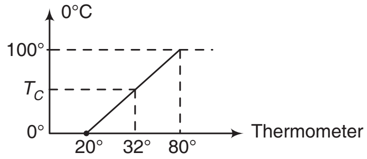
Finally $T_C = 20.11 + 40 = 60.11°\text{C}$

$$\therefore \quad T_F = 32 + \left(\frac{180}{100}\right)T_C$$

$$= 32 + \left(\frac{180}{100}\right)(60.11)$$

$$= 140.2°\text{F}$$

5.



$$\frac{T_C}{32-20} = \frac{100}{80-20} \quad \text{or} \quad T_C = 20°\text{C}$$

6. The temperature on the platinum scale is

$$t = \frac{R_t - R_0}{R_{100} - R_0}\times100°$$

$$= \frac{86-80}{90-80}\times100°\text{C}$$

$$= 60°\text{C}$$ **Ans.**

7. Let the relation between the thermometer reading and centigrade be $y = ax + b$

Given, at $x = 100$, $y = 80$ and at $x = 0$, $y = 10$

$\therefore \quad 80 = 100\,a + b, 10 = b$

$\Rightarrow \quad a = 0.7$

Now, we have to find x when $y = 59$

$\therefore \quad 59 = 0.7x + b \Rightarrow x = 70$

$\therefore$ The answer is 70°C. **Ans.**

8. If T be the corresponding temperature,

$$\sqrt{\frac{3RT}{M_O}} = \sqrt{\frac{3R(300)}{M_H}}$$

$$\therefore \quad T = (300)\left(\frac{M_O}{M_H}\right)$$

$$= 4800\text{ K}$$ **Ans.**

9. Mass of 6.02×10^{23} molecules is 17 g or 0.017 kg.

$\therefore$ Mass of one NH_3 molecule

$$= \frac{0.017}{6.02\times10^{23}}\text{ kg}$$

$$= 2.82\times10^{-26}\text{ kg}$$

10. $\frac{n_1+n_2}{\gamma-1} = \frac{n_1}{\gamma_1-1} + \frac{n_2}{\gamma_2-1}$

$$\therefore \quad \frac{3+2}{\gamma-1} = \frac{3}{1.67-1} + \frac{2}{1.4-1}$$

$$\frac{5}{\gamma-1} = 9.48$$

Solving, we get $\gamma = 1.53$

11. $v = \sqrt{\frac{\gamma p}{\rho}}$

$$\therefore \quad \gamma = \frac{\rho v^2}{p} = \frac{1.3\times(330)^2}{1.013\times10^5} = 1.4$$

$$\gamma = 1 + \frac{2}{f} \qquad (f = \text{degree of freedom})$$

$$1.4 = 1 + \frac{2}{f}$$

Solving, we get

$$f = 5$$

12. 4 g hydrogen = 2 moles hydrogen

11.2 litre He at STP $= \frac{1}{2}$ mole of He

$$p = p_{\text{H}} + p_{\text{He}} = (n_{\text{H}} + n_{\text{He}})\frac{RT}{V}$$

$$= \left(2 + \frac{1}{2}\right)\frac{8.31 \times (300\,\text{K})}{(20 \times 10^{-3})\text{m}^3}$$

$$= 3.12 \times 10^5\ \text{N/m}^2$$ **Ans.**

13. Since, pressure is constant.

$$\therefore \quad V \propto T$$

$$\therefore \quad \frac{V_i}{T_i} = \frac{V_f}{T_f}$$

$$\therefore \quad T_f = \frac{V_f}{V_i}T_i$$

$$\Rightarrow \quad T_f = 2T_i = 600\,\text{K}$$

$$\therefore \quad \Delta U = \frac{f}{2}nR\Delta T$$

$$= \frac{3}{2}R(600 - 300) = 450R$$ **Ans.**

14. From energy conservation principle,

$$E_i = E_f$$

or $$E_1 + E_2 = E$$

$$\therefore \ n_1\left(\frac{3}{2}RT_1\right) + n_2\left(\frac{3}{2}RT_2\right) = (n_1 + n_2)\left(\frac{3}{2}RT\right)$$

$$\therefore \quad T = \frac{n_1T_1 + n_2T_2}{n_1 + n_2}$$ **Ans.**

15. Number of gram moles $= \frac{1}{18} = n$

Avogadro number, $N_A = 6.02 \times 10^{23}$/g-mol

∴ Total number of molecules,

$$N = nN_A = 3.34 \times 10^{22}$$

∴ Number of molecules per cm²

$$= \frac{N}{4\pi R^2} \qquad (R \to \text{in cm})$$

$$= \frac{3.34 \times 10^{22}}{(4\pi)(6400 \times 10^5)^2} = 6500$$

16. $pV = nRT$

$$\therefore \quad nRT = pV$$

$$U = \frac{f}{2}(nRT) \quad (f = \text{degree of freedom})$$

$$\therefore \quad U = \frac{f}{2}(pV)$$

or $$U \propto fpV$$

f has become $\frac{5}{3}$ time (3 for He and 5 for O_2). p has become $\frac{3}{2}$ times and V has become 3 times.

∴ U will become $\frac{5}{3} \times \frac{3}{2} \times 3$ or 7.5 times.

17. $$v_{\text{rms}} = \sqrt{\frac{3RT}{M}} \propto \sqrt{\frac{T}{M}}$$

v_{rms} is same. Hence,

$$\left(\frac{T}{M}\right)_{H_2} = \left(\frac{T}{M}\right)_{O_2}$$

or $$T_{H_2} = \left(\frac{M_{H_2}}{M_{O_2}}\right)T_{O_2}$$

$$= \left(\frac{2}{32}\right)(273 + 47)$$

$$= 20\ \text{K} = -253°\text{C}$$

18. (i) $$\sqrt{\frac{3RT}{M}} = 11.2 \times 10^3\ \text{m/s}$$

$$\therefore \quad T = \frac{(11.2 \times 10^3)^2 M}{3R} \qquad \text{...(i)}$$

$$= \frac{(11.2 \times 10^3)^2 \times 2 \times 10^{-3}}{3 \times 8.31}$$

$$= 10059\ \text{K}$$

(ii) Escape velocity from moon

$$= \sqrt{2g_m R_m}$$

$$= \sqrt{1.6 \times 2 \times 1750 \times 10^3}$$

$$= 2366\ \text{m/s}$$

Substituting in Eq. (i), we have

$$T = \frac{(2366)^2 \times 2 \times 10^{-3}}{3 \times 8.31}$$

$$= 449\ \text{K}$$

19. At constant volume,

$$p \propto T$$

$$\therefore \quad \frac{p_1}{T_1} = \frac{p_2}{T_2}$$

$$\therefore \quad T_2 = \left(\frac{p_2}{p_1}\right)T_1$$

$$= \left(\frac{160}{80}\right)(273) = 546\ \text{K}$$

20. $$t = \left(\frac{R_t - T_0}{R_{100} - R_0}\right) \times 100 = \left(\frac{6.5 - 2.5}{3.5 - 2.5}\right) \times 100$$

$$= 400°$$

21. At constant volume,

$$p \propto T$$

$$\therefore \quad \frac{p_2}{p_1} = \frac{T_2}{T_1} \quad \text{or} \quad T_2 = \left(\frac{p_2}{p_1}\right) T_1$$

$$= \left(\frac{45 + 75}{5 + 75}\right)(273 + 30)$$

$$= 450 \text{ K} = 450 - 273$$

$$= 177^\circ\text{C}$$

22. Strain $= \dfrac{\Delta l}{l} = (\alpha\Delta\theta)$

Stress $= Y \times$ strain $= \gamma\alpha\Delta\theta$

$\therefore$ Tension $= (A)$ (stress) $= YA\alpha\Delta\theta$

Substituting the value, we get

$$T = YA\alpha\Delta\theta$$

$$= (2.0 \times 10^{11})(2 \times 10^{-6})(1.2 \times 10^{-5})(40)$$

$$= 192 \text{ N}$$

23. Change in weight = upthrust on 100% volume

$$\therefore \quad \frac{\Delta W'}{\Delta W} = \frac{F'}{F} = \left(\frac{1 + \gamma_s\,\Delta\theta}{1 + \gamma_l\,\Delta\theta}\right)$$

$$\text{or} \quad \frac{(50 - 45.1)}{(50 - 45)} = \frac{1 + (12 \times 10^{-6})(75)}{1 + \gamma_l\,(75)}$$

Solving this equation, we get

$$\gamma_l = 3.1 \times 10^{-4} \text{ per}^\circ\text{C}$$

24. (a) $n = \dfrac{pV}{RT} = \dfrac{(1.52 \times 10^6)(10^{-2})}{(8.31)(298.15)}$

$$= 6.135$$

(b) $\rho = \dfrac{pM}{RT} = \dfrac{(1.52 \times 10^6)(2 \times 10^{-3})}{8.31 \times 298.15}$

$$= 1.24 \text{ kg/m}^3$$

(c) $\rho \propto M$ (if P and T are same)

$$\therefore \quad \frac{\rho_{O_2}}{\rho_{H_2}} = \frac{M_{O_2}}{M_{H_2}}$$

$$\therefore \quad \rho_{O_2} = \left(\frac{M_{O_2}}{M_{H_2}}\right)\rho_{H_2}$$

$$= \left(\frac{32}{2}\right)(1.23)$$

$$= 19.68 \text{ kg/m}^3$$

25. If T = constant, then

$$p_1V_1 = p_2V_2$$

$$\therefore \quad p_2 = p_1\left(\frac{V_1}{V_2}\right) = (1 \text{ atm}) = \left(\frac{70}{6}\right)$$

$$= 11.7 \text{ atm}$$

26. $n_1 = n_2$

$$\therefore \quad \frac{p_1V_1}{RT_1} = \frac{p_2V_2}{RT_2}$$

$$\therefore \quad V_2 = \left(\frac{p_1}{p_2}\right)\left(\frac{T_2}{T_1}\right)V_1 = \left(\frac{1}{0.5}\right)\left(\frac{270}{300}\right)(500)$$

$$= 900 \text{ m}^3$$

27. p = constant

$$\therefore \quad V \propto T$$

$$\text{or} \quad h \propto T$$

$$\therefore \quad \frac{h_f}{T_f} = \frac{h_i}{T_i}$$

$$\text{or} \quad h_f = \left(\frac{T_f}{T_i}\right)h_i$$

$$= \left(\frac{273 + 100}{273 + 20}\right)(4) = 5.09 \text{ cm}$$

28. $n_1 = \dfrac{0.025}{28} = 8.93 \times 10^{-4}$

$$n_2 = \frac{0.04}{4} = 0.01$$

$$\therefore \quad \frac{n_1}{n_2} = 0.089$$

In equilibrium p and T are same.

$$\therefore \quad pV = nRT$$

$$\therefore \quad V \propto n \quad \text{or} \quad L \propto n$$

$$\therefore \quad \frac{L_1}{L_2} = \frac{n_1}{n_2} = 0.089$$

29. $n = n_1 + n_2$

$$\frac{pV}{RT} = \frac{p_1V_1}{RT} + \frac{p_2V_2}{RT}$$

$$\therefore \quad p = \frac{p_1V_1 + p_2V_2}{V}$$

$$= \frac{(0.11)(1.38) + (0.16)(0.69)}{0.11 + 0.16}$$

$$= 0.97 \text{ MPa}$$

30. $(n_1 + n_2)_1 = (n_1 + n_2)f$

$$\therefore \quad \frac{p_iV_1}{RT_i} + \frac{p_iV_2}{RT_i} = \frac{pV_1}{RT_1} + \frac{pV_2}{RT_2}$$

$$\therefore \quad P = \frac{P\,(V_1 + V_2)}{T_i\,(V_1/T_1 + V_2/T_2)}$$

$$= \frac{(1 \text{ atm})(600)}{(293)\left(\dfrac{400}{373} + \dfrac{200}{273}\right)}$$

$$= 1.13 \text{ atm}$$

31. $V = \dfrac{nRT}{p} = \dfrac{(1)\,(8.31)\,(273.15)}{1.013\times 10^{5}}$

$$= 0.0224\ \text{m}^3 = 22.4\ \text{L}$$

32. $n_1 = n_2$

$$\therefore\quad \frac{p_1V_1}{RT_1} = \frac{p_2V_2}{RT_2} \quad\text{or}\quad p_2 = \left(\frac{V_1}{V_2}\right)\left(\frac{T_2}{T_1}\right)p_1$$

$$= \left(\frac{0.75}{0.48}\right)\left(\frac{273+157}{273+27}\right)(1.5\times 10^5)$$

$$= 3.36\times 10^5\ \text{Pa}$$

33. $n_1 =$ number of moles of $N_2 = \dfrac{1.4}{28} = 0.05$

30% of the gas dissociates into atoms.

$$\therefore\quad n_1' = 2\,(0.3)\,(0.05) + (0.7)\,(0.05) = 0.065$$

$$n_2 = \text{number of moles of He} = \frac{0.4}{4} = 0.1$$

$$\therefore\quad n = n_1' + n_2 = 0.165$$

Now, $P = \dfrac{nRT}{V} = \dfrac{(0.165)\,(8.31)\,(1500)}{(5\times 10^{-3})}$

$$= 4.1\times 10^5\ \text{N/m}^2$$

34. In diatomic gas rotational degree of freedom is two.

$\therefore$ Rotational KE of one molecule

$$\frac{1}{2}I\,\omega^2 = \frac{f}{2}kT = kT \qquad (\text{as } f = 2)$$

$$\therefore\quad \omega = \sqrt{\frac{2kT}{I}}$$

$$= \sqrt{\frac{2\times 1.38\times 10^{-23}\times 300}{8.28\times 10^{-38}\times 10^{-9}}}$$

$$= 10^{13}\ \text{rad/s}$$

35. (a) $C_p = (1 + f/2)\,R$

$$29 = (1 + f/2)\,8.31$$

Solving, we get

$$f = 5$$

(b) $pT =$ constant

$$\therefore\quad p\,(pV) = \text{constant}$$

$$\text{or}\quad pV^{1/2} = \text{constant}$$

C in the process $pV^x =$ constant is given by

$$C = C_V + \frac{R}{1-x} = \frac{f}{2}R + \frac{R}{1-x}$$

$$\therefore\quad 29 = 8.31\left(\frac{f}{2} + \frac{1}{1-1/2}\right)$$

Solving, we get $\quad f = 3$

36. (a) Average translational kinetic energy of any type of molecules is

$$\frac{3}{2}kT = \frac{3}{2}\,(1.38\times 10^{-23})\,(300)$$

$$= 6.21\times 10^{-21}\,\text{J}$$

(b) $\dfrac{2}{5}$ energy is associated with rotation. Hence, it is diatomic gas.

$$Q = nC_V\Delta T = (1)\left(\frac{5}{2}R\right)(1)$$

$$= \frac{5}{3}\times 8.31 = 20.8\ \text{J}$$

37. $C_p = \dfrac{n_1C_{p_1} + n_2C_{p_2}}{n_1 + n_2}$

$$= \frac{2.5R + 3.5R}{1+1} = 3R$$

$$C_V = \frac{n_1C_{V_1} + n_2C_{V_2}}{n_1 + n_2}$$

$$= \frac{1.5R + 2.5R}{2} = 2R$$

$$\gamma = \frac{C_p}{C_V} = \frac{3}{2} = 1.5$$

38. $pV^{-b} =$ constant

$$C = \frac{R}{\gamma - 1} + \frac{R}{1-(-b)}$$

$$C = 0\ ,\ \text{if}\ \gamma - 1 = -\,(1 + b)$$

$$\therefore\quad b = -\,\gamma$$

39. $pV^{-1} =$ constant

$$\therefore\quad C = C_V + \frac{R}{1-x}$$

Here $\qquad x = -1$

$$\therefore\quad C = C_V + \frac{R}{2}$$

40. $K = \dfrac{3}{2}kT \;\Rightarrow\; T = \dfrac{2K}{3k}$

Now, $n = \dfrac{pV}{RT} = \dfrac{3kpV}{2KR}$

$$= \frac{3\,(200\times 10^3)\,(0.1\times 10^{-3})\,(1.38\times 10^{-23})}{2\times 6\times 10^{-21}\times 8.31}$$

$$= 8.3\times 10^{-3}\ \text{mol}$$

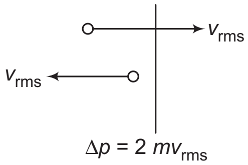
Now, $N = nN_A$

$$= (8.3\times 10^{-3})\,(6.02\times 10^{23})$$

$$= 5\times 10^{21}$$

41. $v_{\text{rms}} = \sqrt{\dfrac{3RT}{M}} = \sqrt{\dfrac{3 \times 8.31 \times (273 + 57)}{46 \times 10^{-3}}}$

$= 423 \text{ m/s}$



Mass of one gas molecule,

$$m = \frac{46}{6.02 \times 10^{23}} \text{ g}$$

$$= 7.64 \times 10^{-26} \text{ kg}$$

Let n molecules strike per second per unit area. Then,

$$\text{Pressure} = \frac{F}{A} = \frac{\Delta P/\Delta t}{A} = 2mn\, v_{\text{rms}}$$

$$\therefore \quad n = \frac{\text{Pressure}}{(2m)\, v_{\text{rms}}} = \frac{2 \times 1.013 \times 10^5}{2 \times 7.64 \times 10^{-26} \times 423}$$

$$= 3.1 \times 10^{27}$$

42. $K_T = \dfrac{3}{2} kT = \dfrac{3}{2} k \left(\dfrac{pV}{nR}\right)$

$$= \frac{3}{2} k \frac{pV}{(M/mN_A)\, R}$$

$$= \frac{3kPV\ m\ N_A}{2MR}$$

$$= \frac{(3 \times 1.38 \times 10^{-23})\,(100 \times 10^3)\,(2 \times 10^{-6})\,(8.0 \times 10^{-23})\,(6.02 \times 10^{23})}{2 \times (50 \times 10^{-3})\,(8.31)}$$

$$= 4.8 \times 10^{-22} \text{J}$$

43. (a) $v_{\text{rms}} \propto \sqrt{T}$

$$\therefore \quad v_0' = \left(\sqrt{\frac{T'}{T}}\right) v_0 = \left(\sqrt{\frac{573}{293}}\right) v_0$$

$$= 1.40\, v_0$$

(b) v_{rms} does not depend on pressure, as long as temperature remains constant.

(c) $v_{\text{rms}} = \sqrt{\dfrac{3RT}{M}}$ or $v_{\text{rms}} \propto \dfrac{1}{\sqrt{M}}$

44. (a) $K_T = \dfrac{3}{2} kT$

$$= \frac{3}{2} (1.38 \times 10^{-23})\,(300)$$

$$= 6.21 \times 10^{-21} \text{J}$$

(b) K_T in one mole $= \dfrac{3}{2} RT$

$$= \frac{3}{2} \times 8.31 \times 300$$

$$= 3740 \text{ J}$$

(c) $v_{\text{rms}} = \sqrt{\dfrac{3RT}{M}} = \sqrt{\dfrac{3 \times 8.31 \times 300}{32 \times 10^{-3}}}$

$$= 484 \text{ m/s}$$

45. Let mass of nitrogen = (m) g. Then, mass of oxygen = $(100 - m)$ g. Number of moles of nitrogen, $n_1 = \dfrac{m}{28}$ and number of moles of oxygen

$$n_2 = \left(\frac{100 - m}{32}\right)$$

For air

$$\rho = \frac{pM}{RT} = \frac{p}{RT} \left(\frac{m_1 + m_2}{n_1 + n_2}\right)$$

$$\therefore \quad 1.284 = \frac{1.01 \times 10^5}{8.31 \times 273} \left[\frac{100 \times 10^{-3}}{(m/28) + (100 - m)/32}\right]$$

Solving this equation, we get

$$m = 76.5 \text{ g}$$

This is also percentage of N_2 by mass on air as total mass we have taken is 100 g.

46. $n_1 = n_2$

$$\therefore \quad \frac{p_1 V_1}{RT_1} = \frac{p_2 V_2}{RT_2}$$

$$\therefore \quad V_2 = \frac{p_1 V_1 T_2}{p_2 T_1} = \frac{(p_0 + \rho gh)\, V_1\, T_2}{p_0 T_1}$$

$$= \frac{(1.01 \times 10^5 + 10^3 \times 10 \times 40)\,(20)\,(273 + 20)}{1.01 \times 10^5\,(273 + 4)}$$

$$\approx 105 \text{ cm}^3$$

47. (a) Molar heat capacity $C_p = \dfrac{Q}{n\Delta T}$

and heat capacity $C_p = \dfrac{Q}{\Delta T}$

$$\therefore \quad C_p = nC_P$$

Similarly, $C_v = nC_V$

Now, $C_p - C_v = n\,(C_P - C_V) - nR$

$$\therefore \quad n = \frac{C_p - C_v}{R} = \frac{29.1}{8.31} = 3.5$$

(b) $C_p = nC_P = n\left(\dfrac{5}{2} R\right)$

$$= (3.5)\,(2.5)\,(8.31)$$

$$= 72.75 \text{ J/K}$$

$$C_v = nC_V = n\left(\frac{3}{2}R\right)$$

$$= (3.5)\,(1.5)\,(8.31)$$

$$= 43.65 \text{ J/K}$$

(c) $C_p = nC_P = n\left(\frac{7}{2}R\right)$

$$= (3.5)\,(3.5)\,(8.31)$$

$$= 101.8 \text{ J/ K}$$

$$C_v = nC_V = n\left(\frac{5}{2}R\right)$$

$$= (3.5)\,(2.5)\,(8.31)$$

$$= 72.75 \text{ J/K}$$

48. (a) As discussed in the above problem,

$$C_v = nC_V$$

$$\therefore \quad n = \frac{C_v}{C_V} = \frac{C_v}{(3/2)R}$$

$$= \frac{35}{1.5 \times 8.31} = 2.81$$

(b) Internal energy,

$$U = n\left(\frac{f}{2}RT\right)$$

$$f = \text{degree of freedom} = 3$$

$$\therefore \quad U = (2.81)\left(\frac{3}{2}\right)(8.31)\,(273)$$

$$= 9562 \text{ J} = 9.56 \text{ kJ}$$

(c) $C_P = \frac{5}{2}R = \left(\frac{5}{2}\right)(8.31)$

$$= 20.8 \text{ J/mol-K}$$

LEVEL 2

Single Correct Option

1. $(n_1 + n_2)_i = (n_1 + n_2)_f$

$$\therefore \quad \frac{p_1V_1}{RT_1} + \frac{p_2V_2}{RT_2} = \frac{p\,(V_1 + V_2)}{RT}$$

Solving, we get $\quad T = \dfrac{T_1T_2p\,(V_1 + V_2)}{p_1V_1T_2 + p_2V_2T_1}$

2. $\Delta l = l\alpha\Delta\theta$

$$\therefore \quad \alpha = \frac{\Delta l}{l\,\Delta\theta} = \frac{0.008}{(10)\,(100)} = 8 \times 10^{-6} \text{ per °C}$$

$$\gamma = 3\alpha = 2.4 \times 10^{-5} \text{ per°C}$$

$$\Delta V = V\gamma\,\Delta\theta = (100)\,(2.4 \times 10^{-5})\,(100)$$

$$= 0.24 \text{ cc}$$

$$\therefore \quad V' = V + \Delta V = 100.24 \text{ cc}$$

3. $T = mV + C$

$$\therefore \quad \frac{pV}{nR} = mV + C$$

or $\quad p = nR\left(m + \dfrac{C}{V}\right)$

$\therefore$ p-V graph is as shown in graph (a).

4. $p^2V = \text{constant}$

$$\therefore \quad \left(\frac{nRT}{V}\right)^2 V = \text{constant}$$

$$\therefore \quad T^2 \propto V$$

or $\quad T \propto \sqrt{V}$

V is made three times. So, T will become $\sqrt{3}$ times.

5. $n = \dfrac{pV}{RT}$

$$\therefore \quad n \propto \frac{1}{T} \quad \text{or} \quad m \propto \frac{1}{T}$$

$$\frac{m_1}{m_2} = \frac{T_2}{T_1} = \frac{273 + 37}{273 + 7}$$

$$= \frac{310}{280} = 1.1$$

6. $v_{\text{av}} = \sqrt{\dfrac{8RT}{\pi M}}$

T and M are same. Hence, average speed of O_2 molecules in both vessels will remain same or v_1.

7. $n = \dfrac{pV}{RT}$

$$\therefore \quad N = nN_A = \frac{pVN_A}{RT}$$

$$= \frac{(1.013 \times 10^5 \times 10^{-13})\,(10^{-6})\,(6.02 \times 10^{23})}{(8.31)\,(300)}$$

$$= 2.4 \times 10^6$$

8. $v_{\text{rms}} = \sqrt{\dfrac{3RT}{M}} = \sqrt{\dfrac{3 \times 8.31 \times 273}{28 \times 10^{-3}}}$

$$= 493 \text{ m/s}$$

Now, increase in gravitation PE

= decrease in kinetic energy

$$\therefore \quad \frac{(mg\,h)}{1 + \dfrac{h}{R}} = \frac{1}{2}\,m\,v_{\text{rms}}^2 \quad \text{or} \quad \frac{2gh}{1 + (h/R)} = v_{\text{rms}}^2$$

or $\quad \dfrac{2 \times 9.81 \times h}{1 + (h/6400 \times 10^3)} = (493)^2$

Solving this equation, we get

$$h \approx 12000 \text{ m}$$

or $\quad$ 12 km

9. $U \propto T$

According to given graph,

$$p \propto V$$

$$\therefore \quad p \propto T$$

Hence, $\quad V = \text{constant}$

10. 28 g of N_2 mean 1 g-mol

Now, $\quad n = \dfrac{pV}{RT} \quad$ or $\quad n \propto \dfrac{p}{T}$

$$\frac{n_f}{n_i} = \left(\frac{p_f}{p_i}\right)\left(\frac{T_i}{T_f}\right) = \left(\frac{1}{2}\right)\left(\frac{273+57}{273+27}\right) = \frac{11}{20}$$

or $\quad n_f = \left(\dfrac{11}{20}\right) n_i = \dfrac{11}{20}$ mol

$$\Delta n = n_i - n_f = 1 - \frac{11}{20} = \frac{9}{20} \text{ g-mol}$$

$$\Delta m = \frac{9}{20} \times 28 \text{ g} = \frac{63}{5} \text{ g}$$

11. 4 g H_2 means 2 g-moles and 8 g He means 2 g-moles.

Now, $\quad M = \dfrac{n_1 M_1 + n_2 M_2}{n_1 + n_2} = \dfrac{(2)(2) + (2)(4)}{2+2}$

$$= 3 \text{ g/mol}$$

$$\rho = \frac{PM}{RT} = \frac{(1.013 \times 10^5)(3 \times 10^{-3})}{(8.31)(273)} = 0.13 \text{ kg/m}^3$$

12. $\rho = \dfrac{1}{V}$

Given, $\quad p \propto K\rho$

$$\therefore \quad \rho \propto \frac{1}{V}$$

or $\quad pV = \text{constant}$

$$\therefore \quad T = \text{constant}$$

More than One Correct Options

1. $p \propto \sqrt{\rho}$ as per process. If ρ becomes half, then p will becomes $\sqrt{2}$ times.

Further, $\quad \rho \propto \dfrac{1}{V}$

$$\therefore \quad \frac{p^2}{(1/V)} = \text{constant}$$

or $\quad (pV)\,p = \text{constant}$

Hence, $\quad Tp = \text{constant} \qquad (\text{as } pV \propto T)$

$$\therefore \quad p \propto \frac{1}{T}$$

or P - T graph is a rectangular hyperbola.

2. $p \propto \dfrac{1}{\sqrt{V}}$

If volume becomes 4 times than p will remain half

$$V \propto \frac{T}{p}$$

$$\therefore \quad Vp^2 = \text{constant}$$

$$\therefore \quad \left(\frac{T}{P}\right) p^2 = \text{constant}$$

or $\quad pT = \text{constant}$

or $\quad p \propto \dfrac{1}{T}$

i.e. p - T graph is a rectangular hyperbola.

If p is halved than T will becomes two times.

4. $\rho \propto \dfrac{1}{V}$

V is doubled so ρ will remain half.

$$U \propto T \propto pV$$

According to given graph, $p \propto V$

$$\therefore \quad U \propto T \propto p^2 \text{ or } V^2$$

V is doubled, so U and T both will become four times.

$$p \propto V$$

$$\therefore \quad \frac{T}{V} \propto V \qquad \left(\text{as } p \propto \frac{T}{V}\right)$$

$$\therefore \quad T \propto V^2$$

or T - V graph is a parabola passing through origin.

6. $V = \dfrac{nRT}{p} = \dfrac{mRT}{Mp} = \left(\dfrac{mR}{Mp}\right) T$

i.e. V - T graph is a straight line passing through origin of slope

$$= \left(\frac{mR}{Mp}\right) \Rightarrow \text{Slope} \propto \frac{m}{p}$$

Hence, slope depends on both m and p.

7. (a) $p = \dfrac{nRT}{V} = \dfrac{(m/V)RT}{M}$

So, given m in the question is mass of gas per unit volume.

(b) m = total mass of gas

(c) m = mass of one molecule of gas.

Match the Columns

1. (a) $K_T = \dfrac{n f_T}{2} RT = \dfrac{(2)(3)\,RT}{2} = 3RT$

(b) $K_R = \dfrac{n f_R RT}{2} = \dfrac{(2)(2)\,RT}{2} = 2RT$

(c) Potential energy = 0

(d) $U = K_R + K_T = 5RT$

2. $U \propto T$ and $\rho \propto \frac{1}{V}$

According to given graph,

$$U \propto \rho \quad \Rightarrow \quad T \propto \frac{1}{V}$$

$$\therefore \quad pV \propto \frac{1}{V} \quad \text{or} \quad p \propto \frac{1}{V^2}$$

Density is increasing. So, volume is decreasing. Hence, pressure will increase.

U is increasing. So, temperature will also increase.

Now, $$\frac{T}{V} \propto \frac{1}{V^2}$$

Volume is decreasing. Hence, $\frac{T}{V}$ will increase.

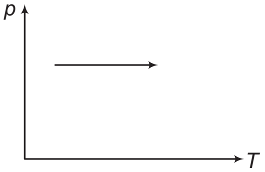
3. Speed of sound $= \sqrt{\frac{\gamma RT}{M}}$

4. (a) Density of water is maximum at 4°C. From 0°C to 4°C, density will first increase, then decrease.
(b) and (c) : Same logic as given in option (a).

(d) $T = 2\pi\sqrt{\frac{l}{g}}$ or $T \propto \sqrt{l}$

As temperature is increased, length will increase. So, time period will also increase.

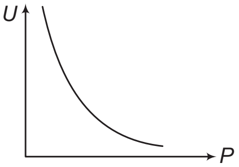
5. (a) $p =$ constant. Hence p - T graph is as shown below.



(b) $\rho = \frac{pM}{RT}$

If $p =$ constant, then

$$\rho \propto \frac{1}{T} \quad \text{or} \quad \rho \propto \frac{1}{U} \qquad (\text{as } U \propto T)$$



(c) If $p =$ constant, then

$$T \propto V$$

i.e. T - V graph is a straight line passing through origin.

(d) $\rho = \frac{pM}{RT}$

If $p =$ constant, then $\rho \propto \frac{1}{T}$

i.e. ρ - T graph is rectangular hyperbola.

Subjective Questions

1. $pV = nRT$

$$pdV = nRdT$$

$$\frac{dV}{dT} = \frac{nR}{P}, \; dV = V\gamma dT$$

$$\therefore \quad \gamma = \frac{dV/dT}{V} = \frac{nR}{PV} = \frac{1}{T}$$

2. In the process $pV^x =$ constant $C = \frac{R}{\gamma - 1} + \frac{R}{1 - x}$,

Given, $C = R$ and $\gamma = 7/5$

Substituting these values, we get $x = \frac{5}{3}$

Now, $pV^{5/3} =$ constant or $p \propto \frac{1}{(V)^{5/3}}$

By increasing volume to two times pressure will decrease $(2)^{5/3}$ times.

$$v_{\text{rms}} \propto \sqrt{T} \quad \text{or} \quad v_{\text{rms}} \propto \sqrt{pV}$$

or v_{rms} will become $\sqrt{\frac{(2)}{(2)^{5/3}}}$ times

or v_{rms} will become $(2)^{-1/3}$ times

or $\frac{1}{(2)^{1/3}}$ times.

Now, $p \propto$ (no. of collisions) (v_{rms})

$$\frac{1}{(2)^{5/3}} \propto (\text{no. of collisions}) \frac{1}{(2)^{1/3}}$$

or number of collisions will decrease $(2)^{4/3}$ times.

Ans.

3. $p_1V = n_1RT$

$$p_2V = n_2RT \qquad (T = 273 \text{ K})$$

$$\therefore \quad (p_1 - p_2)V = (n_1 - n_2)RT = \left(\frac{m_1 - m_2}{M}\right)RT$$

$$(\Delta p)V = \frac{\Delta m}{M}RT \qquad \text{...(i)}$$

In the initial condition (at STP)

$$\frac{RT}{M} = \frac{p_0}{\rho} \qquad \text{...(ii)}$$

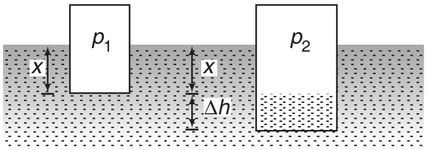
$(T = 273 \text{ K})$

From Eqs. (i) and (ii), we get

$$\Delta m = \frac{\rho V \Delta p}{P_0} = \frac{1.2 \times 0.4 \times 0.24}{1.0}$$

$$= 0.1152 \text{ kg} = 115.2 \text{ g} \qquad \textbf{Ans.}$$

4. $p_2 =$ pressure at depth x



$$p_1 V_1 = p_2 V_2$$

or $\quad p_1(Ah) = p_2(A)(h - \Delta h)$

$\therefore \quad p_1 = \dfrac{p_2(h - \Delta h)}{h} \qquad \ldots\text{(i)}$

Initially, $\quad mg = \rho g x A$

Now, $\quad p_2 = p_0 + \rho g x = p_0 + \dfrac{mg}{A}$

Substituting in Eq. (i), we have

$$p_1 = \left(p_0 + \frac{mg}{A}\right)\left(1 - \frac{\Delta h}{h}\right) \qquad \textbf{Ans.}$$

5. $p = \dfrac{RT}{V} \qquad (n = 1)$

or $\quad p = \dfrac{R}{V}(T_0 + \alpha V^2) \qquad \ldots\text{(i)}$

For minimum attainable pressure

$$\frac{dp}{dV} = 0 \quad \text{or} \quad \frac{-RT_0}{V^2} + \alpha R = 0$$

or $\quad V = \sqrt{\dfrac{T_0}{\alpha}}$

At this volume we can see that $\dfrac{d^2p}{dV^2}$ is positive or p is minimum.

From Eq. (i)

$$p_{\min} = \frac{RT_0}{\sqrt{T_0/\alpha}} + \alpha R \sqrt{T_0/\alpha}$$

$$= 2R\sqrt{\alpha T_0} \qquad \textbf{Ans.}$$

6. At 50°C, density of solid = density of liquid.

At 0°C, fraction submerged $\left(\dfrac{\rho_s}{\rho_l}\right)_{0°\text{C}} \times 100 \qquad \ldots\text{(i)}$

$$(\rho)_{50} = \frac{\rho_0}{1 + 50\gamma}$$

$\therefore \quad \rho_0 = \rho_{50}(1 + 50\gamma)$

Substituting in Eq. (i), we have

% of fraction submerged

$$= \left(\frac{1 + 50\gamma_s}{1 + 50\gamma_l}\right) \times 100 = \left(\frac{1 + 0.3 \times 10^{-5}}{1 + 8 \times 10^{-5}}\right) \times 100$$

$$= 99.99\ \% \qquad \textbf{Ans.}$$

7. $\rho_{100} g h_{100} = \rho_0 g h_0 \quad \text{or} \quad \dfrac{\rho_{100}}{\rho_0} = \dfrac{h_0}{h_{100}}$

$$\left(\frac{1}{1 + 100\gamma}\right) = \frac{39.2}{40}$$

Solving this equation we get

$$\gamma = 2.0 \times 10^{-4} \text{ per °C} \qquad \textbf{Ans.}$$

8. Let Δl be the change in length. (let $\Delta l_s > \Delta l > \Delta l_a$)

$$\text{Strain in steel} = \frac{\Delta l_s - \Delta l}{l_0}$$

and strain in aluminium $= \dfrac{\Delta l - \Delta l_a}{l_0}$

In equilibrium, $\quad 2F_s = F_a$

$$2\left[\frac{\Delta l_s - \Delta l}{l_0}\right] Y_s A = \left[\frac{\Delta l - \Delta l_a}{l_0}\right] Y_a A$$

or $\quad 2(l_0 \alpha_s \theta - \Delta l) Y_s = (\Delta l - l_0 \alpha_a \theta) Ya$

Solving this equation, we get

$$\Delta l = \left(\frac{2\alpha_s Y_s + \alpha_a Y_a}{2Ys + Y_a}\right) l_0 \theta$$

$\therefore$ Total length

$$= l_0 + \Delta l = l_0 \left[1 + \left(\frac{\alpha_a Y_a + 2\alpha_s Y_s}{2Y_s + Y_a}\right)\theta\right] \qquad \textbf{Ans.}$$

9. From $\Delta l = l \alpha \Delta\theta$ we have,

$$0.05 = 25\alpha_A (100)$$

$\therefore \quad \alpha_A = 0.00002 \text{ per°C}$

$$0.04 = 40\,\alpha_B (100)$$

$$\alpha_B = 0.00001 \text{ per°C}$$

In third case let l is the length of rod A. Then length of rod B will be $(50 - l)$ cm.

$$\Delta l = \Delta l_1 + \Delta l_2$$

or $\quad 0.03 = l(0.00002)(50) + (50 - l)(0.00001)(50)$

Solving we get, $l = 10$ cm and $50 - l = 40$ cm

Ans.

21. Laws of Thermodynamics

INTRODUCTORY EXERCISE 21.1

1. ΔU will be same along all paths. Then, we can apply $Q = W + \Delta U$ for all.

2. $\Delta U = Q - W$

$$= 254 - (-73) = 327 \text{ J}$$

INTRODUCTORY EXERCISE 21.2

1. (a) Work done by gas under constant pressure is

$$W = p(V_f + V_i)$$
$$= (1.7 \times 10^5)(0.8 - 1.2)$$
$$= -6.8 \times 10^4 \text{ J}$$

(b) $$Q = W + \Delta U$$
$$= -6.8 \times 10^4 - 1.1 \times 10^5$$

or $|Q| = 1.78 \times 10^5 \text{J}$

As Q is negative. So, net heat flow is out of the gas.

2. (a) $W_1 = +\text{ve}$, as cycle is clockwise

$W_2 = -\text{ve}$ as cycle is anti-clockwise

Since, $|W_1| > |W_2|$

$\therefore$ Net work done by the system is positive.

(b) In cyclic process, $Q_{\text{net}} = W_{\text{net}}$

Since, W_{net} is positive. So, Q_{net} is also positive. So, heat flows into the system.

(c) $W_1 = Q_1 = +\text{ ve}$, so into the system.

$W_2 = Q_2 = -\text{ve}$, so out of the system.

3. Helium is monoatomic. So, degree of freedom $f = 3$.

$$U = \frac{nf}{2}RT = \frac{3n}{2}RT$$

or $$n = \frac{2U}{3RT} = \frac{2 \times 100}{3 \times 8.31 \times 300}$$

$$= 2.67 \times 10^{-2} \text{mol}$$ **Ans.**

4. In isochoric process,

$$W = 0$$
$$Q = \Delta U = nC_V \Delta T = 4\left(\frac{3}{2}R\right)(300)$$
$$= 1800\,R$$

5. W = Area under p-V diagram

Further $p \propto V$ along AB.

Therefore, $p_B = 2p_A = 2p_0$

6. VT = constant

or $V(pV)$ = constant (as $T \propto pV$)

$\therefore$ pV^2 = constant

Comparing with pV^x = constant, we have

$$x = 2$$
$$W = \frac{nR\Delta T}{1 - x} \quad \text{(Table 21.3)}$$
$$= \frac{(2)(R)(300)}{1 - 2}$$
$$= -600\,R$$

7. $pV^2 = K = p_0V_0^2$

$\therefore$ $$p = \frac{K}{V^2}$$

$$W = \int p\,dV = \int_{V_0}^{2V_0} \frac{K}{V^2}\,dV$$
$$= \left[-\frac{K}{V}\right]_{V_0}^{2V_0}$$
$$= \frac{K}{V_0} - \frac{K}{2V_0}$$
$$= \frac{K}{2V_0}$$

Substituting, $K = p_0V_0^2$, we have

$$W = \frac{1}{2}p_0V_0$$

INTRODUCTORY EXERCISE 21.3

1. (a) $Q = nC_V\,\Delta T$

$$200 = (1)\left(\frac{3}{2}R\right)(T_f - 300)$$

or $200 = 1.5 \times 8.31(T_f - 300)$

Solving we get,

$$T_f = 316 \text{ K}$$

(b) $Q = nC_p\,\Delta T$

$$200 = (1)\left(\frac{5}{2}R\right)(T_f - 300)$$

or $200 = 2.5 \times 8.31\,(T_f - 300)$

Solving we get,

$$T_f = 309.6 \text{ K}$$

2. p = constant

$\therefore$ $$T \propto V$$

As the gas expands V increases. So, T also increases. Hence, ΔT is positive. Therefore, in the expression,

$$Q = nC_p \Delta T$$

Q is positive.

3. ***AB***

V is increasing, so $W = +$ ve. Product of pV and therefore T and therefore U is increasing.

So, ΔU is also + ve.

$$Q = W + \Delta U$$

$\therefore$ Q is also positive.

BC $\quad V =$ constant

$\therefore \quad W = 0$

$\therefore \quad Q = \Delta U = -$ ve

CA

V is decreasing.

$\therefore \quad W = -$ ve

ΔU is also negative.

$\therefore \quad Q = W + \Delta U$ is also negative.

4. $Q = 0$ as the box is insulated.

$W_{\text{gas}} = 0$ as on the right hand side there is vacuum.

$\therefore \quad \Delta U = Q - W = 0$

$\therefore \quad \Delta T$ is also zero,

as $\quad U \propto T$

5. In an isobaric process $p =$ constant.

Therefore, $\quad C = C_p$.

Now, $$\frac{\Delta Q}{\Delta U} = \frac{nC_p\Delta T}{nC_V\Delta T} = \frac{C_p}{C_V} = \gamma$$

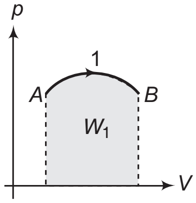
and $$\frac{\Delta Q}{\Delta W} = \frac{\Delta Q}{\Delta Q - \Delta U}$$

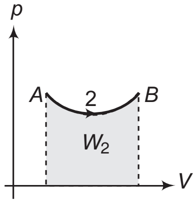
$$= \frac{nC_p\Delta T}{nC_p\Delta T - nC_V\Delta T}$$

$$= \frac{C_p}{C_p - C_V} = \frac{C_p/C_V}{C_p/C_V - 1}$$

$$= \frac{\gamma}{\gamma - 1}$$

6. $Q_1 = W_1 + \Delta U_1$ and $Q_2 = W_2 + \Delta U_2$





U is a state function. Hence, ΔU depends only on the initial and final positions. Therefore,

$$\Delta U_1 = \Delta U_2$$

But, $\quad W_1 > W_2$

as the area under 1 is greater than area under 2.

Hence,

$$Q_1 > Q_2$$

7. $$W = \int_{V_i}^{V_f} p\,dV = \int_1^2 (\alpha V^2)\,dV$$

$$= \int_1^2 (5 \times 1.01 \times 10^5)\,V^2 dV$$

Solving we get,

$$W = 1.18 \times 10^6 \text{ J}$$

$$= 1.18 \text{ MJ}$$

8. $W = nR\,\Delta T$ (in isobaric process)

$$= (1)(8.31)(72)$$

$$= 600 \text{ J} = 0.6 \text{ kJ}$$

$$\Delta U = Q - W = 1.0 \text{ kJ}$$

$$\gamma = \frac{C_p}{C_V} = \frac{n\,C_p\,\Delta T}{n\,C_V\,\Delta T} = \frac{Q}{\Delta U}$$

$$= \frac{1.6}{1.0} = 1.6$$

INTRODUCTORY EXERCISE 21.4

1. Given, $\quad Q_1 = 10^6$ cal

$$T_1 = (827 + 273) = 1100\text{K}$$

and $$T_2 = (27 + 273) = 300 \text{ K}$$

as, $$\frac{Q_2}{Q_1} = \frac{T_2}{T_1} \quad \text{(in Carnot engine)}$$

$\therefore$ $$Q_2 = \frac{T_2}{T_1} \cdot Q_1 = \left(\frac{300}{1100}\right)(10^6)$$

$$= 2.72 \times 10^5 \text{ cal}$$ **Ans.**

Efficiency of the cycle,

$$\eta = \left(1 - \frac{T_2}{T_1}\right) \times 100$$

or $$\eta = \left(1 - \frac{300}{1100}\right) \times 100$$

$$= 72.72\%$$ **Ans.**

2. $T_1 = 2100$ K, $T_2 = 700$ K, $\eta_{\text{actual}} = 40\%$

Maximum possible efficiency of Carnot engine is

$$\eta_{\max} = 1 - \frac{T_2}{T_1} = 1 - \frac{700}{2100}$$

$$= 0.666 = 66.6\%$$

Actual efficiency as the percentage of the maximum possible efficiency is

$$\frac{\eta_{\text{actual}}}{\eta_{\max}}\times 100=\frac{40}{66.6}\times 100$$

$$= 60\% \qquad \textbf{Ans.}$$

3. (a) $\eta = 1-\frac{T_2}{T_1} = 1-\frac{375}{500} = 0.25 = 25\%$

(b) $W = \eta Q_1 = 0.25\times 25\times 10^5$

$= 6.25\times 10^5$ J

(c) $Q_2 = Q_1 - W = (25-6.25)\times 10^5$

$= 18.75\times 10^5$ J

4. $T_1 = 627+273 = 900$ K

$T_2 = 27+273 = 300$ K

$$Q_1 = 3\times 10^6 \text{ cal}$$

$$\eta = \left(1-\frac{T_2}{T_1}\right) = \left(1-\frac{Q_2}{Q_1}\right)$$

$$\therefore \quad \frac{Q_2}{Q_1} = \frac{T_2}{T_1}$$

$$\therefore \quad Q_2 = \frac{T_2}{T_1}\times Q_1$$

$$= \frac{3\times 10^6\times 300}{900} = 10^6 \text{ cal}$$

Work done by the engine,

$$W = Q_1 - Q_2 = 3\times 10^6 - 10^6 \text{ cal}$$

$$= 2\times 10^6 \text{ cal}$$

5. $\eta_1 = 1-\frac{T_2}{T_1}$ or $\frac{1}{6} = 1-\frac{T_2}{T_1}$ ...(i)

In the second case, the temperature of the sink is reduced by 65°C. Hence,

$$\eta_2 = 1-\frac{T_2-65}{T_1}$$

or $\frac{1}{3} = 1-\frac{T_2-65}{T_1}$ ...(ii)

Solving Eqs. (i) and (ii), we get

$T_1 = 390$ K $= 117$°C,

$T_2 = 325$ K

$= 52$°C

6. Coefficient of performance is given by

$$\beta = \frac{T_2}{T_1-T_2}$$

$$\beta_A = \frac{(-10+273)}{(27+273)-(-10+273)}$$

$$= 7.1$$

$$\beta_B = \frac{(-27+273)}{(17+273)-(-27+273)} = 5.6$$

$\beta_A > \beta_B$

Therefore, refrigerator A is better.

7. Here, $T_1 = 25+273 = 298$ K

$T_2 = -10+273 = 263$ K

$Q_2 = 263$ J/s

Coefficient of performance is given by

$$\beta = \frac{Q_2}{Q_1-Q_2} = \frac{T_2}{T_1-T_2}$$

$$\therefore \quad \frac{Q_1}{Q_2} = \frac{T_1}{T_2}$$

$$\therefore \quad Q_1 = \frac{T_1}{T_2}\times Q_2 = \frac{298}{263}\times 263$$

$$= 298 \text{ Js}^{-1}$$

Average power consumed,

$= 298-263 = 35$ J s^{-1} $= 35$ W

8. $\eta = \frac{W_{\text{net}}}{\Sigma Q_{+\text{ve}}}\times 100$

W_{net} = Area under the cycle

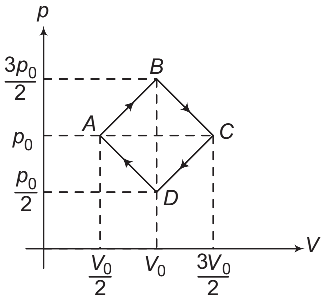
$$= \frac{p_0V_0}{2}$$

$$\Sigma Q_{+\text{ve}} = Q_{ABC}$$

$$= W_{ABC} + \Delta U_{ABC}$$

$$= (\text{Area under } ABC) + nC_V\,\Delta T$$

$$= \left(\frac{5}{4}p_0V_0\right) + n\left(\frac{3}{2}R\right)(T_C - T_A)$$



$$= \frac{5}{4}p_0V_0 + \frac{3}{2}(p_CV_C - p_AV_A)$$

$$= \frac{5}{4}p_0V_0 + \frac{3}{2}\left(\frac{3p_0V_0}{2} - \frac{p_0V_0}{2}\right)$$

$$= \frac{11}{4}p_0V_0$$

$$\therefore \quad \eta = \frac{(p_0V_0/2)}{(11p_0V_0/4)}\times 100 = 18.18\ \%$$

Exercises

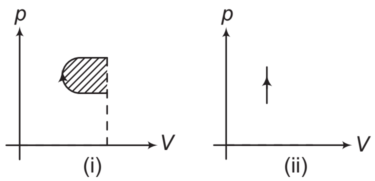
LEVEL 1

Assertion and Reason

1. $Q = 0, \Delta U = -W$

In expansion, W is positive. So, ΔU is negative. Hence, T also decreases.

2.



(i) (ii)

In both figures, $V_i = V_f$

but $W_1 =$ Hatched area

$W_2 = 0$

3. First law is just energy conservation law, which can be applied for any system.

5. $Q - W = \Delta U$ is state function.

So, it will remain constant for any two thermodynamic states.

6. For given temperatures T_1 and T_2 efficiency of a heat engine can't be greater than efficiency of Carnot engine.

7. $pT =$ constant

$$\therefore \quad \left(\frac{T}{V}\right) T = \text{constant}$$

$$\text{or} \quad V \propto T^2$$

If temperature is increased, then volume will also increase. So, work done is positive.

8. $Q = 0$ as chamber is adiabatic

$W = 0$ as expansion is taking place in vacuum.

$$\therefore \quad \Delta U = Q - W = 0$$

$$\therefore \quad U \text{ or } T = \text{constant}$$

$$\text{or} \quad pV = \text{constant}$$

$$\therefore \quad p \propto \frac{1}{V}$$

Objective Questions

1. $p \propto V^2$

$$\therefore \quad \frac{T}{V} \propto V \quad \text{or} \quad T \propto V^3 \Rightarrow V \propto T^{1/3}$$

T is increasing. So, V will also increase. Hence, work done will be positive.

2. $$W_{\text{gas}} = nRT \ln\left(\frac{V_f}{V_i}\right) = nRT \ln\left(\frac{1}{2}\right)$$

$$= -nRT \ln 2$$

$\therefore$ Work done on the gas $= +\, nRT \ln 2$

3. ΔU is same p.

$$Q = W + \Delta U$$

$$W_1 = +\text{ ve}, W_2 = 0$$

$$\text{and} \quad W_3 = -\text{ ve}$$

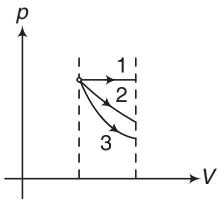
4. In adiabatic compression temperature increases. Hence, pV increases, as $T \propto pV$

5. $$W = -\pi(\text{Radius})^2$$

$$= -\pi\,(\text{Radius})\,(\text{Radius})$$

$$= -\pi\left(\frac{p_2 - p_1}{2}\right)\left(\frac{V_2 - V_1}{2}\right)$$

6.



1 → Isobaric

2 → Isothermal

3 → Adiabatic

Minimum area is under graph-3.

7. $W_1 > W_2$ as area under graph-a is more. Hence,

$$\Delta Q_1 > \Delta Q_2, \text{ as}$$

$$\Delta Q = W + \Delta U \text{ and } \Delta U_1 = \Delta U_2$$

8. $$\eta = \left(1 - \frac{T_2}{T_1}\right) \times 100$$

$$T_2 = 300 \text{ K} \quad \text{and } T_1 = 600 \text{ K}$$

$$\therefore \quad \eta = 50\%$$

9. $$p = \frac{n\,RT}{V}$$

$V =$ constant, but temperature will decrease with time. So, p will decrease.

10. In adiabatic compression, internal energy of gas increases. So, temperature increases.

11. $$pT^{\frac{\gamma}{1-\gamma}} = \text{constant} \quad \text{or} \quad p \propto T^{\frac{\gamma}{\gamma-1}}$$

$$\therefore \quad \alpha = \frac{\gamma}{\gamma - 1} = \frac{1.4}{1.4 - 1} = 3.5$$

12. $$C = C_V + \frac{R}{1-x}$$
$$= \frac{5}{2}R + \frac{R}{1-x} = \frac{5}{2}R - \frac{R}{x-1}$$

C is negative if
$$x - 1 < \frac{2}{5}$$
$$\therefore \qquad x < 1.4$$

If x lies between 1 and 1.4, then also C is negative.

13. $$C_V = \frac{n_1 C_{V_1} + n_2 C_{V_2}}{n_1 + n_2}$$

In option (c),
$$C_V = \frac{(2)\left(\frac{3}{2}R\right) + (4)\left(\frac{5}{2}R\right)}{6}$$
$$= \frac{13R}{6}$$

14. $Q_{\text{net}} = W_{\text{net}} =$ area under the graph
$$= \pi(\text{Radius})(\text{Radius})$$
$$= \pi(10 \times 10^3 \text{ Pa})(10 \times 10^{-3} \text{ m}^3)$$
$$= 10^2 \pi \text{ J}$$

15. Area is same, signs are opposite.

Subjective Questions

1. Helium is monoatomic. So, degree of freedom $f = 3$.
$$U = \frac{nf}{2}RT = \frac{3n}{2}RT$$
$$\text{or} \qquad n = \frac{2U}{3RT}$$
$$= \frac{2 \times 100}{3 \times 8.31 \times 300}$$
$$= 2.67 \times 10^{-2} \text{ mol}$$

2. For all process,
$$\Delta U = nC_V \Delta T$$
$$= \frac{nR\Delta T}{\gamma - 1} \qquad \left(\text{as } C_V = \frac{R}{\gamma - 1}\right)$$

3. (a) In a cyclic process,
$$Q_{\text{net}} = W_{\text{net}}$$
cyclic is clockwise. Hence, work done is positive. So, Q_{net} is also positive.

(b) $W_{\text{net}} = Q_{\text{net}} = 7200$ J

(c) In counter-clockwise direction,
$$W_{\text{net}} = Q_{\text{net}} = -\text{ ve}$$
$$|Q_{\text{net}}| = 7200 \text{ J}$$

4. $Q_{\text{net}} = W_{\text{net}} =$ area under the cycle
$$= (2 \times 10^5)(2.5 \times 10^{-6})$$
$$= 0.5 \text{ J}$$

5. (a) $W_{\text{I}} = +$ ve (as cycle is clockwise)

$W_{\text{II}} = -$ ve (as cycle is anti-clockwise)

But,
$$|W_{\text{I}}| > |W_{\text{II}}|$$
$$\therefore \qquad W_{\text{net}} = +\text{ ve}$$

(c) $$Q_{\text{net}} = W_{\text{net}} = +\text{ ve}$$

(d) In loop-I,
$$Q_{\text{I}} = W_{\text{I}} = +\text{ ve}$$
In loop-II,
$$Q_{\text{II}} = W_{\text{II}} = -\text{ ve}$$

6. Work done per cycle = area under the cycle
$$= \frac{1}{2}(3-2)(10^{-3})(30-10)(1.01 \times 10^5)$$
$$= 1010 \text{ J}$$

Total work done per second
$$= 1010 \times \frac{100}{60}$$
$$= 1683 \text{ J/s}$$

7. (a) $$Q = nC_V \,\Delta T = (1)\left(\frac{3}{2}R\right)(T_f - T_i)$$
$$\therefore \qquad 200 = 1.5 \times 8.31(T_f - 300)$$
Solving we get,
$$T_f = 316 \text{ K}$$

(b) $$Q = nC_p \,\Delta T = (1)\left(\frac{5}{2}R\right)(T_f - T_i)$$
$$\therefore \qquad 200 = 2.5 \times 8.31\,(T_f - 300)$$
$$\therefore \qquad T_f \approx 310 \text{ K}$$

8. $V =$ constant

From $pV = nRT$,
$$V\Delta p = nR(\Delta T)$$
$$Q = nC_V \,\Delta T$$
$$= n\left(\frac{5}{2}R\right)\Delta T = \frac{5}{2}(V\Delta p)$$
$$= \frac{5}{2} \times (10 \times 10^{-3})(4 \times 10^5)$$
$$= 10^4 \text{ J}$$ **Ans.**

9. (a) $W = +$ (Area of the cycle)
$$= +\frac{1}{2}(2V_0 - V_0)(3p_0 - p_0)$$
$$= p_0 V_0$$

(b) $Q_{CA} = nC_p \Delta T$

$$= n\left(\frac{5}{2}R\right)(T_A - T_C)$$

$$= \frac{5}{2}(p_AV_A - p_CV_C)$$

$$= \frac{5}{2}(p_0V_0 - 2p_0V_0) = -\frac{5}{2}\,p_0V_0$$

$$Q_{AB} = nC_V\Delta T$$

$$= n\left(\frac{3}{2}R\right)(T_B - T_A)$$

$$= \frac{3}{2}(p_BV_B - p_AV_A)$$

$$= 3p_0V_0$$

(c) $W_{BC} = +$ (Area under the graph)

$$= 2p_0V_0$$

$$\Delta U_{BC} = nC_V\,\Delta T$$

$$= n\left(\frac{3}{2}R\right)(T_C - T_B)$$

$$= \frac{3}{2}(p_CV_C - p_BV_B) = -\frac{3}{2}\,p_0V_0$$

$$\therefore \quad Q_{BC} = W_{BC} + \Delta U_{BC} = \frac{p_0V_0}{2}$$

(d) p - V equation along path BC is

$$p = -\left(\frac{2p_0}{V_0}\right)V + 5p_0$$

or
$$pV = -\left(\frac{2p_0}{V_0}\right)V^2 + 5p_0V$$

or
$$RT = -\left(\frac{2p_0}{V_0}\right)V^2 + 5p_0V$$

$$\therefore \quad T = \frac{1}{R}\left[5p_0V - \frac{2p_0}{V_0}\cdot V^2\right] \qquad \text{...(i)}$$

For T to be maximum,

$$\frac{dT}{dV} = 0$$

$$\therefore \quad 5p_0 - \frac{4p_0}{V_0}V = 0$$

$$\therefore \quad V = \frac{5}{4}V_0$$

So at this volume, temperature is maximum. Substituting this value of V in Eq. (i), we get

$$T_{\max} = \frac{25p_0V_0}{8R}$$

10. **First process**

$$V = \text{constant}$$

$$\therefore \quad p \propto T$$

Pressure becomes three times. Therefore, temperature also becomes three times.

$$(T_f = 3T_i)$$

Second process

$$p = \text{constant}$$

$$\therefore \quad V \propto T$$

Volume is doubled. So, temperature also becomes two times. ($T_f' = 6T_i$)

Now,
$$C = \frac{Q}{n\,\Delta T} = \frac{Q_1 + Q_2}{n\,\Delta T}$$

$$= \frac{nC_V\,\Delta T_1 + nC_p\,\Delta T_2}{n\,\Delta T}$$

$$= \frac{\left(\frac{5}{2}R\right)(3T_i - T_i) + \left(\frac{7}{2}R\right)(6T_i - 3T_i)}{(6T_i - T_i)}$$

$$= 3.1\,R$$

11. **First Process**

$$V = \text{constant}$$

$$\therefore \quad T \propto p$$

Pressure becomes half. So, temperature also becomes half.

$$Q_1 = n_1C_V\Delta T = 2C_V(150 - 300)$$

$$= -300\,C_V$$

Second Process

$$p = \text{constant}$$

$$Q_2 = nC_p\,\Delta T$$

$$= 2\,C_p(300 - 150)$$

$$= 300\,C_p$$

$$Q = Q_1 + Q_2$$

$$= 300(C_p - C_V) = 300\,R$$

$$= 300 \times 8.31 = 2493 \text{ J}$$

12. $\Delta U = Q - W = nC_V\,\Delta T = n\left(\frac{3}{2}R\right)(T_f - T_i)$

$$\therefore \quad 1200 - 2100 = 5\left(\frac{3}{2} \times 8.31\right)(T_f - 400)$$

$$\therefore \quad T_f = 385 \text{ K}$$

$$\approx 113\ °\text{C}$$

13. $V_i = \dfrac{m}{\rho_i} = \dfrac{2}{999.9} = 2.0002 \times 10^{-3} \text{ m}^3$

$$V_f = \frac{m}{\rho_f} = \frac{2}{1000} = 2 \times 10^{-3}\text{m}^3$$

$$\Delta U = Q - W$$

$$= ms\,\Delta\theta - p_a\Delta V$$

$$= (2)(4200)(4) - (10)^5(-0.002 \times 10^{-3})$$

$$= 33600.2 \text{ J}$$

14. $V_i = \frac{m}{\rho_i} = \frac{0.01}{1000} = 10^{-5}\text{m}^3$

$V_f = \frac{m}{\rho_f} = \frac{0.01}{0.6} = 0.0167\text{ m}^3$

$\Delta U = Q - W$

$= ms\Delta\theta + mL - p_0\Delta V$

$= (0.01 \times 4200 \times 100) + (0.01)(2.5 \times 10)^6 - 10^5(0.0167 - 10^{-5})$

$= 27530\text{ J}$

15. (a) $W = p_0\Delta V$

$= (1.013 \times 10^5)(1671 - 1) \times 10^{-6}$

$= 169\text{ J}$

(b) $Q = mL = (10^{-3})(2.256 \times 10^6)$

$= 2256\text{ J}$

$\therefore \quad \Delta U = Q - W$

$= 2087\text{ J}$

16. (a) $W = p\Delta V = (2.30 \times 10^5)(1.2 - 1.7)$

$= -1.15 \times 10^5\text{ J}$

(b) $Q = W + \Delta U$

$= (-1.15 \times 10^5) + (-1.40 \times 10^5)$

$= -2.55 \times 10^5\text{J}$

17. (a) and (b) $(pV)_A = (pV)_C = 3p_0V_0$

$\therefore \quad T_A = T_C \quad \text{or} \quad \Delta T = 0$

$\therefore \quad \Delta U_{ABC} = 0$

$Q_{ABC} = W_{ABC} = \text{Area under the graph}$

$= -2p_0V_0$ **Ans.**

i.e. Heat is released during the process.

(c) **Process *AB***

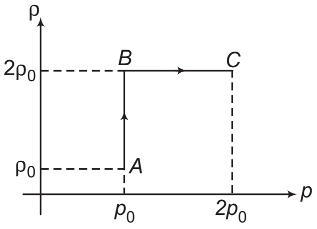
ρ - p graph will be a straight line parallel to ρ - axis because pressure is constant. Further, V is decreasing. Therefore, ρ will increase.

Process *BC*

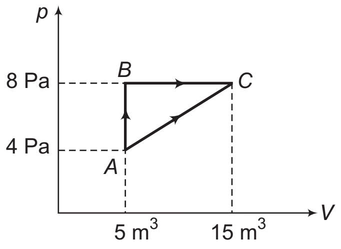
$V = \text{constant} \Rightarrow \rho = \text{constant}$

Therefore, ρ-p graph is a straight line parallel to p - axis.

ρ - p graph is as shown below.



18. (a) W_{AC} is less than W_{ABC} as area under graph is less.



(b) For process A to C,

$Q = 200\text{ J}$

Work done

$W_{AC} = \text{area under } AC$

$= \frac{1}{2}(8 + 4) \times 10$

$= 60\text{ J}$

From first law of thermodynamics,

$\Delta U = Q - W_{AC}$

$U_C - U_A = 200 - 60$

$\therefore \quad U_C = U_A + 140$

$= 10 + 140 = 150\text{ J}$ **Ans.**

(c) From A to B,

$U_B = 20\text{ J}$

$\therefore \quad \Delta U = Q - W_{AB}$

$U_B - U_A = Q - 0$

$20 - 10 = Q$

$\therefore \quad Q = 10\text{ J}$ **Ans.**

19. (a) $U_C - U_A$ along two paths should be same.

$\therefore \quad (Q_{AB} + Q_{BC}) - (W_{AB} + W_{BC}) = Q_{AC} - W_{AC}$

$\therefore \quad (250 + Q_{BC}) - (500 + 0) = 300 - 700$

Solving, we get

$Q_{BC} = -150\text{ J}$

(b) $Q_{CDA} = (W_{CD} + W_{DA}) + (U_A - U_C)$

$= (-800 + 0) - (U_C - U_A)$

$= -800 - (300 - 700)$

$= -400\text{ J}$

20. $V = \frac{m}{\rho} = \frac{1.0}{8.92 \times 10^3}$

$= 1.12 \times 10^{-4}\text{m}^3$

$\gamma = 3\alpha = 2.1 \times 10^{-5}\text{per °C}$

$\Delta V = V\gamma\,\Delta\theta$

$= (1.12 \times 10^{-4})(2.1 \times 10^{-5})(30)$

$= 7.056 \times 10^{-8}\text{ m}^3$

$$W = p\Delta V$$
$$= (1.01\times 10^{5})(7.056\times 10^{-8})$$
$$= 7.13\times 10^{-3}\,\text{J}$$
$$Q = mc\,\Delta Q$$
$$= (1)(387)(30)$$
$$\Delta U = Q - W$$
$$= 11609.99287\ \text{J}$$

21. (a) $T = \dfrac{pV}{nR} = \dfrac{(2\times 10^{5})(1.0\times 10^{-2})}{(1)(8.31)}$

$$= 240.7\ \text{K}$$

(b) In adiabatic process,

$$TV^{\gamma-1} = \text{constant}$$
$$\therefore\quad T_f V_f^{\gamma-1} = T_i V_i^{\gamma-1}$$
$$\therefore\quad T_f = T_i\left(\frac{V_i}{V_f}\right)^{\gamma-1}$$
$$= (240.7)\left[\frac{1.0\times 10^{-2}}{5.0\times 10^{-3}}\right]^{5/3-1}$$
$$\approx 383\ \text{K}$$

(c) Work done on the gas $= \Delta U$

$$= nC_V\,\Delta T$$
$$= (1)\left(\frac{3}{2}R\right)(T_f - T_i)$$
$$= 1.5\times 8.31(383 - 240.7)$$
$$\approx 1770\ \text{J}$$

(d) $\Delta U \approx 1770$ J

22. (a) From conservation of linear momentum,

$$0.01\times 200 = (2 + 0.01)\,v$$
$$\therefore\quad v \approx 1\ \text{m/s}$$

Mechanical energy dissipated in collision,

$$= K_i - K_f$$
$$= \frac{1}{2}\times(0.01)(200)^2 - \frac{1}{2}(2.01)(1)^2$$
$$\approx 199\ \text{J}$$

(b) $n = \dfrac{m}{M} = \dfrac{2000 + 10}{200} = 10.05$

Using,

$$Q = nC_V\,\Delta T$$
$$\therefore\quad \Delta T = \frac{Q}{nC_V} = \frac{199}{10.05\times 3\times 8.31}$$
$$= 0.80^\circ\text{C}$$

23. Along the process CD apply,

$pV =$ constant and find V_C

Similarly along path AB, again apply,

$pV =$ constant and find V_B.

Now, $W_{\text{net}} = W_{AB} + W_{BC} + W_{CD} + W_{DA}$

$$= nRT_A\ln\left(\frac{V_B}{V_A}\right) + p_B\,(V_C - V_B)$$
$$+ nRT_C\ln\left(\frac{V_D}{V_C}\right) + p_D(V_A - V_D)$$

Further, $nRT_A = p_A V_A$

and $nRT_C = p_C V_C$

24. $pV = nRT$

$$\therefore\quad p\Delta V = nR\Delta T$$

Work done under constant pressure is

$$W = p\Delta V = nR\Delta T$$
$$= (0.2)(8.31)(100) = 166.2\ \text{J}$$

LEVEL 2

Single Correct Option

1. $W = \displaystyle\int_V^{2V} p\,dV$

$$= \int_V^{2V}\left(\frac{n\,RT}{V - b}\right)dV$$
$$= nRT\,\ln\left(\frac{2V - b}{V - b}\right)$$

Put $n = 1$,

$$\therefore\quad W = RT\,\ln\left(\frac{2V - b}{V - b}\right)$$

2. **For *AB*** $\quad V = \text{constant}$

$$\therefore\quad W = 0$$

For *BC* $\quad W = n\,RT_2\,\ln\left(\dfrac{V_f}{V_i}\right)$

$$= RT_2\ln\left(\frac{V_2}{V_1}\right)$$

For *CA* $\quad V \propto T$

$$\therefore\quad p = \text{constant}$$
$$W = nR\Delta T$$
$$= R(T_1 - T_2)$$

3. $\because\quad Q = n\,C_p\,\Delta T$

$$\frac{7}{2}RT_0 = (10)\left(\frac{7}{2}R\right)(T_f - T_0)$$
$$T_f = 1.1\,T_0$$

If p = constant, then $V \propto T$

If temperature becomes 1.1 times, then volume will also become 1.1 times.

4. W_{net} = area under the cycle

$$= 2p_0V_0$$

$$Q_{+\text{ve}} = Q_{ABC} = W_{ABC} + \Delta U_{ABC}$$

$$= \text{area under the graph } + nC_V\,\Delta T$$

$$= (3p_0V_0) + n\left(\frac{3}{2}R\right)(T_C - T_A)$$

$$= (3p_0V_0) + \frac{3}{2}(p_CV_C - p_AV_A)$$

$$= 10.5\;p_0V_0$$

$$\eta = \frac{W_{\text{net}}}{Q_{+\text{ve}}} = \frac{4}{21}$$

5. $Q = W + \Delta U$

$$= \text{area under the graph} + \Delta U$$

$$= -\,p_0V_0 - \frac{3p_0V_0}{2}$$

$$= -\frac{5}{2}p_0V_0$$

6. pV^{-1} = constant

In the process, pV^x = constant

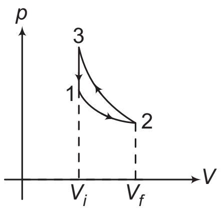
$$C = C_V + \frac{R}{1-x}$$

Here, $C = \frac{3}{2}R + \frac{R}{1+1} = 2R$

$$Q = n\,C\Delta T = (1)(2R)(2T_0 - T_0)$$

$$= 2RT_0$$

7.



In process 3 – 1

V = constant

∴ $T \propto p$

If p is decreasing, then T will also decrease.

8. $TV^{\gamma-1}$ = constant

$$\therefore \quad \frac{T_1}{T_2} = \left(\frac{V_2}{V_1}\right)^{\gamma-1}$$

$$= \left(\frac{L_2}{L_1}\right)^{5/3-1} = \left(\frac{L_2}{L_1}\right)^{2/3}$$

9. $T \propto U$

$$T_C = T_D = T_0 = 300\text{ K}$$

$$T_A = T_B = 2T_0 = 600\text{ K}$$

$$Q_{\text{net}} = Q_{AB} + Q_{BC} + Q_{CD} + Q_{DA}$$

$$= nRT_A \ln\left(\frac{V_f}{V_i}\right) + nC_V(T_C - T_B)$$

$$+\, nRT_C \ln\left(\frac{V_f}{V_i}\right) + nC_V(T_A - T_D)$$

$$= (1)(R)(600)\ln(2) + (1)(C_V)(-300)$$

$$+ (1)(R)(300)\ln\left(\frac{1}{2}\right) + (1)(C_V)(300)$$

$$= 300\,R\ln 2$$

10. **1-2** $\quad T \propto V$

∴ p = constant

$$Q_{\text{net}} = W_{\text{net}} = W_{12} + W_{23} + W_{31}$$

∴ $W_{23} = Q_{\text{net}} - W_{12}$ (as $W_{31} = 0$)

$$= -\,300 - nR\Delta T$$

$$= -\,300 - 2 \times 8.31 \times 300$$

$$= -\,5286\text{ J}$$

11. $Q_A = Q_B$

$$nC_p\,\Delta T_A = nC_V\Delta T_B$$

$$\therefore \quad \Delta T_B = \frac{C_p}{C_V}\cdot\Delta T_A = \gamma\Delta T_A$$

$$= (1.4)(30) = 42\text{ K}$$

12. TV^{n-1} = constant

∴ $(pV)V^{n-1}$ = constant (as $T \propto pV$)

∴ pV^n = constant

Bulk modulus in the process pV^{γ} = constant is γp.

Hence, in the given process Bulk modulus is np.

13. pV^{-1} = constant

In the process, pV^x = constant

$$W = \left(\frac{R}{1-x}\right)\Delta T$$

Here, $x = -1$

$$\therefore \quad W = \frac{R}{2}\Delta T = \frac{R}{2}(T_2 - T_1)$$

14. $\Delta U = Q - W = 450\text{ J} = nC_V\Delta T$

$$= n\left(\frac{3}{2}R\right)\Delta T$$

$$\therefore \quad n\,\Delta T = \left(\frac{300}{R}\right)$$

Now, $$C = \frac{Q}{n\,\Delta T} = \frac{600}{300/R} = 2R$$

15. $W = p\Delta V = p_0(2V_0 - V_0) = p_0V_0$

$$\Delta U = U_f - U_i = 2p_0(2V_0) - 2p_0V_0 = 2p_0V_0$$

$\therefore \quad Q = W + \Delta U = 3p_0V_0$

16. $C = \frac{Q}{n\,\Delta T}$

or $\quad C \propto Q$

ΔU is same. But $W_1 < W_2$ as area under p-V graph is less.

Hence, $\quad Q_1 < Q_2$

or $\quad C_1 < C_2$.

$\therefore \quad \frac{C_1}{C_2} < 1$

17. $Q_{\text{net}} = W_{\text{net}}$

$Q_{AB} = Q_{CD} = 0$

$$Q_{BC} = n\,C_p\Delta T = (1)\left(\frac{5}{2}R\right)(4T - T) = 7.5RT$$

$$Q_{DA} = n\,C_p\Delta T = (1)\left(\frac{5}{2}R\right)(3T - 5T) = -5RT$$

$\therefore \quad W_{\text{net}} = Q_{\text{net}} = 7.5RT - 5RT = 2.5RT$

18. $U\rho =$ constant

$\therefore \quad T\left(\frac{1}{V}\right) =$ constant

or $\quad T \propto V$

$\therefore \quad p =$ constant

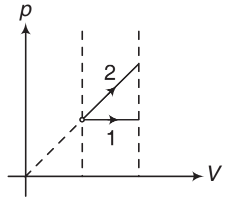
$$\frac{\Delta U}{W} = \frac{\Delta U}{Q - \Delta U} = \frac{n\,C_V\,\Delta T}{n\,C_p\Delta T - n\,C_V\Delta T} = \frac{1}{\gamma - 1} = \frac{1}{\frac{5}{3} - 1} = \frac{3}{2}$$

19. $W =$ Area under F-x graph

$= 17.5$ J

Now, $\quad Q = W + \Delta U = 20$ J

20. In second process, $p \propto V$ i.e. p-V graph is straight line passing through origin.



Area under graph-2 is more.

$\therefore \quad W_2 > W_1$

Further, $\quad T \propto pV$

$(pV)_2 > (pV)_1$

$\therefore \quad T_2 > T_1$

21. $dQ = -dU \quad$ or $\quad dU + dW = -dU$

or $\quad 2dU + dW = 0$

$\therefore \quad 2[n\,C_V dT] + pdV = 0$

or $\quad 2\left[n\left(\frac{R}{\gamma - 1}\right)dT\right] + pdV = 0$

or $\quad \frac{2nRdT}{\gamma - 1} + \left(\frac{nRT}{V}\right)dV = 0$

or $\quad \left(\frac{2}{\gamma - 1}\right)\frac{dT}{T} + \frac{dV}{V} = 0$

Integrating we get,

$$\left(\frac{2}{\gamma - 1}\right)\ln(T) + \ln(V) = \ln(C)$$

Solving we get

$$TV^{\frac{\gamma - 1}{2}} = \text{constant}$$

22. In a cyclic process,

$Q_{\text{net}} = W_{\text{net}}$

$\therefore \quad Q_{AB} + Q_{BC} + Q_{CA} =$ area under the graph

$\therefore \quad 600 + 200 + Q_{CA} = \frac{1}{2}(3 \times 10^{-4})(5 \times 10^5) = 75$ J

$\therefore\ Q_{CA} = -725\text{ J} = W_{CA} + \Delta U_{CA}$

$= -725 =$ (–Area under the graph) $+ \Delta U_{CA}$

$= -\left(\frac{1}{2} \times 11 \times 10^5\right)(3 \times 10^{-4}) + \Delta U_{CA}$
